JANUARY 2013

## 4Mb DRAM WITH FAST PAGE MODE

### FEATURES

- TTL compatible inputs and outputs; tri-state I/O
- Refresh Interval: 512 cycles/8 ms
- Refresh Mode:  $\overline{\text{RAS}}$ -Only,  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  (CBR), and Hidden
- JEDEC standard pinout
- Single power supply:  
5V  $\pm$  10% (IS41C16257C)  
3.3V  $\pm$  10% (IS41LV16257C)
- Byte Write and Byte Read operation via two  $\overline{\text{CAS}}$
- Industrial Temperature Range -40°C to +80°C

### DESCRIPTION

The IS41C16257C and IS41LV16257C are 262,144 x 16-bit high-performance CMOS Dynamic Random Access Memories. Fast Page Mode allows 512 random accesses within a single row with access cycle time as short as 14 ns per 16-bit word. It is asynchronous, as it does not require a clock signal input to synchronize commands and I/O.

These features make the IS41C16257C /IS41LV16257C ideally suited for high band-width graphics, digital signal processing, high-performance computing systems, and peripheral applications that run without a clock to synchronize with the DRAM.

The IS41C16257C/IS41LV16257C are packaged in 40-pin (Type II).

### KEY TIMING PARAMETERS

Parameter	-35	Unit
Max. $\overline{\text{RAS}}$ Access Time ( $t_{\text{RAC}}$ )	35	ns
Max. $\overline{\text{CAS}}$ Access Time ( $t_{\text{CAC}}$ )	13	ns
Max. Column Address Access Time ( $t_{\text{AA}}$ )	18	ns
Min. Fast Page Mode Cycle Time ( $t_{\text{PC}}$ )	14	ns
Min. Read/Write Cycle Time ( $t_{\text{RC}}$ )	60	ns

**Notes:**

1. These WRITE cycles may also be BYTE WRITE cycles (either  $\overline{\text{LCAS}}$  or  $\overline{\text{UCAS}}$  active).
2. These READ cycles may also be BYTE READ cycles (either  $\overline{\text{LCAS}}$  or  $\overline{\text{UCAS}}$  active).
3. Early write only.
4. At least one of the two CAS signals must be active ( $\overline{\text{LCAS}}$  or  $\overline{\text{UCAS}}$ ).
5. Commands valid only after proper initialization.

## FUNCTIONAL DESCRIPTION

The IS41C16257C/IS41LV16257C is a CMOS DRAM optimized for high-speed bandwidth, low-power applications. During READ or WRITE cycles, each bit is uniquely addressed through the 18 address bits. These are entered nine bits (A0-A8) at a time. The row address is latched by the Row Address Strobe ( $\overline{\text{RAS}}$ ). The column address is latched by the Column Address Strobe ( $\overline{\text{CAS}}$ ).  $\overline{\text{RAS}}$  is used to latch the first nine bits and  $\overline{\text{CAS}}$  is used to latch the latter nine bits.

The IS41C16257C/IS41LV16257C has two  $\overline{\text{CAS}}$  controls,  $\overline{\text{LCAS}}$  and  $\overline{\text{UCAS}}$ . The  $\overline{\text{LCAS}}$  and  $\overline{\text{UCAS}}$  inputs internally generate a  $\overline{\text{CAS}}$  signal functioning in an identical manner to the single  $\overline{\text{CAS}}$  input on the other 256K x 16 DRAMs. The key difference is that each  $\overline{\text{CAS}}$  controls its corresponding I/O tristate logic (in conjunction with  $\overline{\text{OE}}$  and  $\overline{\text{WE}}$  and  $\overline{\text{RAS}}$ ).  $\overline{\text{LCAS}}$  controls I/O0 - I/O7 and  $\overline{\text{UCAS}}$  controls I/O8 - I/O15.

The IS41C16257C/IS41LV16257C  $\overline{\text{CAS}}$  function is determined by the first  $\overline{\text{CAS}}$  ( $\overline{\text{LCAS}}$  or  $\overline{\text{UCAS}}$ ) transitioning LOW and the last transitioning back HIGH. The two  $\overline{\text{CAS}}$  controls give the IS41C16257C/IS41LV16257C both BYTE READ and BYTE WRITE cycle capabilities.

### Memory Cycle

A memory cycle is initiated by bringing  $\overline{\text{RAS}}$  LOW and it is terminated by returning both  $\overline{\text{RAS}}$  and  $\overline{\text{CAS}}$  HIGH. To ensure proper device operation and data integrity any memory cycle, once initiated, must not be ended or aborted before the minimum  $t_{\text{RAS}}$  time has expired. A new cycle must not be initiated until the minimum precharge time  $t_{\text{RP}}$ ,  $t_{\text{CP}}$  has elapsed.

### Read Cycle

A read cycle is initiated by the falling edge of  $\overline{\text{CAS}}$  or  $\overline{\text{OE}}$ , whichever occurs last, while holding  $\overline{\text{WE}}$  HIGH. The column address must be held for a minimum time specified by  $t_{\text{AR}}$ . Data Out becomes valid only when  $t_{\text{RAC}}$ ,  $t_{\text{AA}}$ ,  $t_{\text{CAC}}$  and  $t_{\text{OEA}}$  are all satisfied. As a result, the access time is dependent on the timing relationships between these parameters.

### Write Cycle

A write cycle is initiated by the falling edge of  $\overline{\text{CAS}}$  and  $\overline{\text{WE}}$ , whichever occurs last. The input data must be valid at or before the falling edge of  $\overline{\text{CAS}}$  or  $\overline{\text{WE}}$ , whichever occurs last.

### Refresh Cycle

To retain data, 512 refresh cycles are required in each 8 ms period. There are two ways to refresh the memory:

1. By clocking each of the 512 row addresses (A0 through A8) with  $\overline{\text{RAS}}$  at least once every 8 ms. Any read, write, read-modify-write or  $\overline{\text{RAS}}$ -only cycle refreshes the addressed row.
2. Using a  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh cycle.  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh is activated by the falling edge of  $\overline{\text{RAS}}$ , while holding  $\overline{\text{CAS}}$  LOW. In  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh cycle, an internal 9-bit counter provides the row addresses and the external address inputs are ignored.

$\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  is a refresh-only mode and no data access or device selection is allowed. Thus, the output remains in the High-Z state during the cycle.

### Power-On

During Power-on,  $\overline{\text{RAS}}$ ,  $\overline{\text{CAS}}$ ,  $\overline{\text{UCAS}}$ ,  $\overline{\text{LCAS}}$ , and  $\overline{\text{WE}}$  must all track with  $V_{\text{DD}}$  (HIGH) to avoid current surges, and allow initialization to continue. An initial pause of 200  $\mu\text{s}$  is required followed by a minimum of eight initialization cycles (any combination of cycles containing a  $\overline{\text{RAS}}$  signal).

### ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

Symbol	Parameters	Rating	Unit	
V <sub>T</sub>	Voltage on Any Pin Relative to GND	5V	-1.0 to +7.0	V
		3.3V	-0.5 to +4.6	V
V <sub>DD</sub>	Supply Voltage	5V	-1.0 to +7.0	V
		3.3V	-0.5 to +4.6	V
I <sub>OUT</sub>	Output Current	50	mA	
P <sub>D</sub>	Power Dissipation	1	W	
T <sub>A</sub>	Operation Temperature	-40 to +85	°C	
T <sub>STG</sub>	Storage Temperature	-55 to +125	°C	

**Note:**

1. Stress greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

### RECOMMENDED OPERATING CONDITIONS (Voltages are referenced to GND)

Symbol	Parameter	Test Condition	Voltage	Min.	Typ.	Max.	Unit
V <sub>DD</sub>	Supply Voltage		5V	4.5	5.0	5.5	V
			3.3V	3.0	3.3	3.6	V
V <sub>IH</sub>	Input High Voltage		5V	2.4	—	V <sub>DD</sub> + 1.0	V
			3.3V	2.0	—	V <sub>DD</sub> + 0.3	V
V <sub>IL</sub>	Input Low Voltage		5V/3.3V	-0.3	—	0.8	V
I <sub>IL</sub>	Input Leakage Current	Any input 0V ≤ V <sub>IN</sub> ≤ V <sub>DD</sub> Other inputs not under test = 0V		-5		5	μA
I <sub>IO</sub>	Output Leakage Current	Output is disabled (Hi-Z) 0V ≤ V <sub>OUT</sub> ≤ V <sub>DD</sub>		-5		5	μA
V <sub>OH</sub>	Output High Voltage Level	I <sub>OH</sub> = -5.0 mA I <sub>OH</sub> = -2.0 mA	5V	2.4		—	V
			3.3V	2.4		—	
V <sub>OL</sub>	Output Low Voltage Level	I <sub>OL</sub> = +4.2 mA I <sub>OL</sub> = +2 mA	5V	—		0.4	V
			3.3V	—		0.4	

### CAPACITANCE<sup>(1,2)</sup>

Symbol	Parameter	Max.	Unit
C <sub>IN1</sub>	Input Capacitance: A0-A8	5	pF
C <sub>IN2</sub>	Input Capacitance: $\overline{\text{RAS}}$ , $\overline{\text{UCAS}}$ , $\overline{\text{LCAS}}$ , $\overline{\text{WE}}$ , $\overline{\text{OE}}$	7	pF
C <sub>IO</sub>	Data Input/Output Capacitance: I/O0-I/O15	7	pF

**Notes:**

1. Tested initially and after any design or process changes that may affect these parameters.
2. Test conditions: T<sub>A</sub> = 25°C, f = 1 MHz, V<sub>DD</sub> = 3.3V ± 10%.

**ELECTRICAL CHARACTERISTICS<sup>(1)</sup>** (Recommended Operation Conditions unless otherwise noted.)

Symbol	Parameter	Test Condition	V <sub>DD</sub>	Max.	Unit
I <sub>DD1</sub>	Stand-by Current: TTL	$\overline{RAS}, \overline{LCAS}, \overline{UCAS} \geq V_{IH}$	5V	2	mA
			3.3V	2	mA
I <sub>DD2</sub>	Stand-by Current: CMOS	RAS, LCAS, UCAS $\geq V_{DD} - 0.2V$	5V	1	mA
			3.3V	1	mA
I <sub>DD3</sub>	Operating Current: Random Read/Write <sup>(2,3,4)</sup> Average Power Supply Current	$\overline{RAS}, \overline{LCAS}, \overline{UCAS}$ , Address Cycling, $t_{RC} = t_{RC}(\text{min.})$	5V	150	mA
			3.3V	90	mA
I <sub>DD4</sub>	Operating Current: Fast Page Mode <sup>(2,3,4)</sup> Average Power Supply Current	$\overline{RAS} = V_{IL}, \overline{LCAS}, \overline{UCAS}$ , Cycling $t_{PC} = t_{PC}(\text{min.})$	5V	60	mA
			3.3V	30	mA
I <sub>DD5</sub>	Refresh Current: $\overline{RAS}$ -Only <sup>(2,3)</sup> Average Power Supply Current	$\overline{RAS}$ Cycling, $\overline{LCAS}, \overline{UCAS} \geq V_{IH}$ $t_{RC} = t_{RC}(\text{min.})$	5V	90	mA
			3.3V	60	mA
I <sub>DD6</sub>	Refresh Current: CBR <sup>(2,3,5)</sup> Average Power Supply Current	$\overline{RAS}, \overline{LCAS}, \overline{UCAS}$ Cycling $t_{RC} = t_{RC}(\text{min.})$	5V	90	mA
			3.3V	60	mA

**Notes:**

1. An initial pause of 200  $\mu\text{s}$  is required after power-up followed by eight  $\overline{RAS}$  refresh cycles ( $\overline{RAS}$ -Only or CBR) before proper device operation is assured. The eight  $\overline{RAS}$  cycles wake-up should be repeated any time the  $t_{REF}$  refresh requirement is exceeded.
2. Dependent on cycle rates.
3. Specified values are obtained with minimum cycle time and the output open.
4. Column-address is changed once each fast page cycle.
5. Enables on-chip refresh and address counters.

**AC TEST CONDITIONS**

Output load: Two TTL Loads and 100 pF ( $V_{DD} = 5.0V \pm 10\%$ )  
 One TTL Load and 50 pF ( $V_{DD} = 3.3V \pm 10\%$ )

Input timing reference levels:  $V_{IH} = 2.4V$ ,  $V_{IL} = 0.8V$  ( $V_{DD} = 5.0V \pm 10\%$ );  
 $V_{IH} = 2.0V$ ,  $V_{IL} = 0.8V$  ( $V_{DD} = 3.3V \pm 10\%$ )

Output timing reference levels:  $V_{OH} = 2.4V$ ,  $V_{OL} = 0.4V$  ( $V_{DD} = 5V \pm 10\%$ ,  $3.3V \pm 10\%$ )

**Notes:**

1. An initial pause of 200  $\mu$ s is required after power-up followed by eight  $\overline{\text{RAS}}$  refresh cycle ( $\overline{\text{RAS}}$ -Only or CBR) before proper device operation is assured. The eight  $\overline{\text{RAS}}$  cycles wake-up should be repeated any time the  $t_{\text{REF}}$  refresh requirement is exceeded.
2.  $V_{\text{IH}}$  (MIN) and  $V_{\text{IL}}$  (MAX) are reference levels for measuring timing of input signals. Transition times, are measured between  $V_{\text{IH}}$  and  $V_{\text{IL}}$  (or between  $V_{\text{IL}}$  and  $V_{\text{IH}}$ ) and assume to be 1 ns for all inputs.
3. In addition to meeting the transition rate specification, all input signals must transit between  $V_{\text{IH}}$  and  $V_{\text{IL}}$  (or between  $V_{\text{IL}}$  and  $V_{\text{IH}}$ ) in a monotonic manner.
4. If  $\overline{\text{CAS}}$  and  $\overline{\text{RAS}} = V_{\text{IH}}$ , data output is High-Z.
5. If  $\overline{\text{CAS}} = V_{\text{IL}}$ , data output may contain data from the last valid READ cycle.
6. Measured with a load equivalent to one TTL gate and 50 pF.
7. Assumes that  $t_{\text{RCD}} \leq t_{\text{RCD}}$  (MAX). If  $t_{\text{RCD}}$  is greater than the maximum recommended value shown in this table,  $t_{\text{RAC}}$  will increase by the amount that  $t_{\text{RCD}}$  exceeds the value shown.
8. Assumes that  $t_{\text{RCD}} \geq t_{\text{RCD}}$  (MAX).
9. If  $\overline{\text{CAS}}$  is LOW at the falling edge of  $\overline{\text{RAS}}$ , data out will be maintained from the previous cycle. To initiate a new cycle and clear the data output buffer,  $\overline{\text{CAS}}$  and  $\overline{\text{RAS}}$  must be pulsed for  $t_{\text{CP}}$ .
10. Operation with the  $t_{\text{RCD}}$  (MAX) limit ensures that  $t_{\text{RAC}}$  (MAX) can be met.  $t_{\text{RCD}}$  (MAX) is specified as a reference point only; if  $t_{\text{RCD}}$  is greater than the specified  $t_{\text{RCD}}$  (MAX) limit, access time is controlled exclusively by  $t_{\text{CAC}}$ .
11. Operation within the  $t_{\text{RAD}}$  (MAX) limit ensures that  $t_{\text{RCD}}$  (MAX) can be met.  $t_{\text{RAD}}$  (MAX) is specified as a reference point only; if  $t_{\text{RAD}}$  is greater than the specified  $t_{\text{RAD}}$  (MAX) limit, access time is controlled exclusively by  $t_{\text{AA}}$ .
12. Either  $t_{\text{RCH}}$  or  $t_{\text{RRH}}$  must be satisfied for a READ cycle.
13.  $t_{\text{OFF}}$  (MAX) defines the time at which the output achieves the open circuit condition; it is not a reference to  $V_{\text{OH}}$  or  $V_{\text{OL}}$ .
14.  $t_{\text{WCS}}$ ,  $t_{\text{RWD}}$ ,  $t_{\text{AWD}}$  and  $t_{\text{CWD}}$  are restrictive operating parameters in LATE WRITE and READ-MODIFY-WRITE cycle only. If  $t_{\text{WCS}} \geq t_{\text{WCS}}$  (MIN), the cycle is an EARLY WRITE cycle and the data output will remain open circuit throughout the entire cycle. If  $t_{\text{RWD}} \geq t_{\text{RWD}}$  (MIN),  $t_{\text{AWD}} \geq t_{\text{AWD}}$  (MIN) and  $t_{\text{CWD}} \geq t_{\text{CWD}}$  (MIN), the cycle is a READ-WRITE cycle and the data output will contain data read from the selected cell. If neither of the above conditions is met, the state of I/O (at access time and until  $\overline{\text{CAS}}$  and  $\overline{\text{RAS}}$  or  $\overline{\text{OE}}$  go back to  $V_{\text{IH}}$ ) is indeterminate.  $\overline{\text{OE}}$  held HIGH and  $\overline{\text{WE}}$  taken LOW after  $\overline{\text{CAS}}$  goes LOW result in a LATE WRITE ( $\overline{\text{OE}}$ -controlled) cycle.
15. Output parameter (I/O) is referenced to corresponding  $\overline{\text{CAS}}$  input, I/O0-I/O7 by  $\overline{\text{LCAS}}$  and I/O8-I/O15 by  $\overline{\text{UCAS}}$ .
16. During a READ cycle, if  $\overline{\text{OE}}$  is LOW then taken HIGH before  $\overline{\text{CAS}}$  goes HIGH, I/O goes open. If  $\overline{\text{OE}}$  is tied permanently LOW, a LATE WRITE or READ-MODIFY-WRITE is not possible.
17. Write command is defined as  $\overline{\text{WE}}$  going low.
18. LATE WRITE and READ-MODIFY-WRITE cycles must have both  $t_{\text{OD}}$  and  $t_{\text{OEH}}$  met ( $\overline{\text{OE}}$  HIGH during WRITE cycle) in order to ensure that the output buffers will be open during the WRITE cycle. The I/Os will provide the previously written data if  $\overline{\text{CAS}}$  remains LOW and  $\overline{\text{OE}}$  is taken back to LOW after  $t_{\text{OEH}}$  is met.
19. The I/Os are in open during READ cycles once  $t_{\text{OD}}$  or  $t_{\text{OFF}}$  occur.
20. The first  $\chi\overline{\text{CAS}}$  edge to transition LOW.
21. The last  $\chi\overline{\text{CAS}}$  edge to transition HIGH.
22. These parameters are referenced to  $\overline{\text{CAS}}$  leading edge in EARLY WRITE cycles and  $\overline{\text{WE}}$  leading edge in LATE WRITE or READ-MODIFY-WRITE cycles.
23. Last falling  $\chi\overline{\text{CAS}}$  edge to first rising  $\chi\overline{\text{CAS}}$  edge.
24. Last rising  $\chi\overline{\text{CAS}}$  edge to next cycle's last rising  $\chi\overline{\text{CAS}}$  edge.
25. Last rising  $\chi\overline{\text{CAS}}$  edge to first falling  $\chi\overline{\text{CAS}}$  edge.
26. Each  $\chi\overline{\text{CAS}}$  must meet minimum pulse width.
27. Last  $\chi\overline{\text{CAS}}$  to go LOW.
28. I/Os controlled, regardless  $\overline{\text{UCAS}}$  and  $\overline{\text{LCAS}}$ .
29. The 3 ns minimum is a parameter guaranteed by design.
30. Enables on-chip refresh and address counters.

FAST-PAGE-MODE READ CYCLE

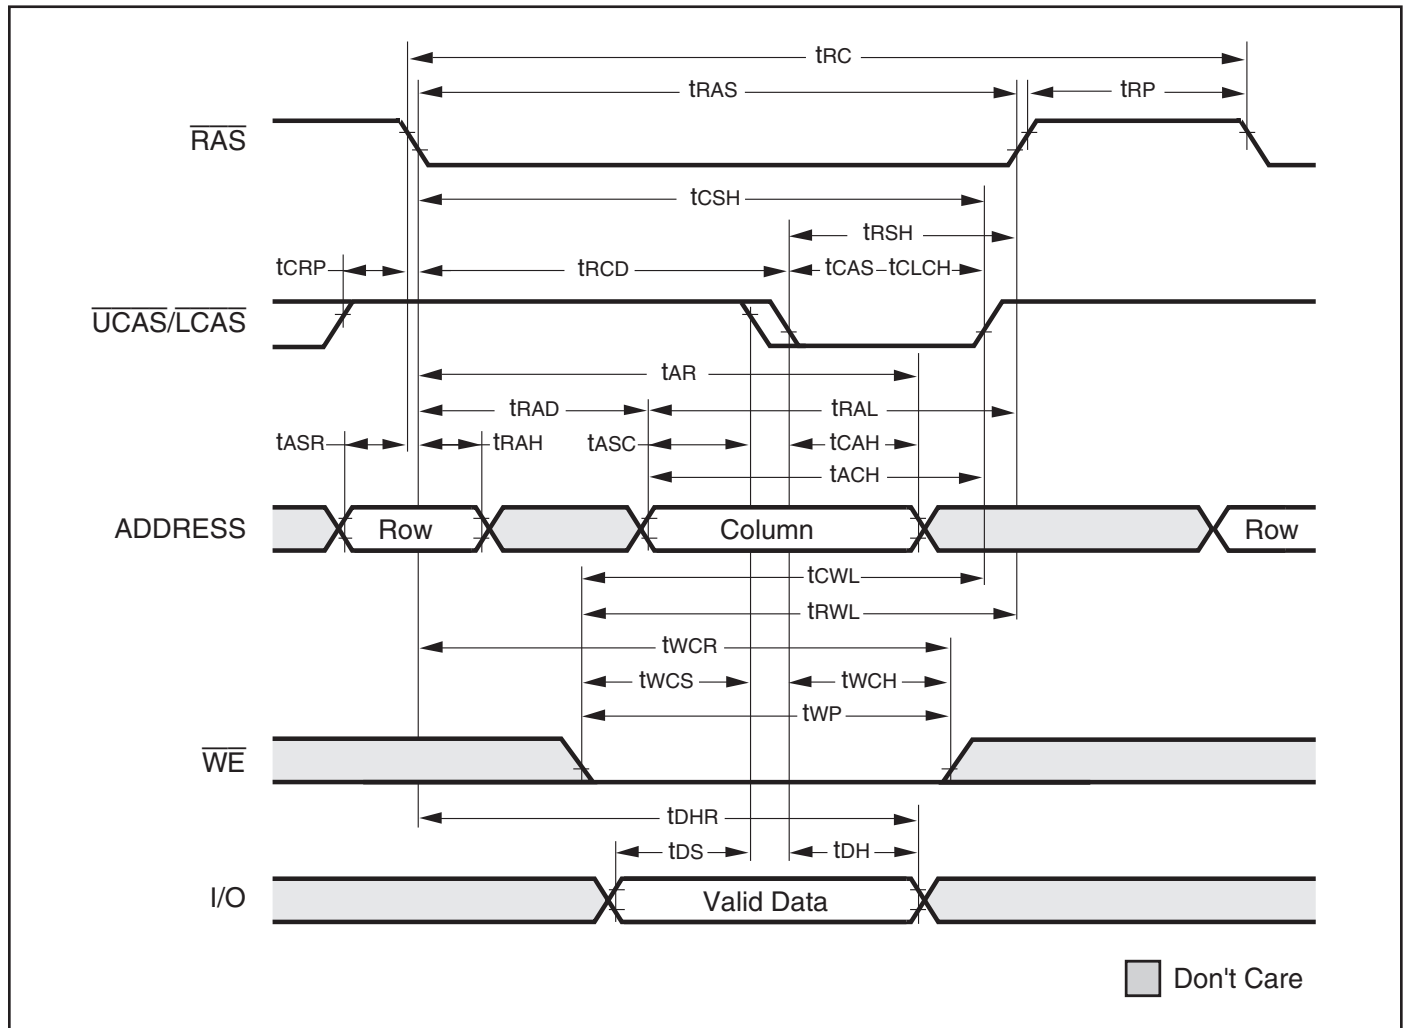

**Note:**  
1.  $t_{OFF}$  is referenced from rising edge of  $\overline{CAS}$ .

FAST PAGE MODE READ-MODIFY-WRITE CYCLE

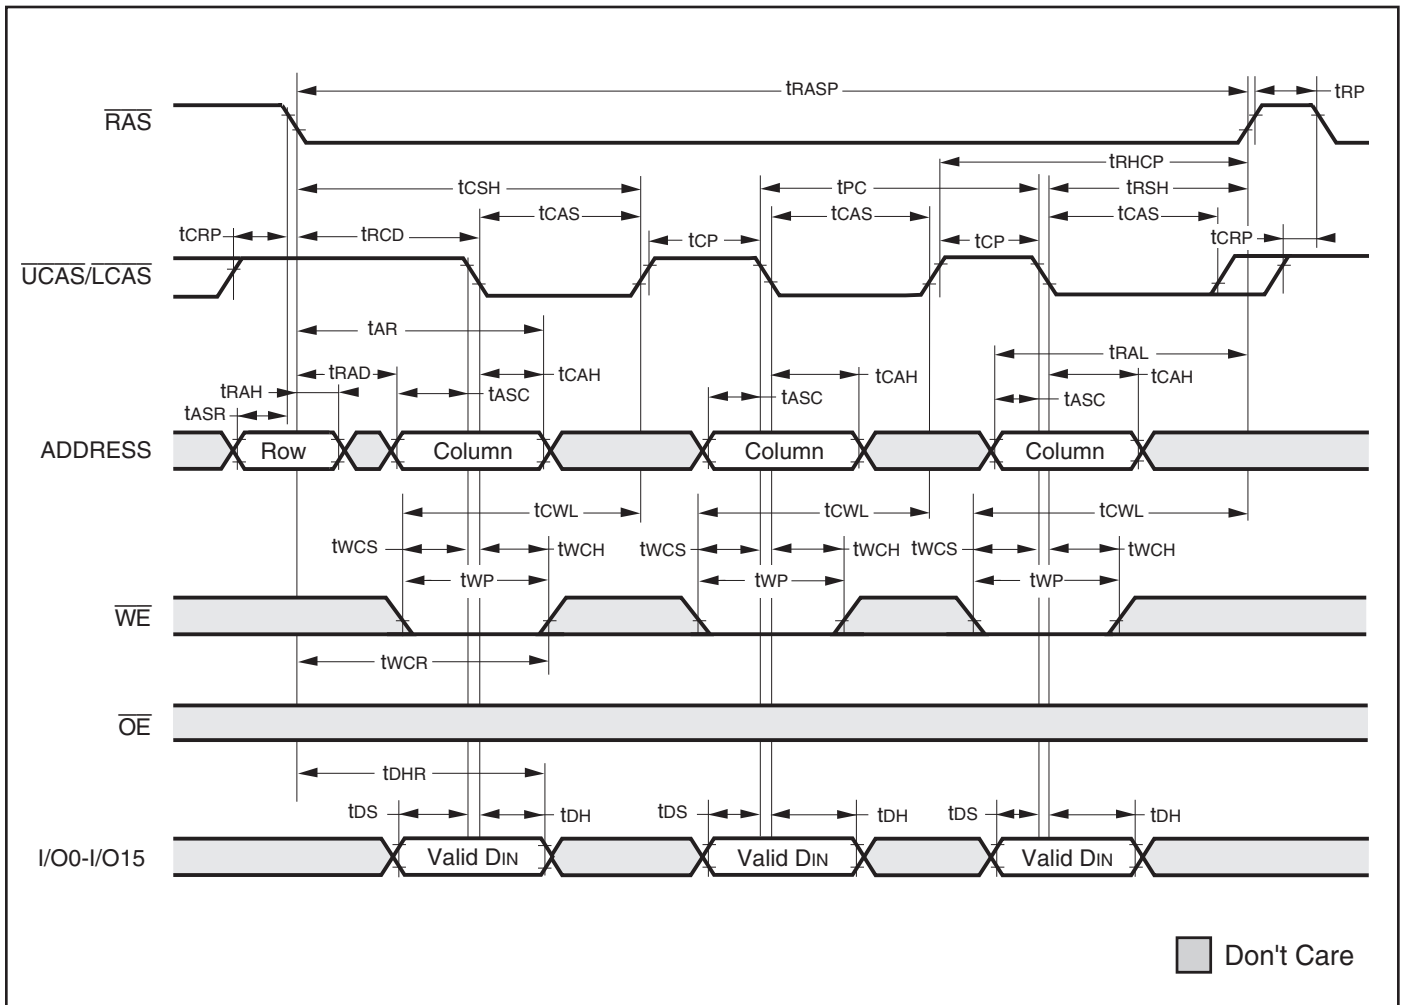

FAST-PAGE-MODE EARLY WRITE CYCLE ( $\overline{OE}$  = DON'T CARE)

**FAST-PAGE-MODE READ WRITE CYCLE (LATE WRITE and READ-MODIFY-WRITE Cycles)**

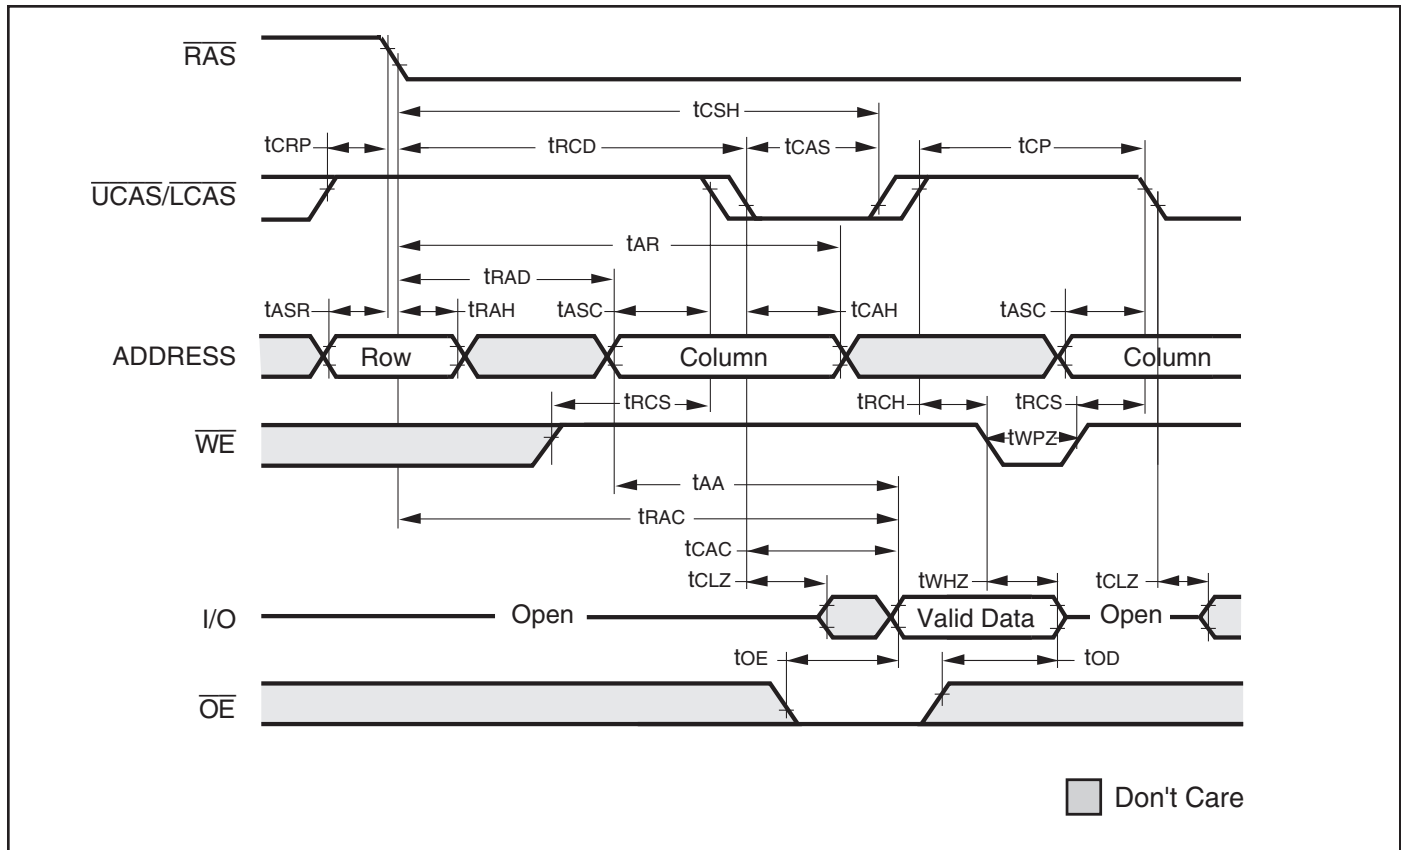

FAST PAGE MODE EARLY WRITE CYCLE

AC WAVEFORMS

READ CYCLE (With  $\overline{WE}$ -Controlled Disable)

RAS-ONLY REFRESH CYCLE ( $\overline{OE}$ ,  $\overline{WE}$  = DON'T CARE)

**$\overline{\text{C}}\text{BR}$  REFRESH CYCLE** (Addresses;  $\overline{\text{O}}\text{E}$  = DON'T CARE)

**HIDDEN REFRESH CYCLE<sup>(1)</sup>** ( $\overline{\text{W}}\text{E}$  = HIGH;  $\overline{\text{O}}\text{E}$  = LOW)

**Notes:**

1. A Hidden Refresh may also be performed after a Write Cycle. In this case,  $\overline{\text{W}}\text{E}$  = LOW and  $\overline{\text{O}}\text{E}$  = HIGH.
2.  $t_{\text{OFF}}$  is referenced from rising edge of  $\overline{\text{R}}\text{AS}$  or  $\overline{\text{C}}\text{AS}$ , whichever occurs last.

**ORDERING INFORMATION: 5V**

**Industrial Range: -40°C to +85°C**

---

Speed (ns)	Order Part No.	Package
35	IS41C16257C-35TLI	400-mil TSOP (Type II), Lead-free

---

**ORDERING INFORMATION: 3.3V**

**Industrial Range: -40°C to +85°C**

---

Speed (ns)	Order Part No.	Package
35	IS41LV16257C-35TLI	400-mil TSOP (Type II), Lead-free

---

**Note:**

1. The -35 speed option supports 35ns and 60ns timing specifications.
2. Contact ISSI for leaded package availability.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
