

# MAX3050/MAX3057

# ±80V Fault-Protected, 2Mbps, Low-Supply Current CAN Transceivers

## General Description

The MAX3050 and MAX3057 interface between the CAN protocol controller and the physical wires of the bus lines in a control area network (CAN). They are primarily intended for systems requiring data rates up to 2Mbps and feature ±80V fault protection against shorts in high-voltage power buses. They provide differential transmit capability to the bus and differential receive capability to the CAN controller.

The MAX3050 and MAX3057 have four modes of operation: high speed, slope control, standby, and shutdown. High-speed mode allows data rates up to 2Mbps. In slope-control mode, data rates are 40kbps to 500kbps, so the effects of EMI are reduced, and unshielded twisted or parallel cable can be used. In standby mode, the transmitters are shut off and the receivers are put into low-current mode. In shutdown mode, the transmitter and receiver are switched off.

The MAX3050 has an AutoShutdown™ function that puts the device into a 15ms shutdown mode when the bus or CAN controller is inactive for 4ms or longer.

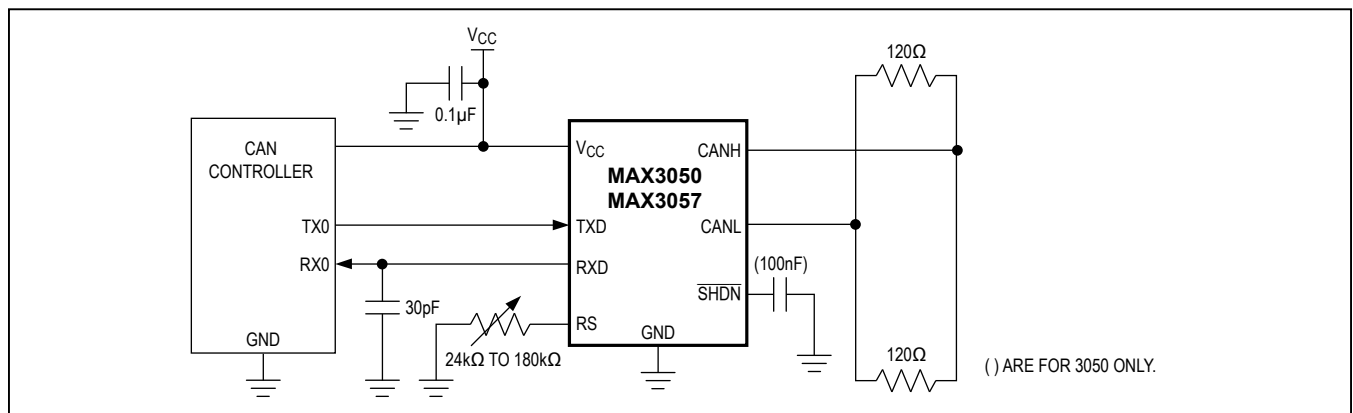

The MAX3050 and MAX3057 are available in an 8-pin SO package and are specified for operation from -40°C to +125°C.

## Applications

- HVAC Controls
- Telecom 72V systems

*AutoShutdown is a trademark of Maxim Integrated Products, Inc.*

## Typical Operating Circuit

## Features

- ±80V Fault Protection for 42V Systems
- Four Operating Modes:
  - High-Speed Operation Up to 2Mbps
  - Slope-Control Mode to Reduce EMI (40kbps to 500kbps)
  - Standby Mode
  - Low-Current Shutdown Mode
- AutoShutdown when Device is Inactive (MAX3050)
- Automatic Wake-Up from Shutdown (MAX3050)
- Thermal Shutdown
- Current Limiting
- Fully Compatible with the ISO 11898 Standard

## Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX3050ASA	-40°C to +125°C	8 SO
MAX3057ASA	-40°C to +125°C	8 SO

## Pin Configuration

**Absolute Maximum Ratings**

V <sub>CC</sub> to GND .....	-0.3V to +6V	Operating Temperature Range .....	-40°C to +125°C
TXD, RS, RXD, SHDN to GND.....	-0.3V to (V <sub>CC</sub> + 0.3V)	Junction Temperature.....	+150°C
RXD Shorted to GND.....	Continuous	Storage Temperature Range .....	-65°C to +150°C
CANH, CANL to GND.....	-80V to +80V Continuous	Lead Temperature (soldering, 10s) .....	+300°C
Continuous Power Dissipation (T <sub>A</sub> = +70°C)			
8-Pin SO (derate 5.9mW/°C above +70°C) .....	470mW		

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Pin Description

PIN	NAME	FUNCTION
1	TXD	Transmit Data Input. TXD is a CMOS/TTL-compatible input from a CAN controller.
2	GND	Ground
3	V <sub>CC</sub>	Supply Voltage. Bypass V <sub>CC</sub> to GND with a 0.1μF capacitor.
4	RXD	Receive Data Output. RXD is a CMOS/TTL-compatible output from the physical bus lines CANH and CANL.
5	$\overline{\text{SHDN}}$	Shutdown Input. Drive $\overline{\text{SHDN}}$ low to put into shutdown mode. See the Detailed Description section for a full explanation of SHDN behavior.
6	CANL	CAN Bus Line Low. CANL is fault protected to ±80V.
7	CANH	CAN Bus Line High. CANH is fault protected to ±80V.
8	RS	Mode Select Pin. Drive RS low or connect to GND for high-speed operation. Connect a resistor from RS to GND to control output slope. Drive RS high to put into standby mode. See the <i>Mode Selection</i> section under <i>Detailed Description</i> .

**Detailed Description**

The MAX3050 and MAX3057 interface between the protocol controller and the physical wires of the bus lines in a CAN. They are primarily intended for applications requiring data rates up to 2Mbps and feature ±80V fault protection against shorts in high-voltage systems. This fault protection allows the devices to withstand up to ±80V with respect to ground with no damage to the device. The built-in fault tolerance allows the device to survive in industrial environments with no external protection devices. The devices provide differential transmit capability to the bus and differential receive capability to the CAN controller. (See Figure 4.)

The device has four modes of operation: high speed, slope control, standby, and shutdown. In high-speed mode, slew rates are not limited, making 2Mbps transmission speeds possible. Slew rates are controlled in slopecontrol mode, minimizing EMI and allowing use of unshielded twisted or parallel cable. In standby mode, receivers are active and transmitters are in high impedance. In shutdown mode, transmitters and receivers are turned off.

The transceivers are designed to operate from a single +5V supply and draw 56mA of supply current in dominant state and 3.6mA in recessive state. In standby mode, supply current is reduced to 135µA. In shutdown mode, supply current is 15µA.

CANH and CANL are output short-circuit current-limited and are protected against excessive power dissipation by thermal-shutdown circuitry that places the driver outputs into a high-impedance state.

**Fault Protection**

The MAX3050 and MAX3057 feature ±80V fault protection. This extended voltage range of CANH and CANL bus lines allows use in high-voltage systems and communication with high-voltage buses. If data is transmitting at 2Mbps, the fault protection is reduced to ±70V.

**Transmitter**

The transmitter converts a single-ended input (TXD) from the CAN controller to differential outputs for the bus lines (CANH, CANL). The truth table for the transmitter and receiver is given in Table 1.

Figure 4. Functional Diagram

**Table 1. Transmitter and Receiver Truth Table**

TXD	RS	$\overline{\text{SHDN}}$	CANH	CANL	BUS STATE	RXD
0	$V_{RS} < 0.75 \times V_{CC}$	$V_{\overline{\text{SHDN}}} > 1.5\text{V}$	High	Low	Dominant*	0
1 or float	$V_{RS} < 0.75 \times V_{CC}$	$V_{\overline{\text{SHDN}}} > 1.5\text{V}$	5 to 25kΩ to $V_{CC}/2$	5 to 25kΩ to $V_{CC}/2$	Recessive*	1
X	$V_{RS} > 0.75 \times V_{CC}$	X	Floating	Floating	Floating	1
X	X	$V_{\overline{\text{SHDN}}} < 0.5\text{V}$	Floating	Floating	Floating	1

X = Don't care.

\* As defined by ISO, bus value is one of two complementary logical values: dominant or recessive. The dominant value represents the logical 0 and the recessive represents the logical 1. During the simultaneous transmission of the dominant and recessive bits, the resulting bus value is dominant.

### High Speed

Connect RS to ground to set the MAX3050 and MAX3057 to high-speed mode. When operating in high-speed mode, the MAX3050 and MAX3057 can achieve transmission rates of up to 2Mbps. Line drivers are switched on and off as quickly as possible. However, in this mode, no measures are taken to limit the rise and fall slope of the data signal, allowing for potential EMI emissions. If using the MAX3050 and MAX3057 in high-speed mode, use shielded twistedpair cable to avoid EMI problems.

### Slope Control

Connect a resistor from RS to ground to select slope-control mode. (See Table 2.) In slope-control mode, the gates of the line drivers are charged with a controlled current, proportional to the resistor connected to the RS pin. Transmission speed ranges from 40kbps to 500kbps. Controlling the rise and fall slope reduces EMI and allows the use of an unshielded twisted pair or a parallel pair of wires as bus lines. The transfer function for selecting the resistor value is given by:

$$R_{RS} \text{ (k}\Omega\text{)} = 12000/\text{speed (in kbps)}.$$

See the Slew Rate vs.  $R_{RS}$  graph in the *Typical Operating Characteristics* section.

### Shutdown

In shutdown mode, the device is switched off. The outputs are high impedance to ± 80V. The MAX3057 features a pulldown at  $\overline{\text{SHDN}}$ . If shutdown is forced low and then left floating, the device remains in shutdown until  $\overline{\text{SHDN}}$  is forced high.

**Table 2. Mode Selection Truth Table**

CONDITION FORCED AT PIN RS	MODE	RESULTING CURRENT AT RS
$V_{RS} < 0.3 \times V_{CC}$	High speed	$ I_{RS}  < 500\mu\text{A}$
$0.4 \times V_{CC} < V_{RS} < 0.6 \times V_{CC}$	Slope control	$10\mu\text{A} <  I_{RS}  < 200\mu\text{A}$
$V_{RS} > 0.75 \times V_{CC}$	Standby	$ I_{RS}  < 10\mu\text{A}$

### Receiver

The receiver reads differential input from the bus lines (CANH, CANL) and transfers this data as a singleended output (RXD) to the CAN controller. It consists of a comparator that senses the difference  $\Delta V = (\text{CANH} - \text{CANL})$  with respect to an internal threshold of 0.7V. If this difference is positive (i.e.,  $\Delta V > 0.7\text{V}$ ) a logic-low is present at the RXD pin. If negative (i.e.,  $\Delta V < 0.7\text{V}$ ), a logic-high is present.

The receiver always echoes the transmitted data.

The CANH and CANL common-mode range is -7V to +12V. RXD is logic high when CANH and CANL are shorted or terminated and undriven. If the differential receiver input voltage (CANH - CANL) is less than or equal to 0.5V, RXD is logic high. If (CANH - CANL) is greater than or equal to 0.9V, RXD is logic low.

### Standby

The MAX3050 and MAX3057 transmitters are three-stated, and the receivers are active in standby. This allows the device to read data on the bus while reducing power consumption.

Receivers take up to 10ms to wake up from standby mode. Therefore, the first bits of information read off the bus when coming out of standby can be lost.

### Thermal Shutdown

If the junction temperature exceeds +160°C, the device is switched off. The hysteresis is approximately 20°C, disabling thermal shutdown once the temperature reaches +140°C.

**AutoShutdown (MAX3050)**

To manage power consumption, AutoShutdown puts the device into shutdown mode after it has been inactive for a period of time. The value of an external capacitor ( $C_{\overline{SHDN}}$ ) connected to  $\overline{SHDN}$  determines the threshold of inactivity time, after which the AutoShutdown triggers. Floating  $\overline{SHDN}$  allows the MAX3050 to automatically change from active mode to shutdown.

Use a 100nF capacitor as  $C_{\overline{SHDN}}$  for a typical threshold of 20ms. Change the capacitor value according to the following equation to change the threshold time period.

$$C_{\overline{SHDN}}(\text{nF}) = \frac{I_{\overline{SHDN}}(\text{mA}) \times \text{time}(\mu\text{s})}{(V_{CC} - V_{\overline{SHDN}})}$$

Drive  $\overline{SHDN}$  high to turn the MAX3050 on and disable AutoShutdown.

When the MAX3050 is in shutdown mode, only the wake-up comparator is active, and normal bus communication is ignored. The remote master of the CAN system wakes up the MAX3050 with a signal greater than 9V on CANH. Internal circuitry in the MAX3050 puts the device in normal operation by driving  $\overline{SHDN}$  high.

The MAX3057 does not have the AutoShutdown feature.

**Driver Output Protection**

The MAX3050 and MAX3057 have several features that protect them from damage. Thermal shutdown switches off the device and puts CANH and CANL into high impedance if the junction temperature exceeds +160°C. Thermal protection is needed particularly when a bus line is short-circuited. The hysteresis for the thermal shutdown is approximately 20°C.

Additionally, a current-limiting circuit protects the transmitter output stage against short-circuit to positive and negative battery voltage. Although the power dissipation increases during this fault condition, this feature prevents destruction of the transmitter output stage.

**Applications Information**

**Reduced EMI and Reflections**

In slope-control mode, the CANH and CANL outputs are slew-rate limited, minimizing EMI and reducing reflections caused by improperly terminated cables. In general, a transmitter's rise time relates directly to the length of an unterminated stub, which can be driven with only minor waveform reflections. The following equation expresses this relationship conservatively:

$$\text{Length} = t_{\text{RISE}} / (15\text{ns/ft})$$

where  $t_{\text{RISE}}$  is the transmitter's rise time.

Figure 5. FFT Dominant Bus at 2Mbps layout.

Figure 6. FFT Recessive Bus at 2Mbps

Figure 8. FFT Recessive Bus at 500kbps

Figure 10. FFT Recessive Bus at 62.5kbps

Figure 9. FFT Dominant Bus at 62.5kbps

The MAX3050 and MAX3057 require no special layout considerations beyond common practices. Bypass  $V_{CC}$  to GND with a 1 $\mu$ F ceramic capacitor mounted close to the IC with short lead lengths and wide trace widths.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,  
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
