1 i.MX 8M Mini introduction

The i.MX 8M Mini applications processor represents NXP's latest video and audio experience combining state-of-the-art media-specific features with high-performance processing while optimized for lowest power consumption.

The i.MX 8M Mini family of processors features advanced implementation of a quad Arm® Cortex®-A53 core, which operates at speeds of up to 1.8 GHz. A general purpose Cortex®-M4 400 MHz core processor is for low-power processing. The DRAM controller supports 32-bit/16-bit LPDDR4, DDR4, and DDR3L memory. A wide range of audio interfaces are available, including I2S, AC97, TDM, and S/PDIF. There are a number of other interfaces for connecting peripherals, such as USB, PCIe, and Ethernet.

2 Modules list

The i.MX 8M Mini family of processors contains a variety of digital and analog modules. [Table 3](#) describes these modules in alphabetical order.

Table 3. i.MX 8M Mini modules list

| Block mnemonic | Block name | Brief description |
|---|---|--|
| 32k Oscillator | Clock system | 32 KHz oscillator is used as the clock source for RTC and internal low speed clock. It can be supplied by external 32.768 KHz oscillator. |
| APBH-DMA | NAND Flash and BCH ECC DMA Controller | DMA controller used for GPMI2 operation. |
| Arm | Arm Platform | The Arm Core Platform includes a quad Cortex-A53 core and a Cortex-M4 core. The Cortex-A53 core includes associated sub-blocks, such as the Level 2 Cache Controller, Snoop Control Unit (SCU), General Interrupt Controller (GIC), private timers, watchdog, and CoreSight debug modules. The Cortex-M4 core is used as a customer microcontroller. |
| BCH | Binary-BCH ECC Processor | The BCH module provides up to 62-bit ECC encryption/decryption for NAND Flash controller (GPMI) |
| CAAM | Cryptographic accelerator and assurance module | CAAM is a cryptographic accelerator and assurance module. CAAM implements several encryption and hashing functions, a run-time integrity checker, entropy source generator, and a Pseudo Random Number Generator (PRNG). The PRNG is certifiable by the Cryptographic Algorithm Validation Program (CAVP) of the National Institute of Standards and Technology (NIST). CAAM also implements a Secure Memory mechanism. In i.MX 8M Mini processors, the secure memory provided is 32 KB. |
| CCM GPC SRC | Clock Control Module, General Power Controller, System Reset Controller | These modules are responsible for clock and reset distribution in the system, and also for the system power management. |
| CSU | Central Security Unit | The Central Security Unit (CSU) is responsible for setting comprehensive security policy within the i.MX 8M Mini platform. |
| CTI-0 CTI-1 CTI-2 CTI-3 CTI-4 | Cross Trigger Interface | Cross Trigger Interface (CTI) allows cross-triggering based on inputs from masters attached to CTIs. The CTI module is internal to the Cortex-A53 core platform. |
| DAP | Debug Access Port | The DAP provides real-time access for the debugger without halting the core to access: <ul style="list-style-type: none"> • System memory and peripheral registers • All debug configuration registers The DAP also provides debugger access to JTAG scan chains. |
| DDRC | Double Data Rate Controller | The DDR Controller has the following features: <ul style="list-style-type: none"> • Supports 32/16-bit LPDDR4 (up to 1.5 GHz), DDR4-2400, and DDR3L-1600 • Supports up to 8 Gbyte DDR memory space |
| eCSPI1 eCSPI2 eCSPI3 | Configurable SPI | Full-duplex enhanced Synchronous Serial Interface, with data rate up to 52 Mbit/s. Configurable to support Master/Slave modes, four chip selects to support multiple peripherals. |

Table 3. i.MX 8M Mini modules list (continued)

| Block mnemonic | Block name | Brief description |
|--|----------------------------------|---|
| ENET1 | Ethernet Controller | The Ethernet Media Access Controller (MAC) is designed to support 10/100/1000 Mbps Ethernet/IEEE 802.3 networks. An external transceiver interface and transceiver function are required to complete the interface to the media. The module has dedicated hardware to support the IEEE 1588 standard. See the ENET chapter of the <i>i.MX 8M Mini Applications Processor Reference Manual (IMX8MMRM)</i> for details. |
| FlexSPI | FlexSPI | The FlexSPI module acts as an interface to external serial flash devices. This module contains the following features: <ul style="list-style-type: none"> • Flexible sequence engine to support various flash vendor devices • Single pad/Dual pad/Quad pad mode of operation • Single Data Rate/Double Data Rate mode of operation • Parallel Flash mode • DMA support • Memory mapped read access to connected flash devices • Multi master access with priority and flexible and configurable buffer for each master |
| GIC | Generic Interrupt Controller | The GIC handles all interrupts from the various subsystems and is ready for virtualization. |
| GPIO1 GPIO2 GPIO3 GPIO4 GPIO5 | General Purpose I/O Modules | Used for general purpose input/output to external ICs. Each GPIO module supports up to 32 bits of I/O. |
| GPMI | General Purpose Memory Interface | The GPMI module supports up to 8x NAND devices and 62-bit ECC encryption/decryption for NAND Flash Controller (GPMI2). GPMI supports separate DMA channels for each NAND device. |
| GPT1 GPT2 GPT3 GPT4 GPT5 GPT6 | General Purpose Timer | Each GPT is a 32-bit “free-running” or “set-and-forget” mode timer with programmable prescaler and compare and capture register. A timer counter value can be captured using an external event and can be configured to trigger a capture event on either the leading or trailing edges of an input pulse. When the timer is configured to operate in “set-and-forget” mode, it is capable of providing precise interrupts at regular intervals with minimal processor intervention. The counter has output compare logic to provide the status and interrupt at comparison. This timer can be configured to run either on an external clock or on an internal clock. |
| GPU3D | Graphics Processing Unit-3D | The GPU3D provides hardware acceleration for 3D graphics algorithms with sufficient processor power to run desktop quality interactive graphics applications on displays. |
| I2C1 I2C2 I2C3 I2C4 | I ² C Interface | I ² C provides serial interface for external devices. Data rates of up to 320 kbps are supported. |
| IOMUXC | IOMUX Control | This module enables flexible I/O multiplexing. Each IO pad has a default as well as several alternate functions. The alternate functions are software configurable. |

Table 3. i.MX 8M Mini modules list (continued)

| Block mnemonic | Block name | Brief description |
|--------------------------------------|-------------------------------|---|
| MIPI CSI2 (four-lane) | MIPI Camera Serial Interface | This module provides one four-lane MIPI camera serial interfaces, which operates up to a maximum bit rate of 1.5 Gbps. |
| MIPI DSI (four-lane) | MIPI Display Serial Interface | This module provides a four-lane MIPI display serial interface operating up to a maximum bit rate of 1.5 Gbps. |
| OCOTP_CTRL | OTP Controller | The On-Chip OTP controller (OCOTP_CTRL) provides an interface for reading, programming, and/or overriding identification and control information stored in on-chip fuse elements. The module supports electrically programmable poly fuses (eFUSEs). The OCOTP_CTRL also provides a set of volatile software-accessible signals that can be used for software control of hardware elements, not requiring non volatility. The OCOTP_CTRL provides the primary user-visible mechanism for interfacing with on-chip fuse elements. Among the uses for the fuses are unique chip identifiers, mask revision numbers, cryptographic keys, JTAG secure mode, boot characteristics, and various control signals requiring permanent non volatility. |
| OCRAM | On-Chip Memory controller | The On-Chip Memory controller (OCRAM) module is designed as an interface between the system's AXI bus and the internal (on-chip) SRAM memory module. In i.MX 8M Mini processors, the OCRAM is used for controlling the 256 KB multimedia RAM through a 64-bit AXI bus. |
| PCIe1 | PCI Express 2.0 | The PCIe IP provides PCI Express Gen 2.0 functionality. |
| PDM | Pulse Density Modulation | The PDM supports up to 8-channels (4 lanes). |
| PMU | Power Management Unit | Integrated power management unit. Used to provide power to various SoC domains. |
| PWM1 PWM2 PWM3 PWM4 | Pulse Width Modulation | The pulse-width modulator (PWM) has a 16-bit counter and is optimized to generate sound from stored sample audio images. It can also generate tones. It uses 16-bit resolution and a 4x16 data FIFO to generate sound. |
| SAI1 SAI2 SAI3 SAI5 SAI6 | Synchronous Audio Interface | The SAI module provides a synchronous audio interface (SAI) that supports full duplex serial interfaces with frame synchronization, such as I2S, AC97, TDM, and codec/DSP interfaces. |

Table 3. i.MX 8M Mini modules list (continued)

| Block mnemonic | Block name | Brief description |
|----------------|--|---|
| SDMA | Smart Direct Memory Access | <p>The SDMA is a multichannel flexible DMA engine. It helps in maximizing system performance by offloading the various cores in dynamic data routing. It has the following features:</p> <ul style="list-style-type: none"> • Powered by a 16-bit Instruction-Set micro-RISC engine • Multi channel DMA supporting up to 32 time-division multiplexed DMA channels • 48 events with total flexibility to trigger any combination of channels • Memory accesses including linear, FIFO, and 2D addressing • Shared peripherals between Arm and SDMA • Very fast Context-Switching with 2-level priority based preemptive multi tasking • DMA units with auto-flush and prefetch capability • Flexible address management for DMA transfers (increment, decrement, and no address changes on source and destination address) • DMA ports can handle unidirectional and bidirectional flows (Copy mode) • Up to 8-word buffer for configurable burst transfers for EMIv2.5 • Support of byte-swapping and CRC calculations • Library of Scripts and API is available |
| SJC | Secure JTAG Controller | <p>The SJC provides JTAG interface (designed to be compatible with JTAG TAP standards) to internal logic. The i.MX 8M Mini family of processors uses JTAG port for production, testing, and system debugging. Additionally, the SJC provides BSR (Boundary Scan Register) standard support, designed to be compatible with IEEE 1149.1 and IEEE 1149.6 standards.</p> <p>The JTAG port must be accessible during platform initial laboratory bring-up, for manufacturing tests and troubleshooting, as well as for software debugging by authorized entities. The i.MX 8M Mini SJC incorporates three security modes for protecting against unauthorized accesses. Modes are selected through eFUSE configuration.</p> |
| SNVS | Secure Non-Volatile Storage | Secure Non-Volatile Storage, including Secure Real Time Clock, Security State Machine, Master Key Control, and Violation/Tamper Detection and reporting. |
| SPDIF1 | Sony Philips Digital Interconnect Format | A standard audio file transfer format, developed jointly by the Sony and Phillips corporations. It supports Transmitter and Receiver functionality. |
| TEMPSENSOR | Temperature Sensor | Temperature sensor |
| TZASC | Trust-Zone Address Space Controller | The TZASC (TZC-380 by Arm) provides security address region control functions required for intended application. It is used on the path to the DRAM controller. |

|----------------------------------|--|--|
| UART1 UART2 UART3 UART4 | UART Interface | Each of the UARTv2 modules supports the following serial data transmit/receive protocols and configurations: <ul style="list-style-type: none"> • 7- or 8-bit data words, 1 or 2 stop bits, programmable parity (even, odd, or none) • Programmable baud rates up to 4 Mbps. This is a higher max baud rate relative to the 1.875 MHz, which is stated by the TIA/EIA-232-F standard. • 32-byte FIFO on Tx and 32 half-word FIFO on Rx supporting auto-baud |
| uSDHC1 uSDHC2 uSDHC3 | SD/MMC and SDXC Enhanced Multi-Media Card / Secure Digital Host Controller | i.MX 8M Mini SoC characteristics: All the MMC/SD/SDIO controller IPs are based on the uSDHC IP. They are designed to support: <ul style="list-style-type: none"> • SD/SDIO standard, up to version 3.0. • MMC standard, up to version 5.1. • 1.8 V and 3.3 V operation, but do not support 1.2 V operation. • 1-bit/4-bit SD and SDIO modes, 1-bit/4-bit/8-bit MMC mode. Two uSDHC controllers (SDHC1 and SDHC3) can support up to an 8-bit interface, the other controller (SDHC2) can only support up to a 4-bit interface. |
| USB1 USB2 | 2x USB 2.0 controllers and PHYs | Two USB controllers and PHYs that support USB 2.0. Each USB instance contains: <ul style="list-style-type: none"> • USB 2.0 core, which can operate in 2.0 mode |
| VPU | Video Processing Unit | A high performing video processing unit (VPU), which covers many SD-level and HD-level video decoders. See the <i>i.MX 8M Mini Applications Processor Reference Manual (IMX8MMRM)</i> for a complete list of the VPU's decoding and encoding capabilities. |
| WDOG1 WDOG2 WDOG3 | Watchdog | The watchdog (WDOG) timer supports two comparison points during each counting period. Each of the comparison points is configurable to evoke an interrupt to the Arm core, and a second point evokes an external event on the WDOG line. |
| XTALOSC | Crystal Oscillator interface | The XTALOSC module enables connectivity to an external crystal oscillator device. In a typical application use case, it is used for a 24 MHz oscillator. |

2.1 Recommended connections for unused input/output

If a function of the i.MX 8M Mini is not in use, the I/Os and power rails of that function can be terminated to reduce overall board power.

3.1.2 Thermal resistance

3.1.2.1 FCBGA package thermal resistance

Table 8 displays the FCBGA package thermal resistance data.

Table 8. Thermal resistance data

| Rating | Test conditions | Symbol | Value | Unit | Notes |
|---|-------------------------|------------------|-------|------|---------|
| Junction to Ambient Natural Convection | Single layer board (1s) | $R_{\theta JA}$ | 30 | °C/W | 1, 2 |
| Junction to Ambient Natural Convection | Four layer board (2s2p) | $R_{\theta JA}$ | 22.9 | °C/W | 1, 2, 3 |
| Junction to Ambient (@200 ft/min) | Single layer board (1s) | $R_{\theta JMA}$ | 24 | °C/W | 1, 3 |
| Junction to Ambient (@200 ft/min) | Four layer board (2s2p) | $R_{\theta JMA}$ | 18.5 | °C/W | 1, 3 |
| Junction to Board | — | $R_{\theta JB}$ | 7.8 | °C/W | 4 |
| Junction to Case | — | $R_{\theta JC}$ | 4 | °C/W | 5 |
| Junction to Package Top | Natural Convection | Ψ_{JT} | 0.2 | °C/W | 6 |

¹ Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.

² Per SEMI G38-87 and JESD51-2 with the single layer board horizontal.

³ Per JEDEC JESD51-6 with the board horizontal.

⁴ Thermal resistance between the die and printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

⁵ Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).

⁶ Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

3.1.3 Operating ranges

Table 9 provides the operating ranges of the i.MX 8M Mini applications processor. For details on the chip's power structure, see the “Power Management Unit (PMU)” chapter of the *i.MX 8M Mini Applications Processor Reference Manual (IMX8MMRM)*.

¹ The BD71847MWW PMIC does not support 0.950 V for VDD_GPU, VDD_VPU, and VDD_DRAM. For this PMIC, 0.975 V typical is acceptable and supported.

² Applying the maximum voltage results in maximum power consumption and heat generation. A voltage set point = (Vmin + the supply tolerance) is recommended. This results in an optimized power/speed ratio.

³ 50% duty cycle for 5 years

⁴ Booting VDD_SOC at 0.800 V ±5% is acceptable (Vmin = 0.760 V). Software is expected to program the VDD_SOC voltage to the typical value in this table prior to first DRAM memory access.

⁵ Ensure the VDD_PCI_1P8 does not have more than 40 mVpp AC power supply noise superimposed on the high power supply voltage for the PHY core (1.8 V nominal DC value). Simultaneously, the VDD_PCI_0P8 should have no more than 20 mVpp AC power supply noise superimposed on the low power supply voltage for the PHY core (0.9 V nominal DC value for the overdrive).

⁶ It can be min 0.78 V when supplied but not operating PCIe.

⁷ "EN" of TMU Enable Register (TMU_TER) is required to be always enabled for the part to operate correctly.

3.1.4 External clock sources

Each i.MX 8M Mini processor has two external input system clocks: a low frequency (RTC_XTALI) and a high frequency (XTALI).

The RTC_XTALI is used for low-frequency functions. It supplies the clock for wake-up circuit, power-down real time clock operation, and slow system and watch-dog counters. The clock input can only be connected to an external oscillator. RTC_XTALO should be directly connected to VDD_SNVS_0P8.

The system clock input XTALI is used to generate the main system clock. It supplies the PLLs and other peripherals. The system clock input can be connected to either an external oscillator or a crystal using internal oscillator amplifier.

Table 10 shows the interface frequency requirements.

Table 10. External input clock frequency

| Parameter Description | Symbol | Min | Typ | Max | Unit |
|-----------------------------------|------------|-----|---------------------|-----|------|
| RTC_XTALI Oscillator ¹ | f_{ckil} | — | 32.768 ² | — | kHz |
| XTALI Oscillator ^{1,3} | f_{xtal} | | 24 | | MHz |

¹ The required frequency stability of this clock source is application dependent.

² Recommended nominal frequency 32.768 kHz.

³ External oscillator or a fundamental frequency crystal appropriately coupled to the internal oscillator amplifier.

The typical values shown in Table 10 are required for use with NXP software to ensure precise time keeping and USB operation. For RTC_XTALI operation, an external oscillator is necessary. RTC_XTALO should be directly connected to VDD_SNVS_0P8 when using an external 32.768 kHz oscillator.

NOTE

There is no internal RC oscillator.

Table 11 shows the external input clock for OSC32K.

Table 11. External input clock for OSC32K

| | Symbol | Min | Typ | Max | Unit |

| | VIL | 0 | — | 0.3 x NVCC_SNVS_1P8 | V |

3.1.5 Maximum supply currents

Power consumption is highly dependent on the application. Estimating the maximum supply currents required for power supply design is difficult because the use cases that requires maximum supply current is not a realistic use cases.

Electrical characteristics

To help illustrate the effect of the application on power consumption, data was collected while running consumer standard benchmarks that are designed to be compute and graphic intensive. The results provided are intended to be used as guidelines for power supply design.

Table 12. Maximum supply currents

| Power rail | Max current | Unit |
|------------------------------|--|------|
| VDD_ARM | 2200 | mA |
| VDD_SOC | 1000 | mA |
| VDD_GPU | 500 | mA |

| NVCC_SNVS_1P8 | 3 | mA |
| NVCC_<XXX> | $I_{max} = N \times C \times V \times (0.5 \times F)$ Where: N—Number of IO pins supplied by the power line C—Equivalent external capacitive load V—IO voltage (0.5 x F)—Data change rate. Up to 0.5 of the clock rate (F). In this equation, I_{max} is in Amps, C in Farads, V in Volts, and F in Hertz. | |
| NVCC_DRAM | | |
| DRAM_VFEF | 10 | mA |

3.1.6 Power modes

The i.MX 8M Mini processors support the following power modes:

- **RUN Mode:** All external power rails are on, CPU is active and running; other internal modules can be on/off based on application.
- **IDLE Mode:** When there is no thread running and all high-speed devices are not active, the CPU can automatically enter this mode. The CPU can be in the power-gated state but with L2 data retained, DRAM and the bus clock are reduced. Most of the internal logic is clock gated but still remains powered. The M4 core can remain running. Compared with RUN mode, all the external power rails from the PMIC remain the same, and most of the modules still remain in their state.
- **SUSPEND Mode:** The most efficient power saving mode where all the clocks are off and all the unnecessary power supplies are off.
- **SNVS Mode:** This mode is also called RTC mode. Only the power for the SNVS domain remains on to keep RTC and SNVS logic alive.
- **OFF Mode:** All power rails are off.

Table 13. Chip power in different LP mode

| Mode | Supply | Max. ¹ | Unit |
|---------|-----------------------|-------------------|------|

3.2 Power supplies requirements and restrictions

The system design must comply with power-up sequence, power-down sequence, and steady state guidelines as described in this section to guarantee the reliable operation of the device. Any deviation from these sequences may result in the following situations:

- Excessive current during power-up phase
- Prevention of the device from booting
- Irreversible damage to the processor (worst-case scenario)

3.2.1 Power-up sequence

Figure 5 illustrates the power-up sequence of i.MX 8M Mini processor.

Figure 3. The power-up sequence

Electrical characteristics

Table 16 represents the timing parameters of the power-up sequence.

3.4 On-chip oscillators

3.4.1 OSC24M

A 24 MHz oscillator is used as the primary clock source for the PLLs to generate the clock for the CPU, BUS, and high-speed interfaces. For fractional PLLs, the 24 MHz clock from the oscillator can be used as the PLL reference clock directly.

3.5.1 DDR I/O DC electrical characteristics

The DDR I/O pads support LPDDR 4, DDR4, and DDR3L operational modes. The DDR Memory Controller (DDRMC) is designed to be compatible with JEDEC-compliant SDRAMs.

DDRMC operation is contingent upon the board's DDR design adherence to the DDR design and layout requirements stated in the hardware development guide for the i.MX 8M Mini applications processor.

3.6 I/O AC parameters

This section includes the AC parameters of the following I/O types:

- General Purpose I/O (GPIO)

The GPIO load circuit and output transition time waveforms are shown in [Figure 5](#) and [Figure 6](#).

3.7 Output buffer impedance parameters

This section defines the I/O impedance parameters of the i.MX 8M Mini family of processors for the following I/O types:

NOTE

DDR I/O output driver impedance is measured with “long” transmission line of impedance Z_{tl} attached to I/O pad and incident wave launched into transmission line. R_{pu}/R_{pd} and Z_{tl} form a voltage divider that defines specific voltage of incident wave relative to OVDD. Output driver impedance is calculated from this voltage divider (see [Figure 7](#)).

Figure 7. Impedance matching load for measurement

3.7.1 DDR I/O output buffer impedance

Table 24 shows DDR I/O output buffer impedance of i.MX 8M Mini family of processors.

Table 24. DDR I/O output buffer impedance

| Parameter | Symbol | Test Conditions DSE (Drive Strength) | Typical | | | Unit |
|-------------------------|--------|---|-------------------------------|-----------------------------|-------------------------------|------|
| | | | NVCC_DRAM = 1.35 V (DDR3L) | NVCC_DRAM = 1.2 V (DDR4) | NVCC_DRAM = 1.1 V (LPDDR4) | |

| | | 111000 | 40 | 40 | 40 | |
| | | 111010 | 34 | 34 | 34 | |

Note:

1. Output driver impedance is controlled across PVTs using ZQ calibration procedure.
2. Calibration is done against 240 Ω external reference resistor.
3. Output driver impedance deviation (calibration accuracy) is ±5% (max/min impedance) across PVTs.

3.8 System modules timing

This section contains the timing and electrical parameters for the modules in each i.MX 8M Mini processor.

3.8.1 Reset timings parameters

Figure 8 shows the reset timing and Table 25 lists the timing parameters.

NOTE

RTC_XTALI is approximately 32 kHz. RTC_XTALI cycle is one period or approximately 30 μ s.

NOTE

WDOGx_B output signals (for each one of the Watchdog modules) do not have dedicated pins, but are muxed out through the IOMUX. See the IOMUXC chapter of the *i.MX 8M Mini Applications Processor Reference Manual* (IMX8MMRM) for detailed information.

3.9 External peripheral interface parameters

The following subsections provide information on external peripheral interfaces.

3.9.1 ECSPi timing parameters

This section describes the timing parameters of the ECSPi blocks. The ECSPi have separate timing parameters for master and slave modes.

3.9.1.1 ECSPi Master mode timing

Figure 10 depicts the timing of ECSPi in master mode. Table 27 lists the ECSPi master mode timing characteristics.

3.9.2 Ultra-high-speed SD/SDIO/MMC host interface (uSDHC) AC timing

This section describes the electrical information of the uSDHC, which includes SD/eMMC 5.1 (single data rate) timing, eMMC 5.1/SD3.0 (dual data rate) AC timing, and SDR50/SDR104 AC timing.

3.9.2.1 SD3.0/eMMC 5.1 (single data rate) AC timing

Figure 12 depicts the timing of SD3.0/eMMC5.1 (SDR), and Table 29 lists the SD3.0/eMMC5.1 (SDR) timing characteristics.

¹ In Low-Speed mode, card clock must be lower than 400 kHz, voltage ranges from 2.7 to 3.6 V.

² In Normal (Full) -Speed mode for SD/SDIO card, clock frequency can be any value between 0–25 MHz. In High-speed mode, clock frequency can be any value between 0–50 MHz.

³ In Normal (Full) -Speed mode for MMC card, clock frequency can be any value between 0–20 MHz. In High-speed mode, clock frequency can be any value between 0–52 MHz.

⁴ To satisfy hold timing, the delay difference between clock input and cmd/data input must not exceed 2 ns.

3.9.2.2 eMMC 5.1/SD3.0 (dual data rate) AC timing

Figure 13 depicts the timing of eMMC 5.1/SD3.0 (DDR). Table 30 lists the eMMC 5.1/SD3.0 (DDR) timing characteristics. Be aware that only DATA is sampled on both edges of the clock (not applicable to CMD).

3.9.2.6 Bus operation condition for 3.3 V and 1.8 V signaling

Signaling level of SD/eMMC4.5/5.0/5.1 can be 1.8 V or 3.3 V depending on the working mode. The DC parameters for the NVCC_SD1, NVCC_SD2 and NVCC_SD3 supplies are identical to those shown in Table 20, "GPIO DC parameters," on page 28.

3.9.3 Ethernet controller (ENET) AC electrical specifications

The following timing specs are defined at the chip I/O pin and must be translated appropriately to arrive at timing specs/constraints for the physical interface.

3.9.3.2 RGMII signal switching specifications

The following timing specifications meet the requirements for RGMII interfaces for a range of transceiver devices.

Table 36. RGMII signal switching specifications¹

| Symbol | Description | Min. | Max. | Unit |
|---------------------|--|------|------|------|
| T_{cyc}^2 | Clock cycle duration | 7.2 | 8.8 | ns |
| T_{skewT}^3 | Data to clock output skew at transmitter | -500 | 500 | ps |
| T_{skewR}^3 | Data to clock input skew at receiver | 1 | 2.6 | ns |
| Duty_G ⁴ | Duty cycle for Gigabit | 45 | 55 | % |
| Duty_T ⁴ | Duty cycle for 10/100T | 40 | 60 | % |
| Tr/Tf | Rise/fall time (20–80%) | — | 0.75 | ns |

¹ The timings assume the following configuration:

DDR_SEL = (11)b

DSE (drive-strength) = (111)b

² For 10 Mbps and 100 Mbps, T_{cyc} will scale to 400 ns \pm 40 ns and 40 ns \pm 4 ns respectively.

³ For all versions of RGMII prior to 2.0; this implies that PC board design will require clocks to be routed such that an additional trace delay of greater than 1.5 ns and less than 2.0 ns will be added to the associated clock signal. For 10/100, the Max value is unspecified.

⁴ Duty cycle may be stretched/shrunk during speed changes or while transitioning to a received packet's clock domain as long as minimum duty cycle is not violated and stretching occurs for no more than three T_{cyc} of the lowest speed transitioned between.

3.9.4 General-purpose media interface (GPMI) timing

The i.MX 8M Mini GPMI controller is a flexible interface NAND Flash controller with 8-bit data width, up to 200 MB/s I/O speed and individual chip select.

It supports Asynchronous Timing mode, Source Synchronous Timing mode and Toggle Timing mode separately, as described in the following subsections.

3.9.4.1 Asynchronous mode AC timing (ONFI 1.0 compatible)

Asynchronous mode AC timings are provided as multiplications of the clock cycle and fixed delay. The maximum I/O speed of GPMI in Asynchronous mode is about 50 MB/s. Figure 21 through Figure 24 depicts the relative timing between GPMI signals at the module level for different operations under Asynchronous mode. Table 37 describes the timing parameters (NF1–NF17) that are shown in the figures.

¹ GPMI's Asynchronous mode output timing can be controlled by the module's internal registers HW_GPMI_TIMING0_ADDRESS_SETUP, HW_GPMI_TIMING0_DATA_SETUP, and HW_GPMI_TIMING0_DATA_HOLD. This AC timing depends on these registers settings. In the table, AS/DS/DH represents each of these settings.

² AS minimum value can be 0, while DS/DH minimum value is 1.

³ T = GPMI clock period - 0.075 ns (half of maximum p-p jitter).

⁴ NF12 is guaranteed by the design.

⁵ Non-EDO mode.

⁶ EDO mode, GPMI clock ≈ 100 MHz
(AS=DS=DH=1, GPMI_CTL1 [RDN_DELAY] = 8, GPMI_CTL1 [HALF_PERIOD] = 0).

In EDO mode (Figure 24), NF16/NF17 are different from the definition in non-EDO mode (Figure 23). They are called tREA/tRHOH (RE# access time/RE# HIGH to output hold). The typical values for them are 16 ns (max for tREA)/15 ns (min for tRHOH) at 50 MB/s EDO mode. In EDO mode, GPMI samples NAND_DATAxx at the rising edge of delayed NAND_RE_B provided by an internal DPLL. The delay value can be controlled by GPMI_CTRL1.RDN_DELAY (see the GPMI chapter of the *i.MX 8M Mini Applications Processor Reference Manual* [IMX8MMRM]). The typical value of this control register is 0x8 at 50 MT/s EDO mode. But if the board delay is big enough and cannot be ignored, the delay value should be made larger to compensate the board delay.

¹ GPMI's Source Synchronous mode output timing can be controlled by the module's internal registers GPMI_TIMING2_CE_DELAY, GPMI_TIMING2_PREAMBLE_DELAY, GPMI_TIMING2_POST_DELAY. This AC timing depends on these registers settings. In the table, CE_DELAY/PRE_DELAY/POST_DELAY represents each of these settings.

² T = tCK(GPMI clock period) - 0.075 ns (half of maximum p-p jitter).

For DDR Source Synchronous mode, [Figure 29](#) shows the timing diagram of NAND_DQS/NAND_DATAxx read valid window. The typical value of tDQSQ is 0.85 ns (max) and 1 ns (max) for tQHS at 200 MB/s. GPMI will sample NAND_DATA[7:0] at both rising and falling edge of an delayed NAND_DQS signal, which can be provided by an internal DPLL. The delay value can be controlled by GPMI register GPMI_READ_DDR_DLL_CTRL.SLV_DLY_TARGET (see the GPMI chapter of the *i.MX 8M Mini Applications Processor Reference Manual [IMX8MMRM]*). Generally, the typical delay value of this register is equal to 0x7 which means 1/4 clock cycle delay expected. But if the board delay is big enough and cannot be ignored, the delay value should be made larger to compensate the board delay.

3.9.4.3 ONFI NV-DDR2 mode (ONFI 3.2 compatible)

3.9.4.3.1 Command and address timing

ONFI 3.2 mode command and address timing is the same as ONFI 1.0 compatible Async mode AC timing. See [Section 3.9.4.1, Asynchronous mode AC timing \(ONFI 1.0 compatible\)](#),” for details.

3.9.4.3.2 Read and write timing

ONFI 3.2 mode read and write timing is the same as Toggle mode AC timing. See [Section 3.9.4.4, Toggle mode AC Timing](#),” for details.

3.9.5 I²C bus characteristics

The Inter-Integrated Circuit (I2C) provides functionality of a standard I2C master and slave. The I2C is designed to be compatible with the I2C Bus Specification, version 2.1, by Philips Semiconductor (now NXP Semiconductors).

3.9.6 MIPI D-PHY timing parameters

MIPI D-PHY electrical specifications are compliance.

3.9.7.1 PCIE_RESREF reference resistor connection

The impedance calibration process requires connection of reference resistor 8.2 k Ω . 1% precision resistor on PCIE_RESREF pads to ground. It is used for termination impedance calibration.

3.9.8 PDM timing parameters

Figure 32 illustrates the input timing of the PDM.

Figure 32. PDM input timing

PDM clock operative range is from 500 kHz to 6 MHz. Within range, only need to configure `ipg_clk_app` rate and `CLKDIV` without I/O timing concerns.

3.9.9 Pulse width modulator (PWM) timing parameters

This section describes the electrical information of the PWM. The PWM can be programmed to select one of three clock signals as its source frequency. The selected clock signal is passed through a prescaler before being input to the counter. The output is available at the pulse-width modulator output (PWMO) external pin.

Figure 33 depicts the timing of the PWM, and Table 42 lists the PWM timing parameters.

3.9.10 FlexSPI timing parameters

Measurements are with a load of 15 pF and an input slew rate of 1 V/ns.

3.9.10.1 FlexSPI input/read timing

There are three sources for the internal sample clock for FlexSPI read data:

- Dummy read strobe generated by FlexSPI controller and looped back internally (FlexSPI_n_MCR0[RXCLKSRC] = 0x0)
- Dummy read strobe generated by FlexSPI controller and looped back through the DQS pad (FlexSPI_n_MCR0[RXCLKSRC] = 0x1)
- Read strobe provided by memory device and input from DQS pad (FlexSPI_n_MCR0[RXCLKSRC] = 0x3)

The following sections describe input signal timing for each of these four internal sample clock sources.

3.9.10.1.1 SDR mode with FlexSPI_n_MCR0[RXCLKSRC] = 0x0, 0x1, 0x2

3.9.10.1.2 SDR mode with FlexSPIn_MCR0[RXCLKSRC] = 0x3

There are two cases when the memory provides both read data and the read strobe in SDR mode:

- A1—Memory generates both read data and read strobe on SCK rising edge (or falling edge)
- A2—Memory generates read data on SCK falling edge and generates read strobe on SCK rising edge

3.9.11 SAI/I2S switching specifications

This section provides the AC timings for the SAI in Master (clocks driven) and Slave (clocks input) modes. All timings are given for non inverted serial clock polarity (SAI_TCR[TSCKP] = 0, SAI_RCR[RSCKP] = 0) and non inverted frame sync (SAI_TCR[TFSI] = 0, SAI_RCR[RFSI] = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timings remain valid by inverting the clock signal (SAI_BCLK) and/or the frame sync (SAI_FS) shown in the figures below.

3.9.12 SPDIF timing parameters

The Sony/Philips Digital Interconnect Format (SPDIF) data is sent using the bi-phase marking code. When encoding, the SPDIF data signal is modulated by a clock that is twice the bit rate of the data signal.

Table 56 and Figure 43 and Figure 44 show SPDIF timing parameters for the Sony/Philips Digital Interconnect Format (SPDIF), including the timing of the modulating Rx clock (SPDIF_SR_CLK) for SPDIF in Rx mode and the timing of the modulating Tx clock (SPDIF_ST_CLK) for SPDIF in Tx mode.

Table 56. SPDIF timing parameters

| Parameter | Symbol | Timing Parameter Range | | Unit |
|--|--------|------------------------|------|------|
| | | Min | Max | |
| SPDIF_IN Skew: asynchronous inputs, no specs apply | — | — | 0.7 | ns |

3.9.13 UART I/O configuration and timing parameters

3.9.13.1 UART RS-232 I/O configuration in different modes

The i.MX 8M Mini UART interfaces can serve both as DTE or DCE device. This can be configured by the DCEDTE control bit (default 0—DCE mode). Table 57 shows the UART I/O configuration based on the enabled mode.

Table 57. UART I/O configuration vs. mode

| Port | DTE Mode | | DCE Mode | |
|---------------|-----------|-----------------------------|-----------|-----------------------------|
| | Direction | Description | Direction | Description |
| UARTx_RTS_B | Output | UARTx_RTS_B from DTE to DCE | Input | UARTx_RTS_B from DTE to DCE |
| UARTx_CTS_B | Input | UARTx_CTS_B from DCE to DTE | Output | UARTx_CTS_B from DCE to DTE |

3.9.13.2 UART RS-232 Serial mode timing

This section describes the electrical information of the UART module in the RS-232 mode.

3.9.13.2.1 UART transmitter

Figure 45 depicts the transmit timing of UART in the RS-232 Serial mode, with 8 data bit/1 stop bit format. Table 58 lists the UART RS-232 Serial mode transmit timing characteristics.

Figure 45. UART RS-232 Serial mode transmit timing diagram

Table 58. RS-232 Serial mode transmit timing parameters

| ID | Parameter | Symbol | Min | Max | Unit |
|-----|-------------------|------------|---------------------------------------|-----------------------------------|------|
| UA1 | Transmit Bit Time | t_{Tbit} | $1/F_{baud_rate}^1 - T_{ref_clk}^2$ | $1/F_{baud_rate} + T_{ref_clk}$ | — |

¹ F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is (ipg_perclk frequency)/16.

² T_{ref_clk} : The period of UART reference clock ref_clk (ipg_perclk after RFDIV divider).

3.9.13.2.2 UART receiver

Figure 46 depicts the RS-232 Serial mode receive timing with 8 data bit/1 stop bit format. Table 59 lists Serial mode receive timing characteristics.

Figure 46. UART RS-232 Serial mode receive timing diagram

Table 59. RS-232 Serial mode receive timing parameters

| ID | Parameter | Symbol | Min | Max | Unit |
|-----|-------------------------------|------------|---|---|------|
| UA2 | Receive Bit Time ¹ | t_{Rbit} | $1/F_{baud_rate}^2 - 1/(16 \times F_{baud_rate})$ | $1/F_{baud_rate} + 1/(16 \times F_{baud_rate})$ | — |

¹ The UART receiver can tolerate $1/(16 \times F_{baud_rate})$ tolerance in each bit. But accumulation tolerance in one frame must not exceed $3/(16 \times F_{baud_rate})$.

² F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is $(ipg_perclk \text{ frequency})/16$.

3.9.14 USB PHY parameters

This section describes the USB-OTG PHY parameters.

3.9.14.1 Pad/Package/Board connections

The USBx_VBUS pin cannot directly connect to the 5 V VBUS voltage on the USB2.0 link.

Each USBx_VBUS pin must be isolated by an external 30 K Ω 1% precision resistor.

The USB 2.0 PHY uses USBx_TXRTUNE and an external resistor to calibrate the USBx_DP/DN 45 Ω source impedance. The external resistor value is 200 Ω 1% precision on each of USBx_TXRTUNE pad to ground.

3.9.14.2 USB PHY worst power consumption

Table 60 shows the USB 2.0 PHY worst power dissipation.

Table 60. USB 2.0 PHY worst power dissipation

| Mode | VDD_USB_0P8 | | VDD_USB_3P3 | | VDD_USB_1P8 | | Total Power | |

| Sleep | 0.761 | | 0.163 | | 0.106 | | 1.472 | |

4 Boot mode configuration

This section provides information on Boot mode configuration pins allocation and boot devices interfaces allocation.

4.1 Boot mode configuration pins

Table 61 provides boot options, functionality, fuse values, and associated pins. Several input pins are also sampled at reset and can be used to override fuse values, depending on the value of BT_FUSE_SEL fuse. The boot option pins are in effect when BT_FUSE_SEL fuse is '0' (cleared, which is the case for an unblown fuse). For detailed Boot mode options configured by the Boot mode pins, see the “System Boot, Fusemap, and eFuse” chapter in the *i.MX 8M Mini Applications Processor Reference Manual* (IMX8MMRM).

Table 61. Fuses and associated pins used for boot

| Pin | Direction at Reset | eFuse name | State during reset (POR_B asserted) | State after reset (POR_B deasserted) | Details |
|------------|--------------------|--------------|-------------------------------------|--------------------------------------|--|
| BOOT_MODE0 | Input | N/A | Input with pull down | Input with pull down | Boot mode selection |
| BOOT_MODE1 | Input | N/A | Input with pull down | Input with pull down | |
| SAI1_RXD0 | Input | BOOT_CFG[0] | Input with pull down | Input with pull down | Boot options pin value overrides fuse settings for BT_FUSE_SEL = "0". Signal configuration as fuse override input at power up. These are special I/O lines that control the boot configuration during product development. In production, the boot configuration can be controlled by fuses. |

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
