Introduction

Overview

This user guide describes the components, features, and operation of the VCU1287 UltraScale® FPGA GTH and GTY transceivers characterization board. The VCU1287 board provides the hardware environment for characterizing and evaluating the GTH and GTY transceivers available on the UltraScale XCVU095-FFVB2104E FPGA. The VCU1287 board schematic, bill-of-material (BOM), layout files, and reference designs are available online at the VCU1287 Characterization Kit website.

FPGA Compatibility

The VCU1287 board is provided with the Virtex UltraScale XCVU095-FFVB2104E FPGA. The board also supports other Virtex UltraScale device densities (XCVU080, XCVU125, and XCVU160), as well as the Kintex® UltraScale XCKU115 device in the pin-compatible FFVB2104 package. However, some transceivers available in large density devices are not available in the XCVU095 device (for example, GTH QUAD_232 and QUAD_233).

Block Diagram

The VCU1287 board block diagram is shown in Figure 1-1.

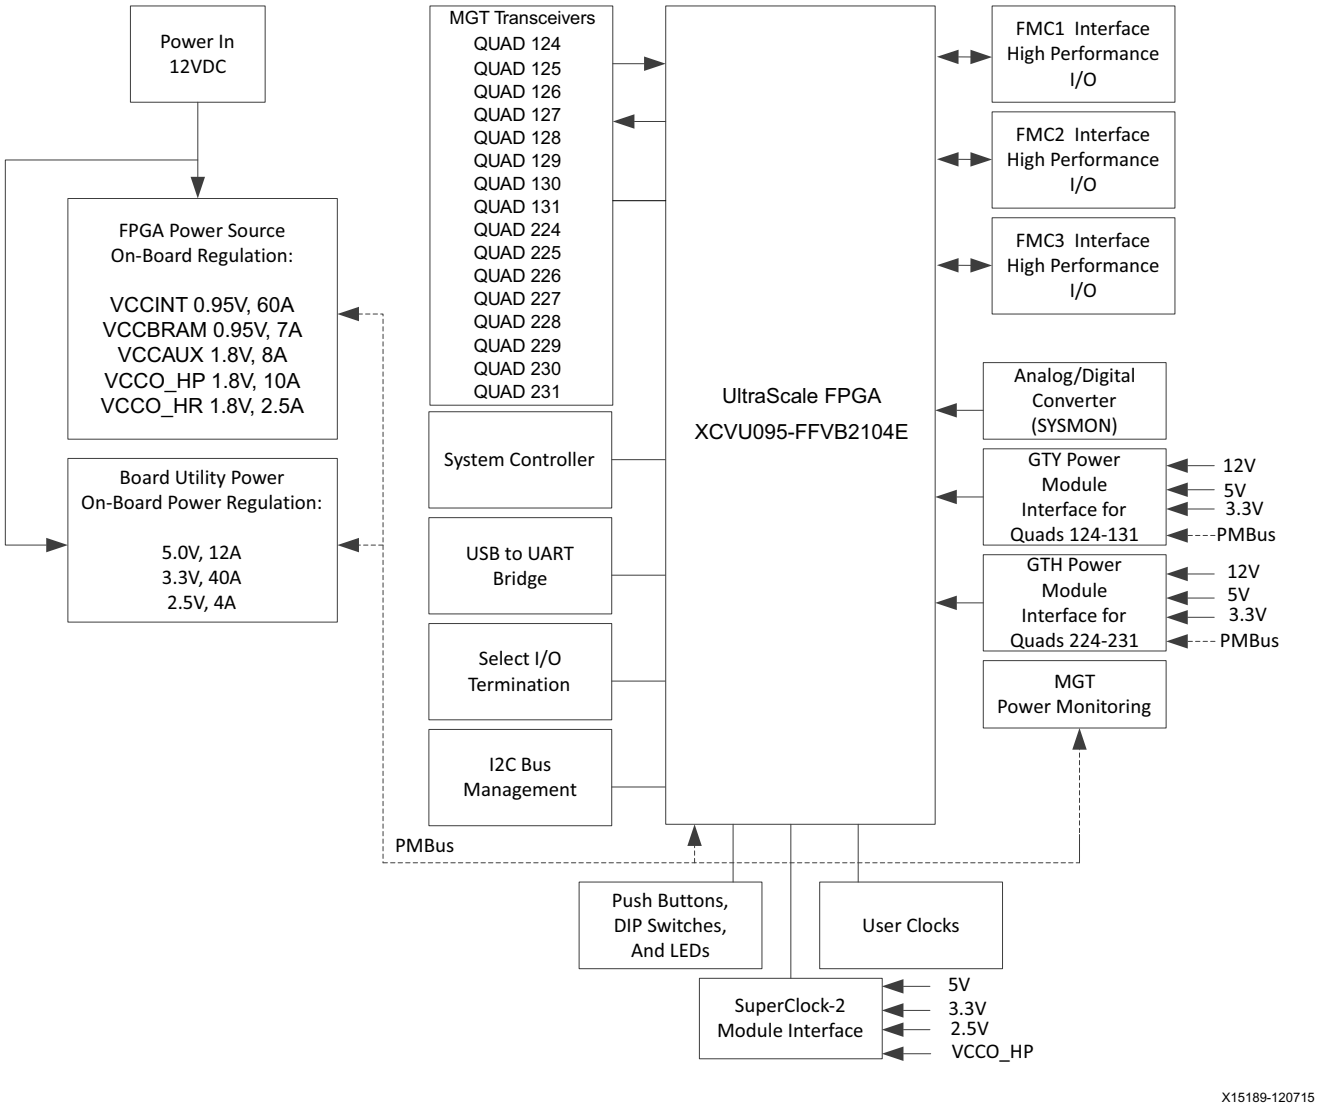

Figure 1-1: **VCU1287 Board Block Diagram**

Board Features

The VCU1287 characterization board features are listed here. Detailed information for each feature is provided in Chapter 3, Board Component Descriptions.

- UltraScale XCVU095-FFVB2104E FPGA
- BullsEye cable access to all 32 GTH and 32 GTY transceivers on the UltraScale XCVU095-FFVB2104E FPGA
- Onboard power supplies for all necessary voltages
- Power connectors for optional use of external power supplies
- Digilent USB JTAG programming port
- System controller (Zynq-7000 AP SoC XC7Z010-CLG225 FPGA)
- Two MGT power modules supporting UltraScale FPGA GTY and GTH transceiver power requirements
- A fixed 300 MHz 2.5V LVDS oscillator wired to multi-region clock capable (MRCC) inputs
- Two pairs of differential MRCC inputs with SMA connectors
- SuperClock-2 module supporting programmable clock outputs
- Samtec BullsEye connector pads for the GTY and GTH transceivers and reference clocks
- General purpose DIP switches, LEDs, pushbuttons, and test I/O
- Three VITA 57.1 FPGA mezzanine card (FMC) high pin count (HPC) connectors
- USB-to-UART bridge
- I2C bus
- PMBus connectivity to the boards digital power supplies
- Active cooling for the FPGA

Board Setup and Configuration

Board Component Location

Figure 2-1 shows the VCU1287 board component locations. Each numbered component shown in the figure is keyed to Table 2-1. Table 2-1 identifies the components and links to a detailed functional description of the components and board features in Chapter 3, Board Component Descriptions.

IMPORTANT: *Figure 2-1 is for visual reference only and might not reflect the current revision of the board.*

CAUTION! *The VCU1287 board can be damaged by electrostatic discharge (ESD). Follow standard ESD prevention measures when handling the board.*

CAUTION! *Do not remove the rubber feet from the board. The feet provide clearance to prevent short circuits on the back side of the board.*

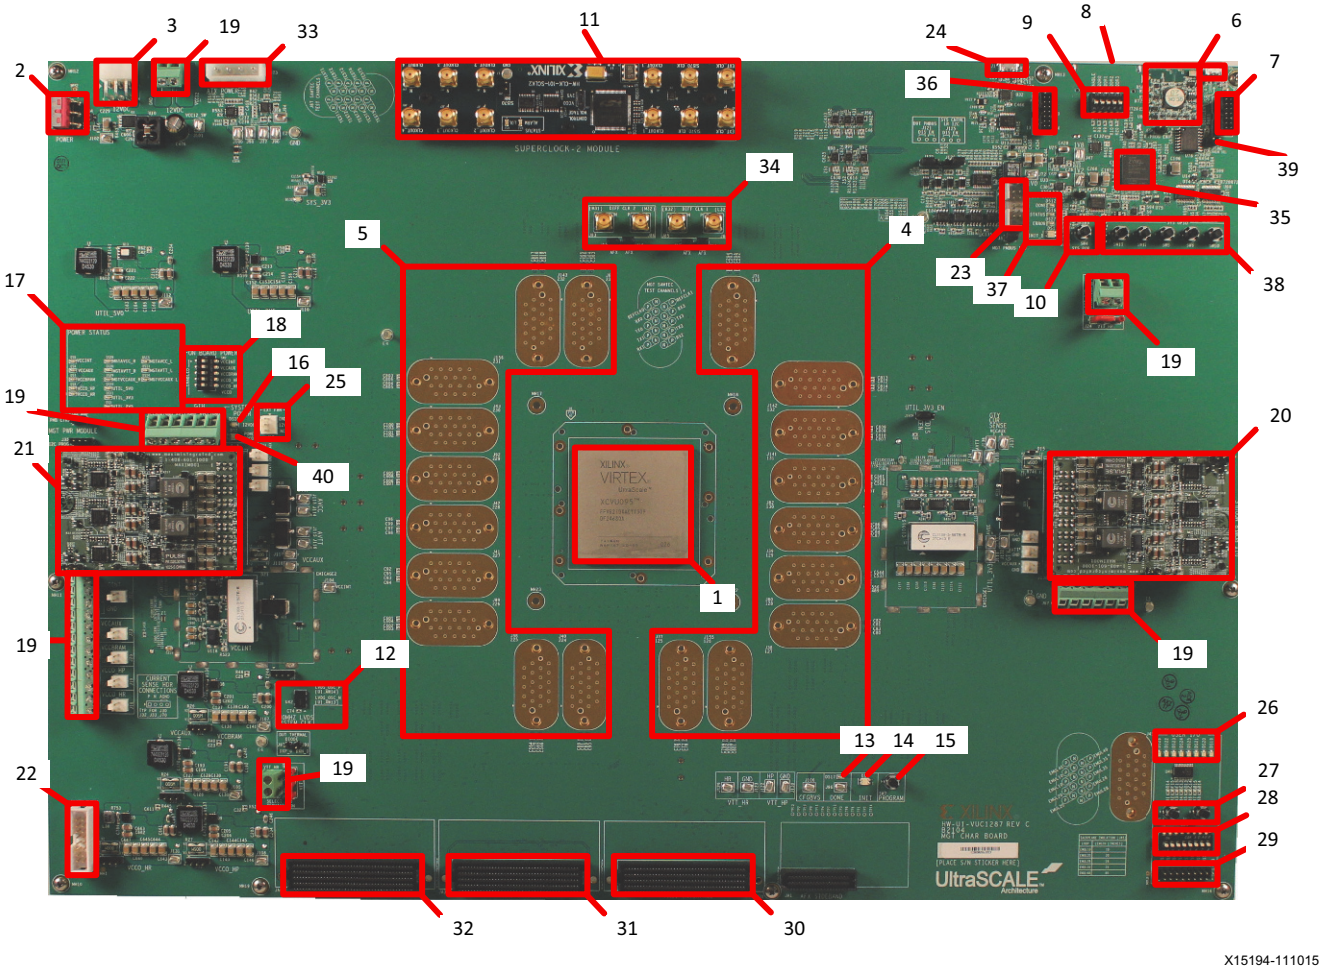

Figure 2-1: **VCU1287 Characterization Board Components**

Callout	Reference Designator	Feature Description
1	U1	Virtex UltraScale XCVU095-FFVB2104E Device
2	SW1	Power Switch
3	J28	12V mini-fit connector (12V Input Power)
4	J37, J155, J38, J80, J39, J82, J141, J142, J71	GTY transceiver connector pads Q124, Q125, Q126, Q127, Q128, Q129, Q130, Q131, Q132 (MGT Transceivers and Reference Clocks)
5	J40, J88, J89, J41, J42, J92, J43, J156, J143, J68	GTH transceiver connector pads Q224, Q225, Q226, Q227, Q228, Q229, Q230, Q231, Q232, Q233 (MGT Transceivers and Reference Clocks)
6	U80	Digilent USB JTAG connector (micro-B receptacle) (A list of jumpers and switches and their required positions for normal board operation is provided in Appendix A, Default Jumper Settings.)
7	J2	Platform USB JTAG connector (alternate access for programming cables) (A list of jumpers and switches and their required positions for normal board operation is provided in Appendix A, Default Jumper Settings.)
8	J10	SD card connector (back-side of board) (A list of jumpers and switches and their required positions for normal board operation is provided in Appendix A, Default Jumper Settings.)
9	SW13	System Controller Configuration DIP Switches
10	SW4	System Controller Reset
11	J36	SuperClock-2 Module
12	U42	300 MHz LVDS Oscillator
13	DS17	FPGA DONE status LED (DONE LED)
14	DS3	FPGA INIT_B status LED (INIT LED)
15	SW7	FPGA PROG_B pushbutton (PROGRAM Pushbutton)
16	DS18	12V power status LED (Power Switch)
17	DS4, DS5, DS6, DS7, DS8, DS9, DS10, DS11, DS13, DS14, DS15, DS28, DS29, DS30, DS32	Status LEDs for FPGA logic, transceiver, and utility power
18	SW2	Power regulation inhibitor switch for onboard regulators (Using External Power Sources)
19	J5, J18, J19, J20, J22, J23, J26, J27, J67, J69	External power supply connectors (Using External Power Sources)
20	J93, J138	Bank 124-132 GTY transceiver power supply module (Onboard Power Regulation and A list of jumpers and switches and their required positions for normal board operation is provided in Appendix A, Default Jumper Settings.)

Table 2-1: **VCU1287 Board Components *(Cont'd)***

Callout	Reference Designator	Feature Description
21	J46, J124	Bank 224-233 GTH transceiver power supply module (A list of jumpers and switches and their required positions for normal board operation is provided in Appendix A, Default Jumper Settings.)
22	J21	FPGA and utility rails PMBUS connector (A list of jumpers and switches and their required positions for normal board operation is provided in Appendix A, Default Jumper Settings.)
23	J4	MGT rails PMBus connector (A list of jumpers and switches and their required positions for normal board operation is provided in Appendix A, Default Jumper Settings.)
24	J1	Connector for USB to Dual UART Bridge (mini-B receptacle)
25	J99	Active Heat Sink Power Connector
26	DS19, DS20, DS21, DS22, DS23, DS24, DS25, DS26	User LEDs (Active-High)
27	SW8, SW9	User Pushbuttons (Active-High)
28	SW3	User DIP Switches (Active-High) and I/O Header
29	J95	User DIP Switches (Active-High) and I/O Header
30	JA2	FMC1 connector (I2C Bus Management)
31	JA3	FMC2 connector (I2C Bus Management)
32	JA4	FMC3 connector (I2C Bus Management)
33	J73	ATX power connector (12V Input Power)
34	J13, J14, J84, J85	Differential SMA MRCC Pin Inputs
35	U38	System controller
36	J3	System controller JTAG connector
37	DS1, DS12, DS16, DS27	System controller status LEDs
38	SW5, SW6, SW10, SW11, SW12	System controller GPIO pushbuttons
39	J6	JTAG chain select
40	DS2	PowerGood LED

Default Jumper and Switch Positions

A list of jumpers and switches and their required positions for normal board operation is provided in Appendix A, Default Jumper Settings.

Board Component Descriptions

Overview

This chapter provides a detailed functional description of the board's components and features. Table 2-1, page 10 identifies the components and links to the corresponding detailed functional description in this chapter. Component locations are shown in Figure 2-1, page 9.

Component Descriptions

Virtex UltraScale XCVU095-FFVB2104E Device

The VCU1287 board is populated with the UltraScale XCVU095-FFVB2104E FPGA at U1 (callout 1, Figure 2-1). For further information on UltraScale FPGAs, see *UltraScale Architecture and Product Overview* (DS890) [Ref 1].

Power Management

12V Input Power

The VCU1287 board receives 12V main power through J28 (callout 3, Figure 2-1) using the 12V AC adapter that is provided with the VCU1287 board characterization kit. J28 is a 6-pin (2 x 3), right angle, mini-fit connector.

CAUTION! *When supplying 12V through J28, use only the power supply provided for use with this board (Xilinx part number 3800033).*

CAUTION! *Do NOT use a 6-pin, PC ATX power supply connector with J28. The pinout of the 6-pin, PC ATX connector is not compatible. J28 and the board will be damaged if an attempt is made to power it from a PC ATX power supply connector.*

12V power can also be provided through:

- Connector J73 (callout 33, Figure 2-1) which accepts an ATX hard drive 4-pin power plug.
- Connector J27 (callout 19, Figure 2-1) which can be connected to a bench-top power supply.

CAUTION! *Because connector J73 provides no reverse polarity protection, use a power supply with a current limit set at 6A maximum.*

CAUTION! *Do NOT apply 12V power to more than a single input source. For example, do not apply power to J73 and J27 at the same time.*

CAUTION! *If J73 or J27 is used to supply the 12V input power, the board consumption should NOT exceed 75W because of Q1 limitation.*

Power Switch

The VCU1287 board main power is turned On or Off using switch SW1 (callout 2, Figure 2-1). When the switch is in the ON position, power is applied to the board and the green LED DS18 illuminates (callout 16, Figure 2-1).

Onboard Power Regulation

Figure 3-1 shows the onboard power supply architecture.

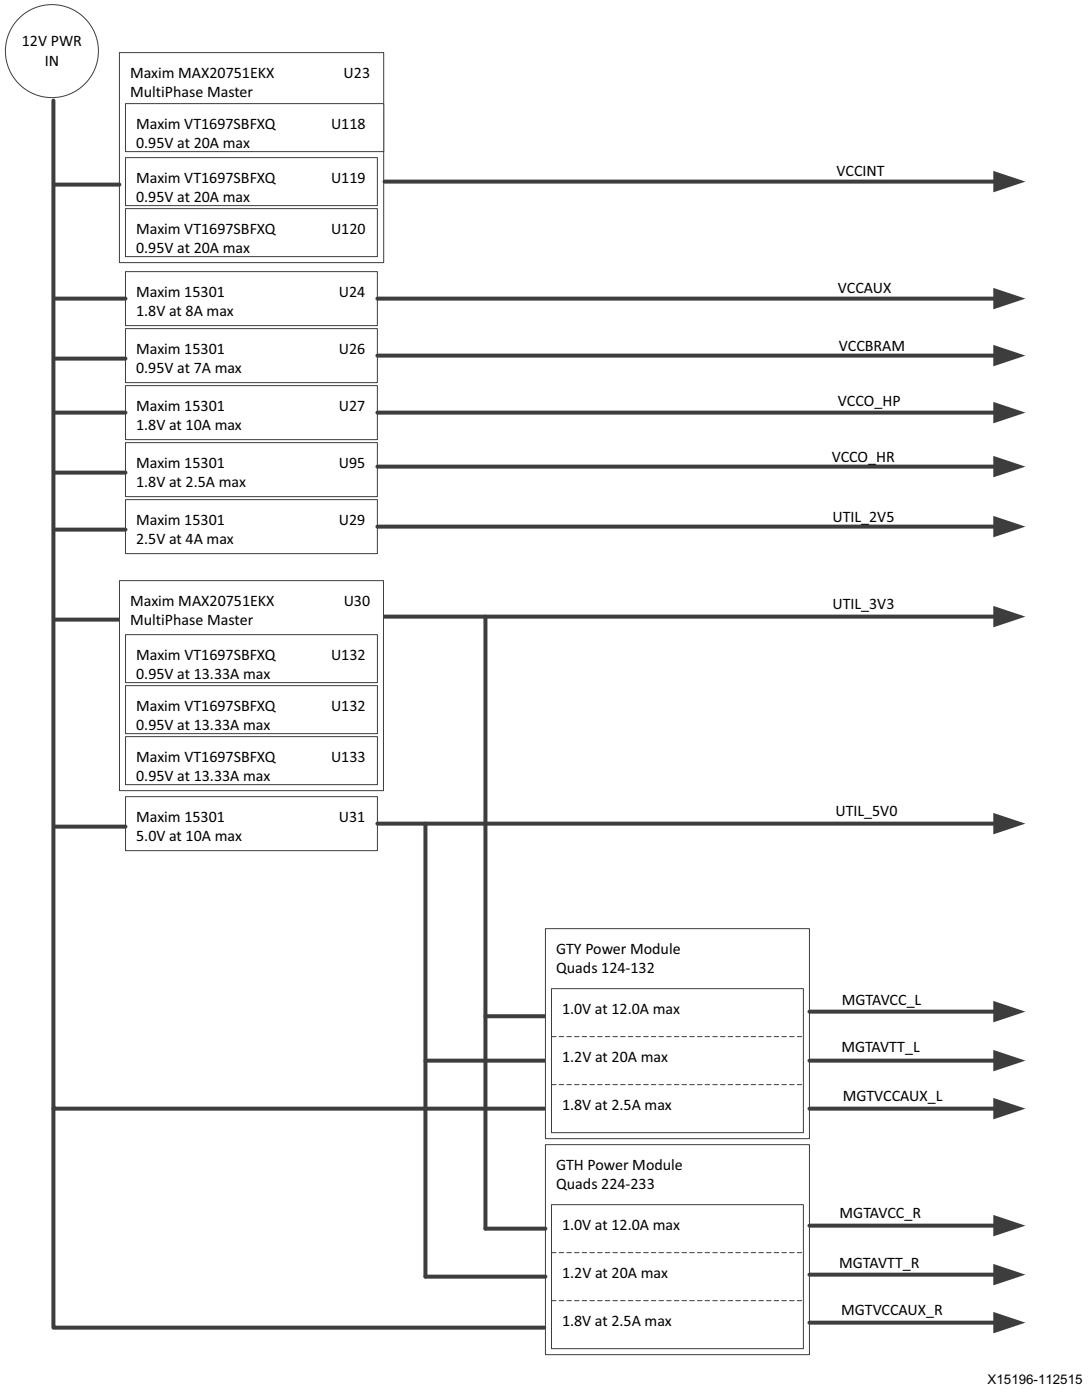

Figure 3-1: **VCU1287 Board Power Supply Block Diagram**

The VCU1287 board uses power regulators and PMBus compliant digital PWM system controllers from Maxim Integrated to supply the FPGA logic and utilities voltages listed in Table 3-1. The board can also be configured to use an external bench power supply for each voltage. See Onboard Power Regulation.

Table 3-1: **Onboard Power System Devices**

Device Part Number	Reference Designator	Description	Power Rail Net Name	Voltage
FPGA Logic				
Maxim MAX20751EKX	U23	MultiPhase master with PMBus interface controller (60A three phases at 20A/phase	VCCINT	0.95V
Maxim MAX15301	U24	InTune digital point of load (PoL) controller, 8A	VCCAUX	1.8V
Maxim MAX15301	U26	InTune digital point of load (PoL) controller, 7A	VCCBRAM	0.95V
Maxim MAX15301	U27	InTune digital point of load (PoL) controller, 10A	VCCO_HP	1.8V
Maxim MAX15301	U95	InTune digital point of load (PoL) controller, 2.5A	VCCO_HR	1.8V
Utility				
Maxim MAX15301	U29	InTune digital point of load (PoL) controller, 10A	UTIL_2V5	2.5V
Maxim MAX20751EKX	U30	MultiPhase Master with PMBus Interface Controller (40A three phases at 13.33A/phase)	UTIL_3V3	3.3V
Maxim MAX15301	U31	InTune digital point of load (PoL) controller, 12A	UTIL_5V0	5.0V
GTY Transceivers (monitoring only)				
INA226	U99	Current shunt and power monitor with I2C interface	MGTAVCC_L	1.0V
INA226	U97	Current shunt and power monitor with I2C interface	MGTAVTT_L	1.2V
INA226	U98	Current shunt and power monitor with I2C interface	MGTVCCAUX_L	1.8V
GTH Transceivers (monitoring only)				
INA226	U50	Current shunt and power monitor with I2C interface	MGTAVCC_R	1.0V
INA226	U51	Current shunt and power monitor with I2C interface	MGTAVTT_R	1.2V
INA226	U52	Current shunt and power monitor with I2C interface	MGTVCCAUX_R	1.8V
System Controller				
Maxim MAX15053	U13	Fixed LDO regulator	SYS_1V0	1.0V
Maxim MAX15027	U33	Fixed LDO regulator	VCC_1V2	1.2V

Table 3-1: **Onboard Power System Devices *(Cont'd)***

Device Part Number	Reference Designator	Description	Power Rail Net Name	Voltage
Maxim MAX15027	U25	Fixed LDO regulator	VCC_1V8	1.8V

CAUTION! *The output voltages of the Max15301 can be reprogrammed using the Maxim InTune Digital Power Tool [Ref 5]. However,* ***extreme caution*** *must be taken when attempting to modify any of the onboard regulators. An incorrectly programmed regulator can damage onboard components.*

Notes:

1. The MAX20751EKX device has limited nonvolatile memory reprogramming saves (four counts).

Using External Power Sources

Callout 19, Figure 2-1

Each voltage rail for the FPGA logic and MGT transceiver has an associated Euro-Mag spring-clamp terminal block that can be used to provide power from an external source (Table 3-2).

CAUTION! *Do NOT apply power to any of the FPGA logic external power supply connectors without first disabling the associated regulator or regulators. Failing to disable the regulator can damage the board.*

Each onboard FPGA logic regulator can be disabled using its respective power regulation inhibitor dip switch (callout 18, Figure 2-1). A regulator is disabled when the power regulation inhibitor switch is set to the ON position. Table 3-2 shows a list of external power connections for the different power rails.

Table 3-2: **FPGA Logic and MGT Transceiver Rails**

	Power Rail Net Name	External Supply Connector (s)	Power Regulation Jumper
FPGA Logic	VCCINT	J25	J22
	VCCAUX		J23
	VCCBRAM		J20
	VCCO_HP		J19
	VCCO_HR		J18
GTH Transceiver	MGTAVCC_R	J26	J15
	MGTAVTT_R		J16
	MGTVCCAUX_R		J17

Table 3-2: **FPGA Logic and MGT Transceiver Rails *(Cont'd)***

	Power Rail Net Name	External Supply Connector (s)	Power Regulation Jumper
GTY Transceiver	MGTAVCC_L	J67	J62
	MGTAVTT_L		J63
	MGTVCCAUX_L		J64

Notes:

1. The MGT power module must be removed before providing external power to any of the transceiver rails (see FPGA Configuration).

Monitoring Voltage and Current

Voltage and current monitoring and control for Maxim power system is available through either the VCU1287 board system controller or the MaximPower Tool software GUI. The VCU1287 board system controller is the most convenient way to monitor the voltage and current values for the power rails listed in Table 3-2. For details on how to use this built-in feature, see Power Monitoring Data Menu in Appendix D, System Controller.

The VCU1287 board includes these PMBus connectors:

- J21 (callout 20, Figure 1-2), for use with the Maxim USB-to-PMBus interface dongle (MAXPOWERTOOL002 [Ref 5]) and the InTune Digital Power GUI.
- J4 (callout 21, Figure 1-2) is used to connect to the MGT power module PMBus using the Maxim USB-to-PMBus interface dongle (MAXPOWERTOOL002 [Ref 5]) and the InTune Digital Power GUI.

Note: Use wires to connect the J4 pins to the Maxim MAXPOWERTOOL002 dongle as shown in Figure 3-2.

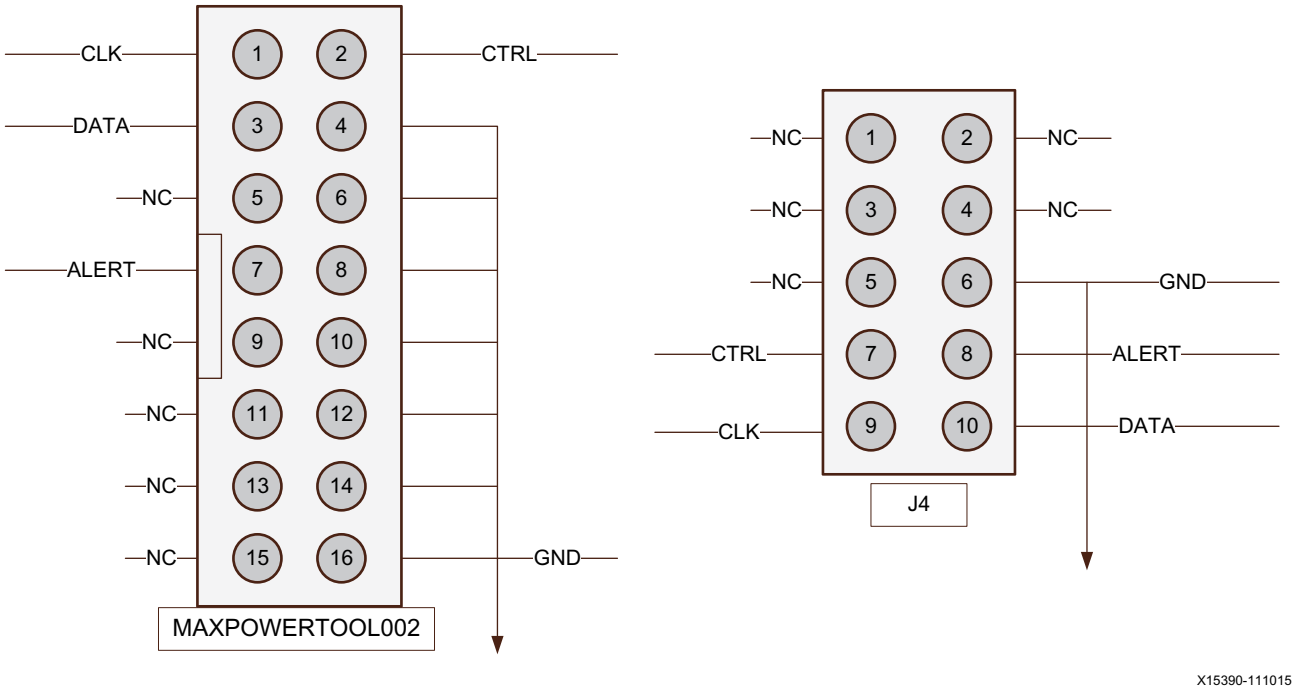

Figure 3-2: **Connecting MAXPOWERTOOL002 to J4**

The onboard Maxim power controllers (U23, U24, U26, U27, U29, U30, U31, and U95) by default are isolated from the MGT power modules PMBus. However, the two interfaces can be linked by removing J8 next to the MGT power module PMBus connector J4. This configuration is required when using Maxim power tools to monitor and control both the FPGA power rails and the transceiver power rails using the Maxim InTune digital power GUI.

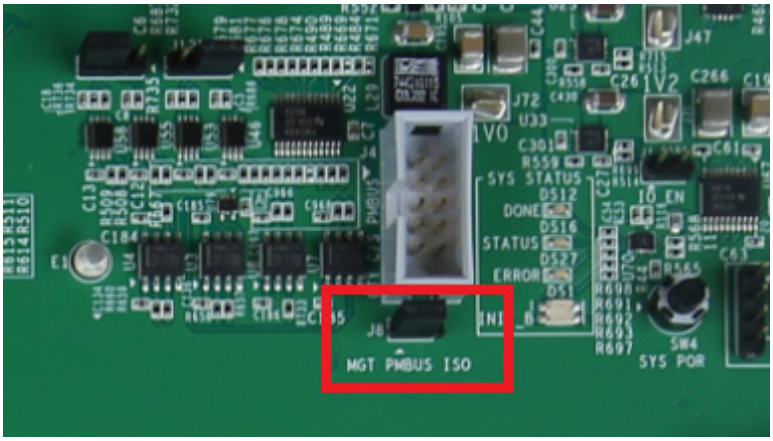

Figure 3-3: **MGT PMBus isolation**

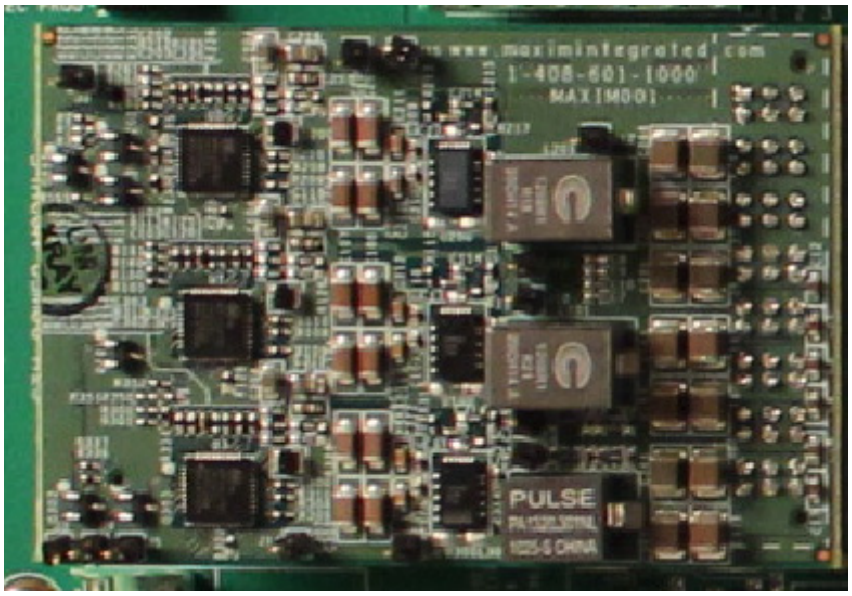
More information about the power system components used by the VCU1287 board is available from the Maxim Integrated InTune digital power website [Ref 5].

MGT Transceiver Power Module

There are two MGT transceiver power modules (callout 20 and 21, Figure 2-1). The GTY power modules supply the MGTAVCC_L, MGTAVTT_L, and MGTVCCAUX_L power rails, which connect to the FPGA GTY transceivers. The GTH power module supplies the MGTAVCC_R, MGTAVTT_R, and MGTVCCAUX_R power rails, which connect to the FPGA GTH transceivers. Two MGT power modules from Maxim Integrated are provided with the VCU1287 board for evaluation. The modules can be plugged into connectors J138 and J93 or J46 and J124 in the outlined and labeled power module locations shown in Figure 3-3 and Figure 3-4.



X15197-103015

Figure 3-4: **Maxim Integrated MGT Power Module**

Table 3-3 lists the nominal voltage values for MGTAVCC_L, MGTAVTT_L, MGTVCCAUX_L, MGTAVCC_R, MGTAVTT_R, and MGTVCCAUX_R power rails. It also lists the maximum current rating for each rail supplied by MGT modules included with the VCU1287 board.

Table 3-3: **MGT Power Modules**

MGT Transceiver Rail Net Name	Nominal Voltage	Maximum Current Rating
MGTAVCC_R	1.0V	12A
MGTAVTT_R	1.2V	20A
MGTVCCAUX_R	1.8V	2.5A
MGTAVCC_L	1.0V	12A
MGTAVTT_L	1.2V	20A
MGTVCCAUX_L	1.8V	2.5A

The MGT transceiver power rails can also be supplied externally. The external supply connectors are described in Table 3-2.

CAUTION! *The MGT Power Module MUST be removed when providing external power to the MGT transceiver rails.*

Information about the available MGT power modules included with the VCU1287 board characterization kit is available from the vendor websites [Ref 5].

Active Heat Sink Power Connector

Callout 25, Figure 2-1

An active heat sink (Figure 3-5) is provided for the FPGA. A 12V fan is affixed to the heat sink and is powered from the 3-pin friction lock header J99 (Figure 3-6).

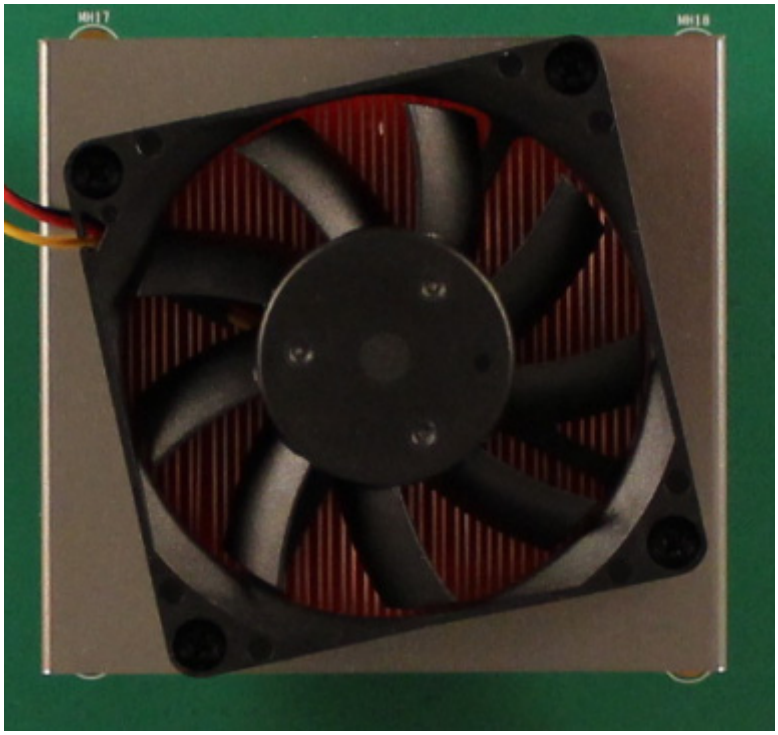


Figure 3-5: **Active FPGA Heat Sink**

The fan power connections are detailed in Table 3-4:

Table 3-4: **Fan Power Connections**

Fan Wire	Header Pin
Black	J99.1 - GND
Red	J99.2 - 12V
Blue	J99.3 - NC

Figure 3-6 shows the heat sink fan power connector J99.

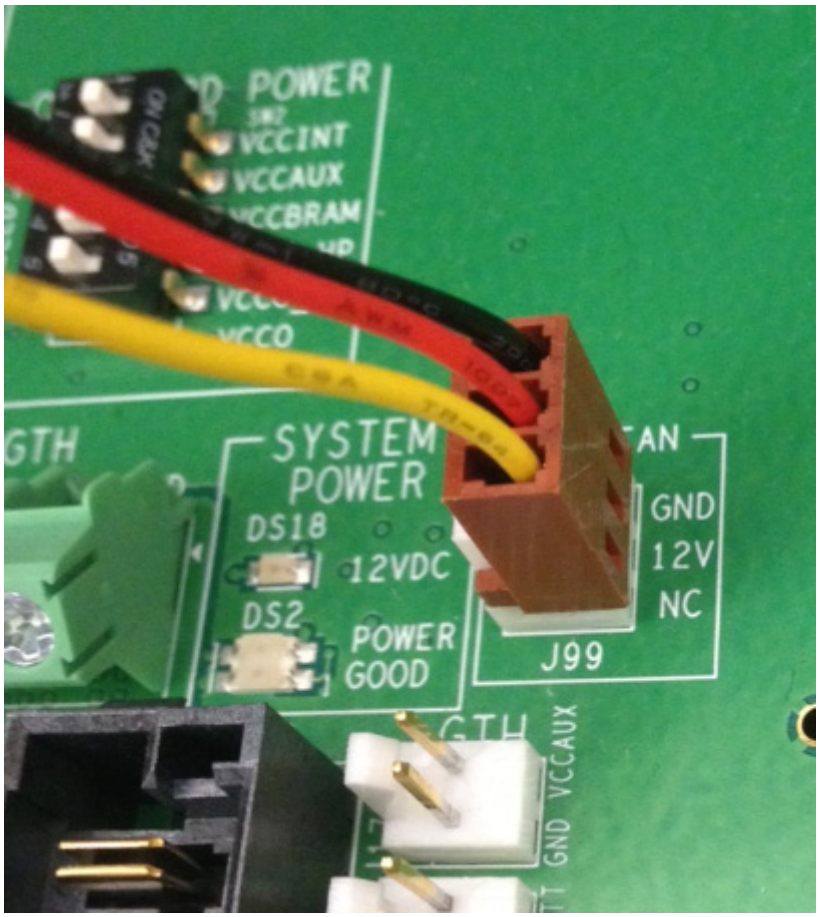

Figure 3-6: **Heat Sink Fan Power Connector J99**

FPGA Configuration

The FPGA is configured using one of the following options:

- Digilent embedded USB JTAG connector (callout 6, Figure 2-1).

  The VCU1287 board comes with an embedded USB-to-JTAG configuration module (Digilent, U80), which allows a host computer to access the board JTAG chain using a Standard A to Micro-B USB cable.

- Platform cable USB JTAG cable connector (callout 7, Figure 2-1).

  A JTAG connector (J2) can be used to provide access to the JTAG chain using the Xilinx Platform Cable USB, Platform Cable USB II, or Parallel Cable IV (PCIV) configuration cable.

- SD card using the Zynq-7000 AP SoC system controller in 8-bit SelectMAP mode (callout 8, Figure 2-1).

  The FPGA can be configured from an SD memory card installed in J10 with the help of the system controller U38, which reads a predefined bit file from the SD card and configures the FPGA in 8-bit SelectMAP configuration mode. See FPGA CONFIG Menu.

The JTAG chain of the board is illustrated in Figure 3-7. By default, only the UltraScale FPGA is part of the chain (J6 jumper uninstalled). Installing the J6 jumper enables an 8-bit bus transceiver (U69, SN74AVC8T245) and adds the FMC interfaces to the chain.

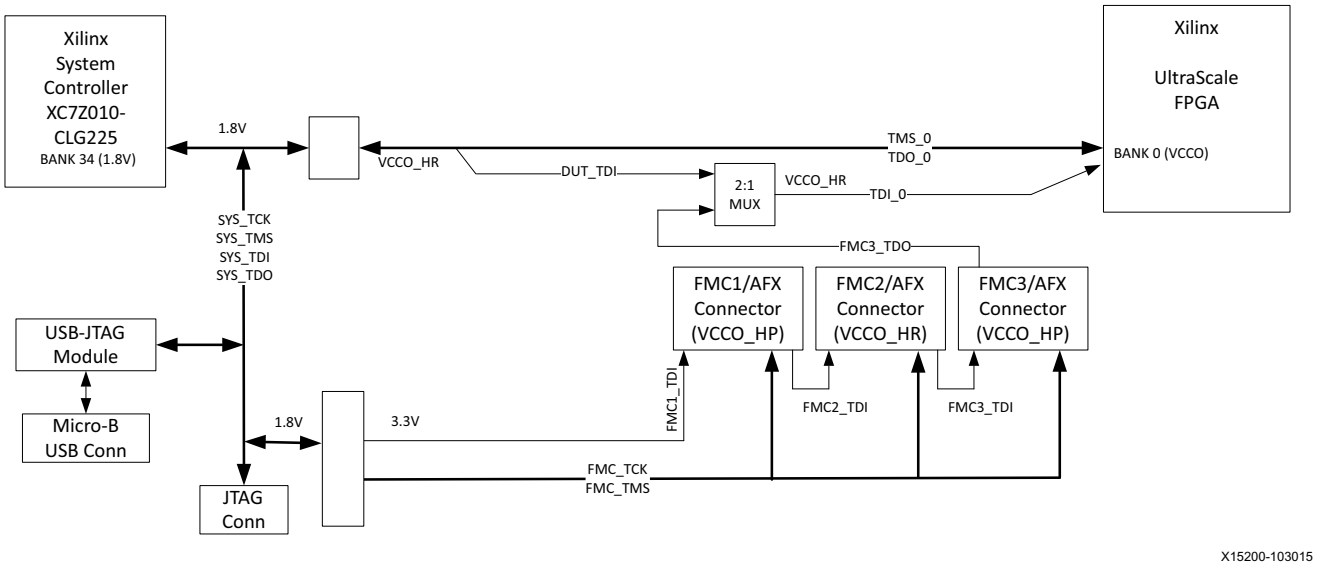

Figure 3-7: **JTAG Chain**

PROGRAM Pushbutton

Pressing the PROGRAM pushbutton SW7 (callout 15, Figure 2-1) asserts the active-Low program pin of the FPGA.

DONE LED

The DONE LED DS17 (callout 13, Figure 2-1) indicates the state of the DONE pin of the FPGA. When the DONE pin is High, DS17 lights indicating the FPGA is successfully configured.

INIT LED

The dual-color INIT LED DS3 (callout 14, Figure 2-1) indicates the FPGA initialization status. During FPGA initialization, the INIT LED illuminates RED. When FPGA initialization has completed, the LED illuminates GREEN.

System Controller

The VCU1287 board utilizes a Xilinx XC7Z010-CLG225 Zynq-7000 AP SoC U38 (callout 35, Figure 2-1) system controller that can be used to:

- Configure the FPGA using predefined selection of configuration bit files on an SD card using 8-bit SelectMAP configuration
- Select the output frequencies of the Super-Clock2 module over I2C
- Monitor the onboard power system (PMBus)

See Appendix D, System Controller for information on the system controller menu options.

System Controller Reset

The SYS_POR pushbutton SW4 (callout 10, Figure 2-1) asserts the active-Low system controller power-on reset (SYS_POR). When SYS_POR is reasserted, the system controller is reconfigured using the controller design stored on an attached SPI flash.

System Controller Status LEDs

DS1, DS12, DS16, and DS27 (callout 37, Figure 2-1) show the system controller INIT_B, DONE, STATUS, and ERROR status, respectively.

System Controller Configuration DIP Switches

DIP switch SW13 (callout 9, Figure 2-1), shown in Figure 3-8, selects the address of the UltraScale FPGA configuration bitstream to be loaded from the SD card. The switch ON position is indicated by the arrow next to bit 1 of the switch. The ENABLE bit (switch position 1) is used to enable the SD card configuration mode.

Figure 3-8: **Configuration DIP Switch (SW13)**

The switch settings for selecting each address are shown in Table 3-5.

Table 3-5: **SW13 DIP Switch Configuration**

Configuration Bitstream Address	ADDR3	ADDR2	ADDR1	ADDR0
0	OFF	OFF	OFF	OFF
1	OFF	OFF	OFF	ON
2	OFF	OFF	ON	OFF
3	OFF	OFF	ON	ON
4	OFF	ON	OFF	OFF
5	OFF	ON	OFF	ON
6	OFF	ON	ON	OFF
7	OFF	ON	ON	ON
8	ON	OFF	OFF	OFF
9	ON	OFF	OFF	ON
10	ON	OFF	ON	OFF
11	ON	OFF	ON	ON
12	ON	ON	OFF	OFF
13	ON	ON	OFF	ON
14	ON	ON	ON	OFF
15	ON	ON	ON	ON

System Controller GPIO Pushbuttons

SW5, SW6, SW10, SW11, SW12 (callout 38, Figure 2-1) are active-high pushbuttons connected to GPIO pins on the system controller. See GPIO Data Menu for more details.

USB to Dual UART Bridge

Callout 24, Figure 2-1

VCU1287 uses a single chip USB-to-dual UART bridge (U32, Silicon Laboratories CP2105) for simultaneous serial communication between a host terminal and the UltraScale FPGA, and between a host terminal and the system controller. The onboard micro-B receptacle USB connector J1 (callout 23, Figure 2-1) pinout is connected to the dual-UART bridge.

The FPGA connects through a serial communication terminal connection (115200-8-N-1) using the standard communication port of the Silicon Labs USB to dual-UART bridge using four signal pins:

- Transmit (TX)
- Receive (RX)
- Request to send (RTS)
- Clear to send (CTS)

The dual-UART interface connections are split between two components:

- UART1 SCI (standard) interface is connected to the XCVU095 FPGA
- UART2 ECI (enhanced) interface is connected to the XC7Z010 system controller

Silicon Labs provides royalty-free virtual COM port (VCP) drivers for the host computer. These drivers permit the CP2105GM dual USB-to-UART bridge to appear as a pair of COM ports to communications application software (for example, TeraTerm or HyperTerm) that runs on the host computer.

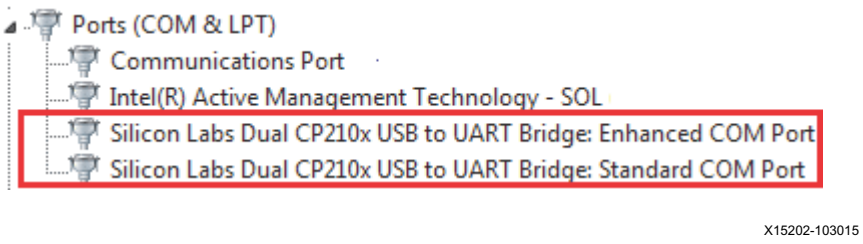

Figure 3-9: **Silicon Labs USB to UART Bridge Standard COM Port**

IMPORTANT: *The VCP device drivers must be installed on the host PC prior to establishing communications with the VCU1287 board.*

The driver assigns the higher PC COM port number to UART1 (SCI) and the lower PC COM port number to UART (ECI).

The connections of these signals between the FPGA and the CP2105 are listed in Table 3-6.

Table 3-6: **FPGA to UART Connection**

FPGA(U1)				Schematic Net Name	Device(U32)		
Pin	Function	Direction	IOSTANDARD		Pin	Function	Direction
BA12	RTS	Output	LVCMOS18	UART_CTS_I_B	18	CTS	Input
BB12	CTS	Input	LVCMOS18	UART_RTS_O_B	19	RTS	Output
BF13	TX	Output	LVCMOS18	UART_RXD_I	20	RXD	Input
BF14	RX	Input	LVCMOS18	UART_TXD_O	21	TXD	Output

The bridge device also provides as many as four GPIO signals that can be defined for status and control information (Table 3-7).

Table 3-7: **CP2105 USB-to-UART Bridge User GPIO**

FPGA(U1)				Schematic Net Name	Device(U32)		
Pin	Function	Direction	IOSTANDARD		Pin	Function	Direction
AY15	SelectIO	IN/OUT	LVCMOS18	UART_GPIO_0	24	GPIO	IN/OUT
AV13	SelectIO	IN/OUT	LVCMOS18	UART_GPIO_1	23	GPIO	IN/OUT
AR15	SelectIO	IN/OUT	LVCMOS18	UART_GPIO_2	22	GPIO	IN/OUT
AR16	SelectIO	IN/OUT	LVCMOS18	UART_GPIO_3	15	GPIO	IN/OUT

The second port of the CP2105 USB-to-dual UART is connected to the onboard system controller. See Appendix D, System Controller.

300 MHz LVDS Oscillator

The VCU1287 board has one 300 MHz LVDS oscillator U42 (callout 12, Figure 2-1) connected to multi-region clock capable (MRCC) inputs on the FPGA. Table 3-8 lists the FPGA pin connections to the LVDS oscillator.

Table 3-8: **LVDS Oscillator MRCC Connections**

FPGA (U1)				Schematic Net Name	Device (42)		
Pin	Function	Direction	I/O Standard		Pin	Function	Direction
AW14	SYSTEM CLOCK_P	Input	LVDS	LVDS_OSC_P	4	300 MHz LVDS oscillator	Output
AW13	SYSTEM CLOCK_N	Input	LVDS	LVDS_OSC_N	5	300 MHz LVDS oscillator	Output

Differential SMA MRCC Pin Inputs

The VCU1287 board provides two pairs of differential SMA transceiver clock inputs (callout 34, Figure 2-1) that can be used for connecting to an external clock source. The FPGA MRCC pins are connected to the SMA connectors as shown in Table 3-9.

Table 3-9: **Differential SMA Clock Connections**

FPGA(U1)				Schematic Net Name	SMA Connector
Pin	Function	Direction	IOSTANDARD		
L32	USER CLOCK_1_P	INPUT	LVDS	CLK_DIFF_1_P	J84
K32	USER CLOCK_1_N	INPUT	LVDS	CLK_DIFF_1_N	J85
M31	USER CLOCK_2_P	INPUT	LVDS	CLK_DIFF_2_P	J83
M32	USER CLOCK_2_N	INPUT	LVDS	CLK_DIFF_2_N	J86

SuperClock-2 Module

The SuperClock-2 module (callout 11, Figure 2-1) connects to the clock module interface connector (J36) and provides a programmable, low-noise and low-jitter clock source for the VCU1287 board. The clock module maps to FPGA I/O by way of 14 control pins, 2 LVDS pairs, 1 regional clock pair, and 1 reset pin. Table 3-10 shows the FPGA I/O mapping for the SuperClock-2 module interface. The VCU1287 board supplies UTIL_5V0, UTIL_3V3, UTIL_2V5 and VCCO_HP input power to the Table 3-10 clock module interface.

Table 3-10: **SuperClock-2 FPGA I/O Mapping**

FPGA(U1)				Schematic Net Name	J36 Pin		
Pin	Function	Direction	IOSTANDARD		Pin	Function	Direction
L13	Clock recovery	Input	LVDS	CM_LVDS1_P	1	Clock recovery	Output

User LEDs (Active-High)

DS19 through DS26 (callout 24, Figure 2-1) are eight active-High LEDs that are connected to user I/O pins on the FPGA as shown in Table 3-11. These LEDs can be used to indicate status or for other purposes.

Table 3-11: **User LEDs**

FPGA(U1)				Schematic Net Name	Reference Designator
Pin	Function	Direction	IOSTANDARD		
BD14	User LED	Output	LVCMOS18	APP_LED1	DS19
BF15	User LED	Output	LVCMOS18	APP_LED2	DS20
BE15	User LED	Output	LVCMOS18	APP_LED3	DS21
BE13	User LED	Output	LVCMOS18	APP_LED4	DS25
BD13	User LED	Output	LVCMOS18	APP_LED5	DS24
BC14	User LED	Output	LVCMOS18	APP_LED6	DS23
BB15	User LED	Output	LVCMOS18	APP_LED7	DS22
BB14	User LED	Output	LVCMOS18	APP_LED8	DS26

User DIP Switches (Active-High) and I/O Header

The DIP switch SW3 (callout 28, Figure 2-1) provides a set of eight active-High switches that connect to user I/O pins on the FPGA as shown in Table 3-12. These pins can be used to set control pins or for other purposes. The eight I/Os also map to a test header J95 (callout 29, Figure 2-1) providing external access for these pins. The I/O pins can be connected to the onboard system controller as additional GPIO between the two devices.

IMPORTANT: *Install J7 to connect the user DIP switches to the system controller.*

Table 3-12: **User DIP Switches**

FPGA(U1)				Schematic Net Name	DIP Switch Reference Designator	J95 Test Header Pin	Device(U38) Pin
Pin	Function	Direction	IOSTANDARD				
AP13	User switch	Input	LVCMOS18	USER_SW1	SW3	1	F12

AW15	User switch	Input	LVCMOS18	USER_SW8		15	F15

Figure 3-10 shows the user I/O connector J95 (callout 29, Figure 2-1).

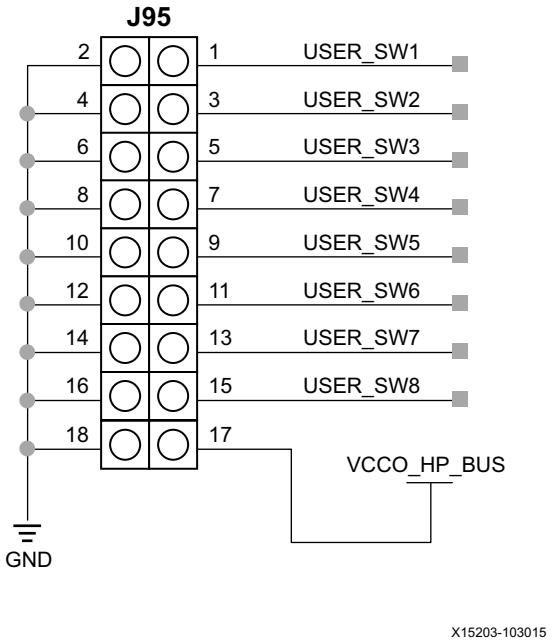

Figure 3-10: **User I/O (J95)**

User Pushbuttons (Active-High)

SW8 and SW9 (callout 27, Figure 2-1) are active-High user push buttons that are connected to user I/O pins on the FPGA as shown in Table 3-13. These switches can be used for any purpose.

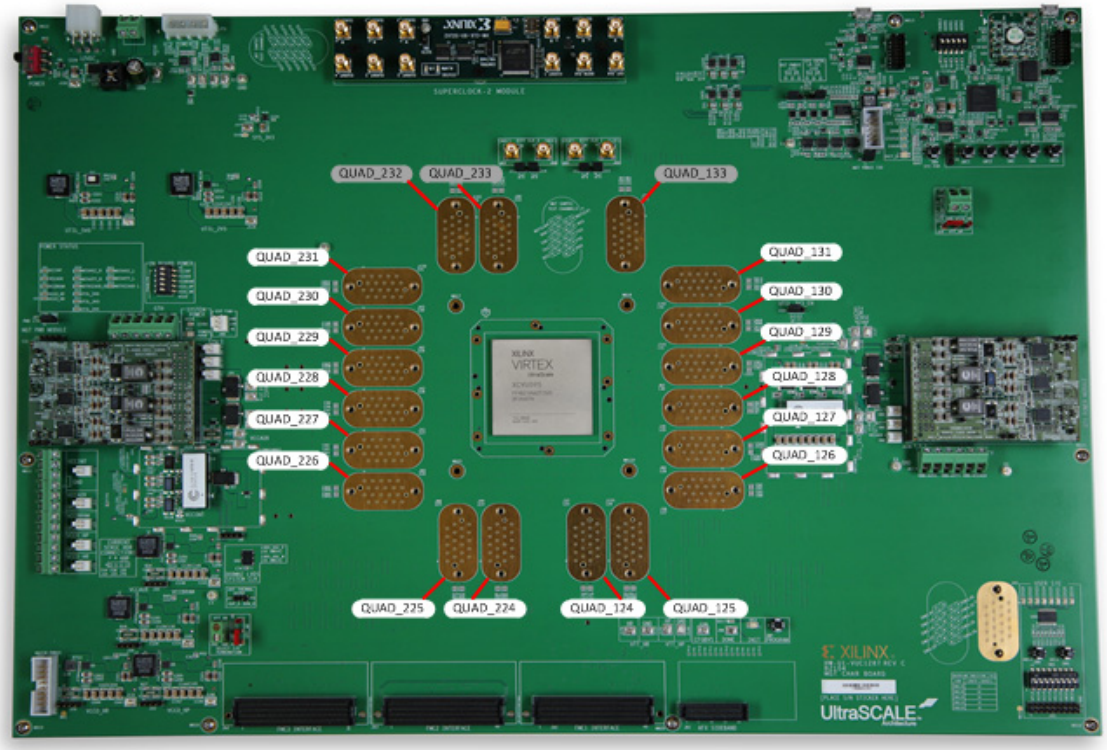
Table 3-13: **User Pushbuttons**

FPGA(U1)				Schematic Net Name	Reference Designator
Pin	Function	Direction	IOSTANDARD		
AN14	User push button	Input	LVCMOS18	USER_PB1	SW9
AM14	User push button	Input	LVCMOS18	USER_PB2	SW8

MGT Transceivers and Reference Clocks

The VCU1287 board provides access to all GTY and GTH transceiver and reference clock pins on the XCVU095 FPGA as shown in Figure 3-11. The MGT transceivers are grouped into eight sets of four TX-RX lanes, referred to as a GTY Quads (Q124 - Q131) on the right side of the board and eight TX-RX lanes, referred to as GTH Quads (Q224 - Q231) on the left side of the board.

IMPORTANT: *Figure 3-11 is for reference only and might not reflect the current revision of the board. Quad 132, Quad 232, and Quad 233 are not available on the XCVU095 FPGA device density.*



X15205-112515

Figure 3-11: **MGT Quad Locations**

Each MGT Quad and its associated reference clocks (CLK0 and CLK1) are brought out to a connector pad that interfaces with Samtec BullsEye connectors used with the Samtec HDR-155805-01-BEYE cable assembly. Contact Samtec, Inc. [Ref 6], for information about this or other cable assemblies. Figure 3-12 shows the connector pad (A) and the connector pinout (B).

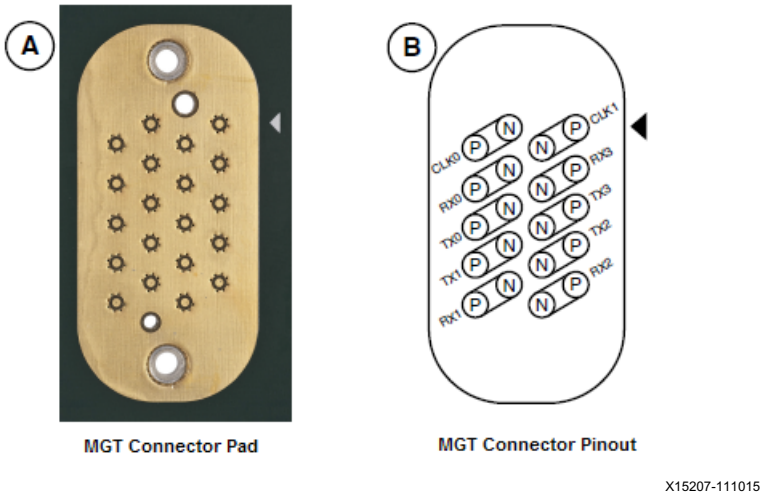


Figure 3-12: **MGT Connector Pad and Pinout**

The information for each GTY transceiver pin is shown in Table 3-14.

FPGA Mezzanine Card HPC Interface

Callout 30, 31, and 32, Figure 2-1

The VCU1287 board features two high pin count (HPC) connectors as defined by the VITA 57.1 FPGA Mezzanine card (FMC) specification. The FMC HPC connector is a 10 x 40 position socket. See Appendix B, VITA 57.1 FMC Connector Pinouts for a cross-reference of signal names to pin coordinates.

The FMC1 HPC connector JA2 provides connectivity for:

- 75 differential user defined pairs:
  - 34 LA pairs
  - 24 HA pairs
  - 17 HB pairs
- 4 differential clocks

The FMC2 HPC connector JA3 provides connectivity for:

- 20 differential user defined pairs:
  - 20 LA pairs
- 2 differential clocks

The FMC3 HPC connector JA4 provides connectivity for:

- 80 differential user defined pairs:
  - 34 LA pairs
  - 24 HA pairs
  - 22 HB pairs
- 4 differential clocks

IMPORTANT: *The V_{ADJ} voltage on the FMC1 and FMC3 HPC connectors tracks VCCO_HP. While the V_{ADJ} voltage on the FMC2 HPC connectors tracks VCCO_HR.*

The FMC HPC connectors on the VCU1287 board are identified as FMC1 at JA2, FMC2 at JA3, and FMC3 at JA4. The connections for each of these connectors are listed in Table 3-18, Table 3-19 and Table 3-20, respectively.

System Monitor

The SYSMON monitors the physical environment using on-chip temperature and supply sensors, up to 17 external analog inputs, and an integrated analog-to-digital converter (ADC). The SYSMON is powered using the on-chip reference (VREF) shown in Figure 3-13. More information about the system monitor is available in the *UltraScale Architecture System Monitor User Guide* (UG580) [Ref 2].

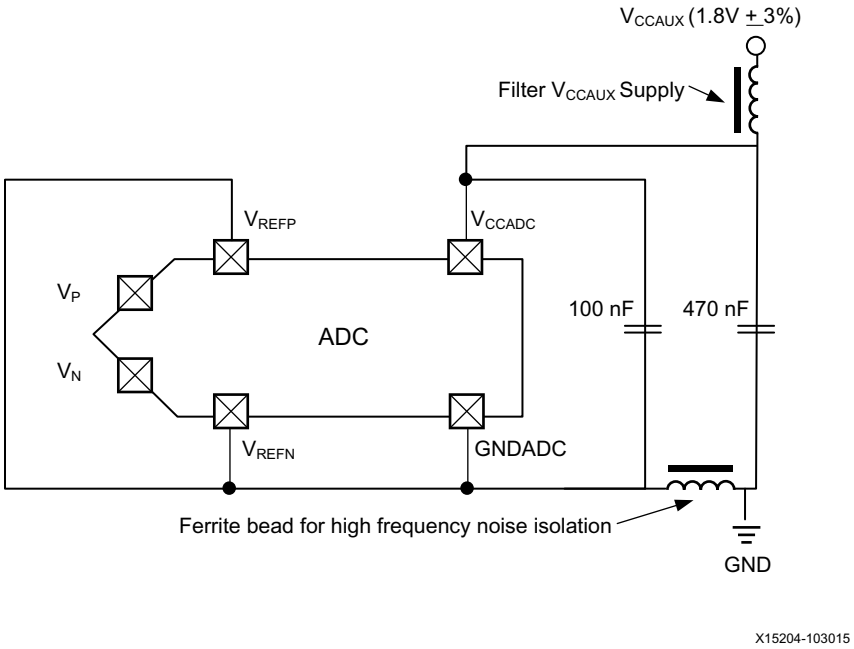

Figure 3-13: **SYSMON On-Chip Reference**

I2C Bus Management

The I2C bus is routed through U22, an 8-channel I2C-bus multiplexer (NXP Semiconductor TCA9548). The I2C IDcode for the PCA9548 device is 0x75. The multiplexer provides I2C/PMBus communication between the bus master (system controller or FPGA) and six sub-systems:

- Onboard regulators and power monitoring
- SuperClock-2 module
- System controller EEPROM
- FMC1 connector
- FMC2 connector
- FMC3 connector

Table 3-21 shows the I2C channel assignments.

Table 3-21: **I2C Channel Assignments**

U22 Channel	I2C Component
0	System PMBus
1	SuperClock-2 module
2	System controller EEPROM
3	FMC1
4	FMC2
5	FMC3

The upstream port of the TCA9548 multiplexer connects to PCA9306 (U46, U53, U55, and U58) dual bidirectional I2C and SMBus voltage-level translator and bus repeaters, with an enable (EN) signal (see Figure 3-14). J121 and J125 are used to enable or disable the bus repeaters and isolate the system controller or the UltraScale FPGA I2C bus.

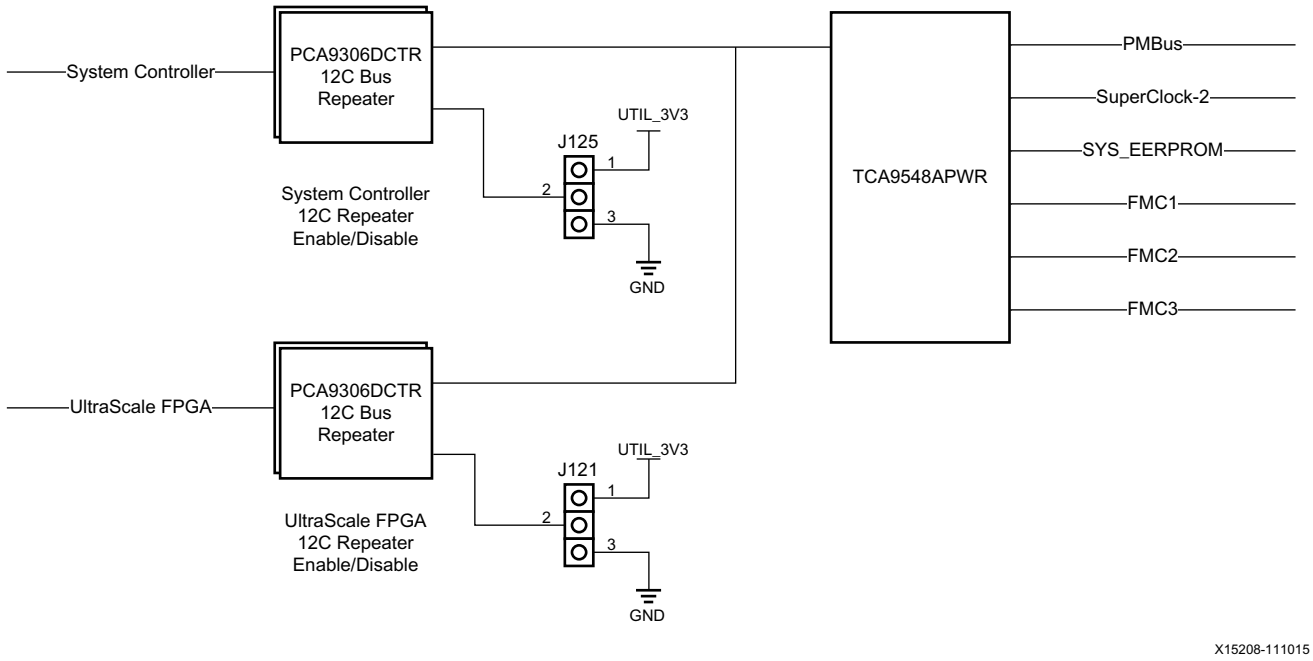

Figure 3-14: **I2C Bus Multiplexer and Upstream Repeater**

Default Jumper Settings

Introduction

Table A-1 lists the jumpers that must be installed on the VCU1287 board for proper operation. These jumpers must be installed except where specifically noted in this user guide.

Note: Any jumper not listed in Table A-1 should be left open for normal operation.

Table A-1: **Default Jumper Settings**

Reference Designator	Name	Board Location	Jumper/Dip-switch Position	Comments
SW2.1	VCCINT	Upper Left	OFF	
SW2.2	VCCBRAM	Upper Left	OFF	
SW2.3	VCCAUX	Upper Left	OFF	
SW2.4	VCCO_HP	Upper Left	OFF

Master Constraints File Listing

Introduction

The VCU1287 board master Xilinx design constraints (XDC) file template provides for designs targeting the VCU1287 UltraScale FPGA GTH and GTY Transceiver Characterization Board. Net names in the listed constraints correlate with net names on the VCU1287 board schematic. Identify the appropriate pins and replace the net names with net names in the user RTL. See the *Vivado Design Suite User Guide: Using Constraints* (UG903) [Ref 3] for more information.

IMPORTANT: *See the Xilinx Virtex UltraScale FPGA VCU1287 Characterization Kit website for the latest XDC file.*

System Controller

Overview

The Xilinx system controller is an ease-of-use application that runs on a Zynq-7000 AP SoC at power-up on the VCU1287 board. The system controller command line can be accessed through a serial communication terminal connection (115200-8-N-1) using the enhanced communication port of the Silicon Labs USB to Dual UART described in USB to Dual UART Bridge.

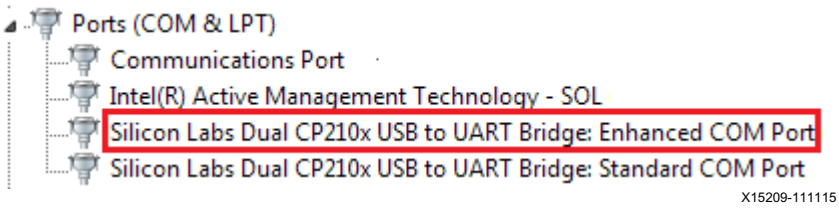

Figure D-1: **Silicon Labs Enhancement COM Port**

The main menu lists the available options:

```
VCU1287 System Controller v1.0

      - Main Menu -

-----------------------------

1. Set Programmable Clocks

2. Get Power System (PMBUS) Voltages

3. Get Power Monitoring Data (INA226)

4. Adjust FPGA Mezzanine Card (FMC) Settings

5. Get GPIO Data

6. Get EEPROM Data

7. Configure UltraScale FPGA
```

Programmable Clocks Menu

The clock menu is used to set the frequency of the Super Clock-2 module (see SuperClock-2 Module) clock sources.

```
VCU1287 System Controller v1.0

-----------------------------

   - Clock Menu-

1. Set VCU1287 Si570 Frequency

2. Set VCU1287 Si5368 Frequency

3. Save VCU1287 Clock Frequency to EEPROM

4. Restore VCU1287 Clock Frequency from EEPROM

5. View VCU1287 Saved Clocks in EEPROM

6. Set VCU1287 Clock Restore Options

7. Read VCU1287 Si570 Frequency

8. Read VCU1287 Si5368 Frequency

0. Return to Main Menu
```

Clock Menu Options

This section includes a description of the clock menu options using arbitrary sample value entries and system controller responses. The entry value commentary is shown in parentheses.

Option 1: Set VCU1287 Si570 Frequency

```
Enter the Si570 frequency <10-810MHz>:
```

(enter a value between 10 and 810)

```
200

RFreq_Cal[0]=0x02, RFreq_Cal[1]=0xBB, RFreq_Cal[2]=0xFF, RFreq_Cal[3]=0x8F,
RFreq_Cal[4]=0xC9

Freq:200.0000000000 HS_DIV=7 N1=4 DCO=5600.0 RFREQ=0x030FFF8251
```

(The returned values include diagnostic information.)

Option 2: Set VCU1287 Si5368 Frequency

```
Enter the Si5368 frequency (0.002-808MHz):
```

200

```
Choose Si5368 operating mode:
1 - Auto-Select
2- Free-Run using XA-XB crystal
```

1

```
Freq:200.0000000000 fosc=5600.000MHz f3= 5.000KHz LBW=0.200KHz N1=28 N1_HS=7
NC1_LS=4 N2=1120000 N2_HS=4 N2_LS=280000 N31=40000 N32=22857
```

(The returned values include diagnostic information.)

Note: Several seconds might elapse before the result is returned.

IMPORTANT: *Make sure J121 is set to position (2-3) DUT I2C DIS to isolate the DUT I2C signals and prevent bus contention. If contention occurs, the system controller will hang up while executing these commands.*

Option 3: Save VCU1287 Clock Frequency to EEPROM

```
VCU1287 System Controller
        - Save Menu -
-----------------------------
1. Save VCU1287 Si570 Frequency to EEPROM
2. Save VCU1287 Si5368 Frequency to EEPROM
0. Return to Clock Menu
```

1

```
Saving Si570 Frequency = 200.000 MHz to EEPROM
```

2

```
Saving Si5368 Frequency = 200.000 MHz to EEPROM
```

Option 4: Restore VCU1287 Clock Frequency from EEPROM

```
1. Restore VCU1287 Si570 Frequency from EEPROM
2. Restore VCU1287 Si5368 Frequency from EEPROM
0. Return to Clock Menu
```

1

```
RFreq_Cal[0]=0x02, RFreq_Cal[1]=0xBB, RFreq_Cal[2]=0xFF, RFreq_Cal[3]=0x8F,
RFreq_Cal[4]=0xC9

Freq:200.0000000000 HS_DIV=7 N1=4 DCO=5600.0 RFREQ=0x030FFF8251
Restored Si570 Frequency = 200.000 MHz from EEPROM
```

(The returned values include diagnostic information)

2

```
Freq:200.0000000000 fosc=5600.000MHz f3= 5.000KHz LBW=0.200KHz N1=28 N1_HS=7
NC1_LS=4 N2=1120000 N2_HS=4 N2_LS=280000 N31=40000 N32=22857
```

(The returned values include diagnostic information)

Note: Several seconds might elapse before the result is returned.

Option 5: View VCU1287 Saved Clocks in EEPROM

```
Saved Clocks in EEPROM
------------------------------
Si570 User Clock: 200.00000000 MHz
Si5328 MGT Clock: 200.00000000 MHz
```

Option 6: Set VCU1287 Clock Restore Options

```
1. View VCU1287 Clock Restore Options
2. Enable VCU1287 Si570 Automatic Restore at Power-Up/Reset
3. Enable VCU1287 Si5328 Automatic Restore at Power-Up/Reset
4. Disable VCU1287 Si570 Automatic Restore at Power-Up/Reset
5. Disable VCU1287 Si5328 Automatic Restore at Power-Up/Reset
0. Return to Clock Menu
```

Option 7: Read VCU1287 Si570 Frequency

7

```
Si570 Current Frequency = 2.000000E+02 MHz
```

Option 8: Read VCU1287 Si5328 Frequency

8

```
Si5368 CKOUT1 Current Frequency = 2.000000E+02 MHz
Si5368 CKOUT2 Current Frequency = 2.000000E+02 MHz
Si5368 CKOUT3 Current Frequency = 2.000000E+02 MHz
Si5368 CKOUT4 Current Frequency = 2.000000E+02 MHz
```

```
Si5368 CKOUT5 Current Frequency = 2.000000E+02 MHz
```

Option 0: Return to Main Menu

This option returns to the menu level above.

PMBus Menu

The PMBus bus commands are used to read the voltage settings of the VCU1287 power rails controlled by the Maxim power system. Through the PMBus menu, these power rails can be read once or scanned continuously until stopped by a key press. Table D-1 lists the voltage rails accessible through the system controller's interface to the Maxim PMBus.

Table D-1: **Maxim Power Supply Rail**

Maxim Power Supply Rail	I2C Address	Nominal Voltage
VCCINT	0x70	0.95V
VCCAUX	0x0B	1.80V
VCCBRAM	0x0F	0.95V
VCCO_HP	0x13	1.80V
VCCO_HR	0x11	1.80V
UTIL_5V0	0x1C	5.00V
UTIL_3V3	0x71	3.30V
UTIL_2V5	0x1A	2.50V

PMBus Menu Options

```
VCU1287 System Controller v1.0

- PMBus Menu-

1. Get PMBUS Voltages

2. Continuous Scan PMBUS Voltages

3. Get VCCINT Voltage

4. Get VCCAUX Voltage

5. Get VCCBRAM Voltage

6. Get VCCOHP Voltage

7. Get VCCOHR Voltage
```

```
8. Get UTIL5V0 Voltage

9. Get UTIL3V3 Voltage

A. Get UTIL2V5 Voltage

0. Return to Main Menu
```

Option 1: Get PMBus Voltages

```
VCCINT =  0.950 V
VCCAUX =  1.800 V
VCCBRAM =  0.950 V
VCCO_HP =  1.800 V
VCCO_HR =  1.800 V
UTIL2V5 =  2.499 V
UTIL3V3 =  3.300 V
UTIL5V0 =  5.000 V
```

Option 2: Continuous Scan PMBUS Voltages

The list of voltages shown in option 1 is displayed and updated about once per second. Pressing any key displays the PMBus menu.

Option 3: Get VCCINT Voltage

```
VCCINT =  0.950 V
Unscaled Hex: MSB = 0x00, LSB = 0x8D
```

(The returned values include configuration setting details.)

Option 4: Get VCCAUX Voltage

```
VCCAUX = 1.800 V
Unscaled Hex: MSB = 0x1C, LSB = 0xC9
```

(The returned values include configuration setting details.)

Option 5: Get VCC_BRAM Voltage

```
VCCBRAM = 0.950 V
Unscaled Hex: MSB = 0x0F, LSB = 0x34
```

(The returned values include configuration setting details.)

Option 6: Get VCCO_HP Voltage

```
VCCO_HP = 1.800 V
Unscaled Hex: MSB = 0x1C, LSB = 0xCD
```

(The returned values include diagnostic information.)

Option 7: Get VCCO_HR Voltage

```
VCCO_HR = 1.800 V
Unscaled Hex: MSB = 0x1C, LSB = 0xCB
```

(The returned values include diagnostic information.)

Option 8: Get UTIL5V0 Voltage

```
UTIL5V0 = 5.000 V
Unscaled Hex: MSB = 0x50, LSB = 0x00
```

(The returned values include diagnostic information.)

Option 9: Get UTIL3V3 Voltage

```
UTIL3V3 = 3.300 V
Unscaled Hex: MSB = 0x00, LSB = 0xFB
```

(The returned values include diagnostic information.)

Option A: Get UTIL2V5 Voltage

```
UTIL2V5 = 2.500 V
Unscaled Hex: MSB = 0x27, LSB = 0xFB
```

(The returned values include diagnostic information.)

Option 0: Return to Main Menu

This option returns to the menu level above.

Power Monitoring Data Menu

The VCU1287 includes the Texas Instrument INA226 power monitoring devices. The Power Monitoring Data menu, unlike the PMBus menu, provides both voltage and current monitoring for the MGT power modules, as well as the FPGA power rails.

```
VCU1287 System Controller v1.0

     - INA226 Menu -

-----------------------------

1. Continuous Scan Voltage and Current

2. Advanced Settings

0. Return to Main Menu
```

Option 1: Continuous Scan Voltage and Current

This option lists the voltages shown in Option 1: Get PMBus Voltages and displays the average, minimum, and maximum current of each rail. The list is updated about once per second. Pressing any key displays the PMBus menu.

Option 2: Advanced Setting

This option can be used to select one of the PMBus power monitors and explore additional user settings such as monitor calibration. Refer to the INA226 data sheet [Ref 7] for device registers information.

Select the advanced setting operation

```
VCU1287 System Controller v1.0
    - INA226 Advanced Menu -
-----------------------------
1. Select INA226 Device
2. Get    INA226 Register
3. Set    INA226 Register
0. Return to Previous Menu
```

Select the device

```
VCU1287 System Controller v1.0
    - Select INA226  Menu -
-----------------------------
1. Select VCCINT       Monitor
2. Select VCCAUX       Monitor
3. Select VCCBRAM      Monitor
4. Select VCCO_HP      Monitor
5. Select VCCO_HR      Monitor
6. Select MGTAVCC_R    Monitor
7. Select MGTAVTT_R    Monitor
8. Select MGTVCCAUX_R  Monitor
9. Select MGTAVCC_L    Monitor
A. Select MGTAVTT_L    Monitor
B. Select MGTVCCAUX_L  Monitor
0. Return to Previous Menu
```

Read the selected INA226 registers1

```
VCU1287 System Controller v1.0
    - RAIL INA226 Menu -
-----------------------------
1. Get SHUNT         Register
2. Get BUS           Register
3. Get POWER         Register
4. Get CURRENT       Register
5. Get CALIBRATION   Register
6. Get MASK_ENABLE   Register
7. Get ALERT_LIMIT   Register
8. Get CONFIGURATION Register
9. Get DIE ID        Register
0. Return to Previous Menu
```

Set the selected INA226 registers

```
VCU1287 System Controller v1.0
    -  RAIL INA226 Menu -
-----------------------------
1. Set CALIBRATION   Register
2. Set MASK_ENABLE   Register
3. Set ALERT_LIMIT   Register
4. Set CONFIGURATION Register
0. Return to Previous Menu
```

FPGA Mezzanine Card (FMC)

The VCU1287 board provides three FPGA mezzanine card (FMC) ANSI/VITA 57.1 expansion interfaces. All FMC mezzanine cards must host an IIC EEPROM that can be read out through the FMC menu. A raw hexadecimal display and a formatted version of the FMC EEPROM data are provided through the FMC menu. The VITA 57.1 standard identifies the data fields of the intelligent platform management interface (IPMI) specification used for the FMC EEPROM. The VCU1287 board system controller supports the programmable clock resources on these FMC modules:

IMPORTANT: *These FMC modules are not included.*

- FMC XM101 LVDS QSE card
- FMC XM104 MGT serial connectivity card
- FMC XM105 debug card
- FMC XM107 loopback card

These mezzanine cards can be attached to JA2 (callout 28), J3A (callout 29), or J4A (callout 30) of the VCU1287 expansion ports. Table D-2 shows the accessible clock resources on each FMC module.

Table D-2: **FMC Module Clock Resources**

Xilinx FMC Module/Board	Clock Source #1	Clock Source #2
XM101	Si570	SI570
XM104	Si570	Si5638
XM105	Si570	n/a
XM107	Si570	n/a

FMC Menu Options

```
VCU1287 System Controller v1.0

     - FMC Menu -

-----------------------------

1. Set FMC XMxxx CLOCKS

2. Read FMC1 IIC EEPROM

3. Read FMC2 IIC EEPROM

4. Read FMC3 IIC EEPROM

0. Return to Main Menu
```

Identify the FMC module types and the FMC connecter number. The subsequent examples use FMC-XM107 connected to FMC1.

Option 1: Set FMC XMxxx CLOCKS

```
VCU1287 System Controller v1.0
      - FMC Clock Menu -
-----------------------------
1. Set FMC XM101 Clocks
2. Set FMC XM104 Clocks
3. Set FMC XM105 Clocks
4. Set FMC XM107 Clocks
0. Return to FMC Menu
```

Set FMC XM107 Clocks

```
VCU1287 System Controller v1.0
      - XM107 Menu -
-----------------------------
1. Set FMC1 Si570   Frequency
2. Set FMC2 Si570   Frequency
3. Set FMC3 Si570   Frequency
0. Return to FMC Clock Menu
```

Set FMC1 Si570 Frequency

(The returned values include diagnostic information)

```
FMC1 card present
board_area_offset = 008
board_area_format_version = 0x01
board_area_length = 056
board_mfg_hdr_offset = 014
board_mfg_length = 010
ReadBuffer index = 026
ReadBuffer[i] = 58
ReadBuffer[i+1] = 4D
ReadBuffer[i+2] = 31
ReadBuffer[i+3] = 30
ReadBuffer[i+4] = 37
Enter the Si570 frequency (10-810MHz):
100
Freq:100.0000000000 HS_DIV=5 N1=10 DCO=5000.0 RFREQ=0x02BC7E566E
```

(The returned values include diagnostic information)

Option 2: Read FMC IIC EEPROM

If the FMC IIC EEPROM has been programmed, several data groupings are displayed:

```
ReadBuffer[000] - ReadBuffer[255] displays various value contents
Common Header
Board Area Info
MultiRecord Area
- OEM FMC Record
- DC Load Records (three groups)
- DC Output Records (three groups)
```

If the FMC IIC EEPROM has not been programmed, ReadBuffer[000] - ReadBuffer[255] displays buffer contents = `0xFF` and the Common Header reports “Invalid Format Version FF”.

GPIO Data Menu

The system controller continuously scans specific user-activated inputs and several onboard status signals. Positions 1-4 (ADDR3, ADDR2, ADDR1, ADDR0) of address DIP switch SW13 are monitored, as well as five user pushbuttons (SW5, SW6, SW10, SW11, SW12).

GPIO Menu Options

```
VCU1287 System Controller v1.0

    - GPIO Menu -

------------------------------

1. Get GPIO PL Data

2. Continuous Scan GPIO Readings

0. Return to Main Menu
```

Option 1: Get GPIO PL Data

The signals monitored with this option are currently not available in the VCU1287 board.

```
----------------------
FMC1_PRSNT = NO
FMC2_PRSNT = NO
PMBUS_CABLE_B = NO
FPGA_IIC_BUSY = YES
PMBUS_ALERT = YES
```

Option 2: Continuous Scan GPIO Readings

```
Press any Key to Return to GPIO Menu
```

When any of the address DIP SW13 poles 1-4 are changed, or a pushbutton pressed, the value beneath the switch position changes accordingly (showing a 0 or a 1).

```
SYS ADDR (SW13) (ADDR3, ADDR2, ADDR1, ADDR0)
0 0 0 0
Pushbuttons (SW11, SW12, SW5, SW6, SW10)
0 0 0 0 0
----------------------
FMC1_PRSNT = NO
FMC2_PRSNT = NO
PMBUS_CABLE_B = NO
FPGA_IIC_BUSY = YES
PMBUS_ALERT = YES
```

Board EEPROM Data Menu

The VCU1287 includes a QSPI memory device (N25Q128A) that is used to store the system controller firmware as well as additional test information

```
VCU1287 System Controller v1.0

    - EEPROM Menu -

------------------------------

1. Read Board EEPROM Data

0. Return to Main Menu
```

Option 1: Read Board EEPROM Data Options

```
Board Name: VCU1287
Board Revision: 1.0
 Serial Number:
 Test Revision:
     Test Date:
     Test Time:
     Test Name    -    Status
-------------------------------
```

FPGA CONFIG Menu

The system controller CONFIG menu is used to configure the VCU1287 UltraScale FPGA from an SD card (callout 8). One of sixteen bitstreams can be selected for use by the configuration engine by setting a binary encoded value on the system controller mode DIP switch SW13 (see System Controller Configuration DIP Switches) prior to board power up or when the system controller POR pushbutton (SW4) is pressed. The system controller CONFIG menu can also be used to select the SD card bitstream.

```
CONFIG Menu Options

VCU1287 System Controller v1.0

OCEAN CHIPS
Океан Электроники
Поставка электронных компонентов

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «**JONHON**», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «**FORSTAR**».

AVIC JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
