1.2 A, 30 V Step-Down DC/DC Converter

NO.EA-269-160225

OUTLINE

The R1245x is a CMOS-based Step-down DC/DC converter with internal N-channel high side Tr. The ON resistance of the built-in high-side transistor is 0.35 Ω and the R1245x can provide the maximum 1.2 A output current. Each of the ICs consists of an oscillator, a PWM control circuit, a voltage reference unit, an error amplifier, a phase compensation circuit, a slope compensation circuit, a soft-start circuit, protection circuits, an internal voltage regulator, and a switch for bootstrap circuit. The ICs can make up a step-down DC/DC converter with an inductor, resistors, a diode, and capacitors.

The R1245x is a current mode operating type DC/DC converter without an external current sense resistor, and realizes fast response and high efficiency. As an output capacitor, a ceramic type capacitor can be used with the R1245x. The options of the internal oscillator frequency are preset at 330 kHz for version A and B, 500 kHz for version C and D, 1000 kHz for version E and F, 2400 kHz for version G and H.

As for protection, an Lx peak current limit circuit cycle by cycle, a thermal shutdown function and an under voltage lockout (UVLO) function are built in. Furthermore, there are two types for short protection, for A/C/E/G version, a latch protection function which makes the output latch off if the output voltage keeps lower than the set output voltage for a certain time after detecting current limit is built in, for B/D/F/H version, a fold-back protection function which changes the oscillator frequency slower after detecting short circuit or equivalent.

As for the packages of the R1245x, HSOP-8E, DFN(PLP)2020-8, SOT23-6W are available.

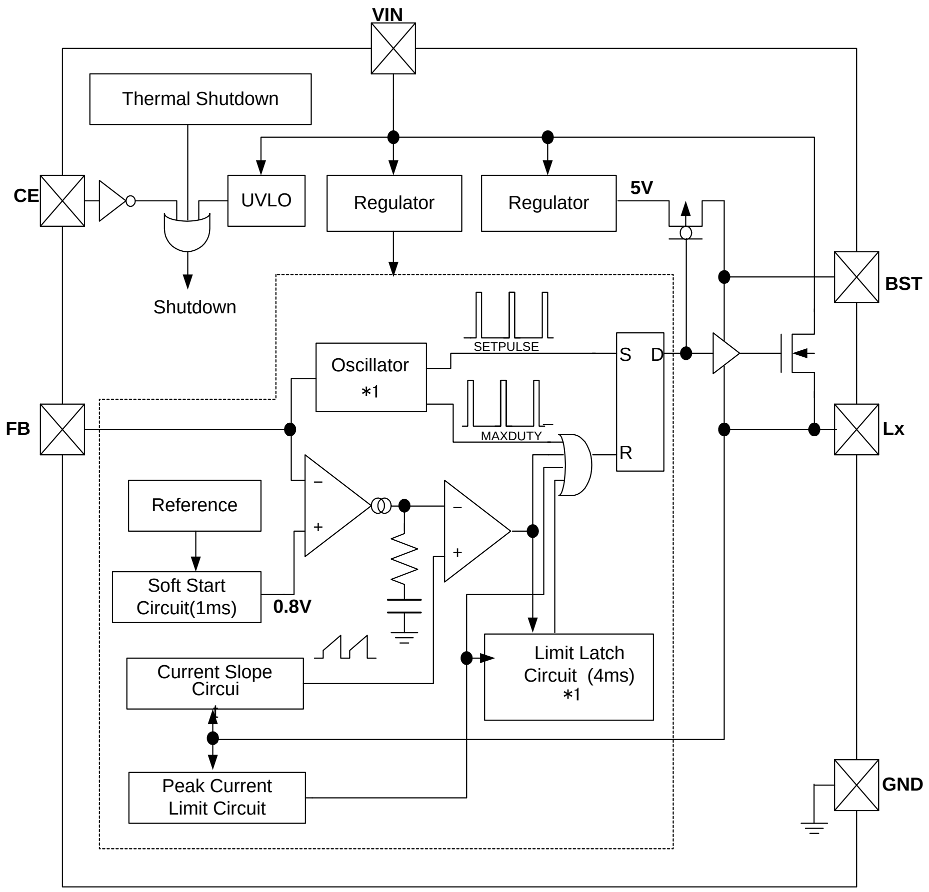
FEATURES

- Operating Voltage ··· 4.5 V to 30 V
- Internal N-channel MOSFET Driver ······················ Typ. R_{ON} = 0.35 Ω
- Adjustable Output Voltage with External Resistor ···· 0.8 V or more
- Feedback Voltage and Tolerance ························ 0.8 V±1.0%
- Peak Current Limit·· Typ. 2.0 A
- UVLO Function Released Voltage························ Typ. 4.0 V
- Operating Frequency ······································· 330 kHz (Ver. A/B), 500 kHz (Ver. C/D), 1000 kHz (Ver. E/F), 2400 kHz (Ver. G/H)
- Fold-back Protected Frequency·························· 170 kHz (Ver. B/D), 250 kHz (Ver. F), 400 kHz (Ver. H)
- Latch Protection Delay Time ······························ Typ. 4 ms (Ver. A/C/E/G)
- Ceramic Capacitors Recommended for Input and Output.
- Stand-by Current··· Typ. 0 µA
- Packages ·· SOT-23-6W, DFN(PLP)2020-8, HSOP-8E

APPLICATIONS

- Digital Home Appliances: Digital TVs, DVD Players
- Office Equipment: Printers, Faxes
- 5V PSU or 2-cell or more Li-ion Battery Powered Communication Equipment, Cameras, VCRs, Camcorders
- High Voltage Battery-powered Equipment

BLOCK DIAGRAM



R1245x Block Diagram

*1

Version	Oscillator Frequency	Short Protection Type
A	330 kHz	330 kHz
B	330 kHz	330 kHz
C	500 kHz	500 kHz
D	500 kHz	500 kHz
E	1000 kHz	1000 kHz
F	1000 kHz	1000 kHz
G	2400 kHz	2400 kHz
H	2400 kHz	2400 kHz

SELECTION GUIDE

In the R1245x, the package, type of short protection (Latch or Fold-back), and the oscillator frequency can be selected with the user's request.

Selection Guide

Product code	Package	Quantity per Reel	Pb Free	Halogen Free
R1245S003∗-E2-FE	HSOP-8E	1,000 pcs	Yes	Yes
R1245K003∗-TR	DFN(PLP)2020-8	5,000 pcs	Yes	Yes
R1245N001∗-TR-FE	SOT-23-6W	3,000 pcs	Yes	Yes

∗: Designation of the oscillator frequency and the protection function option.

Symbol	Oscillator Frequency	Latch Protection	Fold-back Protection
A	330 kHz	✓	
B	330 kHz		✓
C	500 kHz	✓	
D	500 kHz		✓
E	1000 kHz	✓	
F	1000 kHz		✓

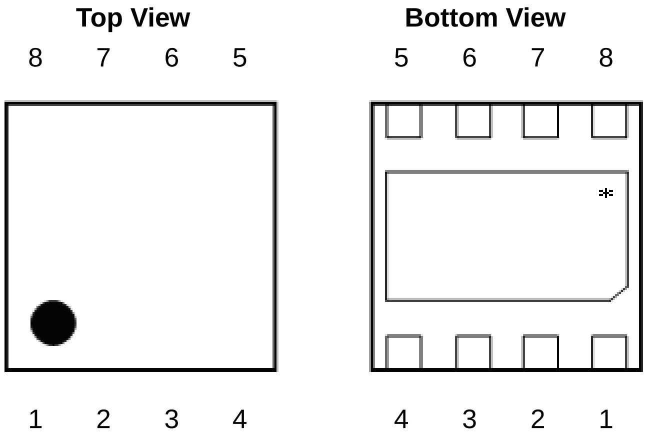
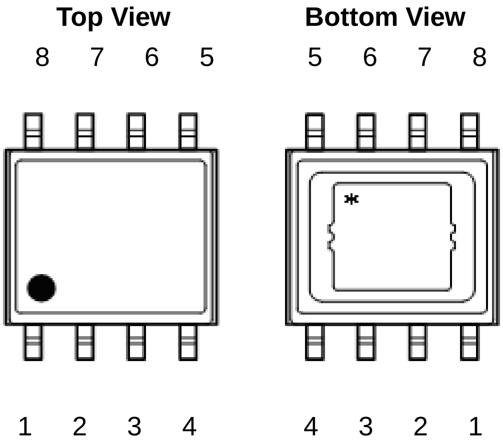
H	2400 kHz		✓

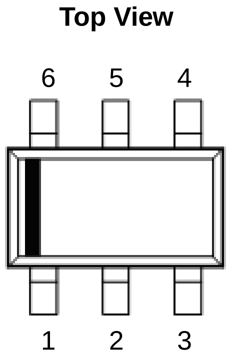
PIN DESCRIPTIONS



DFN(PLP)2020-8 Pin Configuration



HSOP-8E Pin Configuration



SOT-23-6W Pin Configuration

* Connect the backside heat radiation tub to GND or same as GND level (recommendation). The tub is connected to the GND pin.

R1245S Pin Description

Pin No.	Symbol	Description
1	Lx	Lx Switching Pin
2	VIN	Power Supply Pin
3	CE	Chip Enable Pin, Active with "H"
4	TEST	TEST pin (must be open for user side.)
5	GND	Ground Pin
6	FB	Feedback Pin
7	NC	No connection
8	BST	Bootstrap Pin

***** Connect the backside heat radiation tub to GND or same as GND level (recommendation). The tub is connected to the GND pin.

R1245K Pin Description

Pin No.	Symbol	Description
1	Lx	Lx Switching Pin
2	VIN	Power Supply Pin
3	VIN	Power Supply Pin
4	CE	Chip Enable Pin, Active with "H"
5	GND	Ground Pin
6	FB	Feedback Pin
7	TEST	Test Pin (must be open for user side.)
8	BST	Bootstrap Pin

* Connect the backside heat radiation tub to GND or same as GND level (recommendation). The tub is connected to the GND pin.

R1245N Pin Description

Pin No.	Symbol	Description
1	BST	Bootstrap Pin
2	GND	Ground Pin
3	FB	Feedback Pin
4	CE	Chip Enable Pin, Active with "H"
5	VIN	Power Supply Pin
6	Lx	Lx Switching Pin

ABSOLUTE MAXMUM RATINGS

Absolute Maximum Ratings (GND = 0 V)

Symbol	Item	Rating		Unit
V_{IN}	Input Voltage	−0.3 V to 32 V		V
V_{BST}	BST Pin Voltage	V_{LX} −0.3 V to V_{LX} + 6 V		V
V_{LX}	Lx Pin Voltage	−0.3 V to V_{IN} + 0.3		V
V_{CE}	CE Pin Input Voltage	−0.3 V to V_{IN} + 0.3		V
V_{FB}	CE Pin Input Voltage	−0.3 V to 6 V		V
P_D	Feedback Pin Voltage	−0.3 V to 32 V		V
Ta	Power Dissipation (Standard Land Pattern)*	HSOP-8E	2900	mW
		DFN(PLP)2020-8	880	
		SOT-23-6W	430	
Tstg	Operating Temperature Range	−40 to 105		ºC
V_{IN}	Storage Temperature Range	−55 to 125		ºC

* For Power Dissipation, refer to the PACKAGE INFORMATION on the web site.

ABSOLUTE MAXIMUM RATINGS
Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause the permanent damages and may degrade the lifetime and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings is not assured.

RECOMMENDED OPERATING CONDITIONS (ELECTRICAL CHARACTERISTICS)
All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

ELECTRICAL CHARACTERISTICS

Electrical Characteristics (Unless otherwise noted, V_{IN} = 12 V, Ta = 25ºC)

Symbol	Item	Conditions		Min.	Typ.	Max.	Unit
V_{IN}	Operating Input Voltage			4.5		30	V
I_{IN}	Consumption Current	V_{IN} = 30 V, V_{FB} = 1.0 V			0.5	1.0	mA
V_{UVLO1}	UVLO Detect Voltage	Specified V_{IN} falling edge		3.6	V_{UVLO2} −0.2	V_{UVLO2} −0.1	V
V_{UVLO2}	UVLO Released Voltage	Specified rising edge		3.8	4.0	4.2	V
V_{FB}	VFB Voltage Tolerance			0.792	0.800	0.808	V
$\Delta V_{FB}/\Delta Ta$	VFB Voltage Temperature Coefficient	−40ºC ≤ Ta ≤ 105ºC			±100		ppm/ºC

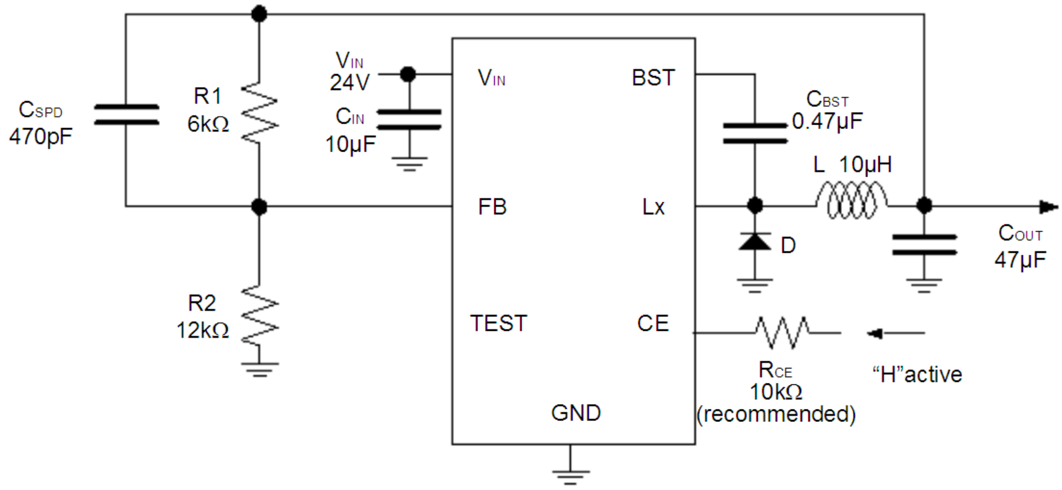
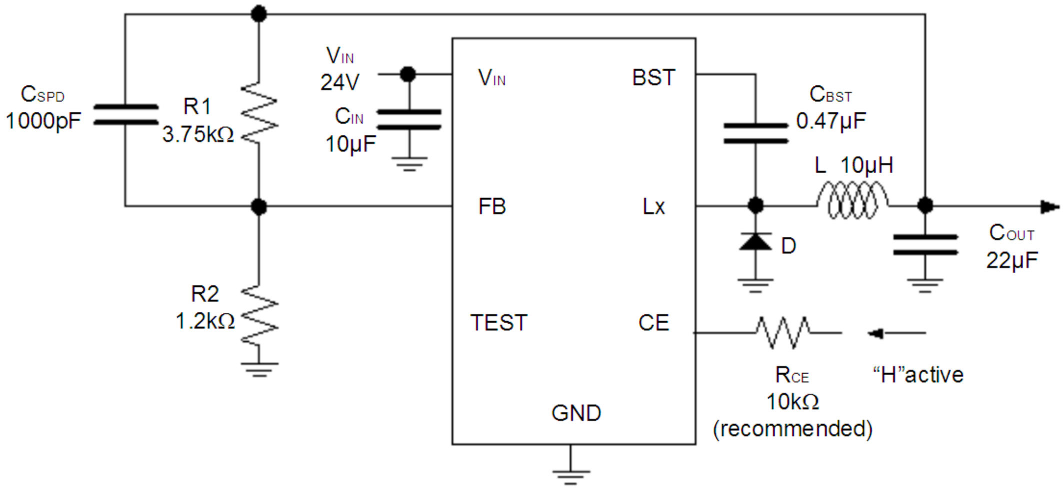
			Ver. H		400		
Maxduty	Oscillator Maximum Duty Cycle	Ver. A/B/C/D		92			%
		Ver. E/F		88			
		Ver. G/H		76			
	Soft-start Time	V_{FB} = 0.72 V			1		ms
	Delay Time for Latch Protection	Ver. A/C/E/G			4		ms
tstart	Lx High Side Switch ON Resistance	V_{BST} − V_{LX} = 4.5 V			0.35		Ω
t_{DLY}	Lx High Side Switch Leakage Current	V_{IN} = 30 V, V_{CE} = 0 V			0	5	µA
R_{LXH}	Lx High Side Switch Limited Current	V_{BST} − V_{LX} = 4.5 V		1.5	2.0	2.7	A
I_{LXHOFF}	CE "L" Input Voltage	V_{IN} = 30 V				0.3	V
I_{LIMLXH}	CE "H" Input Voltage	V_{IN} = 30 V		1.6			V
V_{CEH}	VFB Input Current	V_{IN} = 30.0 V, V_{FB} = 1.0 V		−1.0		1.0	µA
V_{CEL}	CE "L" Input Current	V_{IN} = 30 V, V_{CE} = 0 V		−1.0		1.0	µA
I_{FB}	CE "H" Input Current	V_{IN} = 30 V, V_{CE} = 30 V		−1.0		1.0	µA
I_{CEH}	Thermal Shutdown Detect Temperature	Hysteresis 30ºC			160		ºC
I_{CEL}	Standby Current	V_{IN} = 30 V			0	5	µA

TYPICAL APPLICATION

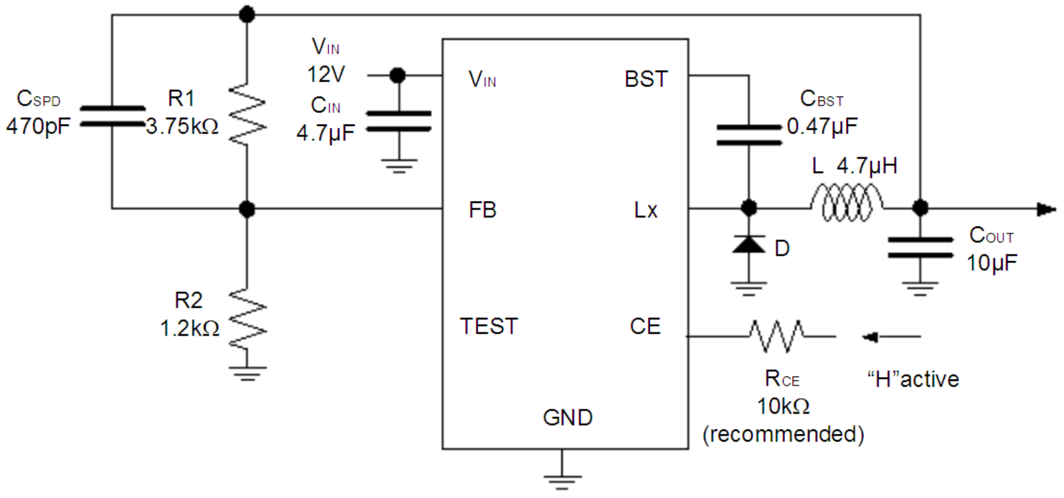


R1245x00xA/B Typical Application, 330 kHz, V_{OUT} = 1.2 V, V_{IN} = 24 V

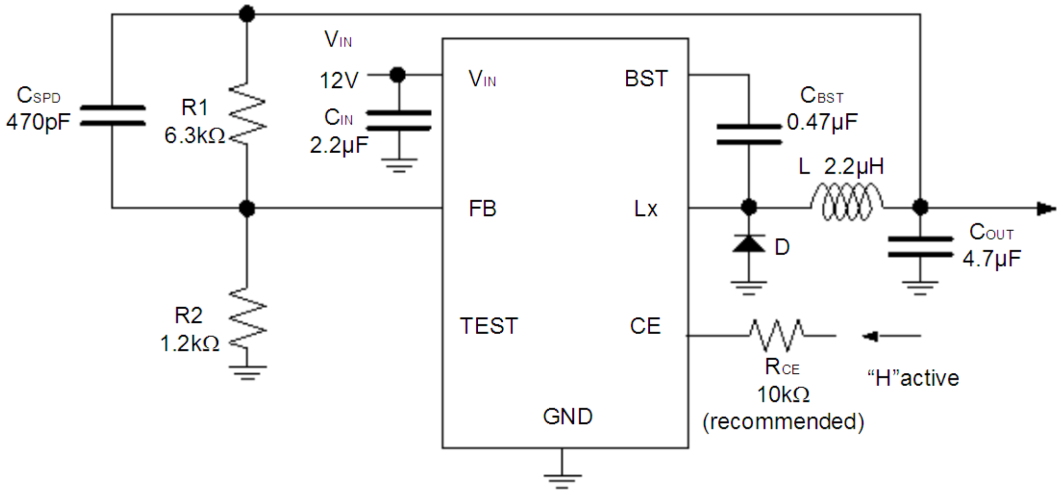


R1245x00xC/D Typical Application, 500 kHz, V_{OUT} = 3.3 V, V_{IN} = 24 V

* TEST pin must be open.



R1245x00xE/F Typical Application, 1000 kHz, V_{OUT} = 3.3 V V_{IN} = 12 V



R1245x00xG/H Typical Application, 2400 kHz, V_{OUT} = 5. 0 V, V_{IN} = 12 V

* TEST pin must be open.

TECHNICAL NOTES

- External components must be connected as close as possible to the ICs and make wiring as short as possible. Especially, the capacitor connected in between VIN pin and GND pin must be wiring the shortest. If their impedance is high, internal voltage of the IC may shift by the switching current, and the operating may be unstable. Make the power supply and GND lines sufficient. In the wiring of the power supply, GND, LX, VOUT and the inductor, large current by switching may flow. To avoid the bad influence, the wiring between the resistance, "R_{UP}" for setting the output voltage and loading, and the wiring between the inductor and loading must be separated.

- The ceramic capacitors have low ESR (Equivalent Series Resistance) and recommended for the ICs. The recommendation of CIN capacitor between VIN and GND is 10 μF or more for A/B/C/D version, 4.7 μF or more for E/F version, and 2.2 μF or more for G/H version. Verify the bias dependence and the temperature characteristics of the ceramic capacitors. Recommendation conditions are written based on the case which the recommendation parts are used with the R1245x.

- The R1245x is designed with the recommendation inductance value and ceramic capacitor value and phase compensation has been made. If the inductance value is large, due to the lack of current sensing amount of the current mode, unstable operation may result. On the contrary, if the inductance value is small, the current sensing amount may increase too much, low frequency oscillation may occur when the on duty ratio is beyond 50%. Not only that, if the inductance value is small, according to the increase of the load current, the peak current of the switching may increase, as a result, the current may reach the current limit value and the current limit may work.

- As for the diode, use the Schottky diode with small capacitance between terminals. The reference characteristic of the capacitance between terminals is around 100 pF or less at 10 V. If the capacitance between terminals is large, excess switching current may flow and the operation of the IC may be unstable. If the capacitance between terminals of the Scottky diode is beyond 100 pF at 10 V or unknown, verify the load regulation, line regulation, and the load transient response.

- Output voltage can be set by adjustment of the values of R1 and R2. The equation of setting the output voltage is $V_{OUT} = V_{FB} \times (R1 + R2) / R2$. If the values of R1 and R2 are large, the impedance of FB pin increases, and pickup the noise may result. The recommendation value range of R2 is approximately between 1.0 kΩ to 16 kΩ. If the operation may be unstable, reduce the impedance of FB pin.

- For the CE pin, as an ESD protection element, a diode to VIN pin is formed internal of the IC. If CE pin voltage may become higher than VIN pin voltage, to prevent flowing large current from CE pin to VIN pin, connect 10 kΩ or more resistor between CE and VIN pin.

- Connect the backside heat radiation tub of the DFN(PLP)2020-9/HSOP-8E to the GND. As for multi-layered boards, to make better power dissipation, putting some thermal via on the thermal pad in the land pattern and radiation of the heat to another layer is effective.

- After the soft-start operation, the latch function is enabled for version A/C/E/G. The latch protection starts the internal counter when the internal current limit protection circuit detects the current limit. When the internal counter counts up to the latch timer limit, typically 4 ms, the output is latched off. To reset the latch function, make the CE pin "L", or make VIN pin voltage lower than UVLO detector threshold. Then in the case that the output voltage or FB voltage becomes setting voltage within the latch timer preset time, counter is initialized. If the slew rate of the power supply is too slow and after the soft-start time, the output voltage does not reach the set output voltage even if the latch timer preset time is over, the latch function may work unexpectedly.

- After the soft-start operation, fold-back protection function is enabled for version B/D/F/H. The fold-back function will limit the oscillator frequency if the FB pin voltage becomes lower than typically 0.56 V. For B/D version, the oscillator frequency will be reduced typically into 170 kHz, for F version, into 250 kHz, for H version, into 400 kHz.
- If the slew rate of the power supply is too slow, and even after the soft-start time, the output voltage is still less than 70% of the set output voltage, or FB pin voltage is less than typically 0.56 V, then this function may work unexpectedly.

- The performance of power circuit using this IC largely depends on external components. Selection of external components is very important, especially, do not exceed each rating value (voltage/current/power).

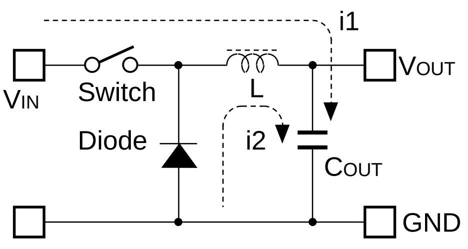
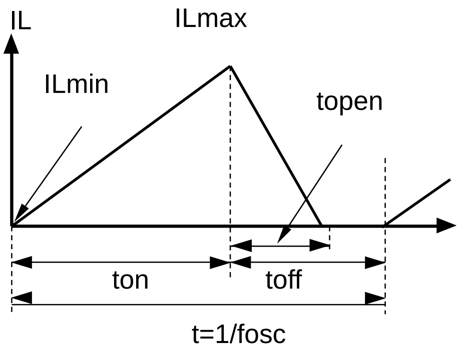
R_{CE}	An up diode is formed between the CE pin and the VIN pin as an ESD protection element. If the CE pin may become higher than the voltage of the VIN pin, connect the 10 kΩ resistance between the CE pin and VIN pin, to prevent a large current from flowing into the VIN pin from the CE pin.			

OPERATION OF THE BUCK CONVERTER AND THE OUTPUT CURRENT

The DC/DC converter charges energy in the inductor when the switch turns on, and discharges the energy from the inductor when the switch turns off and controls with less energy loss, so that a lower output voltage than the input voltage is obtained. Refer to the following figures.



Basic Circuit



Current flowing through the Inductor

Step 1: The switch turns on and current IL (= i1) flows, and energy is charged into C_{OUT}. At this moment, IL increases from ILmin (= 0) to reach ILmax in proportion to the on-time period (ton) of the switch.

Step 2: When the switch turns off, the diode turns on in order to maintain IL at ILmax, and current IL (= i2) flows.

Step 3: IL (= i2) decreases gradually and reaches IL = ILmin = 0 after a time period of topen, and the diode turns off. This case is called as discontinuous mode. If the output current becomes large, next switching cycle starts before IL becomes 0 and the diode turns off. In this case, IL value increases from ILmin (> 0), and this case is called continuous mode.

In the case of PWM control system, the output voltage is maintained by controlling the on-time period (ton), with the oscillator frequency (fosc) being maintained constant.

OUTPUT CURRENT AND SELECTION OF EXTERNAL COMPONENTS

The relation between the output current and external components is as follows:

When the switch of Lx turns on:

(Wherein, the peak to peak value of the ripple current is described as I_{RP}, the ON resistance of the switch is described as R_{ONH}, and the diode forward voltage as V_F, and the DC resistance of the inductor is described as R_L, and on time of the switch is described as ton)

$V_{IN} = V_{OUT} + (R_{ONH} + R_L) \times I_{OUT} + L \times I_{RP} / ton$ ············ Equation 1

When the switch turns off (the diode turns on) as toff:

$L \times I_{RP} / toff = V_F + V_{OUT} + R_L \times I_{OUT}$ ············ Equation 2

Put Equation 2 to Equation 1 and solve for ON duty of the switch, ton / (toff + ton) = D_{ON},

$D_{ON} = (V_{OUT} + V_F + R_L \times I_{OUT}) / (V_{IN} + V_F - R_{ONH} \times I_{OUT})$ ············ Equation 3

Ripple Current is as follows:

$I_{RP} = (V_{IN} - V_{OUT} - R_{ONH} \times I_{OUT} - R_L \times I_{OUT}) \times D_{ON} / fosc / L$ ············ Equation 4

wherein, peak current that flows through L, and the peak current ILmax is as follows:

$ILmax = I_{OUT} + I_{RP} / 2$ ············ Equation 5

As for the valley current ILmin,

$ILmin = I_{OUT} - I_{RP} / 2$ ············ Equation 6

If ILmin < 0, the step-down DC/DC converter operation becomes current discontinuous mode.
Therefore the current condition of the current discontinuous mode, the next formula is true.

$I_{OUT} < I_{RP} / 2$ ············ Equation 7

Consider ILmax and ILmin, conditions of input and output and select external components.

*The above explanation is based on the calculation in an ideal case in continuous mode.

Ripple Current and Lx Current Limit

The ripple current of the inductor may change according to the various reasons. In the R1245x, as an Lx current limit, Lx peak current limit is used. Therefore the upper limit of the inductor current is fixed.

The peak current limit is not the average current of the inductor (output current). If the ripple current is large, peak current becomes also large. The characteristic is used for the fold-back current limit of version B/D/F/H. In other words, the peak current limit is maintained and the switching frequency is reduced, as a result, the average current of the inductor is reduced. To release this condition, at 170 kHz for version B/D, at 250 kHz for version F, at 400 kHz for version H must not be beyond the peak current limit. In the fig.1, the sequence of the Lx current limit function is described.

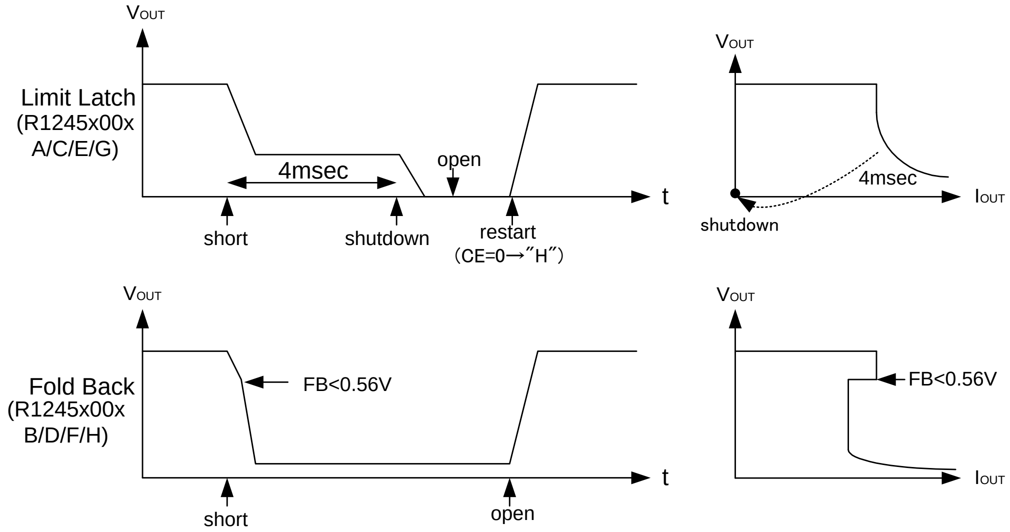


Fig.1 Lx Limit function sequence

Latch Protection Function for Version A/C/E/G

The latch function works after detecting current limit and if the output voltage becomes low for a certain time, the output is latched off. Refer to the TECHNICAL NOTES.

Fold-back Protection Function for Version B/D/F/H

If FB voltage becomes lower than approximately 0.56 V, the fold-back protection function limits the oscillator frequency to typically 170 kHz for version B/D, typically 250 kHz fir version F, typically 400 kHz for version H. By reducing frequency, the ripple current increases. The R1245x has the peak current limit function, therefore as in the equation 8, the Lx average current decreases by the increase of the ripple current.

$I_{OUT} = ILmax + I_{RP} / 2$……………………………………………………………………………………..Equation 8

If FB voltage becomes less than 0.56 V, the oscillator frequency is reduced. At heavy load, if the R1245x becomes into the fold-back protection mode, the situation may not be released by increase the ripple current. In terms of other notes on this protection function, refer to the TECHNICAL NOTES.

MAXIMUM OUTPUT CURRENT

The output current of the R1245x is limit by the power dissipation P_D of the package and the maximum specification 1.2 A. The loss of the IC includes the switching loss, and it is difficult to estimate. To estimate the maximum output, using the efficiency data is one method.
By using the efficiency data, the loss including the external components can be calculated with the equation, (100 / efficiency (%) - 1) x (V_{OUT} (V) x I_{OUT} (V)). From this equation, by reducing the loss of external components, the loss of the IC can be estimated. The main loss of the external components is composed by the rectifier diode and DCR of the inductor. Supposed that the forward voltage of the diode is described as V_F, the loss of the diode can be described as follows:
(V_{IN} (V) - R_{ON} (Ω) x I_{OUT} (A) - V_{OUT} (V) - V_F (V))) / V_{IN} (V) x V_F (V) x I_{OUT} (A)
The loss by the DCR of the inductor can be calculated by the formula DCR (Ω) x I_{OUT}^2 (A).
Thus,
The loss of the IC = (100 / efficiency (%) - 1) x (V_{OUT} (V) x I_{OUT} (A) - (V_{IN} (V) - R_{ON} (Ω) x I_{OUT} (A) - V_{OUT} (V) -V_F (V)) / V_{IN} (V) x V_F (V) x I_{OUT} (A) – DCR (Ω) x I_{OUT}^2 (A)

The efficiency of the R1245x at Ta = 25°C, V_{IN} = 12 V, V_{OUT} = 3.3 V, I_{OUT} = 600 mA is approximately 89.5% for version A/B (Oscillator frequency: 330 kHz). Supposed that the On resistance of the internal driver is 0.35 Ω, the DCR of the inductor is 65 mΩ, the V_F of the rectifier diode is 0.3 V and applied to the formula above,
The loss of the IC = (100% / 89.5% - 1) x (3.3 V x 0.6 A) - (12 V - 0.35 Ω x 0.6 A - 3.3 V - 0.3 V) / 12 V x 0.3 V x 0.6 A - 0.065 Ω x 0.6^2 A = 86 mW
The power dissipation P_D of the package is specified at Ta = 25°C based on the Tjmax = 125°C. Thus the thermal resistance of the package θja = (Tjmax (°C) - Ta(°C)) / P_D (W), therefore the thermal resistance of the each available package is as follows:
HSOP-8E: (125°C - 25°C) /2.9 W = 34.5°C/W
DFN(PLP)2020-8: (125°C - 25°C) / 0.88 W = 114°C/W
SOT-23-6W: (125°C - 25°C) / 0.43 W = 233°C/W
Due to the loss of the IC is 86mW for this example, therefore Tj increase of the each package is as follows:
HSOP-8E: 34.5°C/W x 86 mW = 2.96°C
DFN(PLP)2020-8: 114°C/W x 86 mW = 9.80°C
SOT-23-6W: 233°C/W x 86 mW = 20.0°C

For all the packages, even if the ambient temperature is at 105°C, Tj can be suppressed less than 125°C. By the increase of the temperature, on resistance and switching loss increases, therefore, temperature margin is not enough, measure the efficiency at the actual maximum temperature and recalculation is necessary.

At the same condition, if the preset frequency is 2400 kHz, the efficiency will be down to approximately 81%. The result of the loss calculation is 310 mW, therefore the Tj increase of each package is,

HSOP-8E: 34.5°C/W x 310 mW = 11°C
DFN(PLP)2020-8: 114°C/W x 310 mW = 35°C
SOT-23-6W: 233°C/W x 310 mW = 72°C

HSOP-8E can be used at the ambient temperature 105°C, DFN(PLP)2020-8 can be used at the ambient temperature up to 90°C, SOT-23-6W can be used at the ambient temperature up to 53°C. Note that the result is different by the frequency.

The next graphs are the output current and estimated ambient temperature limit.

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh's or any third party's intellectual property rights or any other rights.
5. The products listed in this document are intended and designed for use as general electronic components in standard applications (office equipment, telecommunication equipment, measuring instruments, consumer electronic products, amusement equipment etc.). Those customers intending to use a product in an application requiring extreme quality and reliability, for example, in a highly specific application where the failure or misoperation of the product could result in human injury or death (aircraft, spacevehicle, nuclear reactor control system, traffic control system, automotive and transportation equipment, combustion equipment, safety devices, life support system etc.) should first contact us.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, fire containment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

RoHS Compliant
Halogen Free

Ricoh is committed to reducing the environmental loading materials in electrical devices with a view to contributing to the protection of human health and the environment.
Ricoh has been providing RoHS compliant products since April 1, 2006 and Halogen-free products since April 1, 2012.

OCEAN CHIPS
Океан Электроники
Поставка электронных компонентов

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения **«JONHON»**, а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов **«FORSTAR»**.

AVIC JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
