

Serial EEPROM Series Standard EEPROM  
SPI BUS EEPROM

# BR25Sxxx-W Series (32K 64K 128K 256K)

●General Description

BR25Sxxx-W series is a serial EEPROM of SPI BUS interface method

●Features

- High speed clock action up to 20MHz (Max.)
- Wait function by HOLDB terminal
- Part or whole of memory arrays settable as read only memory area by program
- 1.7V to 5.5V single power source action most suitable for battery use
- Page write mode useful for initial value write at factory shipment
- Highly reliable connection by Au pad and Au wire
- For SPI bus interface (CPOL, CPHA) = (0, 0), (1, 1)
- Auto erase and auto end function at data rewrite
- Low current consumption
  - At write action (5V) : 1.5mA (Typ.)
  - At read action (5V) : 1.0mA (Typ.)
  - At standby action (5V) : 0.1μA (Typ.)
- Address auto increment function at read action
- Write mistake prevention function
  - Write prohibition at power on
  - Write prohibition by command code (WRDI)
  - Write prohibition by WP pin
  - Write prohibition block setting by status registers (BP1, BP0)
  - Write mistake prevention function at low voltage
- Data kept for 40 years
- Data rewrite up to 1,000,000 times
- Data at shipment
  - Memory array: FFh
  - Status register: WPEN, BP1, BP0 : 0

## ●Features

### ○Status registers

This IC has status register. The status register expresses the following parameters of 8 bits.

BP0 and BP1 can be set by write status register command. These 2 bits are memorized into the EEPROM, therefore are valid even when power source is turned off.

Rewrite characteristics and data hold time are same as characteristics of the EEPROM.

WEN can be set by write enable command and write disable command. WEN becomes write disable status when power source is turned off. R/B is for write confirmation, therefore cannot be set externally.

The value of status register can be read by read status register command.

### 1. Contexture of status register

Product number	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
BR25S320-W	WPEN	0	0	0	BP1	BP0	WEN	$\bar{R}/B$
BR25S640-W								
BR25S128-W								
BR25S256-W								

bit	Memory location	Function
WPEN	EEPROM	WP pin enable / disable designation bit WPEN=0=invalid WPEN=1=valid
BP1 BP0	EEPROM	EEPROM write disable block designation bit
WEN	registers	Write and write status register write enable / disable status confirmation bit WEN=0=prohibited WEN=1=permitted
$\bar{R}/B$	registers	Write cycle status (READY / BUSY) status confirmation bit $\bar{R}/B=0=READY$ $\bar{R}/B=1=BUSY$

### 2. Write disable block setting

BP1	BP0	Write disable block			
		BR25S320-W	BR25S640-W	BR25S128-W	BR25S256-W
0	0	None	None	None	None
0	1	C00h-FFFh	1800h-1FFFh	3000h-3FFFh	6000h-7FFFh
1	0	800h-FFFh	1000h-1FFFh	2000h-3FFFh	4000h-7FFFh
1	1	000h-FFFh	0000h-1FFFh	0000h-3FFFh	0000h-7FFFh

### ○OWP pin

By setting WP=LOW, write command is prohibited. And the write command to be disabled at this moment is WRSR. However, when write cycle is in execution, no interruption can be made.

Product number	WRSR	WRITE
BR25S320-W	Prohibition possible but WPEN bit "1"	Prohibition impossible
BR25S640-W		
BR25S128-W		
BR25S256-W		

### ○HOLDB pin

By HOLDB pin, data transfer can be interrupted. When SCK="0", by making HOLDB from "1" into "0", data transfer to EEPROM is interrupted. When SCK = "0", by making HOLDB from "0" into "1", data transfer is restarted.

●Command mode

Command	Contents	Ope code	
WREN	Write enable command	0000	0110
WRDI	Write disable command	0000	0100
READ	Read command	0000	0011
WRITE	Write command	0000	0010
RDSR	Read status register command	0000	0101
WRSR	Write status register command	0000	0001

●Timing chart

1. Write enable (WREN) / disable (WRDI) command

Figure 31. Write enable command

Figure 32. Write disable command

This IC has write enable status and write disable status. It is set to write enable status by write enable command, and it is set to write disable status by write disable command. As for these commands, set CSB LOW, and then input the respective commands. The respective commands are accepted at the 7-th clock rise. Even with input over 7 clocks, command becomes valid.

When to carry out write command, it is necessary to set write enable status by the write enable command. If write command is input in the write disable status, the command is cancelled. And even in the write enable status, once write command is executed, it gets in the write disable status. After power on, this IC is in write disable status.

2. Read command (READ)

Figure 33. Read command

Product number	Address length
BR25S320-W	A11-A0
BR25S640-W	A12-A0
BR25S128-W	A13-A0
BR25S256-W	A14-A0

By read command, data of EEPROM can be read. As for this command, set CSB LOW, then input address after read ope code. EEPROM starts data output of the designated address. Data output is started from SCK fall of 23-th clock, and from D7 to D0 sequentially. This IC has increment read function. After output of data for 1 byte (8bits), by continuing input of SCK, data of the next address can be read. Increment read can read all the addresses of EEPROM. After reading data of the most significant address, by continuing increment read, data of the most insignificant address is read.

3. Write command (WRITE)

Product number	Address length
BR25S320-W	A11-A0
BR25S640-W	A12-A0
BR25S128-W	A13-A0
BR25S256-W	A14-A0

Figure 34. Write command

By write command, data of EEPROM can be written. As for this command, set CSB LOW, then input address and data after write ope code. Then, by making CSB HIGH, the EEPROM starts writing. The write time of EEPROM requires time of tE/W (Max 5ms). During tE/W, other than read status register command is not accepted. Set CSB HIGH between taking the last data (D0) and rising the next SCK clock. At the other timing, write command is not executed, and this write command is cancelled. This IC has page write function, and after input of data for 1 byte (8 bits), by continuing data input without setting CSB HIGH, 2byte or more data can be written for one tE/W. The maximum number of write bytes is specified per device of each capacity. Up to 64 arbitrary bytes can be written (in the case of BR25S128/256-W). In page write, the insignificant 5 bit of the designated address is incremented internally at every time when data of 1 byte is input and data is written to respective addresses. When data of the maximum bytes or higher is input, address rolls over, and previously input data is overwritten.

4. Write status register, Read status register command (WRSR/RDSR)

Figure 35. Write status register

Write status register command can write data of status register. The data can be written by this command are 3 bits, that is, WPEN(bit7), BP1 (bit3) and BP0 (bit2) among 8 bits of status register. By BP1 and BP0, write disable block of EEPROM can be set. As for this command, set CSB LOW, and input ope code of write status register, and input data. Then, by making CSB HIGH, EEPROM starts writing. Write time requires time of tE/W as same as write. As for CSB rise, set CSB HIGH between taking the last data bit (bit0) and the next SCK clock rising. At the other timing, command is cancelled. Write disable block is determined by BP1 BP0, and the block can be selected from 1/4 , 1/2, and entire of memory array (Refer to the write disable block setting table.). To the write disabled block, write cannot be made, and only read can be made.

Figure 36. Read status register command

### ● $\overline{WP}$ cancel valid area

$\overline{WP}$  is normally fixed to "H" or "L" for use, but when  $\overline{WP}$  is controlled so as to cancel write status register command, pay attention to the following  $\overline{WP}$  valid timing.

While write status register command is executed, by setting  $\overline{WP} = "L"$  in cancel valid area, command can be cancelled. The area from command ope code to CSB rise at internal automatic write start becomes the cancel valid area. However, once write is started, by any input write cycle cannot be cancelled.  $\overline{WP}$  input becomes Don't Care, and cancellation becomes invalid.

Figure 37.  $\overline{WP}$  valid timing (At inputting WRSR command)

### ● HOLDB pin

By HOLDB pin, command communication can be stopped temporarily (HOLD status). The command communications are carried out when the HOLDB pin is HIGH. To get in HOLD status, at command communication, when SCK=LOW, set the HOLDB pin LOW. At HOLD status, SCK and SI become Don't Care, and SO becomes high impedance (High-Z). To release the HOLD status, set the HOLDB pin HIGH when SCK=LOW. After that, communication can be restarted from the point before the HOLD status. For example, when HOLD status is made after A5 address input at read, after release of HOLD status, by starting A4 address input, read can be restarted. When in HOLD status, keep CSB LOW. When it is set CSB=HIGH in HOLD status, the IC is reset, therefore communication after that cannot be restarted.

●Method to cancel each command

OREAD, RDSR

- Method to cancel : cancel by CSB = "H".

Figure 38. READ cancel valid timing

Figure 39. RDSR cancel valid timing

OWRITE, PAGE WRITE

- a : Ope code or address input area  
Cancellation is available by CSB="H".
- b : Data input area (D7 to D1 input area)  
Cancellation is available by CSB="H".
- c : Data input area (D0 area)  
In this area, cancellation is not available.  
When CSB is set HIGH, write starts.
- d : tE/W area  
In the area c, by rising CSB, write starts.  
While writing, by any input, cancellation cannot be made.

Figure 40. WRITE cancel valid timing

Note1) If Vcc is made OFF during write execution, designated address data is not guaranteed, therefore write it once again.  
 Note2) If CSB is risen at the same timing as that of the SCK rise, write execution / cancel becomes unstable, therefore, it is recommended to rise in SCK = "L" area. As for SCK rise, assure timing of tCSS / tCSH or more.

OWRSR

- a : From ope code to 15-th clock rise  
Cancellation is available by CSB="H".
- b : From 15-th clock rise to 16-th clock rise (write enable area)  
In this area, cancellation is not available.  
When CSB is set HIGH, write starts.
- c : After 16-th clock rise.  
Cancellation is available by CSB="H".  
However, if write starts (CSB is risen) in the area b, cancellation cannot be made by any means.  
And, by inputting on SCK clock, cancellation cannot be made.

Figure 41. WRSR cancel valid timing

Note1) If Vcc is made OFF during write execution, designated address data is not guaranteed, therefore write it once again

Note2) If CSB is risen at the same timing as that of the SCK rise, write execution / cancel becomes unstable, therefore, it is recommended to rise in SCK = "L" area. As for SCK rise, assure timing of tCSS / tCSH or more.

OWREN/WRDI

- a : From ope code to 7-th clock rise, cancellation is available by CSB = "H".
- b : Cancellation is not available 7-th clock.

Figure 42. WREN/WRDI cancel valid timing

## ● I/O peripheral circuits

In order to realize stable high speed operations, pay attention to the following input / output pin conditions.

### ○ Input pin pull up, pull down resistance

When to attach pull up, pull down resistance to EEPROM input pin, select an appropriate value for the microcontroller VOLM, IOL with considering VIL characteristics of this IC.

#### 1. Pull up resistance

Figure 43. Pull up resistance

$$R_{PU} \geq \frac{V_{CC} - V_{OLM}}{I_{OLM}} \quad \dots \textcircled{1}$$

$$V_{OLM} \leq V_{ILE} \quad \dots \textcircled{2}$$

Example) When  $V_{CC}=5V$ ,  $V_{ILE}=1.5V$ ,  $V_{OLM}=0.4V$ ,  $I_{OLM}=2mA$ , from the equation ①,

$$R_{PU} \geq \frac{5 - 0.4}{2 \times 10^{-3}}$$

$$\therefore R_{PU} \geq 2.3[k\Omega]$$

With the value of  $R_{PU}$  to satisfy the above equation,  $V_{OLM}$  becomes 0.4V or lower, and with  $V_{ILE}(=1.5V)$ , the equation ② is also satisfied.

- $V_{ILE}$  :EEPROM  $V_{IL}$  specifications
- $V_{OLM}$  :Microcontroller  $V_{OL}$  specifications
- $I_{OLM}$  :Microcontroller  $I_{OL}$  specifications

And, in order to prevent malfunction or erroneous write at power ON/OFF, be sure to make CSB pull up.

#### 2. Pull down resistance

Figure 44. Pull down resistance

$$R_{PD} \geq \frac{V_{OHM}}{I_{OHM}} \quad \dots \textcircled{3}$$

$$V_{OHM} \geq V_{IHE} \quad \dots \textcircled{4}$$

Example) When  $V_{CC}=5V$ ,  $V_{OHM}=V_{CC}-0.5V$ ,  $I_{OHM}=0.4mA$ ,  $V_{IHE}=V_{CC} \times 0.7V$ , from the equation ③,

$$R_{PD} \geq \frac{5 - 0.5}{0.4 \times 10^{-3}}$$

$$\therefore R_{PD} \geq 11.3[k\Omega]$$

Further, by amplitude  $V_{IHE}$ ,  $V_{ILE}$  of signal input to EEPROM, operation speed changes. By inputting  $V_{CC}/GND$  level amplitude of signal, more stable high speed operations can be realized. On the contrary, when amplitude of  $0.8V_{CC}$  /  $0.2V_{CC}$  is input, operation speed becomes slow.<sup>1</sup>

In order to realize more stable high speed operation, it is recommended to make the values of  $R_{PU}$ ,  $R_{PD}$  as large as possible, and make the amplitude of signal input to EEPROM close to the amplitude of  $V_{CC}$  /  $GND$  level.

(<sup>1</sup> In this case, guaranteed value of operating timing is guaranteed.)

### ○ SO load capacity condition

Load capacity of SO output pin affects upon delay characteristic of SO output (Data output delay time, time from HOLDB to High-Z, Output rise time, Output fall time.). In order to make output delay characteristic into better, make SO load capacity small.

Figure 45. SO load capacity

### ○ Other cautions

Make the each wire length from the microcontroller to EEPROM input pin same length, in order to prevent setup / hold violation to EEPROM, owing to difference of wire length of each input.

●Equivalent circuit

○Output circuit

Figure 46. SO output equivalent circuit

○Input circuit

Figure 47. CSB input equivalent circuit

Figure 48. SCK input equivalent circuit

Figure 49. SI input equivalent circuit

Figure 50. HOLDB input equivalent circuit

Figure 51.  $\overline{WP}$  input equivalent circuit

### ●Notes on power ON/OFF

#### ○At standby

Set CSB "H", and be sure to set SCK, SI input "L" or "H". Do not input intermediate electric potential.

#### ○At power ON/OFF

When Vcc rise or fall, set CSB="H" (=Vcc).

When CSB is "L", this IC gets in input accept status (active). If power is turned on in this status, noises and the likes may cause malfunction, erroneous write or so. To prevent these, at power ON, set CSB "H". (When CSB is in "H" status, all inputs are canceled.)

Figure 52. CSB timing at power ON/OFF

(Good example) CSB terminal is pulled up to Vcc.

At power OFF, take 10ms or more before supply. If power is turned on without observing this condition, the IC internal circuit may not be reset.

(Bad example) CSB terminal is "L" at power ON/OFF.

In this case, CSB always becomes "L" (active status), and EEPROM may have malfunction or erroneous write owing to noises and the likes.

Even when CSB input is High-Z, the status becomes like this case.

#### ○Operating timing after power ON

As shown in Figure 53, at standby, when SCK is "H", even if CSB is fallen, SI status is not read at fall edge. SI status is read at SCK rise edge after fall of CSB. At standby and at power ON/OFF, set CSB "H" status.

Figure 53. Operating timing

#### ○At power on malfunction preventing function

This IC has a POR (Power On Reset) circuit as mistake write countermeasure. After POR action, it gets in write disable status. The POR circuit is valid only when power is ON, and does not work when power is OFF. When power is ON, if the recommended conditions of the following  $t_R$ ,  $t_{OFF}$ , and  $V_{bot}$  are not satisfied, it may become write enable status owing to noises and the likes.

Figure 54. Rise waveform

Recommended conditions of  $t_R$ ,  $t_{OFF}$ ,  $V_{bot}$

$t_R$	$t_{OFF}$	$V_{bot}$
10ms or below	10ms or higher	0.3V or below
100ms or below	10ms or higher	0.2V or below

#### ○Low voltage malfunction preventing function

LVCC (Vcc-Lockout) circuit prevents data rewrite action at low power, and prevents wrong write.

At LVCC voltage (Typ. =1.2V) or below, it prevent data rewrite.

**●Noise countermeasures**

## ○Vcc noise (bypass capacitor)

When noise or surge gets in the power source line, malfunction may occur, therefore, for removing these, it is recommended to attach a bypass capacitor (0.1μF) between IC Vcc and GND. At that time, attach it as close to IC as possible.

And, it is also recommended to attach a bypass capacitor between board Vcc and GND.

## ○SCK noise

When the rise time of SCK (t<sub>RC</sub>) is long, and a certain degree or more of noise exists, malfunction may occur owing to clock bit displacement. To avoid this, a Schmitt trigger circuit is built in SCK input. The hysteresis width of this circuit is set about 0.2V, if noises exist at SCK input, set the noise amplitude 0.2V<sub>p-p</sub> or below. And it is recommended to set the rise time of SCK (t<sub>RC</sub>) 100ns or below. In the case when the rise time is 100ns or higher, take sufficient noise countermeasures. Make the clock rise, fall time as small as possible.

○W<sub>P</sub> noise

During execution of write status register command, if there exist noises on WP pin, mistake in recognition may occur and forcible cancellation may result. To avoid this, a Schmitt trigger circuit is built in WP input. In the same manner, a Schmitt trigger circuit is built in CSB input, SI input and HOLDB input too.

**●Notes for use**

- (1) Described numeric values and data are design representative values, and the values are not guaranteed.
- (2) We believe that application circuit examples are recommendable, however, in actual use, confirm characteristics further sufficiently. In the case of use by changing the fixed number of external parts, make your decision with sufficient margin in consideration of static characteristics and transition characteristics and fluctuations of external parts and our LSI.
- (3) Absolute maximum ratings  
If the absolute maximum ratings such as impressed voltage and operating temperature range and so forth are exceeded, LSI may be destructed. Do not impress voltage and temperature exceeding the absolute maximum ratings. In the case of fear exceeding the absolute maximum ratings, take physical safety countermeasures such as fuses, and see to it that conditions exceeding the absolute maximum ratings should not be impressed to LSI.
- (4) GND electric potential  
Set the voltage of GND terminal lowest at any action condition. Make sure that each terminal voltage is higher than that of GND terminal.
- (5) Heat design  
In consideration of permissible dissipation in actual use condition, carry out heat design with sufficient margin.
- (6) Terminal to terminal short circuit and wrong packaging  
When to package LSI onto a board, pay sufficient attention to LSI direction and displacement. Wrong packaging may destruct LSI. And in the case of short circuit between LSI terminals and terminals and power source, terminal and GND owing to foreign matter, LSI may be destructed.
- (7) Use in a strong electromagnetic field may cause malfunction, therefore, evaluate design sufficiently.

**Status of this document**

The Japanese version of this document is formal specification. A customer may use this translation version only for a reference to help reading the formal version.

If there are any differences in translation version of this document formal version takes priority.

## Precaution on using ROHM Products

- Our Products are designed and manufactured for application in ordinary electronic equipments (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment <sup>(Note 1)</sup>, transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASS III	CLASS III	CLASS II b	CLASS III
CLASS IV		CLASS III	

- ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
  - Installation of protection circuits or other protective devices to improve system safety
  - Installation of redundant circuits to reduce the impact of single or multiple circuit failure
- Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc. prior to use, must be necessary:
  - Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
  - Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
  - Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl<sub>2</sub>, H<sub>2</sub>S, NH<sub>3</sub>, SO<sub>2</sub>, and NO<sub>2</sub>
  - Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
  - Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
  - Sealing or coating our Products with resin or other coating materials
  - Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
  - Use of the Products in places subject to dew condensation
- The Products are not subject to radiation-proof design.
- Please verify and confirm characteristics of the final or mounted products in using the Products.
- In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.
- De-rate Power Dissipation (Pd) depending on Ambient temperature (Ta). When used in sealed area, confirm the actual ambient temperature.
- Confirm that operation temperature is within the specified range described in the product specification.
- ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

## Precaution for Mounting / Circuit board design

- When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.
- In principle, the reflow soldering method must be used; if flow soldering method is preferred, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

**Precautions Regarding Application Examples and External Circuits**

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.
2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

**Precaution for Electrostatic**

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of ionizer, friction prevention and temperature / humidity control).

**Precaution for Storage / Transportation**

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
  - [a] the Products are exposed to sea winds or corrosive gases, including Cl<sub>2</sub>, H<sub>2</sub>S, NH<sub>3</sub>, SO<sub>2</sub>, and NO<sub>2</sub>
  - [b] the temperature or humidity exceeds those recommended by ROHM
  - [c] the Products are exposed to direct sunshine or condensation
  - [d] the Products are exposed to high Electrostatic
2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.
3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.
4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

**Precaution for Product Label**

QR code printed on ROHM Products label is for ROHM's internal use only.

**Precaution for Disposition**

When disposing Products please dispose them properly using an authorized industry waste company.

**Precaution for Foreign Exchange and Foreign Trade act**

Since our Products might fall under controlled goods prescribed by the applicable foreign exchange and foreign trade act, please consult with ROHM representative in case of export.

**Precaution Regarding Intellectual Property Rights**

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data. ROHM shall not be in any way responsible or liable for infringement of any intellectual property rights or other damages arising from use of such information or data.:
2. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the information contained in this document.

**Other Precaution**

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.
2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.
3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.
4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

**General Precaution**

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.
2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.
3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
