**CHOICE OF THE HEATSINK**

The user must choose the heatsink according to the working conditions of the component (power, room temperature). Maximum working temperature must not exceed 125 °C. The dissipated power is simply calculated by the following ratio:

$$P = \frac{\Delta T}{[R_{TH} (j-c) + R_{TH} (c-a)]} \quad (1)$$

P: Expressed in W

T: Difference between maximum working temperature and room temperature

$R_{TH} (j-c)$ : Thermal resistance value measured between resistive layer and outer side of the resistor. It is the thermal resistance of the component: (see specifications environmental paragraph).

$R_{TH} (c-a)$ : Thermal resistance value measured between outer side of the resistor and room temperature. It is the thermal resistance of the heatsink, depending on the heatsink itself (type, shape) and the quality of the fastening device.

**Example:**

$R_{TH} (c-a)$  for RPS 250 power dissipation 180 W at + 50 °C room temperature.

$$\Delta T \leq 125 \text{ °C} - 50 \text{ °C} \leq 75 \text{ °C}$$

$$R_{TH} (j-c) + R_{TH} (c-a) = \frac{\Delta T}{P} = \frac{75}{180} = 0.42 \text{ °C/W}$$

$$R_{TH} (j-c) = 0.22 \text{ °C/W}$$

$$R_{TH} (c-a) \leq 0.42 \text{ °C/W} - 0.22 \text{ °C/W} \leq 0.20 \text{ °C/W}$$

**RECOMMENDATIONS FOR MOUNTING ONTO A HEATSINK**

Surfaces in contact must be carefully cleaned. The heatsink must have an acceptable flatness: from 0.05 mm to 0.1 mm/100 mm. Roughness of the heatsink must be around 6.3 μm. In order to improve thermal conductivity, surfaces in contact should be coated with a silicone grease (type SI 340 from Rhône-Poulenc or Dow 340 from Dow Corning).

The fastening of the resistor to the heatsink is under pressure control of two screws (tightening torque 3 Nm).

In order to improve the dissipation, either forced-air cooling or liquid cooling may be used.

Do not forget to respect an insulation value between two resistors (dielectric strength in dry air 1 kV/mm).

In any case the hot spot temperature, measured locally on the case must not exceed 125 °C.

Test should be performed by the user.

**OVERLOADS**

In any case the applied voltage must be lower than 2.5 Un.  $U_{maxi} < 2.5 U_n < 12\ 500\ V$ .

**Short time overload:**  $4 P_n/10\ s$

**Accidental overload:** The values indicated on the graph below are applicable to resistors in air or mounted onto a heatsink.

**ENERGY CURVE**

**POWER RATING CHART**

The temperature of the heatsink should be maintained in the limit specified.

To improve the thermal conductivity, surfaces in contact should be coated with a silicone grease.
