

## High efficiency constant current LED driver for automotive applications

Datasheet - production data

### Features

Max $V_{BATT}$	40	V
Operation supply battery voltage $V_{BATT}$	5.6 - 24	V
Oscillator frequency range	100 - 500	kHz

- Automotive qualified
- Constant current operation
- Current LED settable by external sensing resistor and adjustable via SPI
- Converter switching frequency adjustable by external resistor ( $R_{SF}$ )
- EMC reduction by internal spread spectrum dither oscillator
- Low frequency PWM dimming operation.
- Maximum input current limiter
- Maximum switching duty cycle limiter
- Slope compensation adjustable by external resistor ( $R_9$ )
- Battery overvoltage shut down protection (ext.  $R_3$ ,  $R_4$  resistors required)
- Led chain OV detection (ext.  $R_5$ ,  $R_6$ )
- Multiplexed output for monitoring and control of LED temperature (external NTC resistor required), voltage of LED chain, and low frequency PWM
- SPI communication serial interface transceiver (SDI, SDO, SCK, CSN)

- Regulated output for micro supply  $5\text{ V} \pm 2\%$  -20 mA
- Parameter programming and settings of internal memory registers by the dedicated SPI interface:
  - LED current reference adjusting ( $\pm 66.7\%$ )
  - Maximum input current limiter reference adjusting ( $\pm 55.5\%$ )
  - Random dither frequency sweeping, modulation frequency and deviation percentage
- Power on reset pin output
- ESD protection

### Applications

Automotive day time running light, LED HeadLamps

### Description

L99LD01 is a precise constant current DC-DC converter LED driver for automotive applications, dedicated to the control of high-brightness LED headlights and housed in a LQFP32™ package.

The device is designed to be used in Boost, Buck-Boost and Fly back converter topologies. An internal random dither oscillator works in low frequency modulation, allowing the RF spectrum of the switching frequency to spread so to reduce EMC emissions. The slope compensation ensures good converter loop stability whatever is the duty cycle needed by the application.

The converter is able to work either in full power mode or in low frequency dimming mode.

The device includes an internal low drop voltage regulator, that can be used to supply a microcontroller, and a reset pin, that is useful for resetting the microcontroller at the start up and every time that the regulated output voltage falls down below an established voltage threshold.

20	I <sub>SENSE-</sub>	Negative terminal of the LED sense resistor
21	I <sub>SENSE+</sub>	Positive terminal of the LED sense resistor
22	C5V	Output for 5 V buffer capacitor
23	PGND	Power ground
24	G1	Gate 1 output for external PMOS M1
25	V <sub>CC2</sub>	10 V voltage regulator 2 output (ext. capacitor required)
26	ISN	Negative terminal of the shunt resistor
27	ISP	Positive terminal of the shunt resistor
28	GND1	GND of controller
29	ENABLE	Enable pin
30	VS	Supply voltage input pin
31	SC	Slope compensation setting resistor
32	RSF	Oscillator frequency setting resistor

1. In case of externally supplied microcontroller, attach this pin to its external supply voltage pin.

## 2 Functional description

### 2.1 Operating modes

The device is able to work both with a microcontroller and without it (stand alone configuration).

#### 2.1.1 Operation with an external microcontroller

This way allows parameters to be adjusted and checked by means of the SPI interface.

The adjusted device parameters, stored, i.e., inside the micro EEPROM, can be loaded into device internal registers after the start up phase.

By means of a small 8 pins microcontroller it is possible to implement the following functions:

- Parameters setting:
  - LED current level and maximum input current limit can be adjusted according to the application, the LED characteristic and spreads
  - Dither oscillator parameters as random, frequency modulation and deviation percentage can be programmed
- Flexible PWM operation with duty cycle and frequency managed by the microcontroller
- Diagnostic feedback:
  - Fault condition is sent to the micro when the CSN pin is pulled down
- Advanced LED monitoring:
  - LED voltage drop and temperature are multiplexed and sent to the microcontroller through the dedicated MOUT pin in order to monitor the selected parameter with the A/D of the microcontroller. The multiplexer is driven through a SPI command. This function allows a sophisticated control of the LED status. For example, as an alternative to the default overvoltage detection, it is possible to monitor the LED drop voltage, reduced by the external R5/R6 resistor divider. So taking into account the spread and temperature influence on the LED voltage drop, the microcontroller is able to detect if there is one or more LED shorted. Furthermore, it is possible to monitor the LED chain temperature, by means of the voltage feedback through the dedicated NTC pin. The temperature limit control, operated by the device by default, can be disabled via the SPI and the voltage applied on the NTC pin can be sent back to the microcontroller via the multiplexed output, MOUT, so allowing the microcontroller itself to control the LED chain either acting on the internal current LED register or reducing the low frequency PWM duty cycle.
- In case of  $V_{R1}$  over temperature, its output will be switched off, the device enters in limp home mode and a failsafe bit will be set in the internal status register (see details in the following paragraph). In order to restart the normal operation, so clearing the corresponding status register bit, the  $V_S$  or ENABLE voltage has to be switched off and then on. The mentioned bit can be cleared by the microcontroller only when it is external supplied.

### 2.1.2 Stand alone operation

The device operates with default parameters. The overall tolerance depends on the internal references precision and the external resistors tolerance. In details:

- LED current via external sensing resistor:

$$I_{LED} = 150 \text{ mV}/R_{SENSE}$$

- Maximum input current via an external shunt resistor.
- Oscillator dither effects are set to its default parameters; a low level on the SDI allows disabling the function.
- Low frequency dimming operation is allowed either by PWM pin or by logic level PWM\_L input pin. Connecting the PWM control pin to the supply voltage via a resistor divider, allows the converter to be synchronized to the low frequency PWM generated, i.e., from the smart junction box.
- Connecting the MOUT pin, which by default provides a logic level image of the control input, to the PWM\_L input, it is possible to drive the LED according to the PWM frequency and duty cycle of control. (See application circuit of [Figure 38](#)).
- In case of  $V_{R1}$  over temperature, its output will be permanently switched off. The device still continues to work in normal mode but with  $V_{R1} = \text{OFF}$ .

The L99LD01 can operate in 4 different modes:

- Start-up fail
- Normal mode
- Software limp home
- Limp home

After the power on reset, the device stays in start-up phase until  $V_{CC1}$  reaches a specified threshold,  $V_{CC1\_TH}$ . Then the device enters in normal mode either with microcontroller or standalone, depending on the voltage level on the  $N_{reset}$  pin.

*Note:* The information about the operation with microcontroller or standalone is latched until a new power on reset.

If  $V_{CC1}$  does not reach both  $V_{CC1\_fail}$  and  $V_{CC1\_TH}$  thresholds within a given delay or if a  $V_{CC1}$  over temperature event occurs, the device enters in a corresponding state.

### 2.1.3 Start-up fail

The device enters this mode in case a  $V_{CC1}$  under voltage event occurs during start-up phase and  $V_S < V_{SMIN}$ , provided that a microcontroller is detected. In this case  $V_{CC1}$  is turned off.

If  $V_S$  remains below  $V_{SMIN}$ , then the converter is switched off.

If  $V_S$  rises above  $V_{SMIN}$ , the converter behaves according to the PWM\_L pin.

### 2.1.4 Normal mode

- Normal mode with microcontroller: the device enters this mode after a successful start up ( $V_{CC1} > V_{CC1\_TH}$ ) and a microcontroller is detected. The device keeps this mode as long as the watchdog is retriggered before a timeout event.
- Normal mode in standalone configuration: the device enters this mode if a standalone configuration is detected, independently from  $V_{CC1}$  errors. The L99LD01 keeps this mode even in case of watchdog timeouts.

In both cases, the converter behaves according to the PWM\_L pin.

### 2.1.5 Software limp home

This device enters software limp home mode in case the Lh\_Sw bit is set (see [Section : Control registers 3](#)).

The control registers are set to their default values, with the exception of the Lh\_Sw bit, which remains unchanged.

The converter behaves according to the signal on the LHM pin:

- Turned on if a high signal is detected at the LHM pin
- Turned off if a low signal is detected at the LHM pin

### 2.1.6 Limp home mode

The device enters limp home mode, if a microcontroller is detected, in the following cases:

- Watchdog timeout in normal mode
- $V_{CC1}$  under voltage ( $V_{CC1} < V_{CC1\_TH}$ ) for more than 2 ms in normal mode
- $V_{CC1}$  is below the  $V_{CC1\_FAIL}$  threshold for more than 4 ms during start-up
- $V_{CC1}$  is below  $V_{CC1\_uv}$  for more than 100 ms during start-up and  $V_S$  is above  $V_{SMIN}$  threshold
- Thermal shutdown of  $V_{CC1}$
- SDI stuck at 0 or 1

In Limp Home mode, all the control registers are set to their default values, except Lh\_Sw (see [Section : Control registers 3](#)), which remains unchanged.

The converter behaves according to the voltage level on the LHM pin:

- Turned on if a High signal is detected at the LHM pin
- Turned off if a Low signal is detected at the LHM pin

Depending on the root cause, the action taken to quit the limp home mode (provided that the limp home condition has disappeared) is different. Some of the recovery paths require the microcontroller to be supplied by external supply.

A power on reset is always possible.

Figure 3. Operating modes, main states

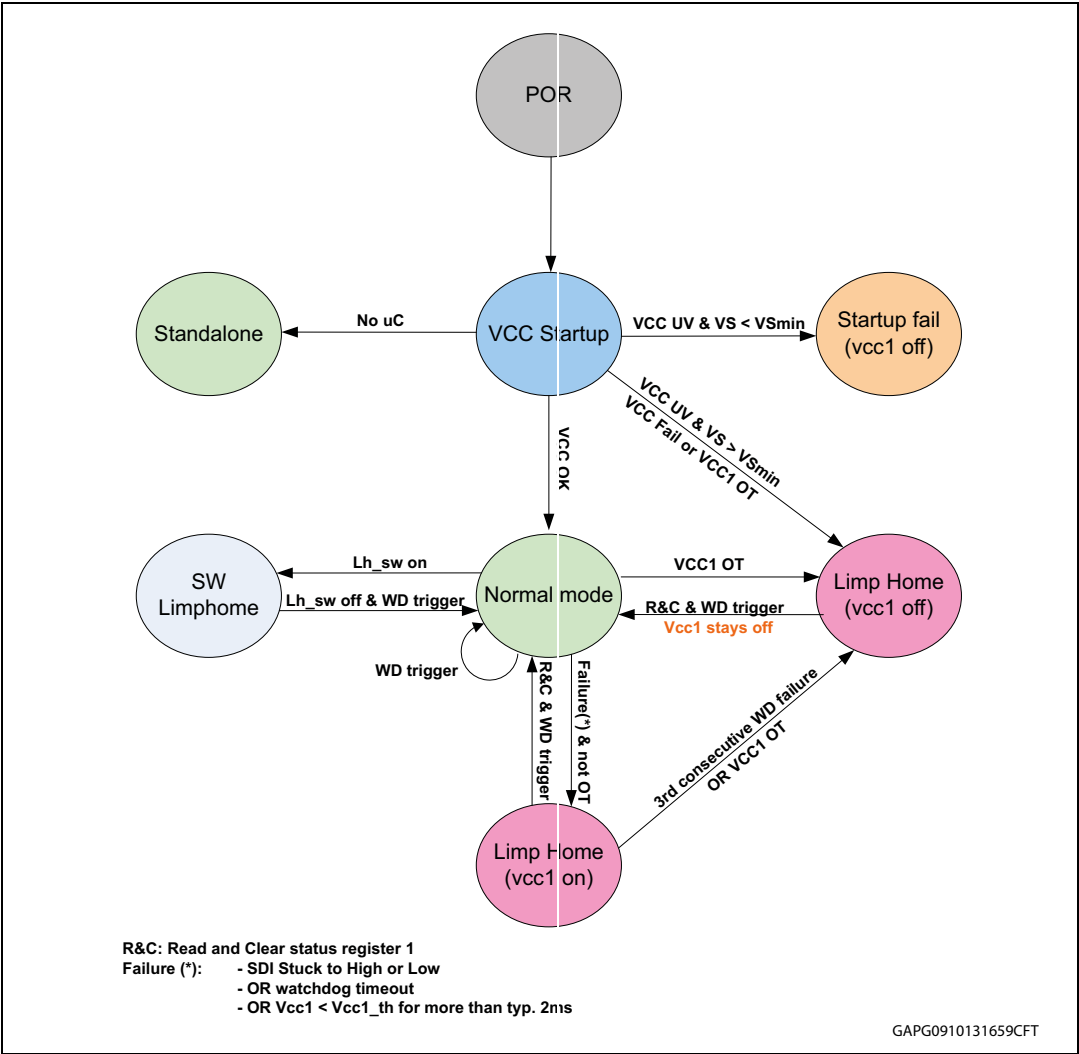

Table 2. Limp home mode: recovery paths

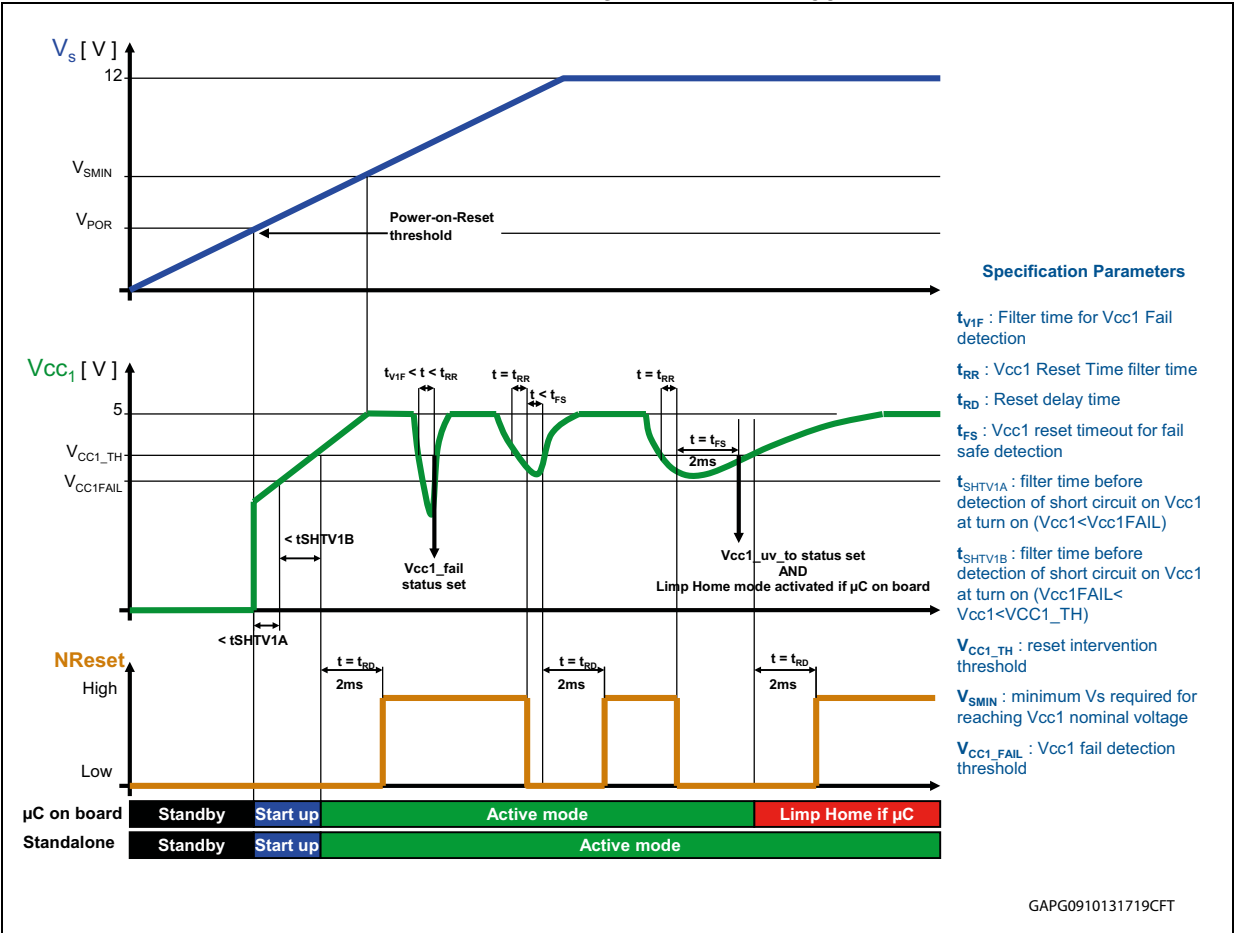

Transition	Root cause	Action to get back to normal mode	Response in the next SPI command
Normal mode → Limp Home V <sub>CC1</sub> on	WD timeout (1 <sup>st</sup> or 2 <sup>nd</sup> WD timeout)	Read and clear status1 AND WD trigger	Fail Safe bit = 0 WD_Fail bit = 0
	V <sub>CC1</sub> < V <sub>CC1_TH</sub> for more than 2 ms		Fail Safe bit = 0 Vcc1_Uv_To bit = 0
	SDI stuck at 0 or 1		Fail Safe bit = 0 SDI_Stuck@ = 0

Table 2. Limp home mode: recovery paths (continued)

Transition	Root cause	Action to get back to normal mode	Response in the next SPI command
Limp home $V_{CC1}$ on $\rightarrow$ limp home $V_{CC1}$ off	3 consecutive WD timeouts (microcontroller is supplied by $V_{CC1}$ )	Power on reset OR toggling of EN pin	Fail Safe bit = 0 WD_Fail bit = 0 Reset bit = 1
	3 consecutive WD timeouts (microcontroller is supplied by another $V_{REG}$ )	Read and clear Status1 AND WD trigger	Fail Safe bit = 0 WD_Fail bit = 0
Start up $\rightarrow$ limp home $V_{CC1}$ off	$V_{CC1} < V_{CC1\_FAIL}$ during start up for more than 4 ms	Power on reset	Failsafe bit = 0 Vcc1_Sc bit = 0 Reset bit = 1
	$V_{CC1} < V_{CC1\_FAIL}$ during start up for more than 4 ms (microcontroller supplied by another $V_{REG}$ )	Read and clear Status1 AND WD trigger OR Toggling of EN pin	Failsafe bit = 0 Vcc1_Sc bit = 0 Vcc1_Fail = 0
	$V_{CC1} < V_{CC1\_TH}$ for more than 100 ms during start up AND $V_S > V_{SMIN}$	Power on reset OR toggling of EN pin	Fail Safe bit = 0 Vcc1_Sc bit = 0 Reset bit = 1
	$V_{CC1} < V_{CC1\_TH}$ for more than 100 ms during start up AND $V_S > V_{SMIN}$ (microcontroller supplied by another $V_{REG}$ )	Read and clear Status1 AND WD trigger	Fail Safe bit = 0 Vcc1_Sc bit = 0
Any state except normal mode standalone $\rightarrow$ limp home $V_{CC1}$ off	$V_{CC1}$ over temperature	Read and clear Status1 AND WD trigger	Fail Safe bit = 0 Vcc1_Ot bit = 0
Normal mode $\rightarrow$ SW limp home	Software limp home is activated	Reset Lh_Sw bit AND WD trigger	Fail Safe bit = 0 Lh_Sw_St = 0

The following [Figure 4](#), [Figure 5](#) (a), (b) and [Figure 6](#) (a) show the behavior of the device and NRES during start-up in case of normal  $V_S$  ramp up or in case of  $V_{CC1}$  failures ( $V_{CC1}$  fail or reset under voltage), both with microcontroller and standalone. [Figure 6](#) (b) and [Figure 7](#) show the behavior at  $V_S$  ramp down fast and slow respectively.

Figure 4. Normal start up vs  $V_S$  ramp up and  $V_{CC1}$  voltage dips

Note: Normal start up with or without microcontroller.

Figure 5.  $V_{CC1\_FAIL}$  or  $V_{CC1}$  reset under voltage ( $V_S > V_{SMIN}$ ) at start up

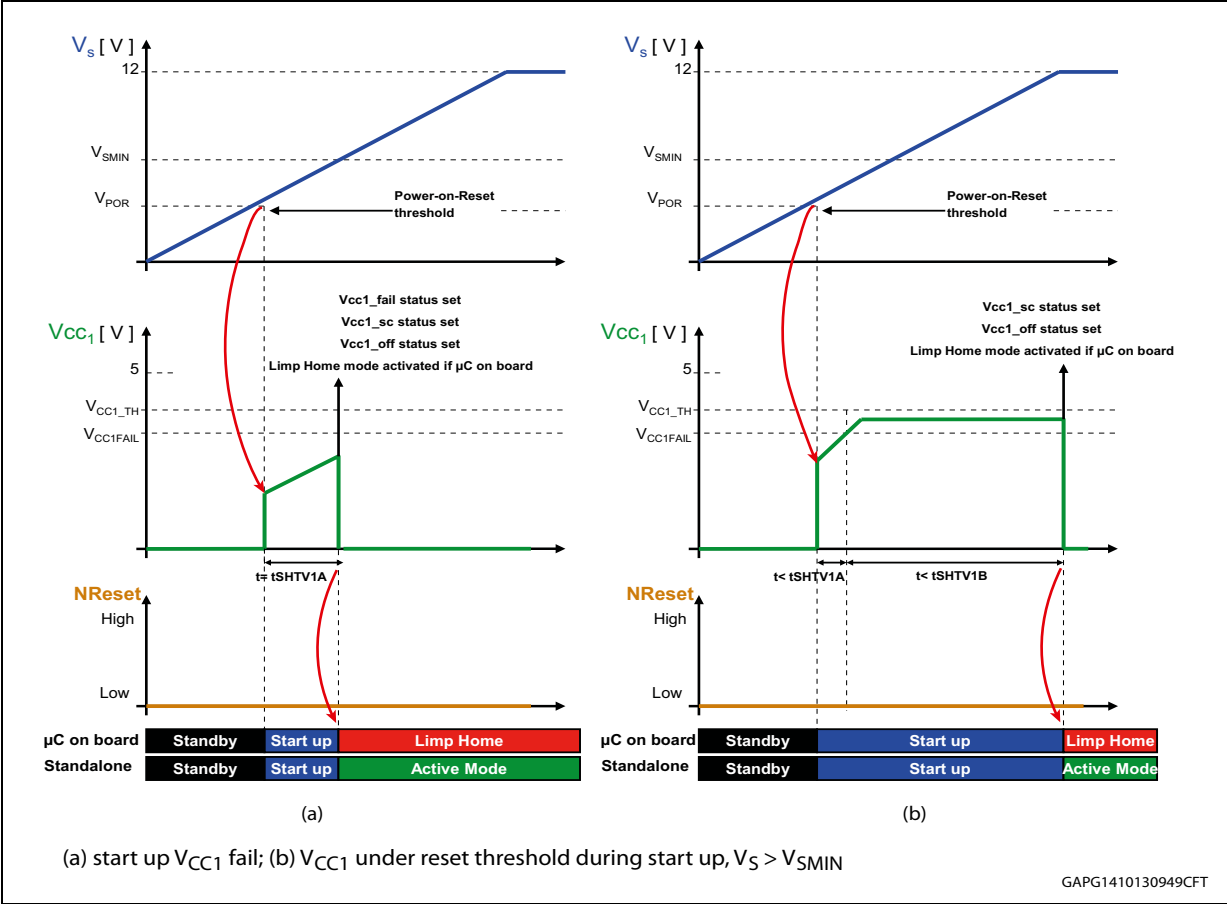

Figure 6.  $V_{CC1}$  reset under voltage at start up ( $V_S < V_{SMIN}$ ) and fast  $V_S$  ramp down

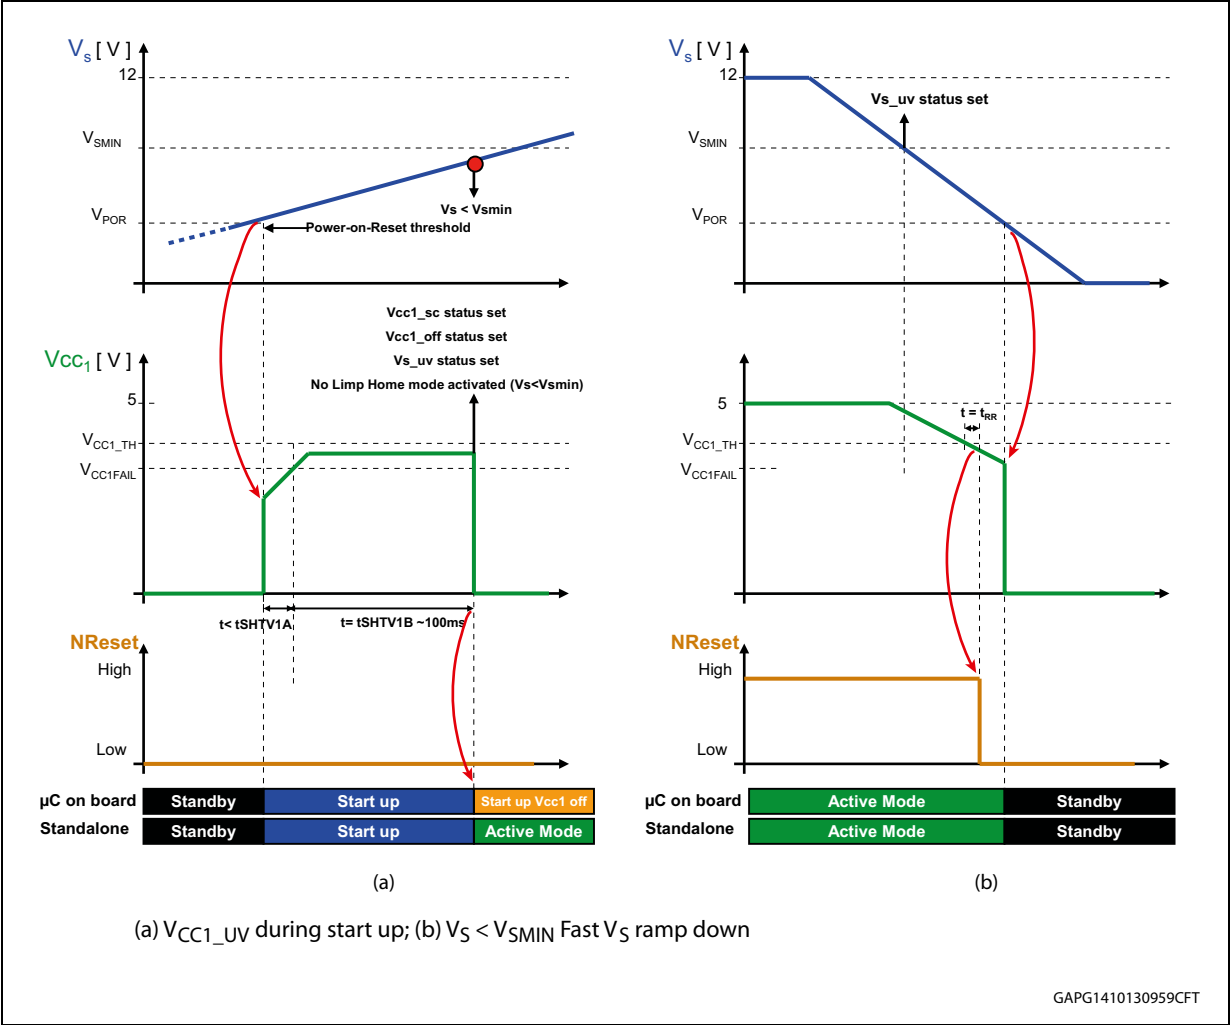

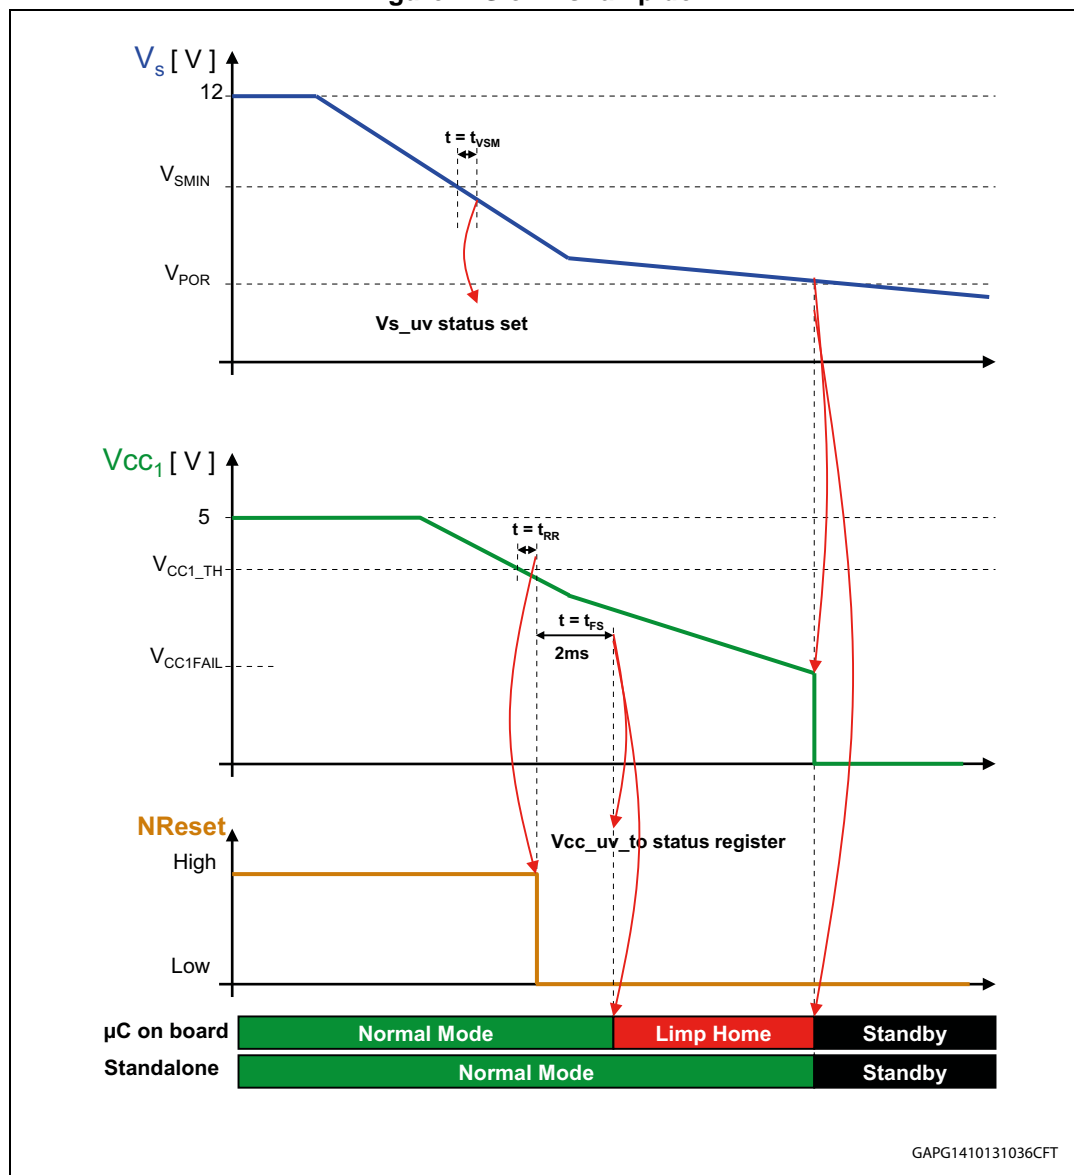

Figure 7. Slow vs ramp down

## 2.2 Protections and functions

### 2.2.1 LED current adjust and temperature control

The LED current can be adjusted within a range of  $\pm 66.7\%$ , with respect to the default value set by the LED current sense resistor, via the SPI input, so allowing the end of line calibration. The LED chain temperature measurement is achieved by means of an external NTC resistor connected between the NTC pin and GND. The NTC resistor is supplied through a resistor connected to the 5 V internal regulator output. As soon as the voltage on the NTC resistor becomes lower than the internal threshold,  $V_{NTC\_TH}$ , (due to an overtemperature in the LED chain) an internal circuitry is activated and the internal LED current reference voltage decreases proportionally, so that the LED current is progressively

reduced (maximum 50 % of the nominal LED current), not allowing the LED temperature to increase over the programmed limit.

Thermal limit intervention is reported by properly setting a bit inside the internal status register.

## 2.2.2 Slope compensation

Slope compensation is needed to ensure the stability of the control loop with all possible values of duty cycle

$$D = \frac{T_{ON}}{T}$$

( $0 < D < 1$ )

especially for duty cycle greater than 0.5. The recommended slope  $S_{ADD}$  of the additional ramp is proportional to the inductor current slope during the turn off phase, that is:

$$S_{ADD} = \alpha \cdot S_L$$

where  $S_{ADD}$  is the additional slope introduced by the circuit,

$$S_L = \left. \frac{dI_L}{dt} \right|_{OFF}$$

is the off-time inductor slope and

$$0.5 < \alpha < 1$$

$S_L$  is also given by the formula:

$$S_L = \frac{G_{LA} \cdot R_{SHUNT} \cdot (V_{OUT} - V_{IN})}{L}$$

Being  $G_{LA}$  the gain of the linear amplifier (see [Chapter 5: Electrical characteristics](#) for  $G_{LA}$  parameter values) and  $R_{SHUNT}$  is the resistor across pin  $I_{SP}$  and  $I_{SN}$  (see [Chapter 7: Application circuits](#)).

The simplified internal circuit structure for the slope compensation is shown in [Figure 8](#).

The additional slope is obtained from the internal oscillator ramp voltage. A fraction of the oscillator voltage ramp is added to the output voltage of the sensing amplifier, which is proportional to the sense resistor voltage drop, and therefore, to the current flowing through power mosfet M1.

The added ramp voltage is

$$V_{ADD} = I \cdot R_{SLOPE}$$

where

$$I = 2 \cdot \frac{V_{OSC}}{R_T}$$

and  $R_{\text{SLOPE}}$  and  $R_T$  are defined in the [Figure 8](#), together with their typical values.

Therefore, will result:

$$V_{ADD} = 2 \cdot V_{OSC} \cdot \frac{R_{SLOPE}}{R_T}$$

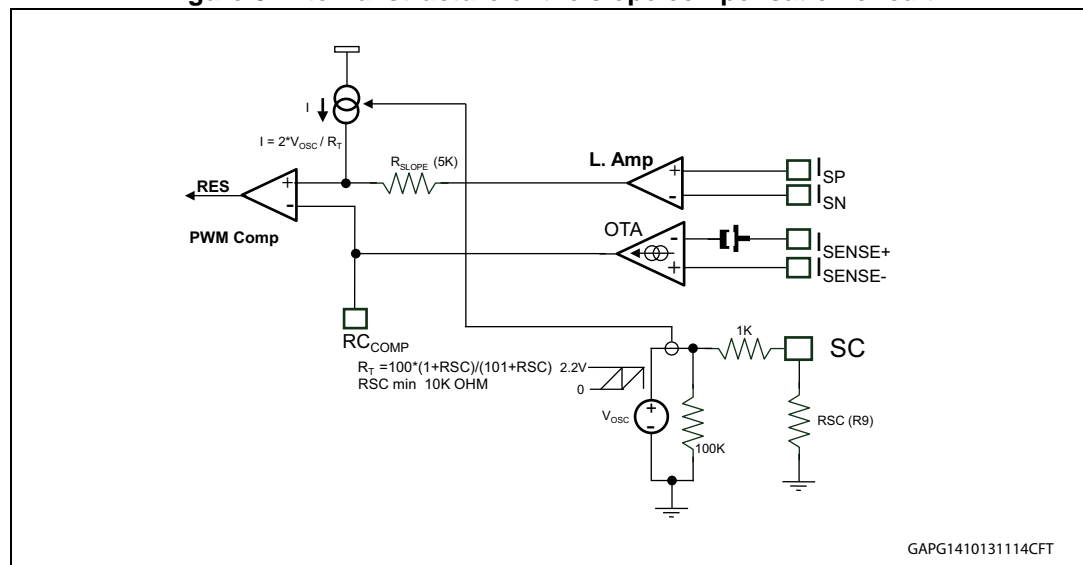

and consequently:

$$S_{\text{ADD}} = \frac{V_{\text{ADD}}}{T} = \frac{2 \cdot V_{\text{OSC}} \cdot R_{\text{SLOPE}}}{R_T \cdot T}$$

where  $T$  is the period of the converter oscillator.

The additional compensating current slope can be simply adjusted by properly setting the value of the external resistor R9 (and consequently  $R_T$ ).

**Figure 8. Internal structure of the slope compensation circuit**

### 2.2.3 LED chain overvoltage detection

Via the external resistor divider (R5, R6) it is possible to detect LED overvoltage events, by programming a threshold for the maximum drop voltage of the LED chain for a specific LED board (see [Section 2.2.12](#) for details). In case Boost or Fly back topology is used, the L<sub>MODE</sub> pin must be connected to GND. In this case the voltage at pin V<sub>LED</sub> will be referred to ground. Instead, if Buck Boost topology is used, the L<sub>MODE</sub> pin must be connected to 5 V or left open. An internal pull up current source keep this pin high, and in this case, the voltage applied by the resistor divider R5/R6 at pin V<sub>LED</sub> will be referred to the battery voltage applied at pin V<sub>S</sub>. If a valid overvoltage event occurs, which is detected if the LED drop voltage reaches a value  $V_{LED} \geq OV\_TH1$ , the device is switched off immediately forcing the

pins G1 and G2 to zero voltage and the event is registered in the status register of the SPI interface and read by the micro.

In case of LED overvoltage, immediately after stopping the device, an internal resistor is applied between pin  $I_{SENSE+}$  and GND through the switch "C\_disch" (see [Figure 1](#)), in order to discharge capacitors C1 and C4, avoiding LED flashing when the converter restarts. Any LED\_OV event will be written in the GSB (Global Status Byte) bit 7 and also in the SR1 (Status Register 1) bit 18.

## 2.2.4 Battery overvoltage shutdown

In case supply voltage applied to the  $V_S$  pin rises above a maximum voltage threshold, sensed by a resistor divider attached at pin INP\_OV, the converter is switched off immediately, forcing outputs pin G1 and G2, to zero voltage. This prevents a LED over current in case of load-dump.

If, following the input overvoltage event, the battery voltage decreases under a second threshold, lower than the former, the converter starts again.

## 2.2.5 Regulators thermal shut down

Both voltage regulators inside the chip are provided with over temperature detection circuits.

If  $V_{R1}$  reaches its maximum temperature,  $V_{R1}$  will be switched off. After that, the behavior of the device depends on the application (see [Section 2.2.1: LED current adjust and temperature control](#)).

If instead, is  $V_{R2}$  to reach its maximum temperature (typ 175 °C), then the device will be completely switched off ( $V_{CC1}$  and  $V_{CC2} = 0$ ).

Only the internal temperature monitoring of  $V_{CC2}$  remains alive and when the temperature falls down under a second lower temperature threshold (150 °C typ.), the device tries to restart again.

## 2.2.6 Reset

The NRES pin (active low), generates a reset signal for the microcontroller.

An external pull up resistor (typ. 100 k) maintain normally high the voltage at pin NRES (see [Figure 32](#)).

Following a power up condition, the NRES pin is forced low while the voltage provided by regulator 1 ( $V_{CC1}$ ) is below an internal fixed threshold  $V_{CC1\_TH}$  of typ 4.5 V. After  $V_{CC1}$  has reached the above mentioned internal threshold, NRES voltage is kept low for a fixed default time of 2 ms; after that, the NRES pin will be released reaching the normal high state. However, this time can be externally extended by an additional capacitance connected between NRES and GND (see C6 in the application circuits), which is charged by the external pull-up. Depending on the reset-input-threshold of the  $\mu P$  ( $U_{TR}$ ), the required capacitance for a typical  $T_{RD}$  can be calculated as follows:

$$C6 = -T_{RD} / (R_{PU} \cdot \lg(1 - U_{TR}/V_{CC1}))$$

$R_{PU}$  is the pull up resistor (value in ohm)

In case  $V_{CC1}$  voltage drops below the internal threshold during the normal functioning, or when the device is put in standby, the NRES pin is forced to low, but after a time interval  $T_{RR}$  has expired and kept low until the  $V_{CC1}$  has gone back again to the internal threshold (see [Figure 4](#) for more details).

### 2.2.7 Watchdog

In case the application uses a microcontroller, during the device power-up a reset pulse is generated periodically every 200 ms (default) for 2.0 ms waiting for microcontroller acknowledgment. Timeout window is selectable by SPI (100 ms or 200 ms) and the reset time could be extended by the external capacitor C6.

- Timeout WD is refreshed by bit toggling.
- After the 1<sup>st</sup> WD timeout, a reset pulse is generated and the device enters in Limp Home mode. After the second WD timeout, another reset pulse cycle is generated, waiting for microcontroller response.
- After 3 consecutive reset cycles without WD refresh, which means that microcontroller is not responding, the voltage regulator,  $V_{CC1}$ , is turned off and the device keeps working in “Limp Home Mode” (see [Figure 33](#)). Safety critical functions like Low Beam application require the LED Driver to be turned on if the microcontroller fails, while in case of high beam application, it is required the driver to be switched off in case of microcontroller failure. As a consequence, the device operates according to the state of LHM pin which is enabled during the recognition of the microcontroller failure. In particular, if LHM pin is kept low the device will be always OFF. If instead, LHM pin is high or left open, the device will be switched permanently ON, regardless of the status of PWM\_L pin. If the application doesn't use a microcontroller (stand alone operation), the start-up WD control must to be deactivated. This can be done by connecting NRES pin to the battery supply voltage  $V_S$ . In such a case the driver will operate in normal mode as above mentioned (see stand alone operation).

### 2.2.8 Standby and wake up by ENABLE pin

A low consumption mode is required in case of applications directly connected to the battery.

The device enters in standby mode, that is the default operating modes because of an internal pull down, in case of low level signal at the ENABLE pin and it wakes up in case of high level signal. During standby mode,  $V_{CC1}$  and  $V_{CC2}$  are switched off. [Figure 9](#) and [Figure 10](#) show two possible application schematics in case of direct connection to the battery.

In case of [Figure 9](#) the microcontroller of the application goes in standby when the microcontroller sets the LIN transceiver in standby mode: NSLP = Low → INH goes Low → the DRL driver goes in standby.

The application is waken up from the standby when a wake up source is detected by the LIN transceiver. That means INH goes high and so ENABLE, then the DRL driver restarts and consequently  $V_{CC1}$  is activated and supplies the microcontroller.

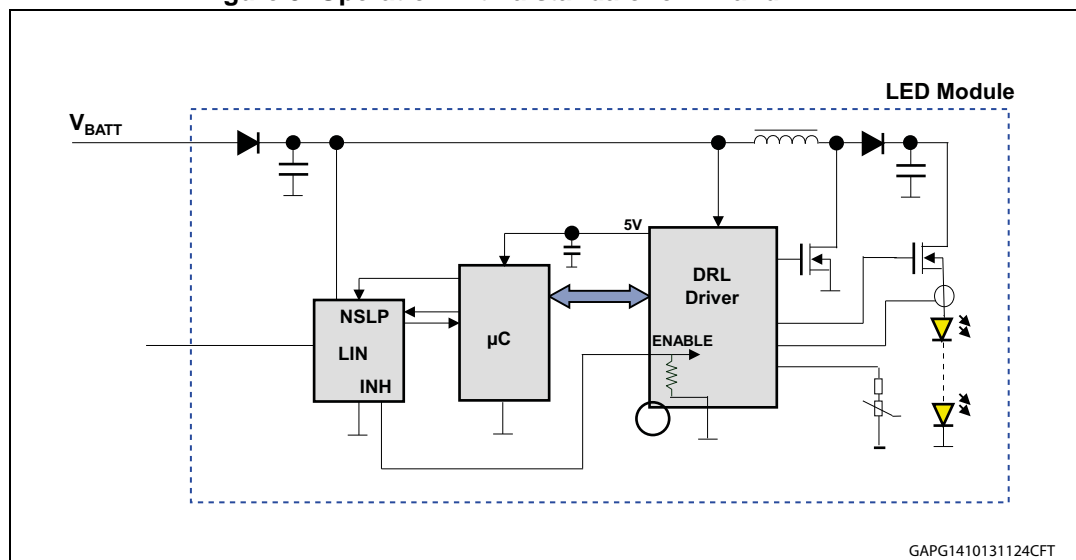

In case of [Figure 10](#), a power management device is present, which supplies the microcontroller. Normally the inverted FSO signal coming from the power management device is high. This output is inverted by an external logic and applied to one of the two input OR diodes and therefore, at the input of the OR the voltage is normally at logical zero.

So in this case the LED driver goes:

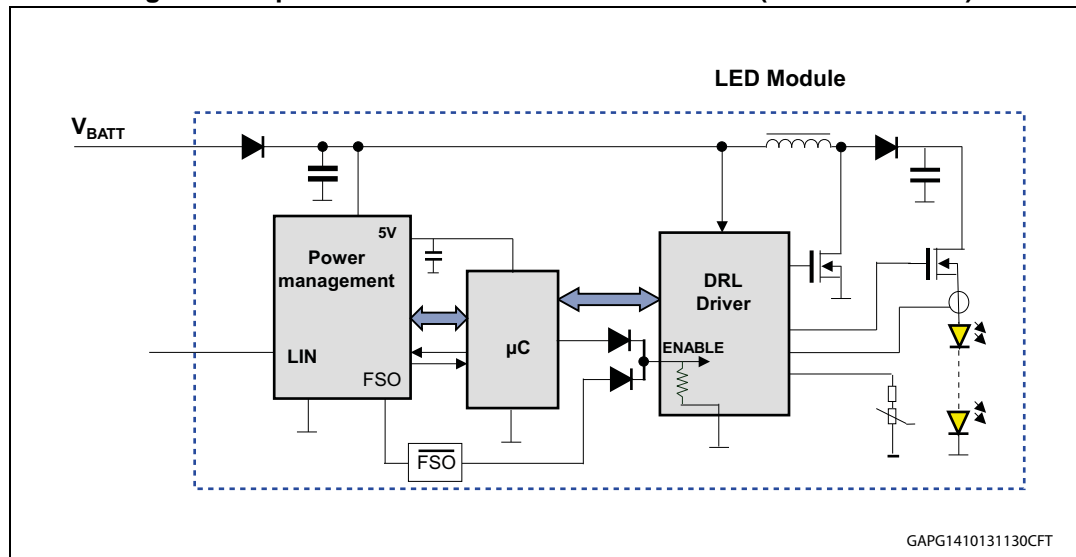

- In stand-by mode with a low level on ENABLE pin operated by the microcontroller
- In normal mode with a high level on ENABLE pin operated by the microcontroller

The inverted FSO signal, coming from the power management device ensures, putting through the inverter and the external OR diode ENABLE pin high, that the LED driver correctly restarts even if the microcontroller fails.

**Figure 9. Operation with a standalone LIN and ENABLE**

**Figure 10. Operation with PM device and ENABLE (FSO active Low)**

1. An inverter network is required.

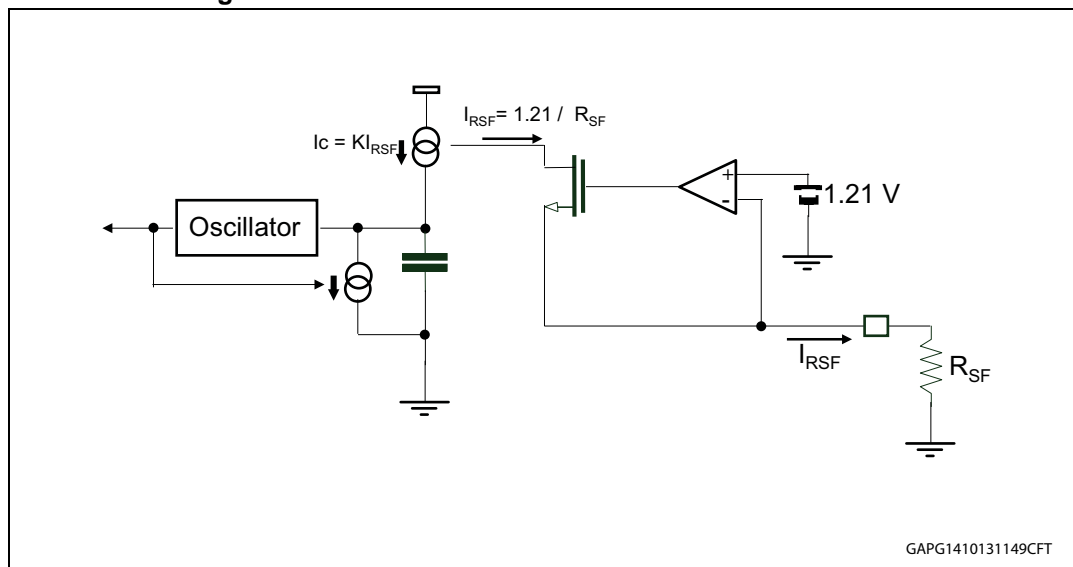

## 2.2.9 Frequency setting and dither effect

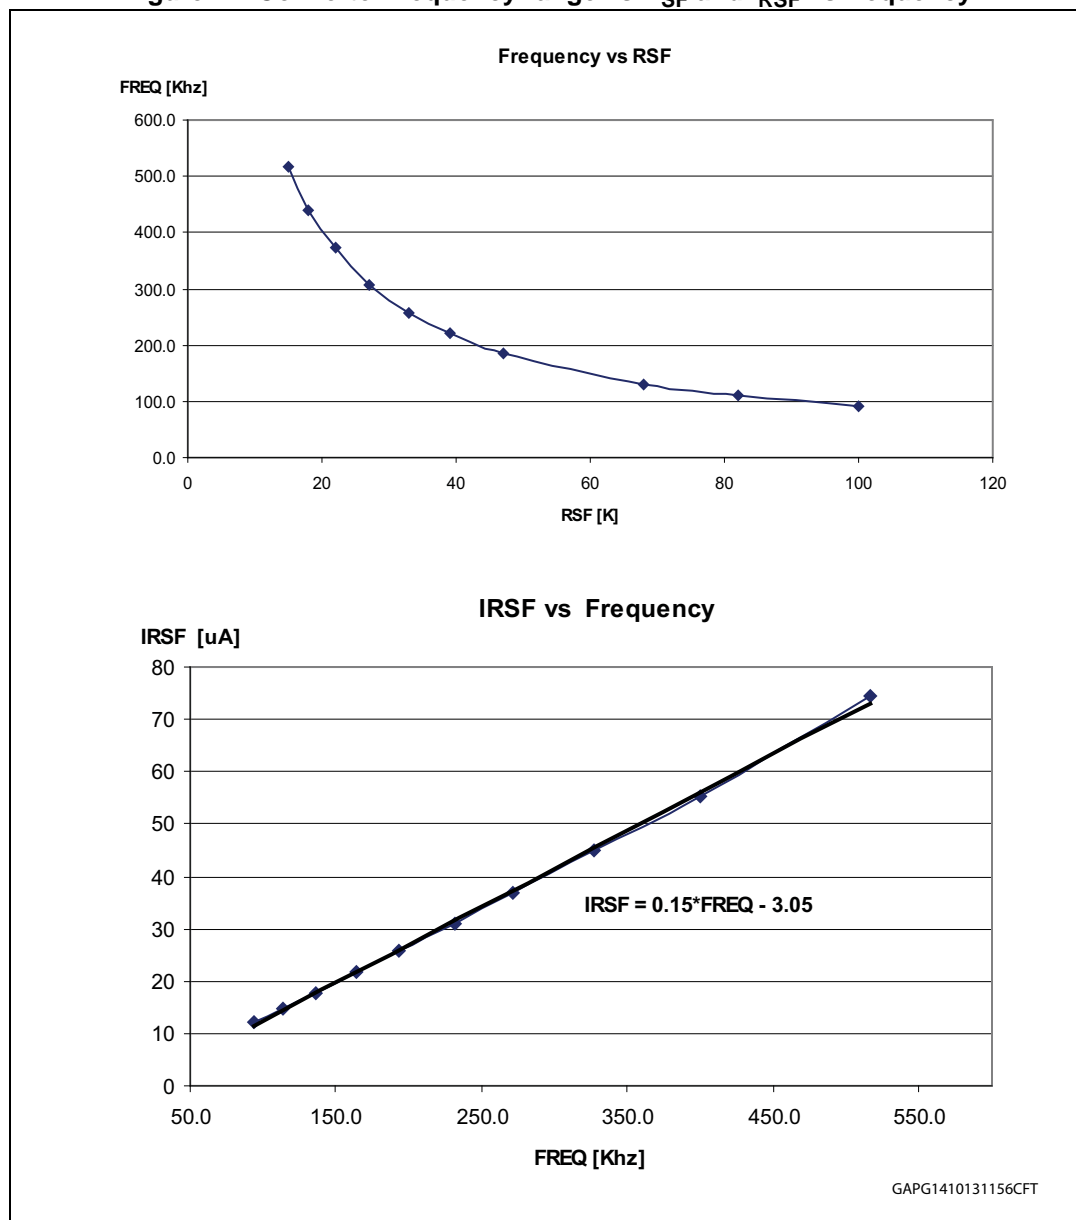

The internal main converter oscillator structure is reported in [Figure 11](#).

The external resistor applied between pin  $R_{SF}$  and ground is setting the converter working frequency. The voltage applied on pin  $R_{SF}$  is the internal reference reported by the source follower structure which is a constant voltage of 1.21 V. The converter frequency is directly related to the current flowing through the  $R_{SF}$  pin. [Figure 12](#) reports the behavior of frequency converter as function of the external resistor  $R_{SF}$  and  $I_{RSF}$  as function of converter frequency. As above mentioned the converter oscillator spread parameters (dither effect) are adjustable via SPI.

Dither effect is disabled by default during standalone operation, but it is possible enabling it simply connecting the SDI pin to 5 V voltage.

**Figure 11. Internal structure of main converter oscillator**

**Figure 12. Converter frequency range vs  $R_{SF}$  and  $I_{RSF}$  vs frequency**

### 2.2.10 Start up LED overvoltage management

The following diagram shows the purpose of delay time windows “ $t_{DStart}$ ” and “ $t_{EnRecov}$ ”.

The first delay window  $t_{DStart}$  has been thought to ensure an initial time period for charging the external buffer capacitor of the charge pump C9. When  $V_S$  is below  $V_{SMIN}$ , the LED overvoltage recovery bit is set. During this time interval, triggered as soon as the battery voltage  $V_S$  overcomes  $V_{SMIN}$  threshold, the converter remain in a stop condition, independently from PWM\_L. When the  $t_{DStart}$  is elapsed (typ. 5 ms), the converter is released and behaves according to the PWM\_L signal provided, that no failure occurs.

If no LED overvoltage comes during the 2<sup>nd</sup> time interval  $t_{EnRecov}$ , LED ov recovery bit is reset.

If a LED overvoltage failure occurs afterwards, the failure will be latched and the converter is stopped until a read and clear of the status register 1.

Note that during  $t_{DStart}$ , the converter is stopped to enable the buffer capacitor C9 to charge at a sufficient voltage to correctly drive the mosfet M2. This delay prevents the converter to turn on, while M2 stays off, avoiding a LED overvoltage event.

If the application uses a big capacitor<sup>(a)</sup>, it is recommended to keep the PWM\_L signal low after a power on reset or after a  $V_S$  under voltage, until C9 is totally charged, to avoid a LED overvoltage. [Figure 13](#) shows the device behavior in case of no LED overvoltage failure, after  $t_{DStart}$ .

If C9, after  $t_{DStart}$  time, should be not enough charged to allow correct driving operation, a possible LED overvoltage will appear when, the converter will be released. [Figure 14](#) shows what happens in this case.

After  $t_{DStart}$ , the converter is released while the C9 capacitor is only partially charged. Consequently,  $V_{LED}$  increases up to LED OV\_TH1 and a LED overvoltage event is detected during the  $t_{EnRecov}$  phase. The LED\_Ov\_Rec bit is not reset at the end of the  $t_{EnRecov}$  phase due to the LED overvoltage event. The discharge path is activated until  $V_{LED}$  crosses LED OV\_TH2. Then, the LED\_Ov\_Rec bit is reset, the converter is released, and the buffer capacitor C9 is now fully charged, enabling the dimming mosfet M2 to turn on.

[Figure 15](#) shows the case of LED\_Ov\_Rec bit during a start up with a rising edge on PWM\_L = High after the expiration of  $t_{DStart}$ . In this case, the  $t_{EnRecov}$  phase starts only when the PWM\_L signal goes High. [Figure 16](#) shows the case of LED overvoltage event, which could appear during normal functioning.

The LED overvoltage status bit is set (latched) and the discharge path is activated until  $V_{LED}$  crosses LED OV\_TH2. The converter is stopped, independently from PWM\_L, until a read and clear command of the status register 1 (LED\_Ov\_Rec bit is reset).

If a LED overvoltage failure event occurs during  $V_S$  overvoltage, (battery OV), the discharge path for the output capacitor is inhibited and the LED overvoltage status bit is not set.

When the  $V_S$  overvoltage event disappears, ( $V_S$  crosses  $V_S$  OV\_TH2), the LED overvoltage status bit is set (latched) and the discharge path is activated until  $V_{LED}$  crosses LED OV\_TH2. The converter is stopped, independently from PWM\_L, until the LED ov status bit is cleared (read and clear of the status register 1). [Figure 17](#) shows such a case.

Finally [Figure 18](#) shows how will be managed the LED\_Ov\_Rec bit in case signal PWM\_L has a low on-time. In this case the LED\_Ov\_Rec bit is reset when the cumulated running time of  $t_{EnRecov}$  exceeds typ. 5 ms. This feature enables a single recovery of a LED overvoltage event, due to a too fast regulation loop (set by the resistor and capacitor connected to RCCOMP pin), even in PWM operation with low on-time. However, a proper choice of RC network values, avoiding fast transients on the LED string voltage, when the converter is switched ON, it is carefully recommended

### 2.2.11 Programming the over/under voltage threshold

The voltage across the LED string is continuously sensed by the external resistor divider R5/R6 and reported inside the chip through the apposite pin  $V_{LED}$ . Considering negligible the voltage drop due to the sense resistor and the  $V_{DS}$  of external mosfet M2 respect to the LED

voltage string, according to the equation reported below, the LED overvoltage thresholds are given by the following formulas:

$$V_{LED\_OV} = OV\_TH1 / K_L; \text{ being } K_L = R_6 / (R_5 + R_6);$$

OV\_TH1 is the reference for the OV internal comparator. Typical value for OV\_TH1 is 3.5 V.

LED OV event makes the converter and also mosfet M2 immediately switched OFF, in order to prevent any damage to the LED string or to the driver. Furthermore, following an OV event, the LED\_OV status register is set and an internal load is applied between I<sub>SENSE+</sub> pin and ground in order to fast discharge the voltage across capacitor C4.

In the boost topology application, if a short circuit between the source of external mosfet M2 and GND occurs, an uncontrolled current could flow. In order to avoid this situation, a maximum LED current protection has been inserted, which continuously monitors the voltage across the sense resistor R<sub>SENSE</sub>. If this voltage reaches a value in excess of an internal fixed threshold of (see [Table 24](#) - LED over current protection threshold parameter), the status bit LED\_OC (led over current) is set and the converter and also mosfet M2 will be immediately switched OFF.

Following a stop of the converter due to an OV event, the device can not be restarted before of C4 discharge (V<sub>LED</sub> is below OV\_TH2).

After an OV event, the converter could restart if a read and clear command of the LED\_OV status bit is done. [Table 3](#) summarizes the suggested value of K<sub>L</sub> resistor ratio, supposing to have a LED\_OV event, when the voltage across LED string, reaches a value in excess of 50 % of its nominal value.

**Figure 19. LED chain overvoltage thresholds settings. An example for boost and fly back converters**

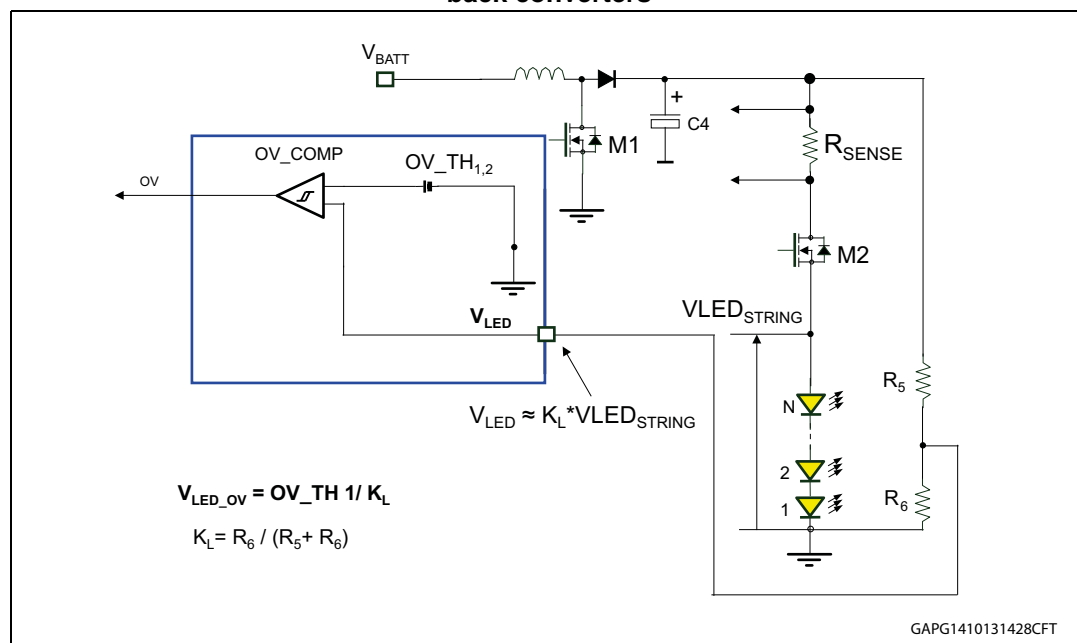

Table 3. Suggested  $K_L$  value and overvoltage thresholds

N Number of LED	$K_L$	LED CHAIN nominal DROP $N \cdot V_F$ [V]	overvoltage $V_{LED\_OV}$ [V]
1 <sup>(1)</sup>	0.583	4	6
2 <sup>(1)</sup>	0.292	8	12
3 <sup>(1)</sup>	0.194	12	18
4 <sup>(1)</sup>	0.146	16	24
5	0.117	20	30
6	0.097	24	36
7	0.083	28	42
8	0.073	32	48
9	0.065	36	54 <sup>(2)</sup>
10	0.0583	40	60 <sup>(2)</sup>

1. Not Applicable on boost converter topology, since the chain LED Drop must be always larger as the maximum battery voltage.
2. Theoretical value; effective value will be clamped to 52 V (typ) by the OV protection.

### 2.2.12 Input overvoltage programming

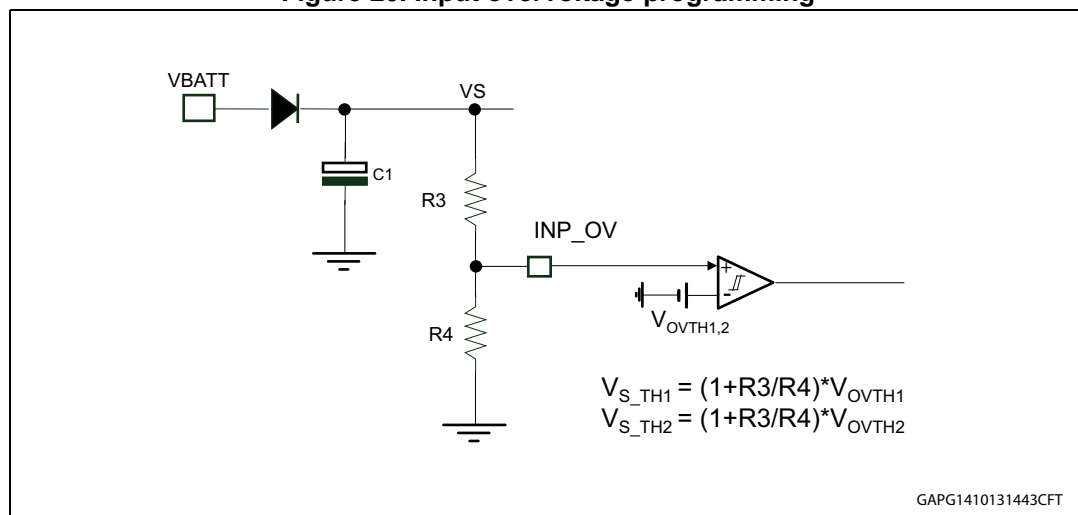

Supply overvoltage is programmed by the external partition ratio  $K_I = R3/R4$

According to the [Figure 20](#) input overvoltage thresholds depend on the internal reference voltages  $V_{OVTH1}$  and  $V_{OVTH2}$  (being  $V_{OVTH2} < V_{OVTH1}$ )

Typical values of these internally generated references are 3.5 V and 3 V.

When the Battery voltage reaches a value in excess to  $V_{S\_TH1}$  the converter is immediately stopped. When the battery voltage, going down, reaches a value just lower to  $V_{S\_TH2}$ , the converter restarts again.

Figure 20. Input overvoltage programming

As an example, if we want  $V_{S\_TH1} = 20\text{ V}$ , according to the formula of [Figure 20](#),  $R3/R4$  will result equal to 4.7 and consequently the deactivation threshold  $V_{S\_TH2}$  will result  $\sim 17\text{ V}$ .<sup>(b)</sup>

---

b. Notice that the deactivation threshold must be always greater than the maximum allowed battery value in normal conditions.

### 3 SPI functional description

#### 3.1 Serial peripheral interface (ST SPI standard)

The SPI communication is based on a standard ST-SPI 24-bit interface, using CSN, SDI, SDO and SCK signal lines.

Input data are shifted into SDI, MSB first while output data are shifted out on SDO, MSB first.

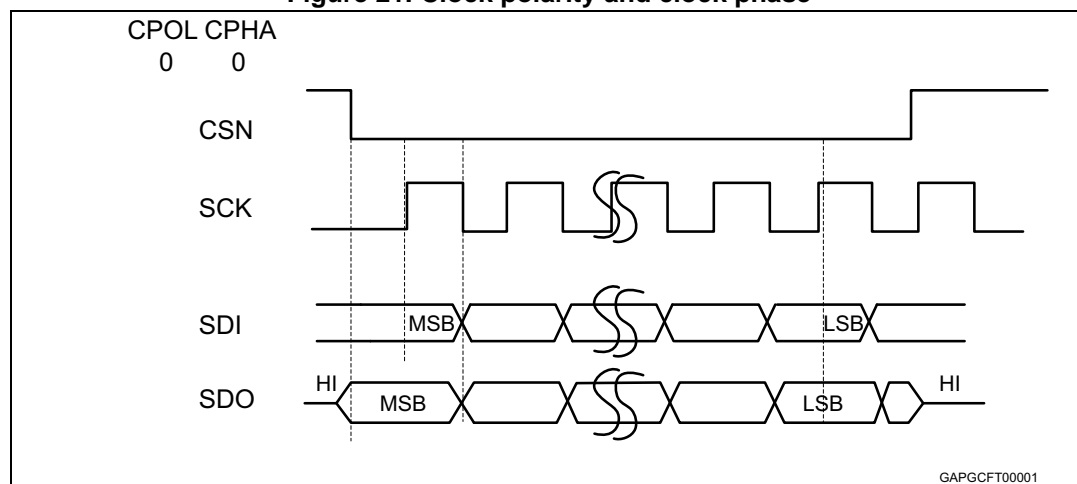

During active mode, the SPI:

- Triggers the watchdog
- Controls the modes and status of all internal modules (incl. input and output drivers)
- Provides driver output diagnostic
- Provides device diagnostic (incl. over temperature warning, device operation status)

*Note: During standby modes, the SPI is generally deactivated.*

The SPI can be driven by a microcontroller with its SPI peripheral running in following mode:

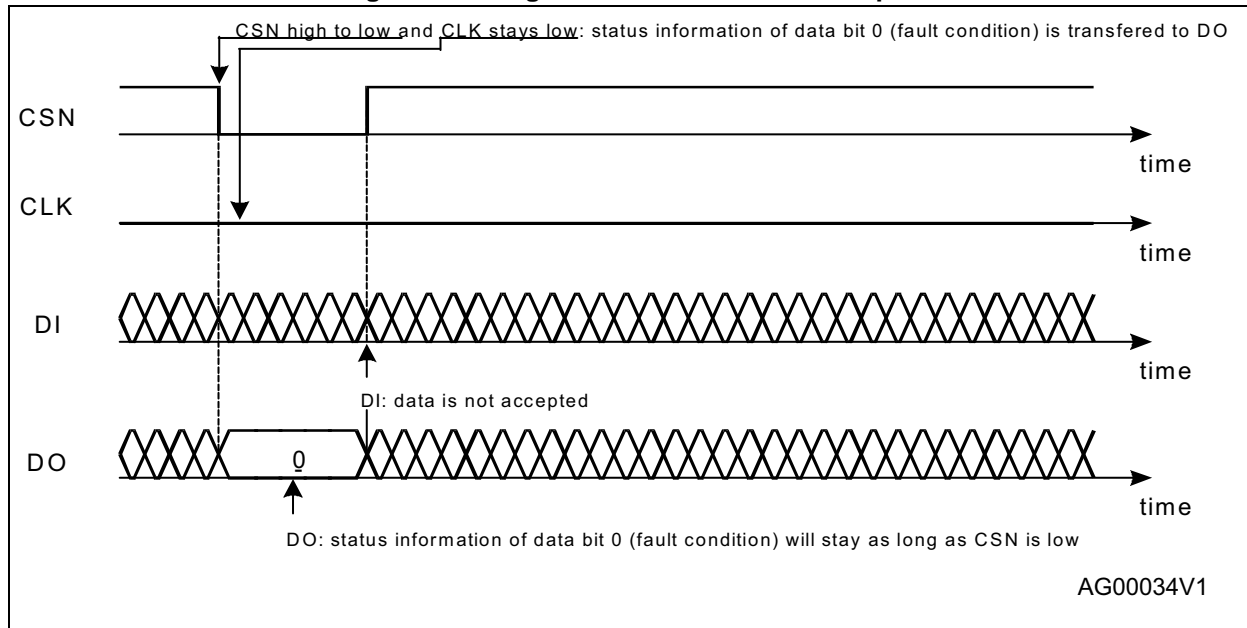

**Figure 21. Clock polarity and clock phase**

According to the standard, a generic input bit is sampled by the low to high transition of the clock CLK and a generic output bit changes synchronously to the high to low transition of CLK.

This device is not limited to micro controller through a built-in SPI. Only three CMOS-compatible output pins and one input pin will be needed to communicate with the device. A fault condition can be detected by setting CSN low. If CSN = 0, the DO pin will reflect the global error flag (fault condition) of the device (see [Figure 22](#)). This operation does not cause a communication error bit in the global status byte to be set.

Figure 22. SPI global error information output

## 3.2 Signal description

- **Serial Clock (SCK):** this input signal provides the timing of the serial interface. Data present at Serial Data Input (SDI) is latched on the rising edge of Serial Clock (SCK). Data on Serial Data Out (SDO) is shifted out at the falling edge of Serial Clock (SCK).
- **Serial Data Input (SDI):** This input is used to transfer data serially into the device. It receives the data to be written. Values are latched on the rising edge of Serial Clock (SCK).
- **Serial Data Output (SDO):** this output signal is used to transfer data serially out of the device. Data is shifted out on the falling edge of Serial Clock (SCK). SDO also reflects the status of the <Global Error Flag> (Bit 7 of the <Global Status Register>) while CSN is low and no clock signal is present
- **Chip Select Not (CSN):** when this input signal is High, the device is deselected and Serial Data Output (SDO) is high impedance. Driving this input Low enables the communication. The communication must start and stop on a Low level of Serial Clock (SCK).

## 3.3 SPI protocol

### 3.3.1 SDI, SDO format

SDI format during each communication frame starts with a command byte.

It begins with two bits of operating code (OC0, OC1) which specify the type of operation (read, write, read and clear status, read device information) and is followed by a 6 bit address (A0:A5). The command byte is followed by an input data byte (D0:D15).

At the beginning of each communication the master device read the contents of the <SPI-frame-ID> register (ROM address 3Eh) of the slave device. This 8 bit register indicates the SPI frame length (24 bit) and the availability of additional features.

Each communication frame consists of a command byte which is followed by 2 data bytes.

The data returned on SDO within the same frame always starts with the <Global Status Byte>. It provides general status information about the device. It is followed by 2 data bytes (i.e. "in-frame-response").

For write cycles the <Global Status Byte> is followed by the previous content of the addressed register.

**Table 4. Command byte (8 bit)**

Bit	23	22	21	20	19	18	17	16
Name	OC1	OC0	A5	A4	A3	A2	A1	A0

**Table 5. Input data byte**

Bit	Data Byte 1								Data Byte 0							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

SDO format during each communication frame starts with a specific byte called Global Status Byte (see [Section 3.3.2](#)). This byte is followed by two output data byte (D0:D7, D8:D15).

**Table 6. Global status byte**

Bit	23	22	21	20	19	18	17	16
Name	GEF	Comm_Err	Not (chip reset or Comm_Error)	LED overload	Temp. warning	Overvoltage	V <sub>CC1</sub> Error	Fail safe

**Table 7. Output data byte**

Bit	Data Byte 1								Data Byte 0							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Name	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

### 3.3.2 Global status byte description

The data shifted out on SDO during each communication starts with a specific byte called Global Status Byte. This one is used to inform the microcontroller about global faults which can be happened on the channel part (like thermal warning, OVL,...) or on the SPI interface (like communication error,...). This specific register has the following format.

Table 8. Global status byte

Bit	Name	Description
23	Global Error Flag (GEF)	This bit is an OR combination of the remaining bits of the register OR (Vs_uv) OR (Lmode_err)
22	Comm_Err	The right number of SPI clocks within any valid spi command is 24. If not, then this bit is set to '1'. This bit goes to '0' automatically after any valid spi command
21	Not (Chip reset OR Comm Err)	After a POR phase this bit is active ('0'). It becomes inactive ('1') after the first valid spi command, provided that any communication error occurs.
20	LED Overload	This bit is set when an LED overcurrent event is detected
19	Temp. warning	Temperature Warning for the LED
18	Overvoltage	LED chain overvoltage or Vs overvoltage via INP_OV (Led_Ov OR Vs_Overvoltage)
17	V <sub>CC1</sub> Error	This bit is an OR combination of all the errors related to V <sub>CC1</sub>
16	Fail Safe	This bit is set if the device is in a limp home mode (Data In stuck at '0' or '1', watchdog time out, software limp home), V <sub>CC1</sub> undervoltage for more than 2 ms in active mode.

### 3.3.3 Operating code definition

The SPI interface features four different addressing modes which are listed in [Table 10](#).

Table 9. Operation code definition

OC1	OC0	Meaning
0	0	Write operation
0	1	Read operation
1	0	Read and clear status operation
1	1	Read device information

The <Write Mode> and <Read Mode> operations allow access to the RAM of the device.

A <Read and Clear Mode> operation is used to read a status register and subsequently clears its content.

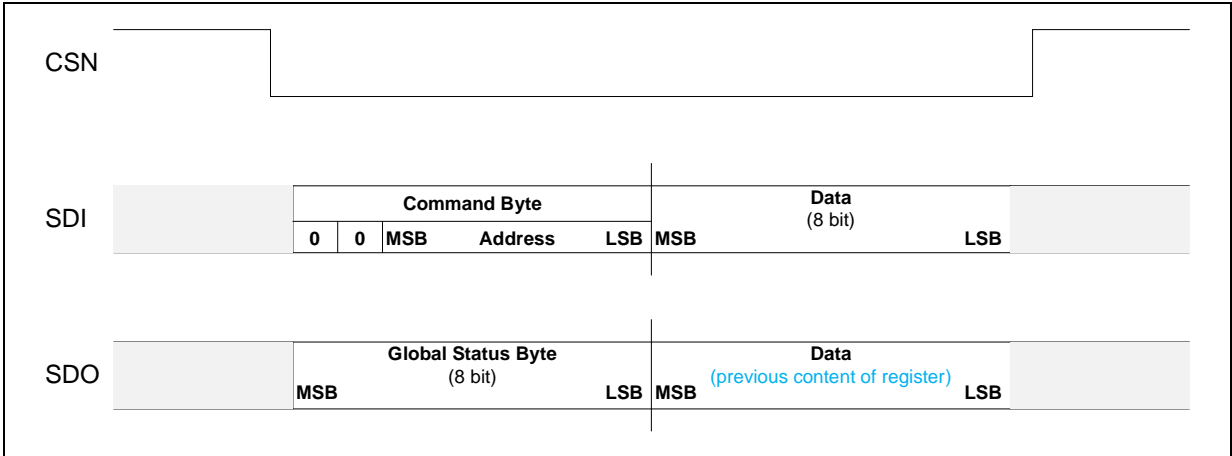

The <Read Device Information> allows access to the ROM area which contains device related information such as <ID-Header>, <Product Code>, <Silicon Version> and <SPI-frame-ID>.

#### Write mode

The write mode of the device allows writing the content of the input data byte into the addressed register. Incoming data are sampled on the rising edge of the serial clock (SCK), MSB first.

During the same sequence outgoing data are shifted out MSB first on the falling edge of the CSN pin and subsequent bits on the falling edge of the serial clock (SCK). The first byte corresponds to the Global Status Byte and the second to the previous content of the addressed register.

Figure 23. SPI write operation

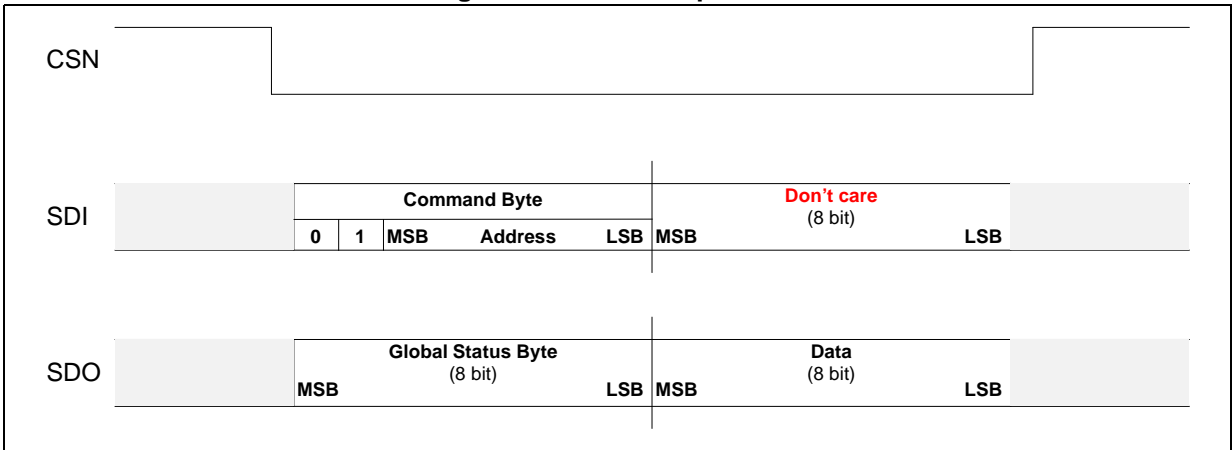

### Read mode

The read mode of the device allows to read and to check the state of any register. Incoming data are sampled on the rising edge of the serial clock (SCK), MSB first. Outgoing data are shifted out MSB first on the falling edge of the CSN pin and others on the falling edge of the serial clock (SCK). The first byte corresponds to the Global Status Byte and the second to the content of the addressed register. In case of a read mode on an unused address, the 'global status/error' byte on the SDO pin is following by 00H byte.

In order to avoid inconsistency between the Global status byte and the status register, the status register contents are frozen during SPI communication.

Figure 24. SPI read operation

### Read and clear status command

The read and clear status operation is used to clear the content of the addressed status register (see [Section : Status registers 1](#)). A read and clear status operation with address

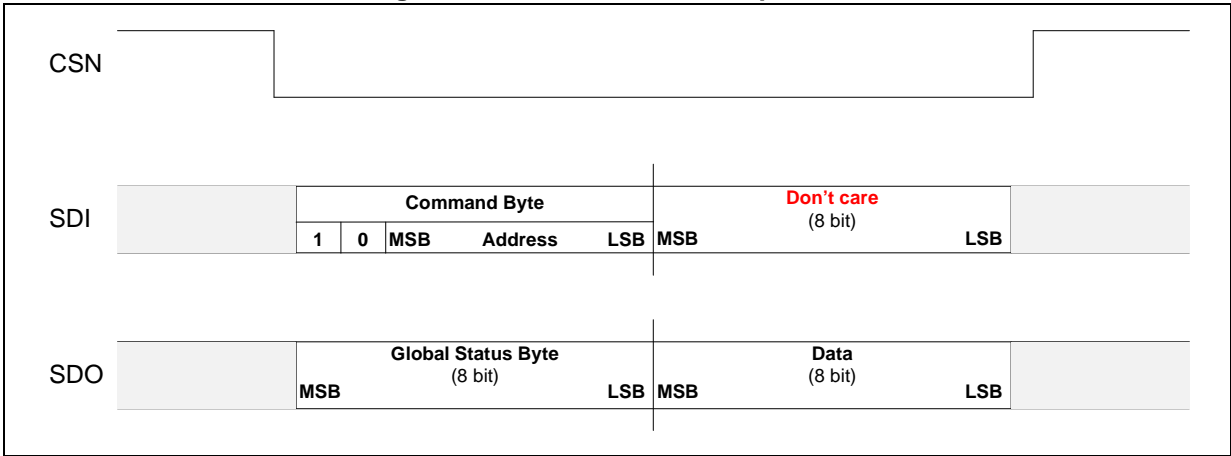

3Fh clears all status registers simultaneously and reads back the configuration register (GLOBCTR).

Incoming data are sampled on the rising edge of the serial clock (SCK), MSB first. The command byte allows to determine which register content is read then erased while the data byte is 'don't care'.

Outgoing data are shifted out MSB first on the falling edge of the CSN pin and others on the falling edge of the serial clock (SCK). The first byte corresponds to the Global Status byte and the second to the content of the addressed register.

In order to avoid inconsistency between the Global status byte and the status register, the status register contents are frozen during SPI communication.

Figure 25. SPI read and clear operation

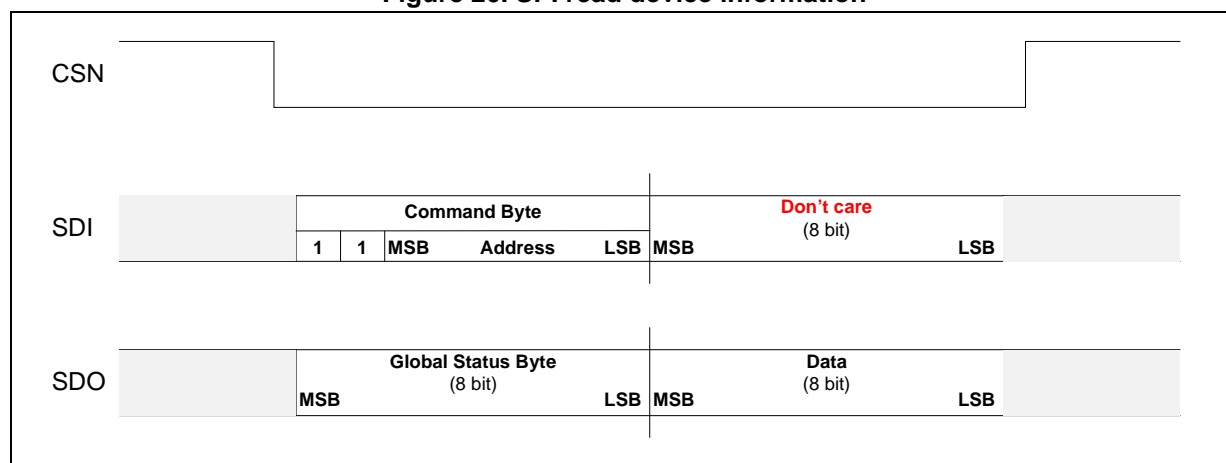

Read device information

Specific information can be read but not modified during this mode.

Incoming data are sampled on the rising edge of the serial clock (SCK), MSB first. The command byte allows to determine which information is read while the data byte is 'don't care'.

Outgoing data are shifted out MSB first on the falling edge of the CSN pin and others on the falling edge of the serial clock (SCK). The first byte corresponds to the Global Status byte and the second to the content of the addressed register.

Figure 26. SPI read device information

### 3.4 Address mapping

Table 10. RAM memory map

Address	Name	Access	Content
00h	Reserved	Read/write	Reserved
01h	Control register 1	Read/write	Mux settings, WD period and retrigger
02h	Control register 2	Read/write	Spread spectrum settings, max input current and LED current settings
03h	Control register 3	Read/write	SW Limp Home, OTA/driver and converter delay control
04h	Status register 1	Read	Detailed status information
05h	Status register 2	Read	WD status, operation mode and LMode error
3E	Trimming and test	Read	Trimming bus and test mode select
3F	Configuration reg.	Read/write	WD retrigger bit

Table 11. ROM memory map

Address	Name	Access	Content
00h	ID header	Read only	4300h (ASSP ST_SPI)
01h	Version	Read only	0100h
02h	Product code 1	Read only	3100h (dec. 49)
03h	Product code 2	Read only	5100h (ASCII 'Q')
3Eh	SPI frame ID	Read only	4200h (Watchdog available, 24 bit ST-SPI)

### 3.5 Control registers (RAM)

#### Control registers 1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved										Mux[[1:0]		Mux_En	En_Ntc	WD_Period	WD_trig

**Address:** 0x01h

**Type:** R/W

**Reset:** 0000 0000 0000 1110b

Bit [6:15] Reserved

Bit [5:4] Mux[1:0]:

00 (default): the signal on the PWM pin is reflected on Mout pin

01: the signal on the  $V_{LED}$  is reflected on Mout pin

10: the signal on NTC is selected

11: the signal on Lmode pin is selected

Bit [3] Mux\_En:

0: the Mout pin is inactive (tristate)

1: the Mout pin is active (default)

Bit [2] En\_Ntc:

When set, the current fold back feature enabled in case of LED overtemperature conditions.

This bit is ignored in case of any LIMP MODE and the LED temperature monitoring is activated (the NTC control is internal)

Bit [1] WD\_Period:

0: WD timeout = 100 ms

1: WD timeout = 200 ms (default)

Bit [0] WD\_trig:

This bit must be toggled within the WD period to refresh the WD

## Control registers 2

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Fdev[2:0]			Fmod[1:0]		Dith_En	Led_Curr[4:0]				Max_Curr[4:0]					

**Address:** 0x02h

**Type:** R/W

**Reset:** 0101 1110 0001 1111b

Bit [15:13] Fdev[2:0]: frequency deviation of the internal oscillator (see [Table 12](#))

Bit [12:11] Fmod[1:0]: frequency modulation of the internal oscillator (see [Table 13](#))

Bit [10] Dith\_En: enable or disable random dither effect.

If this bit is set Dithering is enabled;

If the bit is reset, the dithering is disabled

Bit [9:5] Led\_Curr[4:0]: these bits set the LED current.

The LED current is given by:

$$0.05 + (0.2 * \text{Led\_Curr}[4:0]_{\text{d}} / 31) / (R_{\text{SENSE}}) \text{ [A] (typ)}$$

Where Led\_Curr[4:0]d = decimal value of Led\_Curr[4:0]

Bit [4:0] Max\_Curr[4:0]: these bits set the maximum input current.

The internal current limiter voltage threshold is:

$$1 + (2.5 * \text{Max\_Curr}[4:0]_{\text{d}} / 31) \text{ in [V] (typ)}$$

Considering the gain of the amplifier of 10, the current limitation is:

$$(1 + 2.5 * \text{Max\_Curr}[4:0]_{\text{d}} / 31) / (10 R_{\text{SHUNT}}) \text{ (typ);}$$

Where Max\_Curr[4:0]d = decimal value of Max\_Curr[4:0]

**Table 12. Internal oscillator frequency deviation settings**

Fdev[2]	Fdev[1]	Fdev[0]	Frequency deviation
0	0	0	0 %
0	0	1	5 %
0	1	0	10 %
0	1	1	15 %
1	0	0	20 %
1	0	1	25 %
1	1	0	30 %

**Table 13. Internal oscillator frequency modulation settings**

Fmod[1]	Fmod[0]	Frequency modulation
0	0	1.95 kHz
0	1	3.9 kHz
1	0	7.8 kHz
1	1	15.6 kHz

## Control registers 3

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved			Lh_Sw	Ctrl_Ota[3:0]				Ctrl_Drv[3:0]							

**Address:** 0x03h

**Type:** R/W

**Reset:** 0000 1000 0000 0000b

Bit [15:13] Reserved

Bit [12] Lh\_Sw:

The device goes in Limp Home mode without WD supervision ( $V_{CC1}$  stays on) when the bit is set

Bit [11:8] Ctrl\_Ota[3:0]: these bits set the delay between a rising edge of the PWM\_L signal and a connection of the output of the operation transconductance amplifier.

The delay is given by  $\text{Ctrl\_Ota}[3:0]d * 3.3 \mu s$  (typ.)

Where Ctrl\_Ota[3:0]d is the decimal value of Ctrl\_Ota[3:0]

The default of these bits are loaded from the corresponding control bus

Bit [7:4] Ctrl\_Drv[3:0]: these bits set the delay between a rising edge of the PWM\_L signal and the activation of the converter

The delay is given by:

$\text{Ctrl\_Drv}[3:0]d * 1.67 \mu s$  (typ.)

Where Ctrl\_Drv[3:0]d is the decimal value of Ctrl\_Drv[3:0]

The default of these bits are loaded from the corresponding control bus

Bit [3:0] Ctrl\_Sw[3]: these bits set the delay between the falling edge of the PWM\_L signal and the turn off of the dimming mosfet M2.

The delay is given by:

$\text{Ctrl\_Sw}[3:0]d * 1.67 \mu s$  (typ.)

Where Ctrl\_Sw[3:0]d is the decimal value of Ctrl\_Sw[3:0]

The default of these bits are loaded from the corresponding control bus.

## 3.6 Status registers

### Status registers 1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved			Lmode_Err	Vs_Ov	Vs_Uv	Led_Temp_War	Led_Oc	Led_Ov	Vcc1_Off	Vcc1_Fail	Vcc1_Uv_To	Vcc1_Ot	Vcc1_Sc	SDI_stuck@	WD_fail
—			R <sup>(1)</sup>	R	R <sup>(1)</sup>	R/C <sup>(2)</sup>			R	R/C <sup>(2)</sup>					

1. "Read only", real time bit.

2. These bits are latched until a "Read and Clear" access.

**Address:** 0x04h

**Type:** R/C

Bit [15:13] Reserved

Bit [12] Lmode\_Err: this bit is set if a mismatch between the signal on LMODE pin and VLED pin is detected.

Bit [11] Vs\_Ov: is set if an overvoltage event at the supply line is detected

Bit [10] Vs\_Uv: is set if an under voltage event at the supply line is detected

Bit [9] Led\_Temp\_Warn: temperature warning for the LED

Bit [8] Led\_Oc: Is set if an over current event across the LED chain is detected

Bit [7] Led\_Ov: is set if an overvoltage event across the LED chain is detected

Bit [6] Vcc1\_Off: when set, this bit indicated that  $V_{CC1}$  is off

Bit [5] Vcc1\_Fail

Indicates that:

$V_{CC1}$  is below  $V_{CC1\_FAIL}$  threshold for typ. 2  $\mu$ s in active mode

$V_{CC1}$  is below  $V_{CC1\_FAIL}$  threshold for more than 4 ms typ. during start up

Bit [4] Vcc1\_Uv\_To: this bit is set in active mode if  $V_{CC1}$  is below the reset threshold for more than typ. 2 ms

Bit [3] Vcc1\_Ot: set if an overtemperature condition has been detected on  $V_{CC1}$

Bit [2] Vcc1\_Sc: indicates a short circuit on  $V_{CC1}$ .

This bit is set if  $V_{CC1}$  stays below the  $V_{CC1\_FAIL}$  threshold 4 ms (typ.) after the power on reset or below the reset threshold 100 ms after the POR (Power On Reset)

Bit [1] SDI\_stuck@

Bit [0] WD\_fail

## Status registers 2

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved							Led_Ov_Rec	Ext_Vcc	PWM_L	Standalone	LHM	Lh_Sw_St	WD_Status[2:0]		
—							R	R <sup>(1)</sup>		R	R <sup>(1)</sup>	R	R <sup>(2)</sup>		

1. “Read only”, real time bit.

2. “Read only” bit. These bits are cleared by a WD re-trigger.

**Address:** 0x05h

**Type:** R

Bit [15:9] Reserved

Bit [8] Led\_Ov\_Rec

Once this bit is set, the device will make a single trial to recover from an LED overvoltage.

Bit [7] Ext\_Vcc: this bit reflects the signal on the Ext\_Vcc pin,

Bit [6] PWM\_L: this bit reflects the signal on the PWM\_L pin

Bit [5] Standalone: this bit is set if the device operates in standalone mode, without microcontroller

Bit [4] LHM: reflects the level at LHM pin

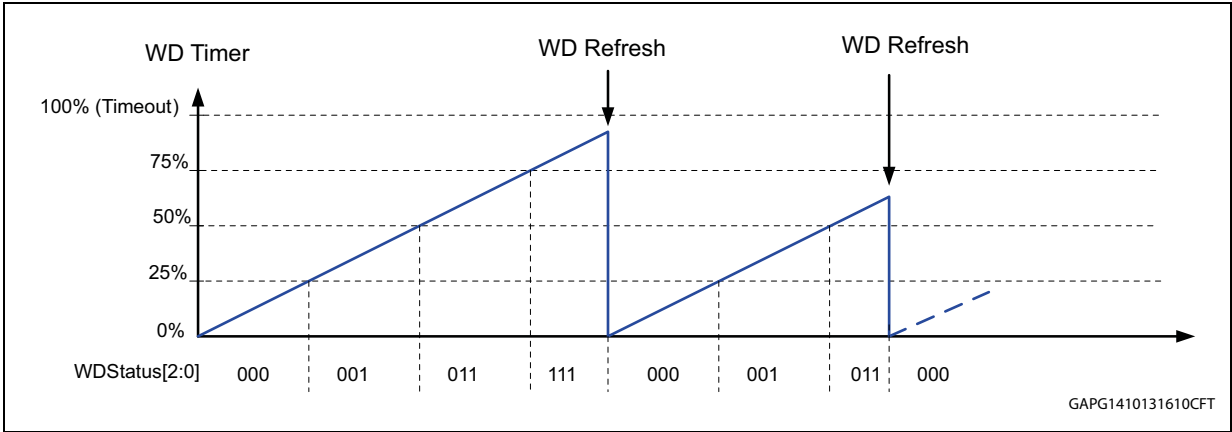

Bit [3] Lh\_Sw\_St: is set if the software limp home mode is activated

Bit [2:0] WD\_status[2:0]: these bits indicate the status of the watchdog timer (see [Table 14](#) and see [Figure 27](#))

**Table 14. Watchdog timer status**

WD_Status[1]	WD_Status[1]	WD_Status[0]	WD timer status
0	0	0	[0...25 %[
0	0	1	[25 % ... 50 %[
0	1	1	[50 % ... 75 %[
1	1	1	[75 % ... 100 %[

Figure 27. Principle of the WD\_Status bits

### Trimming and test register

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TM[5:0]						Trim_Bus[9:0]									
R/W						R									

**Address:** 0x3Eh  
**Type:** R/W  
**Reset:** 0000 0000 0000 0000b

Bit [15:10] TM[5:0]: test mode selection (refer to the UQ49 test controller)  
 Bit [9:0] Trim\_Bus[9:0]: copy of the data stored in the trimming fuse cells

### Configuration register

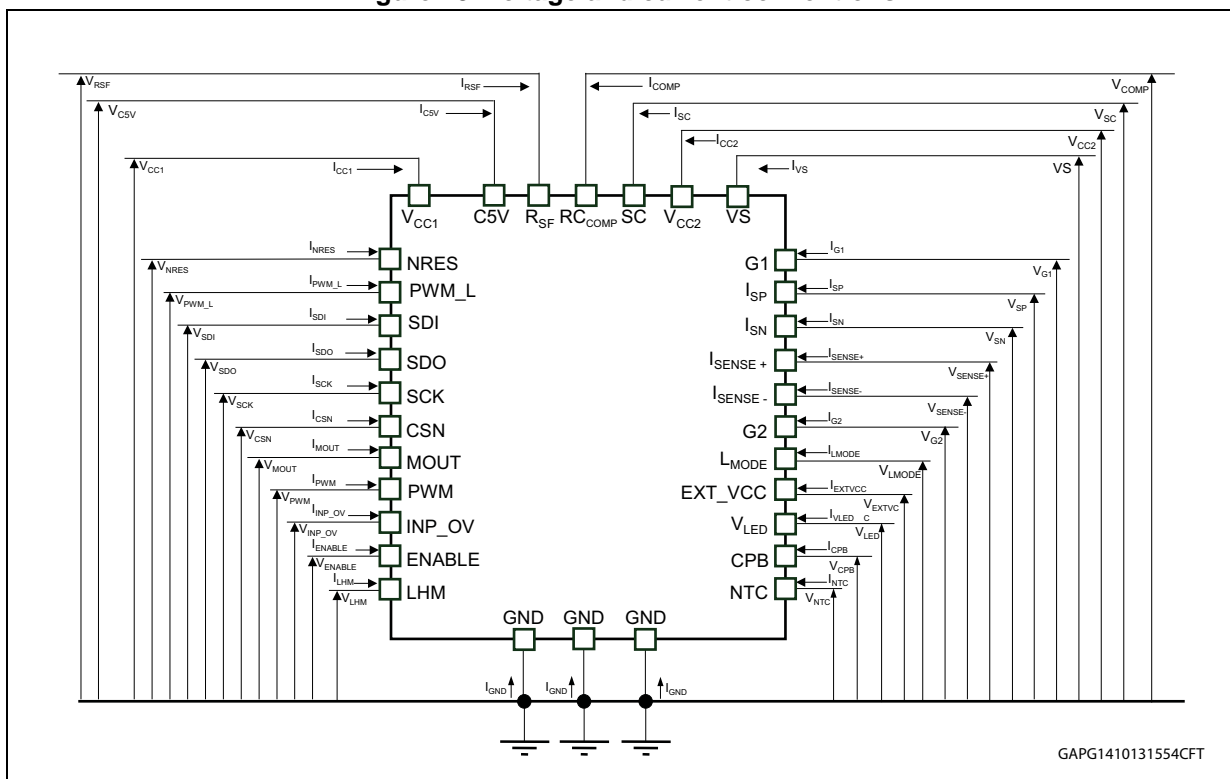

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Reserved															WD_Trig
—															R/W

**Address:** 0x3Fh  
**Type:** R/W  
**Reset:** 0000 0000 0000 0000b

Bit [15:1] Reserved  
 Bit [0] WD\_Trig: this bit must be toggled within the WD period to refresh the WD.  
 Note that this bit is copied in the Control register 1, bit 0

## 4 Electrical specifications

Figure 28. Voltage and current conventions

### 4.1 Absolute maximum ratings

Maximum ratings are absolute ratings; exceeding any one of these values may cause permanent damage to the integrated circuit.

Table 15. Absolute maximum ratings

Symbol	Parameter	Value	Unit
$V_S$	DC operating supply voltage	5.6 / 24	V
$V_{S\_TR}$	Transient operating supply voltage ( $T < 400$ ms)	-0.3 / 40	V
$V_{SDI}$	SPI data input voltage range	-0.3 / +5.3	V
$V_{SDO}$	SPI data output voltage range	-0.3 / +5.3	V
$V_{SCK}$	SPI clock voltage range	-0.3 / +5.3	V
$V_{CSN}$	SPI chip select not voltage range	-0.3 / +5.3	V
$V_{NRES}$	Reset output pin voltage range	-0.3 ÷ $V_S$ + 0.3	V
$V_{CC1}$	Regulator1 supply voltage output	-0.3 / + 5.5	V
$V_{CC2}$	Regulator 2 supply voltage output	-0.3 / + 10.5	V
$V_{ENABLE}$	Enable input pin voltage range	-0.3 ÷ $V_S$ + 0.3	V

Table 15. Absolute maximum ratings (continued)

Symbol	Parameter	Value	Unit
$V_{SC}$	Slope compensation input voltage range	-0.3 / + 5.3	V
$V_{LHM}$	Limp home mode input pin voltage range	-0.3 ÷ $V_S$ +0.3	V
$V_{PWM}$	Input L.F. PWM voltage range	-0.3 ÷ $V_S$ +0.3	V
$V_{PWM\_L}$	Logic level L.F. PWM input voltage range	-0.3 / +5.3	V
$V_{MOUT}$	Multiplexed data output pin voltage range	-0.3 / +5.3	V
$V_{G1}$	Driver 1 output voltage range	-0.3 / ( $V_{CC2}$ + 0.3)	V
$V_{G2}$	Driver 2 gate output voltage range	-0.3 / min ( $V_{CPB}$ + 0.3, 68)	V
$V_{EXT\_VCC}$	External VCC voltage range	-0.3 / 5.3	V
$V_{CPB}$	External capacitor voltage range	$V_{ISENSE+}$ - 0.8 V / min ( $V_{ISENSE+}$ + 16 V, 68 V)	V
$V_{ISENSE+}$	Positive sensing res. voltage range	-0.3 / 55	V
$V_{ISENSE-}$	Negative sensing res. voltage range	$V_{ISENSE+}$ - 5 V / $V_{ISENSE+}$ + 0.3 V	V
$V_{SP}$	Sensing positive shunt res voltage range	-0.3 / +5.3	V
$V_{SN}$	Sensing negative shunt res voltage range	-0.3 / +5.3	V
$V_{INP\_OV}$	overvoltage input pin voltage range	-0.3 ÷ $V_S$ +0.3	V
$V_{RSF}$	External set frequency resistor voltage range	-0.3 / 5.5	V
$V_{C5V}$	C5V ext capacitor voltage range	-0.3 / 5.5	V
$V_{RC\ COMP}$	External RC network input pin voltage range	-0.3 / 5.5	V
$V_{NTC}$	External NTC resistor input voltage range	-0.3 / 5.5	V
$V_{LED}$	LED chain drop voltage detection input range	-0.3 / + 65	V
$V_{LMODE}$	LED Mode switch voltage range	-0.3 / +5.3	V
$V_{ESD}$	Electrostatic discharge (HBM R = 1.5 kΩ; C = 100 pF)	± 2	kV
$V_{ESD}$	CDM model all pin	500	V
$V_{ESD}$	CDM for corner pin	750	V
$T_J$	Junction operating temperature	-40 to 150	°C
$T_{stg}$	Storage temperature	-55 to 150	°C

Table 16. Thermal data

Symbol	Parameter	Value	Unit
$R_{Thj-case}$	Thermal resistance junction to case	27	°C/W
$R_{Thj-amb}$	Thermal resistance junction to ambient	90	°C/W

## 5 Electrical characteristics

Values specified in this section are for  $5.6\text{ V} \leq V_S \leq 24\text{ V}$ ;  $-40\text{ }^{\circ}\text{C} \leq T_J \leq 150\text{ }^{\circ}\text{C}$ , unless otherwise specified

**Table 17.  $V_S$  and  $V_{CC1}$  pin characteristics**

Symbol	Parameter	Test condition	Min	Typ	Max	Unit
$V_S$	Operative battery voltage		5.6		24	V
$I_S$	Supply current consumption in continuous mode (L.F. PWM = 100 %)	$V_S = 13.5\text{ V}$ ; $F_{REQ} = 300\text{ kHz}$ ; $I_{CC1} = I_{CC2} = I_{C5V} = 0$			20	mA
$I_{S\_STBY}$	Supply current consumption in stand by mode	Enable = Low; LHM, CSN, PWM, INP_OV = open; $V_{NRES} \leq 5.5\text{ V}$ ; $V_S = 13.5\text{ V}$ ; $T_J = 25\text{ }^{\circ}\text{C}$			12	$\mu\text{A}$
$V_{SMIN}$	Minimum $V_S$ required for reaching $V_{CC1}$ nominal value	$V_S$ ramp up	4.8	5.2	5.6	V
$V_{SMIN\_HYS}$	$V_{SMIN}$ hysteresis	$V_S$ ramp down		0.2		V
$t_{VSM}$	$V_{SMIN}$ filtering time		13	16	23	$\mu\text{s}$
$V_{CC1}$	D.C. logic supply output voltage	$1 < -I_{CC1} < 10\text{ mA}$	4.9	5	5.1	V
$-I_{CC1}$	Output current capability	$V_S = 13.5\text{ V}$ ; $V_{CC1} = V_{CC1\_1mA} - 0.1\text{ V}^{(1)}$	50			mA
$V_{CC1\_DROP}$	Min voltage drop of $V_{CC1}$ respect to $V_S$ : $V_{CC1\_DROP} = \min(V_S - V_{CC1})$	$-I_{CC1} = 10\text{ mA}$			500	mV
$V_{CC1\_LINE}$	Line regulation voltage	$-I_{CC1} = 10\text{ mA}$ ; $V_{CC1@5.6} - V_{CC1@24}$			5	mV
$V_{CC1\_LOAD}$	Load regulation voltage	$-I_{CC1} = 1\text{ to }10\text{ mA}$ ; $V_S = 13.5\text{ V}$			10	mV
$V_{CC1\_FAIL}$	$V_{CC1}$ fail detection threshold <sup>(2)</sup>	$V_S \geq V_{SMIN}$ ; $V_{CC1}$ rising	2.4	2.6	2.8	V
		$V_S \geq V_{SMIN}$ ; $V_{CC1}$ falling	1.9	2.1	2.3	V
$t_{LMODERR}$	Filtering time for LMODE error		13	16	23	$\mu\text{s}$
$t_{OC}$	Filtering time for LED overcurrent		13	16	23	$\mu\text{s}$
$t_{LEDOV}$	Filtering time for LED overvoltage		12	15	22	$\mu\text{s}$
$t_{WD1}$	1st watchdog time-out period		85	100	135	ms
$t_{WD2}$	2nd watchdog time-out period		170	200	275	ms
$t_{V1F}$	Internal filtering time for $v_{cc1}$ fail detection	$V_S \geq V_{SMIN}$	1.7	2	2.75	$\mu\text{s}$
$t_{SHTV1A}$	Time to detect a short on V1 regulator at turn-on	$V_S \geq V_{SMIN}$ ; $V_{CC1} < V_{CC1\_FAIL}$ ; $t \geq t_{SHTV1A}$		4		ms
$t_{SHTV1B}$	Time to detect a short on V1 regulator at turn-on	$V_S \geq V_{SMIN}$ ; $V_{CC1\_FAIL} \leq V_{CC1} \leq V_{CC1\_TH}$ ; $t \geq t_{SHTV1B}$		100		ms

Table 17. VS and V<sub>CC1</sub> pin characteristics (continued)

Symbol	Parameter	Test condition	Min	Typ	Max	Unit
CV <sub>CC1</sub>	Load capacitance	A good quality (Low ESR) capacitor is recommended	1	10		μF
V <sub>CC1_OT</sub>	Regulator 1 over temperature detection level		150	175	190	°C
V <sub>CC1_OT_HYS</sub>	Hysteresis		20	25	30	°C
t <sub>V1OT</sub>	Filtering time for regulator 1 over temperature detection		0.75	1	1.55	ms

1. V<sub>CC1\_1mA</sub> is V<sub>CC1</sub> at I<sub>LOAD</sub> = 1 mA; V<sub>S</sub> = 13.5 V.

2. Minimum V<sub>CC1</sub> voltage for keep RAM data.

Table 18. V<sub>CC2</sub> and C5V pin characteristics

Symbol	Parameter	Test condition	Min	Typ	Max	Units
V <sub>CC2</sub>	D.C. logic supply output voltage	$1 \leq -I_{CC2} \leq 10 \text{ mA}$ ; V <sub>S</sub> = 13.5 V; V <sub>PWM_L</sub> = 0	9.5	10	10.5	V
-I <sub>CC2</sub>	Output current capability	V <sub>S</sub> = 13.5 V; V <sub>CC2</sub> = V <sub>CC2_1mA</sub> - 0.1 V <sup>(1)</sup> ; V <sub>PWM_L</sub> = 0	20			mA
V <sub>CC2_DROP</sub>	Drop voltage to V <sub>S</sub> : V <sub>CC2_DROP</sub> = (V <sub>S</sub> - V <sub>CC2</sub> )	-I <sub>CC2</sub> = 1 mA; V <sub>CC2</sub> = 9.5 V; V <sub>PWM_L</sub> = 0			100	mV
-I <sub>CC2_SHT</sub>	Short output current limitation	$0 \leq V_{CC2} \leq V_{CC2\_1mA}$ ; V <sub>S</sub> = 13.5 V; V <sub>PWM_L</sub> = 0			100	mA
CV <sub>CC2</sub>	Load capacitance	A good quality (Low ESR) capacitor is recommended for correct managing gate peaks current during switching On and OFF of G1	10			μF
V <sub>CC2_OT</sub>	Regulator 2 over temperature detection level		150	175	190	°C
V <sub>CC2_OT_HYS</sub>	Over temperature detection level hysteresis		20	25	30	°C
V <sub>C5V</sub>	Internal 5 V output voltage	$0 \leq -I_{C5V} \leq 2.5 \text{ mA}$	4.75	5	5.25	V
-I <sub>C5V</sub>	5 V output current	V <sub>C5V</sub> = V <sub>C5V_1mA</sub> <sup>(2)</sup> - 0.1	2.5			mA
-I <sub>C5V_SHT</sub>	Short output current limitation	$0 \leq V_{C5V} \leq V_{C5V\_1mA}$ <sup>(3)</sup> (pulsed s.c. no continuous short)			50	mA
C <sub>5V</sub>	Load capacitance See <a href="#">Figure 34</a>		1			μF

1. V<sub>CC2\_1mA</sub> is the value of V<sub>CC2</sub> at I<sub>load</sub> = 1 mA, V<sub>S</sub> = 13.5 V; T<sub>j</sub> = 25 °C.

2. V<sub>C5V\_1mA</sub> is the value of V<sub>C5V</sub> at external I<sub>C5V</sub> load = 1 mA, V<sub>S</sub> = 13.5 V; T<sub>j</sub> = 25 °C.

3. V<sub>C5V\_1mA</sub> is the value of V<sub>C5V</sub> at external I<sub>C5V</sub> load = 1 mA, V<sub>S</sub> = 13.5 V; T<sub>j</sub> = 25 °C.

Table 19. NRES and L<sub>MODE</sub> pin characteristics

Symbol	Parameter	Test condition	Min	Typ	Max	Unit
V <sub>CC1_TH</sub>	Reset intervention threshold		4.6	4.7	4.8	V
T <sub>RR</sub>	V <sub>CC1</sub> reset filtering time	V <sub>CC1</sub> < V <sub>CC1_TH</sub>	13	16	23	μs
t <sub>FS</sub>	V <sub>CC1</sub> reset time-out for fail safe detection	V <sub>S</sub> ≥ V <sub>SMIN</sub> ; V <sub>CC1</sub> < V <sub>CC1_TH</sub> ; t ≥ t <sub>FS</sub>	1.6	2	2.9	ms
T <sub>RD</sub>	Reset delay time	V <sub>CC1</sub> ≥ V <sub>CC1_TH</sub>	1.6	2	2.9	ms
I <sub>NRES</sub>	High state reset sink current	V <sub>NRES</sub> = V <sub>S</sub> ; NRES active	0.5	1.7	3.5	mA
I <sub>NRES</sub>	High state reset leakage current	V <sub>NRES</sub> = V <sub>S</sub> ; NRES inactive			300	μA
V <sub>NRES_L</sub>	Reset I/O low state level	V <sub>CC1</sub> ≤ V <sub>CC1_TH</sub> ; I <sub>NRES</sub> = 1 mA			0.5	V
V <sub>LMODE_H</sub>	Led mode switch high state input		4			V
V <sub>LMODE_L</sub>	Led mode switch low state input				1	V
-I <sub>LMODE</sub>	Internal pull up current source	V <sub>LMODE</sub> = 0	10	18	25	μA

Table 20. G1 driver 1 pin characteristics

Symbol	Parameter	Test condition	Min	Typ	Max	Unit
V <sub>G1_H</sub>	Gate1 high level		5		V <sub>CC2</sub>	V
V <sub>G1_L</sub>	Gate1 low level				0.5	V
tr <sub>G1</sub>	Gate1 charging rise time	CG = 4.7 nF; V <sub>GS1</sub> rising from 10 % to 90 %; V <sub>S</sub> ≥ 10 V			40	ns
tf <sub>G1</sub>	Gate1 discharging fall time	CG = 4.7 nF; V <sub>GS1</sub> falling from 90 % to 10 %; V <sub>S</sub> ≥ 10 V			40	ns

Table 21. G2 pin characteristics (driver2)

Symbol	Parameter	Test condition	Min	Typ	Max	Unit
V <sub>G2_H</sub>	High state output V <sub>G2</sub> voltage	PWM_L = High; V(I <sub>SENSE+</sub> ) = 30 V	V(I <sub>SENSE+</sub> ) +10		V(I <sub>SENSE+</sub> ) +14	V
V <sub>G2_L</sub>	Low state output voltage V <sub>G2</sub>	PWM_L = Low; V(I <sub>SENSE+</sub> ) = 30 V			0.05	V
-I <sub>G2_H</sub>	Gate 2 high state output current	PWM_L = High; V <sub>GS_M2</sub> = 6 V <sup>(1)</sup> ; C <sub>GS_M2</sub> = 1 nF; V(I <sub>SENSE+</sub> ) = 30 V	200			μA
I <sub>G2_L</sub>	Gate 2 low state output current	PWM_L = Low; V <sub>GS_M2</sub> = 6 V <sup>(2)</sup> ; C <sub>GS_M2</sub> = 1 nF; V(I <sub>SENSE+</sub> ) = 30 V	200			μA

1. I<sub>G2\_H</sub> current is measured when the voltage across gate and source of Mosfet M2 (V<sub>GS\_M2</sub>) reaches a value of 6 V during its rising transient.
2. I<sub>G2\_L</sub> current is measured when the voltage across gate and source of Mosfet M2 (V<sub>GS\_M2</sub>) reaches a value of 6 V during its falling transient.

Table 22. Converter oscillator and R<sub>SF</sub> pin characteristics

Symbol	Parameter	Test condition	Min	Typ	Max	Unit
V <sub>RSF</sub>	Voltage at pin R <sub>SF</sub>	I <sub>RSF</sub> = 42 µA	1.12	1.21	1.25	V
F <sub>O</sub>	DC-DC converter frequency range	See <a href="#">Figure 12</a>	100		520	kHz
F <sub>O_S</sub>	Oscillator frequency spread at 125 kHz	I <sub>RSF</sub> = 17 µA (F <sub>O</sub> ≈ 125 kHz)	100	125	150	kHz
F <sub>O_S</sub>	Oscillator frequency spread at 300 kHz	I <sub>RSF</sub> = 42 µA (F <sub>O</sub> ≈ 300 kHz)	240	300	360	kHz
F <sub>O_S</sub>	Oscillator frequency spread at 470 kHz	I <sub>RSF</sub> = 67 µA (F <sub>O</sub> ≈ 470 kHz)	420	470	520	kHz
Duty cycle max	DC-DC converter max duty cycle limit			90		%
Duty cycle min	DC-DC converter min duty cycle limit			10		%
F <sub>MOD</sub>	Modulation frequency of the internal oscillator	See <a href="#">Section 3.5: Control registers (RAM)</a> F <sub>MOD</sub> [0:1]	1.95, 3.9, 7.8, 15.6			kHz
D% = ΔF <sub>0</sub> / F <sub>0</sub>	Frequency deviation factor	See <a href="#">Section 3.5: Control registers (RAM)</a> F <sub>DEV</sub> [0:2]	0 to ±35 (step ±5 %)			%

Table 23. PWM\_L, PWM, MOUT pin characteristics

Symbol	Parameter	Test condition	Min	Typ	Max	Unit
TON <sub>PWM_L</sub>	Minimum PWM_L on time	Q <sub>G</sub> = 9 nC	100			µs
PWM_L <sub>LOW</sub>	Low level PWM_L input voltage				1	V
PWM_L <sub>HIGH</sub>	High level PWM_L input voltage		4			V
I <sub>PWM_L_PD</sub>	Pull down current source		20	28	35	µA
PWM <sub>LOW</sub>	Low level PWM input voltage				1	V
PWM <sub>HIGH</sub>	High level PWM input voltage		4			V
R <sub>PWM_PD</sub>	Pull Down resistor		50	230	500	kΩ
V <sub>MOUT_H</sub>	High state output voltage (digital mode)	-I <sub>MOUT</sub> = 0.1 mA	4			V
V <sub>MOUT_L</sub>	Low state output voltage (digital mode)	I <sub>MOUT</sub> = 0.1 mA			1	V
Z <sub>MOUT</sub>	Analogue mode output impedance			10		kΩ

Table 24. I<sub>SENSE+</sub>, I<sub>SENSE-</sub> pin, and O.T.A. characteristics

Symbol	Parameter	Test condition	Min	Typ	Max	Units
V <sub>ISENSE+</sub> V <sub>ISENSE-</sub>	Common mode input range		V <sub>S</sub> - 0.3		49	V
(V <sub>ISENSE+</sub> - V <sub>ISENSE-</sub> )	Operative differential input voltage range		-1		0.3	V

Table 24.  $I_{SENSE+}$ ,  $I_{SENSE-}$  pin, and O.T.A. characteristics (continued)

Symbol	Parameter	Test condition	Min	Typ	Max	Units
$(V_{ISENSE+} - V_{ISENSE-})_{TH}$	LED over current protection threshold	$V(I_{SENSE+}) = 25\text{ V};$ $V_{LREF} = V_{LREF\_16};$ $V_{RCCOMP} = 2\text{ V}$	$V_{LREF} + 0.03$	$V_{LREF} + 0.08$	$V_{LREF} + 0.14$	V
$I_{SENSE\_CD}$	Current consumption from $I_{SENSE+}$ (LED_OV)	$V_{SENSE+} = V_{SENSE-} = 25\text{ V}$	3	5	10	mA
$V_{SENSE\_MAX\_1}$	Threshold at pin $I_{SENSE+}$ for overvoltage protection (activation)		49.5	52	54	V
$V_{SENSE\_MAX\_2}$	Threshold at pin $I_{SENSE+}$ for overvoltage protection (de-activation)		25	33	35	V
$V_{OFFS}$	OTA input offset voltage	$V_{LREF} = 0\text{ V}; V(I_{SENSE+}) = 25\text{ V};$ $V_{RCCOMP} = 2\text{ V}$	-10		10	mV
$I_{OFFS}$	OTA input offset current	$V(I_{SENSE+}) = 25\text{ V};$ $V_{RCCOMP} = 2\text{ V}$			10	$\mu\text{A}$
$G_M$	Transconductance gain	$V(I_{SENSE+}) = 25\text{ V};$ $V_{RCCOMP} = 2\text{ V}$	0.95	1.2		mS
$-I_{COMP}$	Sourced output current	$V_{LREF} = V_{LREF\_16};$ $(V_{ISENSE+} - V_{ISENSE-}) = 0$	50	175		$\mu\text{A}$
$I_{COMP}$	Sunk output current	$V_{LREF} = V_{LREF\_16};$ $(V_{ISENSE+} - V_{ISENSE-}) = 300\text{ mV}$	50	175		$\mu\text{A}$
		$V_{LREF} = V_{LREF\_16};$ $(V_{ISENSE+} - V_{ISENSE-}) = 1\text{ V}$	100	300		
$V_{COMP}$	Output voltage range		0		3.5	V
$V_{LREF\_16}$	Default internal voltage reference for constant LED current regulation	Internal LED current register = 16d; $V_{NTC} = 5\text{ V};$ $V_{ISENSE+} = 25\text{ V}$	138	150	162	mV
$V_{LREF}$	Internal voltage reference range-for setting output LED current <sup>(1)</sup>	$V_{NTC} = 5\text{ V}$		$(8 + N) / 24 * V_{LREF\_16(2)}$		mV
$V_{LREF\_NTC}$	Max internal $V_{LREF}$ reduction caused by NTC intervention (thermal LED current reduction)	$V_{NTC} = 0\text{ V}$		$0.5 * V_{LREF}$		mV
$V_{LREF\_STEP}$	Internal voltage reference step			$4 / 3 * (V_{LREF\_16} / 31)$		mV
$I_{SP}$ , $I_{SN}$ pin characteristics						
$V_{SP}, V_{SN}$	Shunt resistor input voltage range		-0.3		5	V

Table 24.  $I_{SENSE+}$ ,  $I_{SENSE-}$  pin, and O.T.A. characteristics (continued)

Symbol	Parameter	Test condition	Min	Typ	Max	Units
$V_{SP-V_{SN}}$	Differential input voltage range		-0.3		0.5	V
$G_{LA\_CPK}$	Gain of internal linear amplifier	$V_{SP} = 100\text{ mV}$ ; $V_{SN} = 0\text{ V}$ ; Pin SC floating	8	9.8	12	
$V_{LA\_OFFS}$	Linear amplifier output offset voltage	$V_{SP} = V_{SN} = 0$		150	350	mV
$V_{CL\_31}$	Default internal reference for the current limiter <sup>(3)</sup>	Internal C.L. register = 31		3.5		V
$(V_{SP-V_{SN}})_{TH}$	Differential threshold voltage for activate max input current prot.	Internal C.L. register = 31; $V_{SC} = 5\text{ V}$	300	350	400	mV
$V_{CL}$	Internal C.L. voltage reference range		$0.279 * V_{CL\_31}$		$V_{CL\_31}$	V
$V_{CL\_STEP}$	Internal C.L. voltage reference step			$(0.721 * V_{CL\_31} / 31)$		V

1. Writing into 5 bit LED Current Register via SPI.
2. N is the number corresponding to the 5 bits of LED\_CURR control register.
3. Settable by loading the 5 bit C.L. Register via SPI.

Table 25. SC pin characteristics

Symbol	Parameter	Test condition	Min	Typ	Max	Units
$V_{SC\_low}$	Min ramp voltage at pin SC	$I_{SC} = 0$		0.2	0.45	V
$V_{SC\_HIGH}$	Max ramp voltage at pin SC	$I_{SC} = 0$	1.4	2	2.6	V
$R_{SC}$	Ext. resistor range		10		1000	kΩ

Table 26.  $V_{LED}$  pin characteristics

Table 30. Power on reset

Symbol	Parameter	Test condition	Min	Typ	Max	Units
POR_TH1	Internal power on reset threshold	$V_{C5V}$ rising; $V_S = 13.5 \text{ V}$ ; $C5V = 10 \mu\text{F}$	3.2	3.7	4.2	V
POR_TH2	Internal power on reset threshold	$V_{C5V}$ falling; $V_S = 13.5 \text{ V}$ ; $C5V = 10 \mu\text{F}$	2.7	3.4	3.7	V

Table 31. Watchdog and timers parameters

Symbol	Parameter	Test condition	Min	Typ	Max	Units
$t_{WDTO}$	Watchdog timeout window			100 or 200 <sup>(1)</sup>		ms
$t_{DStart}$	Start time window			5		ms
$t_{EnRecov}$				5		ms

1. Selectable by SPI command.

## 6 SPI electrical characteristics

### 6.1 DC characteristics

The voltages are referred to ground and currents are assumed positive, when the current flows into the pin.  $6\text{ V} \leq V_S \leq 24\text{ V}$ ; all outputs open;  $T_j = -40\text{ }^{\circ}\text{C}$  to  $150\text{ }^{\circ}\text{C}$ , unless otherwise specified.

**Table 32. SPI DC characteristics**

Symbol	Parameter	Test condition	Min	Typ	Max	Unit
<b>Inputs: CSN, CLK, DI</b>						
$V_{IL}$	Input voltage low level	$V_S = 13.5\text{ V}$			$0.3 V_{C5V}$	V
$V_{IH}$	Input voltage high level	$V_S = 13.5\text{ V}$	$0.7 V_{C5V}$			V
$V_{IHYS}$	Input hysteresis	$V_S = 13.5\text{ V}$	500			mV
$I_{CSN\text{ in}}$	CSN pull-up current source	$V_S = 13.5\text{ V}$	10	18	25	$\mu\text{A}$
$I_{CLK\text{ in}}$	CLK pull-down current source	$V_S = 13.5\text{ V}$	20	25	35	$\mu\text{A}$
$I_{DI\text{ in}}$	DI pull-down current source	$V_S = 13.5\text{ V}$	20	25	35	$\mu\text{A}$
<b>Output: DO</b>						
$V_{OL}$	Output voltage low level	$I_{OL} = 5\text{ mA}; V_S = 13.5\text{ V}$			$0.3 V_{C5V}$	V
$V_{OH}$	Output voltage high level	$I_{OH} = -5\text{ mA}; V_S = 13.5\text{ V}$	$0.7 V_{C5V}$			V

### 6.2 AC characteristics

The voltages are referred to ground and currents are assumed positive, when the current flows into the pin.  $6\text{ V} \leq V_S \leq 24\text{ V}$ ; all outputs open;  $T_j = -40\text{ }^{\circ}\text{C}$  to  $150\text{ }^{\circ}\text{C}$ , unless otherwise specified.

**Table 33. SPI AC characteristics**

Symbol	Parameter	Test condition	Min	Typ	Max	Unit
$C_{OUT}^{(1)}$	Output capacitance (DO)		—	—	10	pF
$C_{IN}^{(1)}$	Input capacitance (DI, CSN, CLK)		—	—	10	pF

1. Value of input capacity is not measured in production test. Parameter guaranteed by design.

## 6.3 Dynamic characteristics

The voltages are referred to ground and currents are assumed positive, when the current flows into the pin.  $6\text{ V} \leq V_S \leq 24\text{ V}$ ; all outputs open;  $T_j = -40\text{ }^{\circ}\text{C}$  to  $150\text{ }^{\circ}\text{C}$ , unless otherwise specified.

For definition of the parameters please see [Figure 29](#) and [Figure 30](#).

**Table 34. SPI dynamic characteristics**

Symbol	Parameter	Test condition	Min	Typ	Max	Unit
$t_{\text{CSNQVL}}$	DO enable from tristate to low level	$C_{\text{DO}} = 100\text{ pF}$ ; $I_{\text{DO}} = 1\text{ mA}$ ; pull-up load to $V_{\text{CC}}$ ; $V_{\text{CC1}} = 5.0\text{ V}$		100	250	ns
$t_{\text{CSNQVH}}$	DO enable from tristate to high level	$C_{\text{DO}} = 100\text{ pF}$ ; $I_{\text{DO}} = -1\text{ mA}$ ; pull-down load to GND; $V_{\text{CC1}} = 5.0\text{ V}$		100	250	ns
$t_{\text{CSNQTL}}$	DO disable from low level to tristate	$C_{\text{DO}} = 100\text{ pF}$ ; $I_{\text{DO}} = 4\text{ mA}$ ; pull-up load to $V_{\text{CC}}$ ; $V_{\text{CC1}} = 5.0\text{ V}$		380	450	ns
$t_{\text{CSNQTH}}$	DO disable from high level to tristate	$C_{\text{DO}} = 100\text{ pF}$ ; $I_{\text{DO}} = -4\text{ mA}$ ; pull-down load to GND; $V_{\text{CC1}} = 5.0\text{ V}$		380	450	ns
$t_{\text{CLKQV}}$	CLK falling until DO valid	$V_{\text{DO}} < 0.3 V_{\text{CC}}$ or $V_{\text{DO}} > 0.7 V_{\text{CC}}$ ; $C_{\text{DO}} = 5\text{ pF}$ ; $V_{\text{CC1}} = 5.0\text{ V}$				ns
		$V_{\text{DO}} < 0.3 V_{\text{CC}}$ or $V_{\text{DO}} > 0.7 V_{\text{CC}}$ ; $C_{\text{DO}} = 100\text{ pF}$ ; $V_{\text{CC1}} = 5.0\text{ V}$				ns
$t_{\text{SCSN}}$	CSN setup time, CSN low before rising edge of CLK	$V_{\text{CC1}} = 5.0\text{ V}$	400			ns
$t_{\text{SDI}}$	DI setup time, DI stable before rising edge of CLK	$V_{\text{CC1}} = 5.0\text{ V}$	200			ns
$t_{\text{HCLK}}$	minimum CLK high time	$V_{\text{CC1}} = 5.0\text{ V}$	115			ns
$t_{\text{LCLK}}$	minimum CLK low time	$V_{\text{CC1}} = 5.0\text{ V}$	115			ns
$t_{\text{HCSN}}$	minimum CSN high time	$V_{\text{CC1}} = 5.0\text{ V}$	4			$\mu\text{s}$
$t_{\text{SCLK}}$	CLK setup time before CSN rising	$V_{\text{CC1}} = 5.0\text{ V}$	400			ns
$t_{\text{r DO}}$	DO rise time	$C_{\text{DO}} = 100\text{ pF}$ ; $V_{\text{CC1}} = 5.0\text{ V}$		80	140	ns
$t_{\text{f DO}}$	DO fall time	$C_{\text{DO}} = 100\text{ pF}$ ; $V_{\text{CC1}} = 5.0\text{ V}$		50	100	ns
$t_{\text{r in}}$	rise time of input signal DI, CLK, CSN	$V_{\text{CC1}} = 5.0\text{ V}$			100	ns
$t_{\text{f in}}$	fall time of input signal DI, CLK, CSN	$V_{\text{CC1}} = 5.0\text{ V}$			100	ns

The timing diagram illustrates the relationship between four signals: CSN (Chip Select), DO (Data Output), CLK (Clock), and DI (Data Input). The signals are shown as waveforms with specific timing parameters indicated by arrows and labels.

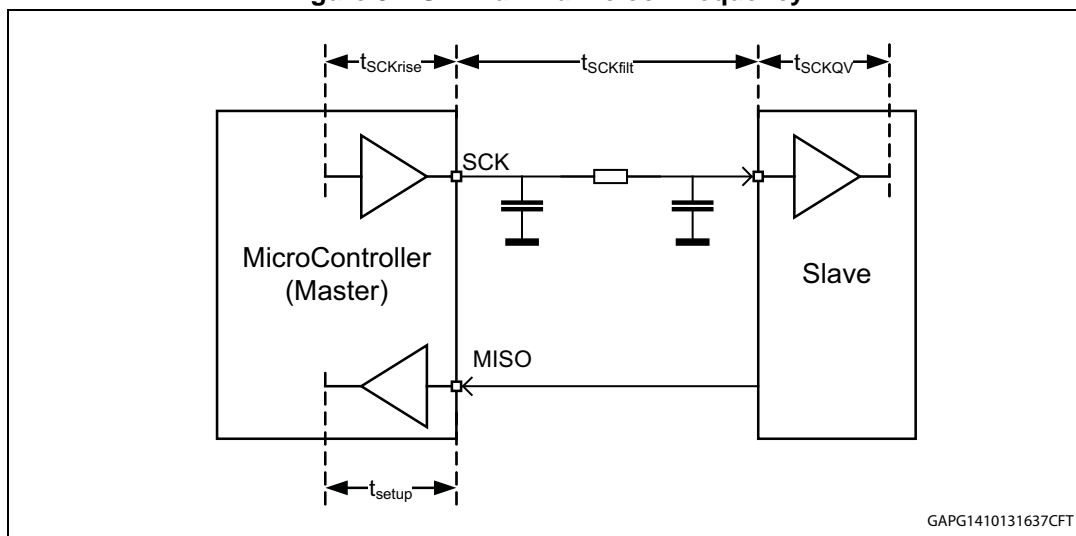

- CSN:** A pulse that goes low to initiate a read operation and high to initiate a write operation. Timing parameters include  $t_{CSNQV}$  (read setup),  $t_{HCSN}$  (write hold), and  $t_{CSNQT}$  (read output delay).
- DO:** The data output signal, shown as a hexagon representing a data bus. It is active during read operations.
- CLK:** The clock signal, shown as a square wave. Timing parameters include  $t_{SCSN}$  (read setup),  $t_{CLKQV}$  (read output delay),  $t_{SCLK}$  (write setup), and  $t_{LCLK}$  (write output delay).
- DI:** The data input signal, shown as a hexagon representing a data bus. It is active during write operations. Timing parameters include  $t_{SDI}$  (write setup) and  $t_{HCLK}$  (write hold).

The diagram shows two data transfer cycles: a read operation (CSN low, DO active) and a write operation (CSN high, DI active). The timing parameters are defined relative to the clock edges and the CSN signal transitions.

The diagram illustrates the timing relationships for the GAPG1410131634CFT device. It features three signal traces: DO (Data Output), DI (Data Input), and CSN (Chip Select). The voltage levels are defined by dashed lines at 0.8 VCC and 0.2 VCC. The clock signal (CLK) is shown as a square wave. The CSN signal is shown as a pulse. The DO signal is shown in two states: low-to-high and high-to-low. The DI signal is shown in two states: high-to-low and low-to-high. The timing parameters are defined as follows:

- $t_{r DO}$ : Output rise/fall time of the DO signal.
- $t_{f in}$ : Input setup time for the DI signal.

Figure 31. SPI maximum clock frequency

The maximum SPI clock frequency can be calculated as follows (see [Figure 31](#)):

$$t_{CLKQV}(total) = t_{CLKrise}(uC) + t_{CLKfilt}(PCB) + t_{CLKQV}(slave) + t_{setup}(uC)$$

$$f_{CLK}(max) < \frac{1}{2} \times t_{CLKQV}(total)$$

Example:

$$t_{CLKQV} = 25 \text{ ns} + 100 \text{ ns} + 250 \text{ ns} + 25 \text{ ns} = 400 \text{ ns}$$

$$f_{CLK}(max) < 1.25 \text{ MHz}$$

Figure 32. NRES pin open drain structure

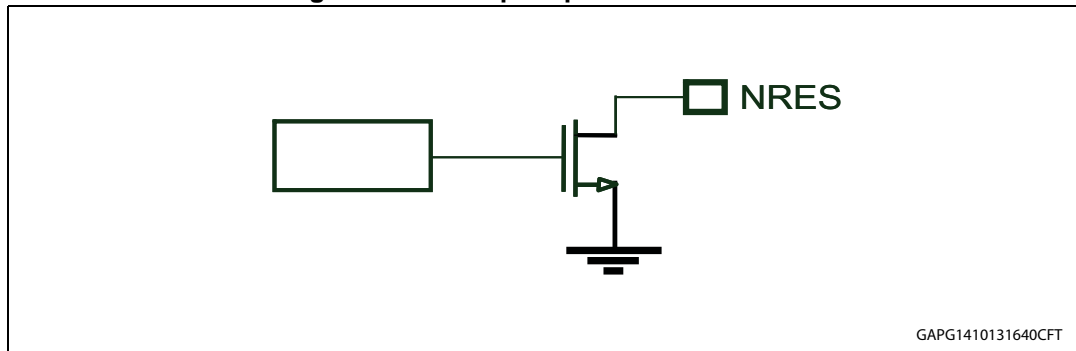

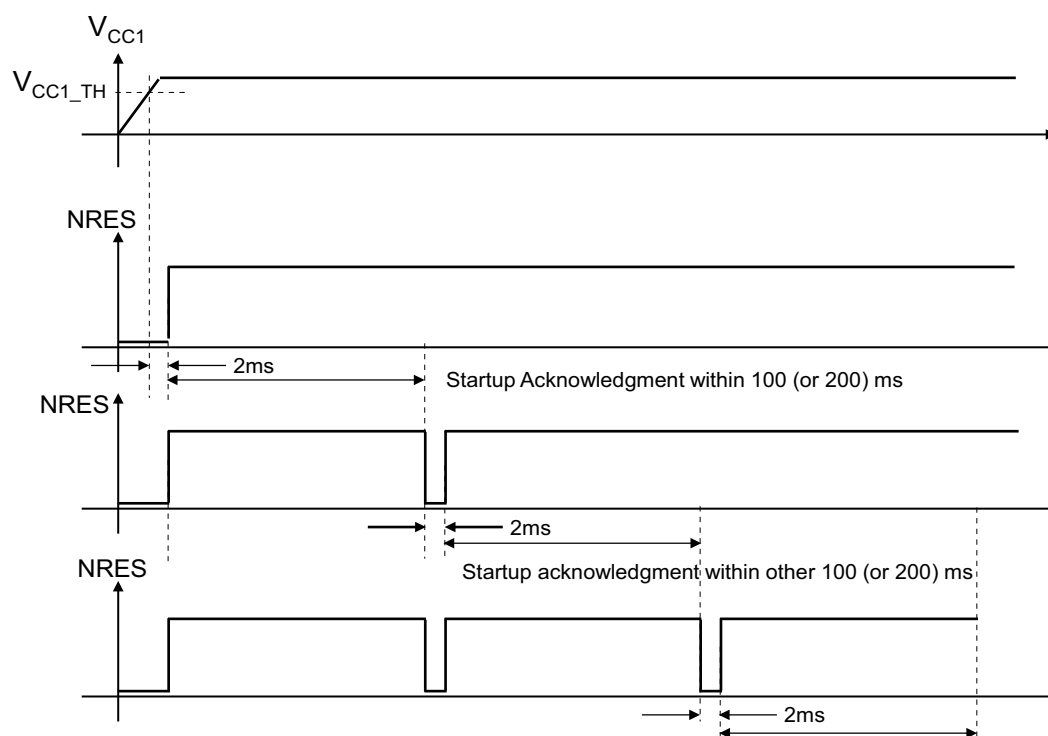

Figure 33. Handshake procedure at start up with microcontroller on board

If no acknowledgment within 100 (or 200) ms → device enters in Limp Home mode.  
 If no acknowledgment after 3 consecutive reset pulses device enters in Limp Home Mode and Regulator VCC1 is switched OFF

GAPG1410131645CFT

## 7 Application circuits

Typical application circuits are shown on the following [Figure 34](#), [Figure 35](#) and [Figure 36](#). [Figure 37](#) shows the case of standalone application. [Figure 38](#) shows an example for the boost converter topology which uses an external Mosfet M3, for provide reverse battery protection, maintaining at same time a very low drop voltage in the normal functioning, but achieving low dissipation and high efficiency, in case of high power applications (LED headlamps).

**Figure 34. Boost application circuit**

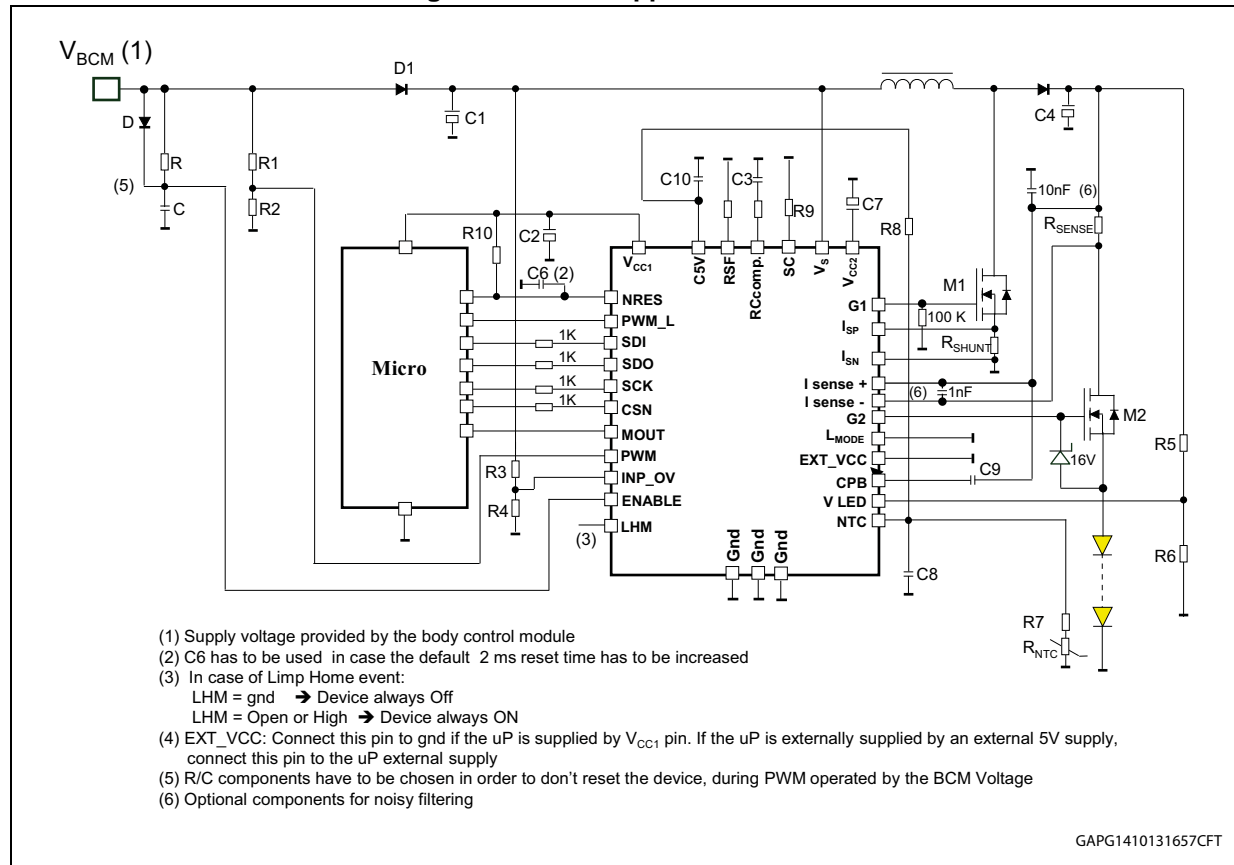

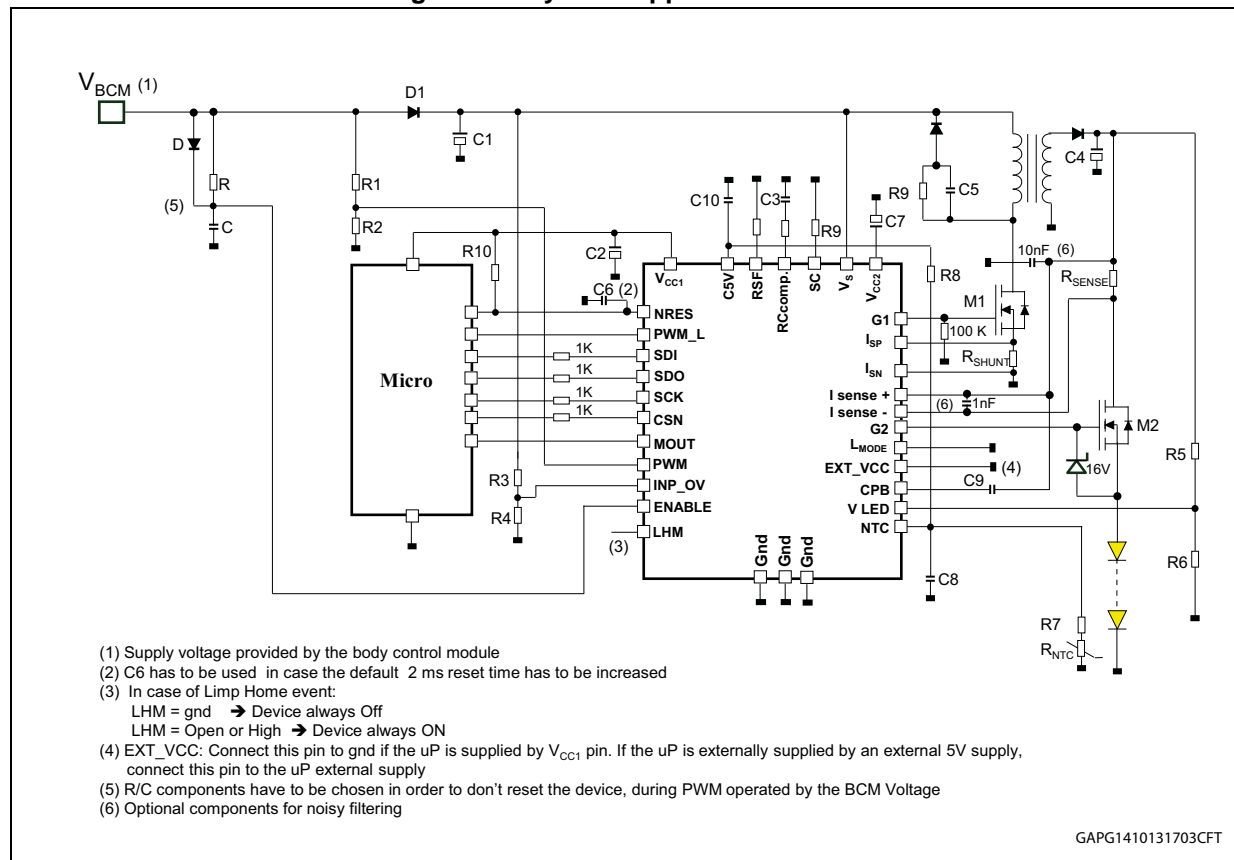

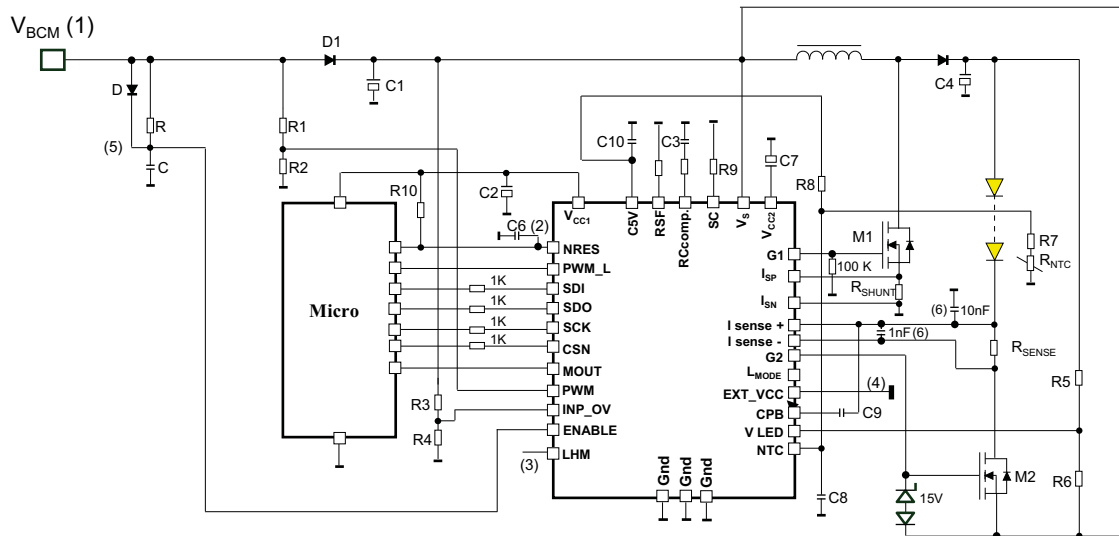

Figure 35. Fly back application circuit

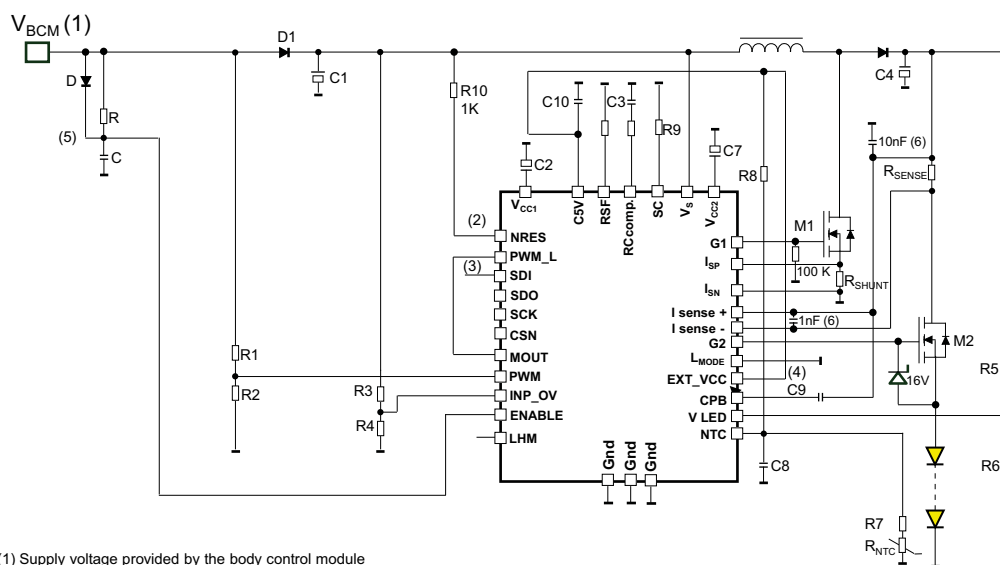

### Figure 36. Buck-boost application circuit

- (1) Supply voltage provided by the body control module
- (2) C6 has to be used in case the default 2 ms reset time has to be increased
- (3) In case of Limp Home event:  
LHM = gnd → Device always Off  
LHM = Open or High → Device always ON
- (4) EXT\_VCC: Connect this pin to gnd if the uP is supplied by V<sub>CC1</sub> pin. If the uP is externally supplied by an external 5V supply, connect this pin to the uP external supply
- (5) R/C components have to be chosen in order to don't reset the device, during PWM operated by the BCM Voltage
- (6) Optional components for noisy filtering

GAPG1410131707CFT

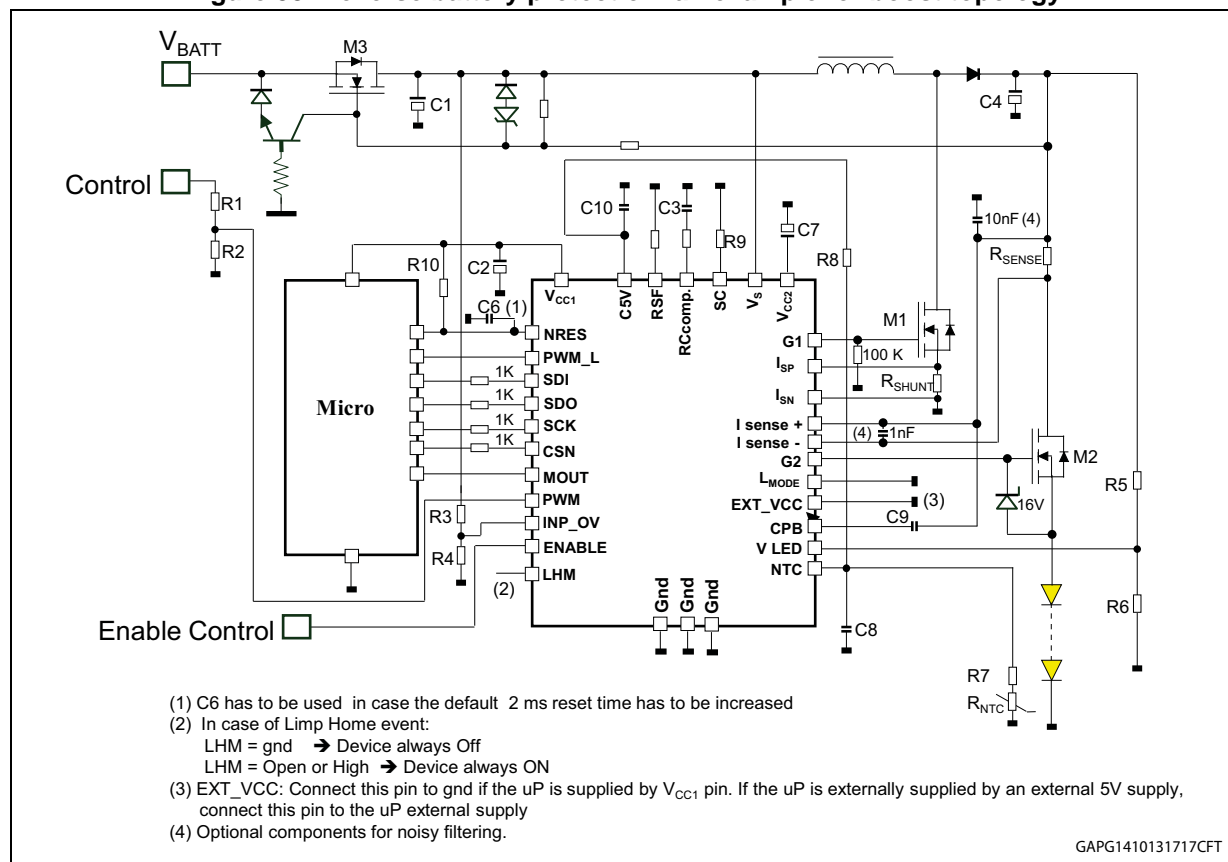

**Figure 37. Stand alone application example for boost topology**

- (1) Supply voltage provided by the body control module
- (2) The internal circuitry recognizes the stand alone operation shorting NRES to VS;
- (3) Connect this pin to 5V for enabling Dither Effect
- (4) EXT\_VCC: In stand alone is suggested to connect this pin to C5V
- (5) R/C components have to be chosen in order to don't reset the device, during PWM operated by the BCM Voltage
- (6) Optional components for noisy filtering

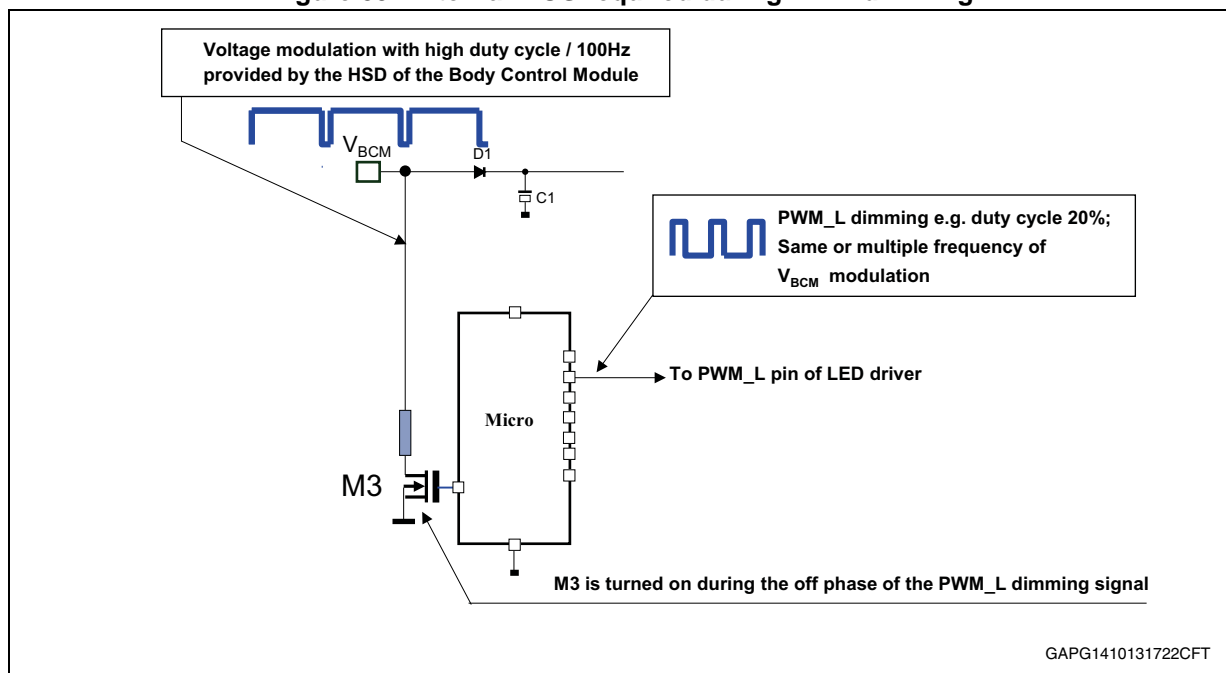

GAPG1410131712CFT

Figure 38. Reverse battery protection: an example for boost topology

If the DRL module is supplied by a high side driver (HSD) of the body control module (BCM), a minimum current consumption is requested during the off phase of the PWM dimming, so that the HSD of the BCM do not detect a wrong open load condition. This is in charge of the  $\mu$ P which has to draw this “minimum current consumption”, from the supply line (see [Figure 39](#)).

Figure 39. External MOS required during PWM dimming

## 8 Package information

### 8.1 ECOPACK®

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK® is an ST trademark.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,  
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
