

## Double channel high-side driver with analog current sense for automotive applications

Datasheet – production data

### Features

Max transient supply voltage	$V_{CC}$	41 V
Operating voltage range	$V_{CC}$	4.5 to 28 V
Max on-state resistance (per ch.)	$R_{ON}$	50 m $\Omega$
Current limitation (typ)	$I_{LIMH}$	27 A
Off-state supply current	$I_S$	2 $\mu$ A <sup>(1)</sup>

1. Typical value with all loads connected.

- General
  - Inrush current active management by power limitation
  - Very low standby current
  - 3.0 V CMOS compatible inputs
  - Optimized electromagnetic emissions
  - Very low electromagnetic susceptibility
  - Compliant with European directive 2002/95/EC
  - Very low current sense leakage
  - AEC-Q100 qualified
- Diagnostic functions
  - Proportional load current sense
  - High current sense precision for wide currents range
  - Current sense disable
  - Off-state open-load detection
  - Output short to  $V_{CC}$  detection
  - Overload and short to ground (power limitation) indication
  - Thermal shutdown indication
- Protections
  - Undervoltage shutdown
  - Overvoltage clamp
  - Load current limitation
  - Self limiting of fast thermal transients
  - Protection against loss of ground and loss of  $V_{CC}$

- Overtemperature shutdown with auto restart (thermal shutdown)
- Reverse battery protected
- Electrostatic discharge protection

### Applications

- All types of resistive, inductive and capacitive loads
- Suitable as LED driver

### Description

The VND5E050ASO-E is a double channel high-side driver manufactured using ST proprietary VIPower<sup>®</sup> M0-5 technology and housed in SO-16L package. The device is designed to drive 12 V automotive grounded loads, and to provide protection and diagnostics. It also implements a 3 V and 5 V CMOS-compatible interface for the use with any microcontroller.

The device integrates advanced protective functions such as load current limitation, inrush and overload active management by power limitation, overtemperature shut-off with auto-restart and overvoltage active clamp. A dedicated analog current sense pin is associated with every output channel providing enhanced diagnostic functions including fast detection of overload and short-circuit to ground through power limitation indication, overtemperature indication, short-circuit to  $V_{CC}$  diagnosis and on-state and off-state open-load detection. The current sensing and diagnostic feedback of the whole device can be disabled by pulling the CS\_DIS pin high to share the external sense resistor with similar devices.

Note:  $V_{Fn} = V_{OUTn} - V_{CC}$  during reverse battery condition.

### 2.1 Absolute maximum ratings

Stressing the device above the rating listed in [Table 3: Absolute maximum ratings](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to the conditions in table below for extended periods may affect device reliability.

Table 3. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V <sub>CC</sub>	DC supply voltage	41	V
-V <sub>CC</sub>	Reverse DC supply voltage	0.3	V
-I <sub>GND</sub>	DC reverse ground pin current	200	mA
I <sub>OUT</sub>	DC output current	Internally limited	A
-I <sub>OUT</sub>	Reverse DC output current	20	A
I <sub>IN</sub>	DC input current	-1 to 10	mA
I <sub>CSD</sub>	DC current sense disable input current	-1 to 10	mA
-I <sub>CSENSE</sub>	DC reverse CS pin current	200	mA
V <sub>CSENSE</sub>	Current sense maximum voltage	V <sub>CC</sub> - 41 to +V <sub>CC</sub>	V

**Table 3. Absolute maximum ratings (continued)**

Symbol	Parameter	Value	Unit
$E_{MAX}$	Maximum switching energy (single pulse) ( $L = 3\text{ mH}$ ; $R_L = 0\ \Omega$ ; $V_{bat} = 13.5\text{ V}$ ; $T_{jstart} = 150^\circ\text{C}$ ; $I_{OUT} = I_{limL} (Typ.)$ )	104	mJ
$V_{ESD}$	Electrostatic discharge (human body model: $R = 1.5\text{ K}\Omega$ ; $C = 100\text{ pF}$ )		
	- Input	4000	V
	- Current sense	2000	V
	- CS_DIS	4000	V
	- Output	5000	V
	- $V_{CC}$	5000	V
$V_{ESD}$	Charge device model (CDM-AEC-Q100-011)	750	V
$T_j$	Junction operating temperature	-40 to 150	$^\circ\text{C}$
$T_{stg}$	Storage temperature	-55 to 150	$^\circ\text{C}$

## 2.2 Thermal data

**Table 4. Thermal data**

Symbol	Parameter	Typ value	Unit
$R_{thj-pcb}$	Thermal resistance junction-pcb <sup>(1)</sup>	18.5	$^\circ\text{C/W}$
$R_{thj-amb}$	Thermal resistance junction - ambient on two layers pcb	See <a href="#">Figure 36</a>	$^\circ\text{C/W}$
$R_{thj-amb}$	Thermal resistance junction - ambient on two layers pcb <sup>(2)</sup>	34.5	$^\circ\text{C/W}$

1. The measure is done in accordance with the JESD 51-8.

2. Four Layers PCB characteristics:

- Cu thickness: 70  $\mu\text{m}$  outer layers, 35  $\mu\text{m}$  inner layers
- Board finish thickness 1.6 mm +/- 10%
- Thermal vias separation 1.2 mm
- Thermal via diameter 0.3 mm +/- 0.08 mm
- Cu thickness on vias 0.025 mm
- Device soldered at about 2 cm from the PCB edge with two sqcm of exposed copper

## 2.3 Electrical characteristics

Values specified in this section are for  $8\text{ V} < V_{CC} < 28\text{ V}$ ;  $-40\text{ }^\circ\text{C} < T_j < 150\text{ }^\circ\text{C}$ , unless otherwise stated.

1. To ensure long term reliability under heavy overload or short circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device is subjected to abnormal conditions, this software must limit the duration and number of activation cycles.

### 3 Application information

Figure 32. Application schematic

Note: Channel 2 has the same internal circuit as channel 1.

#### 3.1 GND protection network against reverse battery

This section provides two solutions to implement a ground protection network against reverse battery.

##### 3.1.1 Solution 1: resistor in the ground line (R\_GND only)

This can be used with any type of load.

The following description shows an indication on how to size the R\_GND resistor.

1.  $R_{GND} \leq 600\text{mV} / (I_{S(on)max})$
2.  $R_{GND} \geq (-V_{CC}) / (-I_{GND})$

where  $-I_{GND}$  is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device datasheet.

Power dissipation in R\_GND (when  $V_{CC} < 0$ : during reverse battery situations) is:

$$P_D = (-V_{CC})^2 / R_{GND}$$

This resistor can be shared amongst several different HSDs. Please note that the value of this resistor should be calculated with formula (1) where  $I_{S(on)max}$  becomes the sum of the maximum on-state currents of the different devices.

Please note that if the microprocessor ground is not shared by the device ground then the R\_GND produces a shift ( $I_{S(on)max} * R_{GND}$ ) in the input thresholds and the status output values. This shift varies depending on how many devices are on in case of several high-side drivers sharing the same R\_GND.

If the calculated power dissipation leads to a large resistor or several devices have to share the same resistor then ST suggests to utilize [Section 3.1.2: Solution 2: diode \(D<sub>GND</sub>\) in the ground line](#).

### 3.1.2 Solution 2: diode (D<sub>GND</sub>) in the ground line

A resistor ( $R_{GND} = 1 \text{ k}\Omega$ ) should be inserted in parallel to  $D_{GND}$  if the device drives an inductive load.

This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network will produce a shift ( $\approx 600 \text{ mV}$ ) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift does not vary if more than one HSD share the same diode/resistor network.

## 3.2 Load dump protection

$D_{ld}$  is necessary (voltage transient suppressor) if the load dump peak voltage exceeds the  $V_{CC}$  maximum DC rating. The same applies if the device is subject to transients on the  $V_{CC}$  line which are greater than the ones shown in the ISO 7637-2: 2004(E) table.

## 3.3 MCU I/Os protection

If a ground protection network is used and negative transient are present on the  $V_{CC}$  line, the control pins are pulled negative. ST suggests to insert a resistor ( $R_{prot}$ ) in line to prevent the microcontroller I/O pins from latching-up.

The value of these resistors is a compromise between the leakage current of microcontroller and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of microcontroller I/Os:

$$-V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

Calculation example:

$$\text{For } V_{CCpeak} = -100V \text{ and } I_{latchup} \geq 20mA; V_{OH\mu C} \geq 4.5V$$

$$5k\Omega \leq R_{prot} \leq 180k\Omega$$

$$\text{Recommended values: } R_{prot} = 10k\Omega, C_{EXT} = 10nF.$$

## 3.4 Current sense and diagnostic

The current sense pin performs a double function (see [Figure 33: Current sense and diagnostic](#)):

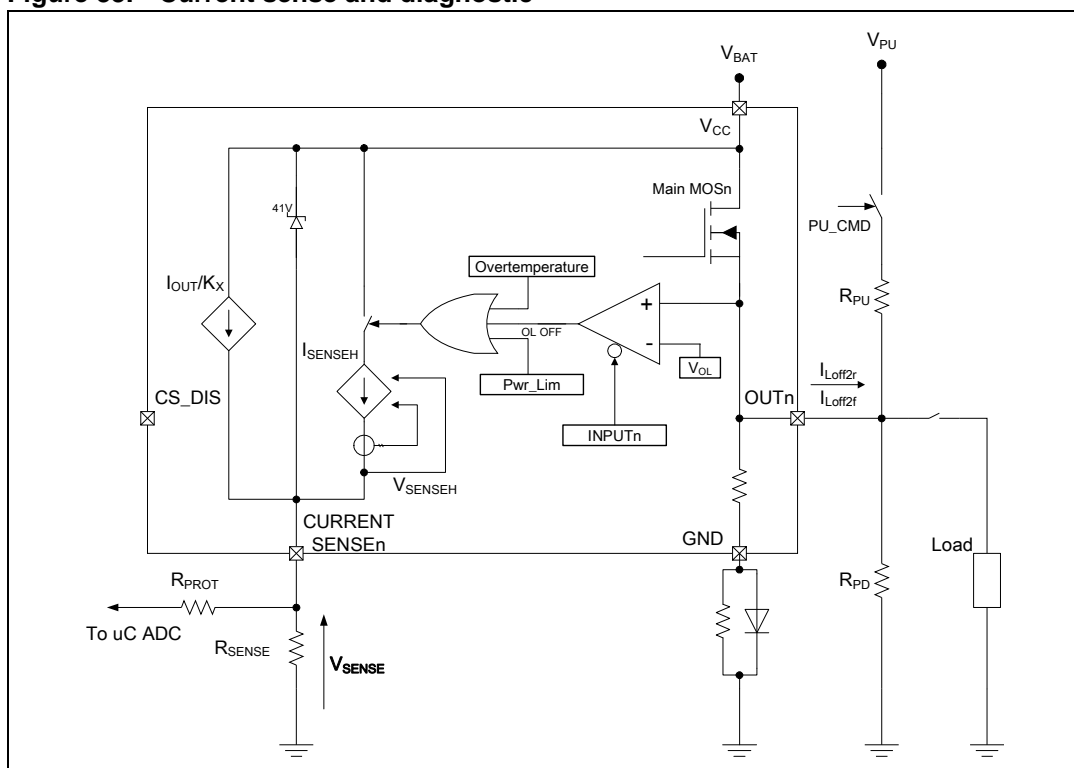

- **Current mirror of the load current in normal operation**, delivering a current proportional to the load current according to a known ratio  $K_X$ .  
The current  $I_{SENSE}$  can be easily converted to a voltage  $V_{SENSE}$  by means of an external resistor  $R_{SENSE}$ . Linearity between  $I_{OUT}$  and  $V_{SENSE}$  is ensured up to 5V minimum (see parameter  $V_{SENSE}$  in [Table 9: Current sense \(8 V <  \$V\_{CC}\$  < 18 V\)](#)). The current sense accuracy depends on the output current (refer to current sense electrical

characteristics [Table 9: Current sense \(8 V < V<sub>CC</sub> < 18 V\)](#)).

- **Diagnostic flag in fault conditions**, delivering a fixed voltage  $V_{SENSEH}$  up to a maximum current  $I_{SENSEH}$  in case of the following fault conditions (refer to [Table 11: Truth table](#)):
  - Power limitation activation
  - Overtemperature
  - Short to  $V_{CC}$  in off-state
  - Open-load in off-state with additional external components.

A logic level high on the CS\_DIS pin simultaneously sets all the current sense pins of the device in a high impedance state, thus disabling the current monitoring and diagnostic detection. This feature allows multiplexing of the microcontroller analog inputs by sharing the sense resistance and ADC line among different devices.

**Figure 33. Current sense and diagnostic**

### 3.4.1 Short to $V_{CC}$ and off-state open-load detection

#### Short to $V_{CC}$

A short circuit between  $V_{CC}$  and output is indicated by the relevant current sense pin set to  $V_{SENSEH}$  during the device off-state. Little or no current is delivered by the current sense during the on-state depending on the nature of the short circuit.

#### Off-state open load with external circuitry

Detection of an open-load in off mode requires an external pull-up resistor ( $R_{PU}$ ) connecting the output to a positive supply voltage ( $V_{PU}$ ).

It is preferable that  $V_{PU}$  is switched off during the module standby mode to avoid an increase in overall standby current consumption in normal conditions, that is, when the load is connected.

An external pull-down resistor ( $R_{PD}$ ) connected between output and GND is mandatory to avoid misdetection in case of floating outputs in off-state (see [Figure 33: Current sense and diagnostic](#)).

$R_{PD}$  must be selected in order to ensure  $V_{OUT} < V_{OLmin}$  unless pulled up by the external circuitry:

$$V_{OUT}|_{Pull-up\_OFF} = R_{PD} \cdot I_{L(off)2f} < V_{OLmin} = 2V$$

$R_{PD} \leq 22 \text{ K}\Omega$  is recommended.

For proper open load detection in off-state, the external pull-up resistor must be selected according to the following formula:

$$V_{OUT}|_{Pull-up\_ON} = \frac{R_{PD} \cdot V_{PU} - R_{PU} \cdot R_{PD} \cdot I_{L(off)2r}}{R_{PU} + R_{PD}} > V_{OLmax} = 4V$$

For the values of  $V_{OLmin}$ ,  $V_{OLmax}$ ,  $I_{L(off)2r}$  and  $I_{L(off)2f}$  see [Table 10: Open load detection \(8 V <  \$V\_{CC}\$  < 18 V\)](#).

### 3.5 Maximum demagnetization energy ( $V_{CC} = 13.5V$ )

Figure 34. Maximum turn-off current versus inductance (for each channel)

Note: Values are generated with  $R_L = 0 \Omega$ . In case of repetitive pulses,  $T_{jstart}$  (at the beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,  
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
