3.3 VOLT CMOS SyncBiFIFO™ WITH BUS-MATCHING 256 x 36 x 2 1,024 x 36 x 2

IDT72V3624 IDT72V3644

FEATURES:

- Memory storage capacity: IDT72V3624-256 x 36 x 2 IDT72V3644-1,024 x 36 x 2
- Clock frequencies up to 100 MHz (6.5ns access time)
- Two independent clocked FIFOs buffering data in opposite directions
- Select IDT Standard timing (using EFA, EFB, FFA, and FFB flags functions) or First Word Fall Through Timing (using ORA, ORB, IRA, and IRB flag functions)
- Programmable Almost-Empty and Almost-Full flags; each has three default offsets (8, 16 and 64)
- · Serial or parallel programming of partial flags
- Port B bus sizing of 36 bits (long word), 18 bits (word) and 9 bits

FUNCTIONAL BLOCK DIAGRAM

(byte)

- Big- or Little-Endian format for word and byte bus sizes
- Master Reset clears data and configures FIFO, Partial Reset clears data but retains configuration settings
- Mailbox bypass registers for each FIFO
- Free-running CLKA and CLKB may be asynchronous or coincident (simultaneous reading and writing of data on a single clock edge is permitted)
- Auto power down minimizes power dissipation
- Available in space saving 128-pin Thin Quad Flatpack (TQFP)
- Pin and functionally compatible version of the 5V operating IDT723624/723644
- Industrial temperature range (-40°C to +85°C) is available
- · Green parts available, see ordering information

DESCRIPTION:

PIN CONFIGURATION

The IDT72V3624/72V3644 are pin and functionally compatible versions of the IDT723624/723644, designed to run off a 3.3V supply for exceptionally low-power consumption. These devices are monolithic, high-speed, low-power, CMOS bidirectional synchronous (clocked) FIFO memory which supports clock frequencies up to 100 MHz and has read access times as fast as 6.5ns. Two independent 256/1,024 x 36 dual-port

SRAM FIFOs on board each chip buffer data in opposite directions. FIFO data on Port B can be input and output in 36-bit, 18-bit, or 9-bit formats with a choice of Big- or Little-Endian configurations.

These devices are a synchronous (clocked) FIFO, meaning each port employs a synchronous interface. All data transfers through a port are gated to the LOW-to-HIGH transition of a port clock by enable signals. The clocks for each port are independent of one another and can be asynchronous or

COMMERCIALTEMPERATURERANGE

coincident. The enables for each port are arranged to provide a simple bidirectional interface between microprocessors and/or buses with synchronous control.

Communication between each port may bypass the FIFOs via two mailbox registers. The mailbox registers' width matches the selected Port B bus width. Each Mailbox register has a flag ($\overline{\text{MBF1}}$ and $\overline{\text{MBF2}}$) to signal when new mail has been stored.

Two kinds of reset are available on these FIFOs: Master Reset and Partial Reset. Master Reset initializes the read and write pointers to the first location of the memory array, configures the FIFO for Big- or Little-Endian byte arrangement and selects serial flag programming, parallel flag programming, or one of three possible default flag offset settings, 8, 16 or 64. There are two Master Reset pins, $\overline{\text{MRS1}}$ and $\overline{\text{MRS2}}$.

Partial Reset also sets the read and write pointers to the first location of the memory. Unlike Master Reset, any settings existing prior to Partial Reset (i.e., programming method and partial flag default offsets) are retained. Partial Reset is useful since it permits flushing of the FIFO memory without changing any configuration settings. Each FIFO has its own, independent Partial Reset pin, PRS1 and PRS2.

These devices have two modes of operation: In the *IDT Standard mode*, the first word written to an empty FIFO is deposited into the memory array. A read operation is required to access that word (along with all other words residing in memory). In the *First Word Fall Through mode* (FWFT), the first longword (36-bit wide) written to an empty FIFO appears automatically on the outputs, no read operation is required (Nevertheless, accessing subsequent words does necessitate a formal read request). The state of the BE/FWFT pin during FIFO operation determines the mode in use.

Each FIFO has a combined Empty/Output Ready Flag (EFA/ORA and EFB/ORB) and a combined Full/Input Ready Flag (FFA/IRA and FFB/

IRB). The $\overline{\text{EF}}$ and $\overline{\text{FF}}$ functions are selected in the IDT Standard mode. $\overline{\text{EF}}$ indicates whether or not the FIFO memory is empty. $\overline{\text{FF}}$ shows whether the memory is full or not. The IR and OR functions are selected in the First Word Fall Through mode. IR indicates whether or not the FIFO has available memory locations. OR shows whether the FIFO has data available for reading or not. It marks the presence of valid data on the outputs.

Each FIFO has a programmable Almost-Empty flag (AEA and AEB) and a programmable Almost-Full flag (AFA and AFB). AEA and AEB indicate when a selected number of words remain in the FIFO memory. AFA and AFB indicate when the FIFO contains more than a selected number of words.

FFA/IRA, FFB/IRB, AFA and AFB are two-stage synchronized to the port clock that writes data into its array. EFA/ORA, EFB/ORB, AEA and AEB are two-stage synchronized to the port clock that reads data from its array. Programmable offsets for AEA, AEB, AFA and AFB are loaded in parallel using Port A or in serial via the SD input. The Serial Programming Mode pin (SPM) makes this selection. Three default offset settings are also provided. The AEA and AEB threshold can be set at 8, 16 or 64 locations from the empty boundary and the AFA and AFB threshold can be set at 8, 16 or 64 locations from the full boundary. All these choices are made using the FS0 and FS1 inputs during Master Reset.

Two or more devices may be used in parallel to create wider data paths. If, at any time, the FIFO is not actively performing a function, the chip will automatically power down. During the power down state, supply current consumption (Icc) is at a minimum. Initiating any operation (by activating control inputs) will immediately take the device out of the power down state.

The IDT72V3624/72V3644 are characterized for operation from 0°C to 70°C. Industrial temperature range (-40°C to +85°C) is available. They are fabricated using high speed, submicron CMOS technology.

PIN DESCRIPTIONS

Symbol	Name	1/0	Description
A0-A35	Port A Data	I/O	36-bit bidirectional data port for side A.
ĀĒĀ	Port A Almost- Empty Flag	0	Programmable Almost-Empty flag synchronized to CLKA. It is LOW when the number of words in FIFO2 is less than or equal to the value in the Almost-Empty A Offset register, X2.
AEB	Port B Almost- Empty Flag	0	Programmable Almost-Empty flag synchronized to CLKB. It is LOW when the number of words in FIFO1 is less than or equal to the value in the Almost-Empty B Offset register, X1.
ĀFĀ	Port A Almost- Full Flag	0	Programmable Almost-Full flag synchronized to CLKA. It is LOW when the number of empty locations in FIFO1 is less than or equal to the value in the Almost-Full A Offset register, Y1.
ĀFB	Port B Almost- Full Flag	0	Programmable Almost-Full flag synchronized to CLKB. It is LOW when the number of empty locations in FIFO2 is less than or equal to the value in the Almost-Full B Offset register, Y2.
B0-B35	Port A Data	I/O	36-bit bidirectional data port for side B.
BE/FWFT	Big-Endian/ First Word Fall Through Select	I	This is a dual purpose pin. During Master Reset, a HIGH on BE will select Big Endian operation. In this case, depending on the bus size, the most significant byte or word on Port A is read from Port B first (A-to-B data flow) or written to Port B first (B-to-A data flow). A LOW on BE will select Little-Endian operation. In this case, the least significant byte or word on Port A is read from Port B first (for A-to-B data flow) or written to Port B first (B-to-A data flow). After Master Reset, this pin selects the timing mode A HIGH on FWFT selects IDT Standard mode, a LOW selects First Word Fall Through mode. Once the timing mode has been selected, the level on FWFT must be static throughout device operation.
ВМ	Bus-Match Select (Port B)		A HIGH on this pin enables either byte or word bus width on Port B, depending on the state of SIZE. A LOW selects long word operation. BM works with SIZE and BE to select the bus size and endian arrangement for Port B. The level of BM must be static throughout device operation.
CLKA	Port A Clock	I	CLKA is a continuous clock that synchronizes all data transfers through Port A and can be asynchronous or coincident to CLKB. FFA/IRA, EFA/ORA, AFA, and AEA are all synchronized to the LOW-to-HIGH transition of CLKA.
CLKB	Port B Clock	I	CLKB is a continuous clock that synchronizes all data transfers through Port B and can be asynchronous or coincident to CLKA. FFB/IRB, EFB/ORB, AFB, and AEB are synchronized to the LOW-to-HIGH transition of CLKB.
CSA	Port A Chip Select	I	CSA must be LOW to enable to LOW-to-HIGH transition of CLKA to read or write on Port A. The A0-A35 outputs are in the high-impedance state when CSA is HIGH.
CSB	Port B Chip Select	I	$\overline{\text{CSB}}$ must be LOW to enable a LOW-to-HIGH transition of CLKB to read or write data on Port B. The B0-B35 outputs are in the high-impedance state when $\overline{\text{CSB}}$ is HIGH.
EFA/ORA	Port A Empty/ Output Ready Flag	0	This is a dual function pin. In the IDT Standard mode, the EFA function is selected. EFA indicates whether or not the FIFO2 memory is empty. In the FWFT mode, the ORA function is selected. ORA indicates the presence of valid data on A0-A35 outputs, available for reading. EFA/ORA is synchronized to the LOW-to-HIGH transition of CLKA.
EFB/ORB	Port B Empty/ Output Ready Flag	0	This is a dual function pin. In the IDT Standard mode, the EFB function is selected. EFB indicates whether or not the FIFO1 memory is empty. In the FWFT mode, the ORB function is selected. ORB indicates the presence of valid data on the B0-B35 outputs, available for reading. EFB/ORB is synchronized to the LOW-to-HIGH transition of CLKB.
ENA	Port A Enable		ENA must be HIGH to enable a LOW-to-HIGH transition of CLKA to read or write data on Port A.
ENB	Port B Enable		ENB must be HIGH to enable a LOW-to-HIGH transition of CLKB to read or write data on Port B.
FFA/IRA	Port A Full/ Input Ready Flag	0	This is a dual function pin. In the IDT Standard mode, the FFA function is selected. FFA indicates whether or not the FIFO1 memory is full. In the FWFT mode, the IRA function is selected. IRA indicates whether or not there is space available for writing to the FIFO1 memory. FFA/IRA is synchronized to the LOW-to-HIGH transition of CLKA.
FFB/IRB	Port B Full/ Input Ready Flag	0	This is a dual function pin. In the IDT Standard mode, the FFB function is selected. FFB indicates whether or not the FIFO2 memory is full.In the FWFT mode, the IRB function is selected. IRB indicates whether or not there is space available for writing to the FIFO2 memory. FFB/IRB is synchronized to the LOW-to-HIGH transition of CLKB.

PIN DESCRIPTIONS (CONTINUED)

Symbol	Name	1/0	Description
FS1/SEN	Flag Offset Select 1/ Serial Enable,	I	FS1/SEN and FS0/SD are dual-purpose inputs used for flag offset register programming. During Master Reset, FS1/SEN and FS0/SD, together with SPM, select the flag offset programming method. Three offset register programming methods are available: automatically load one of three preset values (8, 16, or 64), parallel load from Port A, and serial load.
FS0/SD	Flag Offset Select 0/ Serial Data	I	When serial load is selected for flag offset register programming, FS1/SEN is used as an enable synchronous to the LOW-to-HIGH transition of CLKA. When FS1/SEN is LOW, a rising edge on CLKA load the bit present on FS0/SD into the X and Y registers. The number of bit writes required to program the offset registers is 32 for the 72V3624, and 40 for the 72V3644. The first bit write stores the Y-register (Y1) MSB and the last bit write stores the X-register (X2) LSB.
MBA	Port A Mailbox Select	I	A HIGH level on MBA chooses a mailbox register for a Port A read or write operation. When the A0-A35 outputs are active, a HIGH level on MBA selects data from the mail2 register for output and a LOW level selects FIFO2 output register data for output.
MBB	Port B Mailbox Select	I	A HIGH level on MBB chooses a mailbox register for a Port B read or write operation. When the B0-B35 outputs are active, a HIGH level on MBB selects data from the mail1 register for output and a LOW level selects FIFO1 output register data for output.
MBF1	Mail1 Register Flag	0	$\overline{\text{MBF1}}$ is set LOW by a LOW-to-HIGH transition of CLKA that writes data to the mail1 register. Writes to the mail1 register are inhibited while $\overline{\text{MBF1}}$ is LOW. $\overline{\text{MBF1}}$ is set HIGH by a LOW-to-HIGH transition CLKB when a Port B read is selected and MBB is HIGH. $\overline{\text{MBF1}}$ is set HIGH following either a Master or Partial Reset of FIFO1.
MBF2	Mail2 Register Flag	0	MBF2 is set LOW by a LOW-to-HIGH transition of CLKB that writes data to the mail2 register. Writes to the mail2 register are inhibited while MBF2 is LOW. MBF2 is set HIGH by a LOW-to-HIGH transition of CLKA when a Port A read is selected and MBA is HIGH. MBF2 is set HIGH following either a Master or Partial Reset of FIFO2.
MRS1	FIFO1 Master Reset	I	A LOW on this pin initializes the FIFO1 read and write pointers to the first location of memory and sets the Port B output register to all zeroes. A LOW-to-HIGH transition on MRS1 selects the programming method (serial or parallel) and one of three programmable flag default offsets for FIFO1 and FIFO2. It also configures Port B for bus size and endian arrangement. Four LOW-to-HIGH transitions of CLKA and four LOW-to-HIGH transitions of CLKB must occur while MRS1 is LOW.
MRS2	FIFO2 Master Reset	I	A LOW on this pin initializes the FIFO2 read and write pointers to the first location of memory and sets the Port A output register to all zeroes. A LOW-to-HIGH transition on MRS2, toggled simultaneously with MRS1, selects the programming method (serial or parallel) and one of the programmable flag default offsets for FIFO2. Four LOW-to-HIGH transitions of CLKA and four LOW-to-HIGH transitions of CLKB must occur while MRS2 is LOW.
PRS1	FIFO1 Partial Reset	I	A LOW on this pin initializes the FIFO1 read and write pointers to the first location of memory and sets the Port B output register to all zeroes. During Partial Reset, the currently selected bus size, endian arrangement, programming method (serial or parallel), and programmable flag settings are all retained.
PRS2	FIFO2 Partial Reset	1	A LOW on this pin initializes the FIFO2 read and write pointers to the first location of memory and sets the Port A output register to all zeroes. During Partial Reset, the currently selected bus size, endian arrangement, programming method (serial or parallel), and programmable flag settings are all retained.
SIZE	Bus Size Select	I	A HIGH on this pin when BM is HIGH selects byte bus (9-bit) size on Port B. A LOW on this pin when BM is HIGH selects word (18-bit) bus size. SIZE works with BM and BE to select the bus size and endian arrangement for Port B. The level of SIZE must be static throughout device operation.
SPM	Serial Programming Mode	Ι	A LOW on this pin selects serial programming of partial flag offsets. A HIGH on this pin selects parallel programming or default offsets (8, 16, or 64).
W/RA	Port-A Write/ Read Select	Ι	A HIGH selects a write operation and a LOW selects a read operation on Port A for a LOW-to-HIGH transition of CLKA. The A0-A35 outputs are in the HIGH impedance state when W/RA is HIGH.
W/RB	Port-B Write/ Read Select	Ι	A LOW selects a write operation and a HIGH selects a read operation on Port B for a LOW-to-HIGH transition of CLKB. The B0-B35 outputs are in the HIGH impedance state when \overline{W}/RB is LOW.

4. Characterized values, not currently tested.

5. Industrial temperature range is available by special order.

DETERMINING ACTIVE CURRENT CONSUMPTION AND POWER DISSIPATION

The ICC(f) current for the graph in Figure 1 was taken while simultaneously reading and writing a FIFO on the IDT72V3624/72V3644 with CLKA and CLKB set to fs. All data inputs and data outputs change state during each clock cycle to consume the highest supply current. Data outputs were disconnected to normalize the graph to a zero capacitance load. Once the capacitance load per data-output channel and the number of these device's inputs driven by TTL HIGH levels are known, the power dissipation can be calculated with the equation below.

CALCULATING POWER DISSIPATION

With ICC(f) taken from Figure 1, the maximum power dissipation (PT) of these FIFOs may be calculated by:

 $PT = VCC \times ICC(f) + \Sigma(CL \times VCC^2 \times fo)$ Ν

where:

Ν number of used outputs (36-bit (long word), 18-bit (word) or 9-bit (byte) bus size) =

CL = output capacitance load

fo = switching frequency of an output

Figure 1. Typical Characteristics: Supply Current (Icc) vs. Clock Frequency (fs)

TIMING REQUIREMENTS OVER RECOMMENDED RANGES OF SUPPLY VOLTAGE AND OPERATING FREE-AIR TEMPERATURE

tDIS	Disable Time, \overline{CSA} or W/RA HIGH to A0-A35 at high-impedance and \overline{CSB} HIGH or \overline{W} /RB LOW to B0-B35 at HIGH impedance	1	6	1	8	ns

NOTES:

1. For 10ns (100 MHz operation), Vcc = 3.3V +/- 0.15V; TA = 0° to +70°C; JEDEC JESD8-A compliant.

2. Writing data to the mail1 register when the B0-B35 outputs are active and MBB is HIGH.

3. Writing data to the mail2 register when the A0-A35 outputs are active and MBA is HIGH.

4. Industrial temperature range is available by special order.

SIGNAL DESCRIPTION

MASTER RESET (MRS1, MRS2)

After power up, a Master Reset operation must be performed by providing a LOW pulse to MRS1 and MRS2 simultaneously. Afterwards, each of the two FIFO memories of the IDT72V3624/72V3644 undergoes a complete reset by taking its associated Master Reset (MRS1, MRS2) input LOW for at least four Port A Clock (CLKA) and four Port B Clock (CLKB) LOW-to-HIGH transitions. The Master Reset inputs can switch asynchronously to the clocks. A Master Reset initializes the associated write and read pointers to the first location of the memory and forces the Full/Input Ready flag (FFA/IRA, FFB/IRB) LOW, the Empty/Output Ready flag (EFA/ORA, EFB/ORB) LOW, the Almost-Emptyflag (AEA, AEB) LOW and forces the Almost-Fullflag (AFA, AFB) HIGH. A Master Reset also forces the associated Mailbox Flag (MBF1, MFB2) of the parallel mailbox register HIGH. After a Master Reset, the FIFO's Full/Input Readyflag is set HIGH after two write clock cycles. Then the FIFO is ready to be written to.

A LOW-to-HIGH transition on the FIFO1 Master Reset ($\overline{MRS1}$) input latches the values of the Big-Endian (BE) input for determining the order by which bytes are transferred through Port B. It also latches the values of the Flag Select (FS0, FS1) and Serial Programming Mode (\overline{SPM}) inputs for choosing the Almost-Full and Almost-Empty offset programming method.

ALOW-to-HIGH transition on the FIFO2 Master Reset (MRS2) clears the Flag Offset Registers of FIFO2 (X2, Y2). A LOW-to-HIGH transition on the FIFO2 Master Reset (MRS2) together with the FIFO1 Master Reset (MRS1) input latches the value of the Big-Endian (BE) input for Port B and also latches the values of the Flag Select (FS0, FS1) and Serial Programming Mode (SPM) inputs for choosing the Almost-Full and Almost-Empty offset programming method. (For details see Table 1, *Flag Programming*, and the *Programming the Almost-Empty and Almost-Full Flags* section). The relevant FIFO Master Reset timing diagram can be found in Figure 3.

PARTIAL RESET (PRS1, PRS2)

Each of the two FIFO memories of these devices undergoes a limited reset by taking its associated Partial Reset ($\overline{PRS1}$, $\overline{PRS2}$) input LOW for at least four Port A Clock (CLKA) and four Port B Clock (CLKB) LOW-to-HIGH transitions. The Partial Reset inputs can switch asynchronously to the clocks. A Partial Reset initializes the internal read and write pointers and forces the Full/Input Ready flag (\overline{FFA} /IRA, \overline{FFB} /IRB) LOW, the Empty/Output Ready flag (\overline{EFA} / ORA, \overline{EFB} /ORB) LOW, the Almost-Empty flag (\overline{AEA} , \overline{AEB}) LOW, and the Almost-Full flag (\overline{AFA} , \overline{AFB}) HIGH. A Partial Reset also forces the Mailbox Flag ($\overline{MBF1}$, $\overline{MBF2}$) of the parallel mailbox register HIGH. After a Partial Reset, the FIFO's Full/Input Ready flag is set HIGH after two write clock cycles. Then the FIFO is ready to be written to.

Whatever flag offsets, programming method (parallel or serial), and timing mode (FWFT or IDT Standard mode) are currently selected at the time a Partial Reset is initiated, those settings will be remain unchanged upon completion of the reset operation. A Partial Reset may be useful in the case where reprogramming a FIFO following a Master Reset would be inconvenient. See Figure 4 for the Partial Reset timing diagram.

BIG-ENDIAN/FIRST WORD FALL THROUGH (BE/FWFT)

- ENDIAN SELECTION

This is a dual purpose pin. At the time of Master Reset, the BE select function is active, permitting a choice of Big or Little-Endian byte arrangement for data

written to or read from Port B. This selection determines the order by which bytes (or words) of data are transferred through this port. For the following illustrations, assume that a byte (or word) bus size has been selected for Port B. (Note that when Port B is configured for a long word size, the Big-Endian function has no application and the BE input is a "don't care"¹.)

A HIGH on the BE/FWFT input when the Master Reset (MRS1, MRS2) inputs go from LOW to HIGH will select a Big-Endian arrangement. When data is moving in the direction from Port A to Port B, the most significant byte (word) of the long word written to Port A will be read from Port B first; the least significant byte (word) of the long word written to Port A will be read from Port B last. When data is moving in the direction from Port B to Port A, the byte (word) written to Port B first will be read from Port A as the most significant byte (word) of the long word; the byte (word) written to Port B last will be read from Port A as the least significant byte (word) of the long word; the byte (word) of the long word.

A LOW on the BE/FWFT input when the Master Reset (MRS1, MRS2) inputs go from LOW to HIGH will select a Little-Endian arrangement. When data is moving in the direction from Port A to Port B, the least significant byte (word) of the long word written to Port A will be read from Port B first; the most significant byte (word) of the long word written to Port A will be read from Port B last. When data is moving in the direction from Port B to Port A, the byte (word) written to Port B first will be read from Port B first (word) of the long word; the byte (word) written to Port B last will be read from Port A as the most significant byte (word) of the long word; the byte (word) written to Port B last will be read from Port A as the most significant byte (word) of the long word. Refer to Figure 2 for an illustration of the BE function. See Figure 3 (Master Reset) for the Endian select timing diagram.

— TIMING MODE SELECTION

After Master Reset, the FWFT select function is active, permitting a choice between two possible timing modes: IDT Standard mode or First Word Fall Through (FWFT) mode. Once the Master Reset ($\overline{MRS1}$, $\overline{MRS2}$) input is HIGH, a HIGH on the BE/FWFT input during the next LOW-to-HIGH transition of CLKA (for FIFO1) and CLKB (for FIFO2) will select IDT Standard mode. This mode uses the Empty Flag function (\overline{EFA} , \overline{EFB}) to indicate whether or not there are any words present in the FIFO memory. It uses the Full Flag function (\overline{FFA} , \overline{FFB}) to indicate whether or not the FIFO memory has any free space for writing. In IDT Standard mode, every word read from the FIFO, including the first, must be requested using a formal read operation.

Once the Master Reset (MRS1, MRS2) input is HIGH, a LOW on the BE/ FWFT input during the next LOW-to-HIGH transition of CLKA (for FIFO1) and CLKB (for FIFO2) will select FWFT mode. This mode uses the Output Ready function (ORA, ORB) to indicate whether or not there is valid data at the data outputs (A0-A35 or B0-B35). It also uses the Input Ready function (IRA, IRB) to indicate whether or not the FIFO memory has any free space for writing. In the FWFT mode, the first word written to an empty FIFO goes directly to data outputs, no read request necessary. Subsequent words must be accessed by performing a formal read operation.

Following Master Reset, the level applied to the BE/FWFT input to choose the desired timing mode must remain static throughout FIFO operation. Refer to Figure 3 (Master Reset) for a First Word Fall Through select timing diagram.

PROGRAMMING THE ALMOST-EMPTY AND ALMOST-FULL FLAGS

Four registers in the IDT72V3624/72V3644 are used to hold the offset values for the Almost-Empty and Almost-Full flags. The Port B Almost-Empty flag (\overline{AEB}) Offset register is labeled X1 and the Port A Almost-Empty flag (\overline{AEA}) Offset register is labeled X2. The Port A Almost-Full flag (\overline{AFA}) Offset register is labeled X1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) Offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) offset register is labeled Y1 and the Port B Almost-Full flag (\overline{AFB}) offset register is labeled Y1 and the Port B Almost-Full flag

1. Either a HIGH or LOW can be applied to a "don't care" input with no change to the logical operation of the FIFO. Nevertheless, inputs that are temporarily "don't care" (along with unused inputs) must not be left open, rather they must be either HIGH or LOW.

NOTE:

labeled Y2. The index of each register name corresponds to its FIFO number. The offset registers can be loaded with preset values during the reset of a FIFO, programmed in parallel using the FIFO's Port A data inputs, or programmed in serial using the Serial Data (SD) input (see Table 1).

SPM, FS0/SD, and FS1/SEN function the same way in both IDT Standard and FWFT modes.

- PRESET VALUES

To load a FIFO's Almost-Empty flag and Almost-Full flag Offset registers with one of the three preset values listed in Table 1, the Serial Program Mode (SPM) and at least one of the flag-select inputs must be HIGH during the LOW-to-HIGH transition of its Master Reset input (MRS1, MRS2). For example, to load the preset value of 64 into X1 and Y1, SPM, FS0 and FS1 must be HIGH when FIFO1 reset (MRS1) returns HIGH. Flag-offset registers associated with FIFO2 are loaded with one of the preset values in the same way with FIFO2 Master Reset (MRS2), toggled simultaneously with FIFO1 Master Reset (MRS1). For relevant preset value loading timing diagram, see Figure 3.

- PARALLEL LOAD FROM PORT A

To program the X1, X2, Y1, and Y2 registers from Port A, perform a Master Reset on both FIFOs simultaneously with SPM HIGH and FS0 and FS1 LOW during the LOW-to-HIGH transition of MRS1 and MRS2. After this reset is complete, the first four writes to FIFO1 do not store data in the RAM but load the offset registers in the order Y1, X1, Y2, X2. The Port A data inputs used by the offset registers are (A7-A0) or (A9-A0) for the IDT72V3624 or IDT72V3644, respectively. The highest numbered input is used as the most significant bit of the binary number in each case. Valid programming values for the registers range from 1 to 252 for the IDT72V3624; and 1 to 1,020 for the IDT72V3644. After all the offset registers are programmed from Port A, the Port B Full/Input Ready flag (FFB/IRB) is set HIGH, and both FIFOs begin normal operation. Refer to Figure 5 for a timing diagram illustration of parallel programming of the flag offset values.

— SERIAL LOAD

To program the X1, X2, Y1, and Y2 registers serially, initiate a Master Reset with SPM LOW, FS0/SD LOW and FS1/SEN HIGH during the LOW-to-HIGH transition of MRS1 and MRS2. After this reset is complete, the X and Y register values are loaded bit-wise through the FS0/SD input on each LOW-to-HIGH transition of CLKA that the FS1/SEN input is LOW. There are 32- or 40-bit writes needed to complete the programming for the IDT72V3624 or IDT72V3644, respectively. The four registers are written in the order Y1, X1, Y2, and finally, X2. The first-bit write stores the most significant bit of the Y1 register and the last-bit write stores the least significant bit of the X2 register. Each register value can be programmed from 1 to 252 (IDT72V3624) or 1 to 1,020 (IDT72V3644).

When the option to program the offset registers serially is chosen, the Port A Full/Input Ready (FFA/IRA) flag remains LOW until all register bits are written. FFA/IRA is set HIGH by the LOW-to-HIGH transition of CLKA after the last bit is loaded to allow normal FIFO1 operation. The Port B Full/Input Ready (FFB/IRB) flag also remains LOW throughout the serial programming process, until all register bits are written. FFB/IRB is set HIGH by the LOW-to-HIGH transition of CLKB after the last bit is loaded to allow normal FIFO2 operation. See Figure 6 for *Serial Programming of the Almost-Full Flag and Almost-Empty Flag Offset Values (IDT Standard and FWFT Modes)* timing diagram.

FIFO WRITE/READ OPERATION

The state of the Port A data (A0-A35) lines is controlled by Port A Chip Select (\overline{CSA}) and Port A Write/Read select ($W/\overline{R}A$). The A0-A35 lines are in the High-impedance state when either \overline{CSA} or $W/\overline{R}A$ is HIGH. The A0-A35 lines are active outputs when both \overline{CSA} and $W/\overline{R}A$ are LOW.

Data is loaded into FIFO1 from the A0-A35 inputs on a LOW-to-HIGH transition of CLKA when CSA is LOW, W/RA is HIGH, ENA is HIGH, MBA is LOW, and FFA/IRA is HIGH. Data is read from FIFO2 to the A0-A35 outputs by a LOW-to-HIGH transition of CLKA when CSA is LOW, W/RA is LOW, ENA is HIGH, MBA is LOW, and EFA/ORA is HIGH (see Table 2). FIFO reads and writes on Port A are independent of any concurrent Port B operation.

SPM	FS1/ SEN	FS0/SD	MRS1	MRS2	X1 AND Y1 REGISTERS ⁽¹⁾	X2 AND Y2 REGISTERS ⁽²⁾

TABLE 1 — FLAG PROGRAMMING

NOTES:

1. X1 register holds the offset for \overline{AEB} ; Y1 register holds the offset for \overline{AFA} .

2. X2 register holds the offset for AEA; Y2 register holds the offset for AFB.

COMMERCIALTEMPERATURERANGE

IDT72V3624/72V3644 3.3V CMOS SyncBiFIFO[™] WITH BUS-MATCHING 256 x 36 x 2, 1,024 x 36 x 2

The Port B control signals are identical to those of Port A with the exception that the Port B Write/Read select (\overline{W}/RB) is the inverse of the Port A Write/Read select (W/\overline{RA}). The state of the Port B data (B0-B35) lines is controlled by the Port B Chip Select (\overline{CSB}) and Port B Write/Read select (\overline{W}/RB). The B0-B35 lines are in the high-impedance state when either \overline{CSB} is HIGH or \overline{W}/RB is LOW. The B0-B35 lines are active outputs when \overline{CSB} is LOW and \overline{W}/RB is HIGH.

Data is loaded into FIFO2 from the B0-B35 inputs on a LOW-to-HIGH transition of CLKB when \overline{CSB} is LOW, \overline{W}/RB is LOW, ENB is HIGH, MBB is LOW, and \overline{FFB}/IRB is HIGH. Data is read from FIFO1 to the B0-B35 outputs by a LOW-to-HIGH transition of CLKB when \overline{CSB} is LOW, \overline{W}/RB is HIGH, ENB is HIGH, MBB is LOW, and \overline{EFB}/ORB is HIGH (see Table 3). FIFO reads and writes on Port B are independent of any concurrent Port A operation.

The setup and hold time constraints to the port clocks for the port Chip Selects and Write/Read selects are only for enabling write and read operations and

are not related to high-impedance control of the data outputs. If a port enable is LOW during a clock cycle, the port's Chip Select and Write/ Read select may change states during the setup and hold time window of the cycle.

When operating the FIFO in FWFT mode and the Output Ready flag is LOW, the next word written is automatically sent to the FIFO's output register by the LOW-to-HIGH transition of the port clock that sets the Output Ready flag HIGH. When the Output Ready flag is HIGH, subsequent data is clocked to the output registers only when a read is selected using the port's Chip Select, Write/Read select, Enable, and Mailbox select.

When operating the FIFO in IDT Standard mode, the first word will cause the Empty Flag to change state on the second LOW-to-HIGH transition of the Read Clock. The data word will not be automatically sent to the output register.

						-
CSA	W/RA	ENA	MBA	CLKA	Data A (A0-A35) I/O	Port Function

Instead, data residing in the FIFO's memory array is clocked to the output register only when a read is selected using the port's Chip Select, Write/Read select, Enable, and Mailbox select. Write and read timing diagrams for Port A can be found in Figure 7 and 14. Relevant Port B write and read cycle timing diagrams together with Bus-Matching and Endian select operations can be found in Figures 8 through 13.

SYNCHRONIZED FIFO FLAGS

Each FIFO is synchronized to its port clock through at least two flipflop stages. This is done to improve flag-signal reliability by reducing the probability of metastable events when CLKA and CLKB operate asynchronously to one another. EFA/ORA, AEA, FFA/IRA, and AFA are synchronized to CLKA. EFB/ORB, AEB, FFB/IRB, and AFB are synchro-

TABLE 4 — FIFO1 FLAG OPERATION (IDT Standard and FWFT modes)

Number of Words i	Synchr to Cl	onized LKB	Synchro to CL	onized .KA	
IDT72V3624 ⁽³⁾	IDT72V3644 ⁽³⁾	EFB/ORB	AEB	ĀFĀ	FFA/IRA
0	0	L	L	Н	Н
1 to X1	1 to X1	Н	L	Н	Н
(X1+1) to [256-(Y1+1)]	(X1+1) to [1,024-(Y1+1)]	Н	Н	Н	Н
(256-Y1) to 255	(1,024-Y1) to 1,023	Н	Н	L	Н
256	1,024	Н	Н	L	L

NOTES:

1. When a word loaded to an empty FIFO is shifted to the output register, its previous FIFO memory location is free.

Data in the output register does not count as a "word in FIFO memory". Since in FWFT mode, the first word written to an empty FIFO goes unrequested to the output register (no read operation necessary), it is not included in the FIFO memory count.

X1 is the Almost-Empty offset for FIFO1 used by AEB. Y1 is the Almost-Full offset for FIFO1 used by AFA. Both X1 and Y1 are selected during a FIFO1 reset or port A programming.
 The ORB and IRA functions are active during FWFT mode; the EFB and FFA functions are active in IDT Standard mode.

TABLE 5 — FIFO2 FLAG OPERATION (IDT Standard and FWFT modes)

Number of Words	Synchr to C	onized LKA	Synchro to CL	onized .KB	
IDT72V3624 ⁽³⁾	IDT72V3644 ⁽³⁾	EFA /ORA	ĀĒĀ	AFB	FFB/IRB
0	0	L	L	Н	Н
1 to X2	1 to X2	Н	L	Н	Н

(256-Y2) to 255	(1,024-Y2) to 1,023	Н	Н	L	Н
256	1,024	Н	Н	L	L

NOTES:

1. When a word loaded to an empty FIFO is shifted to the output register, its previous FIFO memory location is free.

Data in the output register does not count as a "word in FIFO memory". Since in FWFT mode, the first word written to an empty FIFO goes unrequested to the output register (no read operation necessary), it is not included in the FIFO memory count.

3. X2 is the Almost-Empty offset for FIFO2 used by AEA. Y2 is the Almost-Full offset for FIFO2 used by AFB. Both X2 and Y2 are selected during a FIFO2 reset or port A programming.

4. The ORA and IRB functions are active during FWFT mode; the EFA and FFB functions are active in IDT Standard mode.

nized to CLKB. Tables 4 and 5 show the relationship of each port flag to FIFO1 and FIFO2.

EMPTY/OUTPUT READY FLAGS (EFA/ORA, EFB/ORB)

These are dual purpose flags. In the FWFT mode, the Output Ready (ORA, ORB) function is selected. When the Output-Ready flag is HIGH, new data is present in the FIFO output register. When the Output Ready flag is LOW, the previous data word is present in the FIFO output register and attempted FIFO reads are ignored.

In the IDT Standard mode, the Empty Flag (EFA, EFB) function is selected. When the Empty Flag is HIGH, data is available in the FIFO's RAM memory for reading to the output register. When the Empty Flag is LOW, the previous data word is present in the FIFO output register and attempted FIFO reads are ignored.

The Empty/Output Ready flag of a FIFO is synchronized to the port clock that reads data from its array. For both the FWFT and IDT Standard modes, the FIFO read pointer is incremented each time a new word is clocked to its output register. The state machine that controls an Output Ready flag monitors a write pointer and read pointer comparator that indicates when the FIFO memory status is empty, empty+1, or empty+2.

In FWFT mode, from the time a word is written to a FIFO, it can be shifted to the FIFO output register in a minimum of three cycles of the Output Ready flag synchronizing clock. Therefore, an Output Ready flag is LOW if a word in memory is the next data to be sent to the FIFO output register and three cycles of the port Clock that reads data from the FIFO have not elapsed since the time the word was written. The Output Ready flag of the FIFO remains LOW until the third LOW-to-HIGH transition of the synchronizing clock occurs, simultaneously forcing the Output Ready flag HIGH and shifting the word to the FIFO output register.

In IDT Standard mode, from the time a word is written to a FIFO, the Empty Flag will indicate the presence of data available for reading in a minimum of two cycles of the Empty Flag synchronizing clock. Therefore, an Empty Flag is LOW if a word in memory is the next data to be sent to the FIFO output register and two cycles of the port Clock that reads data from the FIFO have not elapsed since the time the word was written. The Empty Flag of the FIFO remains LOW until the second LOW-to-HIGH transition of the synchronizing clock occurs, forcing the Empty Flag HIGH; only then can data be read.

ALOW-to-HIGH transition on an Empty/Output Ready flag synchronizing clock begins the first synchronization cycle of a write if the clock transition

occurs at time tSKEW1 or greater after the write. Otherwise, the subsequent clock cycle can be the first synchronization cycle (see Figures 15, 16, 17, and 18).

FULL/INPUT READY FLAGS (FFA/IRA, FFB/IRB)

This is a dual purpose flag. In FWFT mode, the Input Ready (IRA and IRB) function is selected. In IDT Standard mode, the Full Flag (FFA and FFB) function is selected. For both timing modes, when the Full/Input Ready flag is HIGH, a memory location is free in the FIFO to receive new data. No memory locations are free when the Full/Input Ready flag is LOW and attempted writes to the FIFO are ignored.

The Full/Input Ready flag of a FIFO is synchronized to the port clock that writes data to its array. For both FWFT and IDT Standard modes, each time a word is written to a FIFO, its write pointer is incremented. The state machine that controls a Full/Input Ready flag monitors a write pointer and read pointer comparator that indicates when the FIFO memory status is full, full-1, or full-2. From the time a word is read from a FIFO, its previous memory location is ready to be written to in a minimum of two cycles of the Full/Input Ready flag synchronizing clock. Therefore, an Full/Input Ready flag is LOW if less than two cycles of the Full/Input Ready flag synchronizing clock have elapsed since the next memory write location has been read. The second LOW-to-HIGH transition on the Full/Input Ready flag synchronizing clock after the read sets the Full/Input Ready flag HIGH.

ALOW-to-HIGH transition on a Full/Input Ready flag synchronizing clock begins the first synchronization cycle of a read if the clock transition occurs at time tSKEW1 or greater after the read. Otherwise, the subsequent clock cycle can be the first synchronization cycle (see Figures 19, 20, 21, and 22).

ALMOST-EMPTY FLAGS (AEA, AEB)

The Almost-Empty flag of a FIFO is synchronized to the port clock that reads data from its array. The state machine that controls an Almost-Empty flag monitors a write pointer and read pointer comparator that indicates when the FIFO memory status is almost-empty, almost-empty+1, or almost-empty+2. The almost-empty state is defined by the contents of register X1 for AEB and register X2 for AEA. These registers are loaded with preset values during a FIFO reset, programmed from Port A, or programmed serially (see *Almost-Empty flag and Almost-Full flag offset programming* section). An Almost-Empty flag is LOW when its FIFO contains X or less words and is HIGH when its FIFO contains (X+1) or more words. A data word present in the FIFO output register has been read from memory.

Two LOW-to-HIGH transitions of the Almost-Empty flag synchronizing clock are required after a FIFO write for its Almost-Empty flag to reflect the new level of fill. Therefore, the Almost-Full flag of a FIFO containing (X+1) or more words remains LOW if two cycles of its synchronizing clock have not elapsed since the write that filled the memory to the (X+1) level. An Almost-Empty flag is set HIGH by the second LOW-to-HIGH transition of its synchronizing clock after the FIFO write that fills memory to the (X+1) level. A LOW-to-HIGH transition of an Almost-Empty flag synchronizing clock begins the first synchronization cycle if it occurs at time tskEw2 or greater after the write that fills the FIFO to (X+1) words. Otherwise, the subsequent synchronizing clock cycle may be the first synchronization cycle. (See Figure 23 and 24).

ALMOST-FULL FLAGS (AFA, AFB)

The Almost-Full flag of a FIFO is synchronized to the port clock that writes data to its array. The state machine that controls an Almost-Full flag monitors a write pointer and read pointer comparator that indicates when the FIFO memory status is almost-full, almost-full-1, or almost-full-2. The almost-full state

is defined by the contents of register Y1 for AFA and register Y2 for AFB. These registers are loaded with preset values during a FIFO reset, programmed from Port A, or programmed serially (see *Almost-Empty flag and Almost-Full flag offset programming* section). An Almost-Full flag is LOW when the number of words in its FIFO is greater than or equal to (256-Y) or (1,024-Y) for the IDT72V3624 or IDT72V3644 respectively. An Almost-Full flag is HIGH when the number of words in its FIFO is less than or equal to [256-(Y+1)] or [1,024-(Y+1)] for the IDT72V3624 or IDT72V3644 respectively. Note that a data word present in the FIFO output register has been read from memory.

Two LOW-to-HIGH transitions of the Almost-Full flag synchronizing clock are required after a FIFO read for its Almost-Full flag to reflect the new level of fill. Therefore, the Almost-Full flag of a FIFO containing [256/ 1,024-(Y+1)] or less words remains LOW if two cycles of its synchronizing clock have not elapsed since the read that reduced the number of words in memory to [256/1,024-(Y+1)]. An Almost-Full flag is set HIGH by the second LOW-to-HIGH transition of its synchronizing clock after the FIFO read that reduces the number of words in memory to [256/1,024-(Y+1)]. A LOW-to-HIGH transition of an Almost-Full flag synchronizing clock begins the first synchronization cycle if it occurs at time tskew2 or greater after the read that reduces the number of words in memory to [256/1,024-(Y+1)]. Otherwise, the subsequent synchronizing clock cycle may be the first synchronization cycle (see Figure 25 and 26).

MAILBOX REGISTERS

Each FIFO has a 36-bit bypass register to pass command and control information between Port A and Port B without putting it in queue. The Mailbox select (MBA, MBB) inputs choose between a mail register and a FIFO for a port data transfer operation. The usable width of both the Mail1 and Mail2 registers matches the selected bus size for Port B.

ALOW-to-HIGH transition on CLKA writes data to the Mail 1 Register when a Port A write is selected by \overline{CSA} , $W/\overline{R}A$, and ENA with MBA HIGH. If the selected Port B bus size is also 36 bits, then the usable width of the Mail1 register employs data lines A0-A35. If the selected Port B bus size is 18 bits, then the usable width of the Mail1 Register employs data lines A0-A17. (In this case, A18-A35 are don't care inputs.) If the selected Port B bus size is 9 bits, then the usable width of the Mail1 Register employs data lines A0-A8. (In this case, A9-A35 are don't care inputs.)

A LOW-to-HIGH transition on CLKB writes B0-B35 data to the Mail2 Register when a Port B write is selected by \overline{CSB} , \overline{W}/RB , and ENB with MBB HIGH. If the selected Port B bus size is also 36 bits, then the usable width of the Mail2 employs data lines B0-B35. If the selected Port B bus size is 18 bits, then the usable width of the Mail2 Register employs data lines B0-B17. (In this case, B18-B35 are don't care inputs.) If the selected Port B bus size is 9 bits, then the usable width of the Mail2 Register employs data lines B0-B8. (In this case, B9-B35 are don't care inputs.)

Writing data to a mail register sets its corresponding flag (MBF1 or MBF2) LOW. Attempted writes to a mail register are ignored while the mail flag is LOW.

When data outputs of a port are active, the data on the bus comes from the FIFO output register when the port Mailbox select input is LOW and from the mail register when the port Mailbox select input is HIGH.

The Mail1 Register Flag ($\overline{\text{MBF1}}$) is set HIGH by a LOW-to-HIGH transition on CLKB when a Port B read is selected by $\overline{\text{CSB}}$, $\overline{\text{W}}/\text{RB}$, and $\overline{\text{ENB}}$ with MBB HIGH. For a 36-bit bus size, 36 bits of mailbox data are placed on B0-B35. For an 18-bit bus size, 18 bits of mailbox data are placed on B0-B17. (In this case, B18-B35 are indeterminate.) For a 9-bit bus size, 9 bits of mailbox data are placed on B0-B8. (In this case, B9-B35 are indeterminate.) The Mail2 Register Flag ($\overline{\text{MBF2}}$) is set HIGH by a LOW-to-HIGH transition on CLKA when a Port A read is selected by $\overline{\text{CSA}}$, W/ $\overline{\text{RA}}$, and ENA with MBA HIGH.

For a 36-bit bus size, 36 bits of mailbox data are placed on A0-A35. For an 18-bit bus size, 18 bits of mailbox data are placed on A0-A17. (In this case, A18-A35 are indeterminate.) For a 9-bit bus size, 9 bits of mailbox data are placed on A0-A8. (In this case, A9-A35 are indeterminate.)

The data in a mail register remains intact after it is read and changes only when new data is written to the register. The Endian select feature has no effect on mailbox data. For mail register and Mail Register Flag timing diagrams, see Figure 27 and 28.

BUS SIZING

The Port B bus can be configured in a 36-bit long word, 18-bit word, or 9-bit byte format for data read from FIFO1 or written to FIFO2. The levels applied to the Port B Bus Size select (SIZE) and the Bus-Match select (BM) determine the Port B bus size. These levels should be static throughout FIFO operation. Both bus size selections are implemented at the completion of Master Reset, by the time the Full/Input Ready flag is set HIGH, as shown in Figure 2.

Two different methods for sequencing data transfer are available for Port B when the bus size selection is either byte- or word-size. They are referred to as Big-Endian (most significant byte first) and Little-Endian (least significant byte first). The level applied to the Big-Endian select (BE) input during the LOW-to-HIGH transition of MRS1 and MRS2 selects the endian method that will be active during FIFO operation. BE is a don't care input when the bus size selected for Port B is long word. The endian method is implemented at the completion of Master Reset, by the time the Full/Input Ready flag is set HIGH, as shown in Figure 2.

Only 36-bit long word data is written to or read from the two FIFO memories on the IDT72V3624/72V3644. Bus-matching operations are done after

data is read from the FIFO1 RAM and before data is written to the FIFO2 RAM. These bus-matching operations are not available when transferring data via mailbox registers. Furthermore, both the word- and byte-size bus selections limit the width of the data bus that can be used for mail register operations. In this case, only those byte lanes belonging to the selected word- or byte-size bus can carry mailbox data. The remaining data outputs will be indeterminate. The remaining data inputs will be don't care inputs. For example, when a word-size bus is selected, then mailbox data can be transmitted only between A0-A17 and B0-B17. When a byte-size bus is selected, then mailbox data can be transmitted only between A0-A8 and B0-B8. (See Figures 27 and 28).

BUS-MATCHING FIFO1 READS

Data is read from the FIFO1 RAM in 36-bit long word increments. If a long word bus size is implemented, the entire long word immediately shifts to the FIFO1 output register. If byte or word size is implemented on Port B, only the first one or two bytes appear on the selected portion of the FIFO1 output register, with the rest of the long word stored in auxiliary registers. In this case, subsequent FIFO1 reads output the rest of the long word to the FIFO1 output register in the order shown by Figure 2.

When reading data from FIFO1 in byte or word format, the unused B0-B35 outputs are indeterminate.

BUS-MATCHING FIFO2 WRITES

Data is written to the FIFO2 RAM in 36-bit long word increments. Data written to FIFO2 with a byte or word bus size stores the initial bytes or words in auxiliary registers. The CLKB rising edge that writes the fourth byte or the second word of long word to FIFO2 also stores the entire long word in the FIFO2 memory. The bytes are arranged in the manner shown in Figure 2.

When writing data to FIFO2 in byte or word format, the unused B0-B35 inputs are don't care inputs.

Figure 2. Bus Sizing

NOTES:

1. FIFO2 Master Reset (MRS2) is performed in the same manner to load X2 and Y2 with a preset value. For FIFO2 Master Reset, MRS1 must toggle simultaneously with MRS2.

2. PRS1 must be HIGH during Master Reset.

3. If BE/FWFT is HIGH, then EFB/ORB will go LOW one CLKB cycle earlier than in this case where BE/FWFT is LOW.

Figure 3. FIFO1 Master Reset and Loading X1 and Y1 with a Preset Value of Eight⁽¹⁾ (IDT Standard and FWFT Modes)

NOTES:

1. Partial Reset is performed in the same manner for FIFO2.

2. MRS1 must be HIGH during Partial Reset.

3. If BE/FWFT is HIGH, then EFB/ORB will go LOW one CLKB cycle earlier than in this case where BE/FWFT is LOW.

Figure 4. FIFO1 Partial Reset⁽¹⁾ (IDT Standard and FWFT Modes)

NOTES:

tskEw1 is the minimum time between the rising CLKA edge and a rising CLKB edge for FFB/IRB to transition HIGH in the next cycle. If the time between the rising edge of CLKA and rising edge of CLKB is less than tskEw1, then FFB/IRB may transition HIGH one CLKB cycle later than shown.

2. CSA=LOW, W/RA=HIGH, MBA=LOW. It is not necessary to program offset register on consecutive clock cycles.

Figure 5. Parallel Programming of the Almost-Full Flag and Almost-Empty Flag Offset Values after Reset (IDT Standard and FWFT Modes)

NOTES:

- tskEw1 is the minimum time between the rising CLKA edge and a rising CLKB edge for FFB/IRB to transition HIGH in the next cycle. If the time between the rising edge of CLKA and rising edge of CLKB is less than tskEw1, then FFB/IRB may transition HIGH one CLKB cycle later than shown.
- 2. It is not necessary to program offset register bits on consecutive clock cycles. FIFO write attempts are ignored until FFA/IRA and FFB/IRB is set HIGH.
- 3. Programmable offsets are written serially to the SD input in the order AFA offset (Y1), AEB offset (X1), AFB offset (Y2), and AEA offset (X2).

Figure 14. Port-A Read Cycle Timing for FIFO2 (IDT Standard and FWFT Modes)

NOTES:

 tskEw1 is the minimum time between a rising CLKA edge and a rising CLKB edge for ORB to transition HIGH and to clock the next word to the FIFO1 output register in three CLKB cycles. If the time between the rising CLKA edge and rising CLKB edge is less than tskEw1, then the transition of ORB HIGH and load of the first word to the output register may occur one CLKB cycle later than shown.

2. If Port B size is word or byte, ORB is set LOW by the last word or byte read from FIFO1, respectively.

Figure 15. ORB Flag Timing and First Data Word Fall Through when FIFO1 is Empty (FWFT Mode)

NOTES:

1. tskew1 is the minimum time between a rising CLKA edge and a rising CLKB edge for EFB to transition HIGH in the next CLKB cycle. If the time between the rising CLKA edge and rising CLKB edge is less than tskew1, then the transition of EFB HIGH may occur one CLKB cycle later than shown.

2. If Port B size is word or byte, EFB is set LOW by the last word or byte read from FIFO1, respectively.

Figure 16. **EFB** Flag Timing and First Data Read Fall Through when FIFO1 is Empty (IDT Standard Mode)

NOTES:

 tskEw1 is the minimum time between a rising CLKB edge and a rising CLKA edge for ORA to transition HIGH and to clock the next word to the FIFO2 output register in three CLKA cycles. If the time between the CLKB edge and the rising CLKA edge is less than tskEw1, then the transition of ORA HIGH and load of the first word to the output register may occur one CLKA cycle later than shown.

2. If Port B size is word or byte, tskEW1 is referenced to the rising CLKB edge that writes the last word or byte of the long word, respectively.

Figure 17. ORA Flag Timing and First Data Word Fall through when FIFO2 is Empty (FWFT Mode)

NOTES:

1. tskEw1 is the minimum time between a rising CLKB edge and a rising CLKA edge for EFA to transition HIGH in the next CLKA cycle. If the time between the rising CLKB edge and rising CLKA edge is less than tskEw1, then the transition of EFA HIGH may occur one CLKA cycle later than shown.

2. If Port B size is word or byte, tskEW1 is referenced to the rising CLKB edge that writes the last word or byte of the long word, respectively.

Figure 18. EFA Flag Timing and First Data Read when FIFO2 is Empty (IDT Standard Mode)

NOTES:

TEXEW1 is the minimum time between a rising CLKB edge and a rising CLKA edge for IRA to transition HIGH in the next CLKA cycle. If the time between the rising CLKB edge and rising CLKA edge is less than tskew1, then IRA may transition HIGH one CLKA cycle later than shown. 1.

2. If Port B size is word or byte, tSKEW1 is referenced to the rising CLKB edge that reads the last word or byte write of the long word, respectively.

Figure 19. IRA Flag Timing and First Available Write when FIFO1 is Full (FWFT Mode)

NOTES:

tskEw1 is the minimum time between a rising CLKB edge and a rising CLKA edge for FFA to transition HIGH in the next CLKA cycle. If the time between the rising CLKB edge and rising CLKA edge is less than tskEw1, then FFA may transition HIGH one CLKA cycle later than shown.
 If Port B size is word or byte, tskEw1 is referenced from the rising CLKB edge that reads the last word or byte of the long word, respectively.

Figure 20. FFA Flag Timing and First Available Write when FIFO1 is Full (IDT Standard Mode)

NOTES:

1. tskEw1 is the minimum time between a rising CLKA edge and a rising CLKB edge for IRB to transition HIGH in the next CLKB cycle. If the time between the rising CLKA edge and rising CLKB edge is less than tskEw1, then IRB may transition HIGH one CLKB cycle later than shown.

2. If Port B size is word or byte, IRB is set LOW by the last word or byte write of the long word, respectively.

Figure 21. IRB Flag Timing and First Available Write when FIFO2 is Full (FWFT Mode)

NOTES:

1. tskEw1 is the minimum time between a rising CLKA edge and a rising CLKB edge for FFB to transition HIGH in the next CLKB cycle. If the time between the rising CLKA edge and rising CLKB edge is less than tskEw1, then FFB may transition HIGH one CLKB cycle later than shown.

2. If Port B size is word or byte, FFB is set LOW by the last word or byte write of the long word, respectively.

Figure 22. FFB Flag Timing and First Available Write when FIFO2 is Full (IDT Standard Mode)

NOTES:

1. tskEw2 is the minimum time between a rising CLKA edge and a rising CLKB edge for AEB to transition HIGH in the next CLKB cycle. If the time between the rising CLKA edge and rising CLKB edge is less than tskEw2, then AEB may transition HIGH one CLKB cycle later than shown.

2. FIFO1 Write (CSA = LOW, WRA = LOW, MBA = LOW), FIFO1 read (CSB = LOW, WRB = HIGH, MBB = LOW). Data in the FIFO1 output register has been read from the FIFO. 3. If Port B size is word or byte, AEB is set LOW by the last word or byte read from FIFO1, respectively.

Figure 23. Timing for **AEB** when FIFO1 is Almost-Empty (IDT Standard and FWFT Modes)

NOTES:

1. tskEw2 is the minimum time between a rising CLKB edge and a rising CLKA edge for AEA to transition HIGH in the next CLKA cycle. If the time between the rising CLKB edge and rising CLKA edge is less than tskEw2, then AEA may transition HIGH one CLKA cycle later than shown.

2. FIFO2 Write (CSB = LOW, W/RB = LOW, MBB = LOW), FIFO2 read (CSA = LOW, W/RA = LOW, MBA = LOW). Data in the FIFO2 output register has been read from the FIFO. 3. If Port B size is word or byte, tskEw2 is referenced to the rising CLKB edge that writes the last word or byte of the long word, respectively.

Figure 24. Timing for **AEA** when FIFO2 is Almost-Empty (IDT Standard and FWFT Modes)

NOTES:

- 1. tskew2 is the minimum time between a rising CLKA edge and a rising CLKB edge for AFA to transition HIGH in the next CLKA cycle. If the time between the rising CLKA edge and rising CLKB edge is less than tskew2, then AFA may transition HIGH one CLKA cycle later than shown.
- FIFO1 Write (CSA = LOW, W/RA = HIGH, MBA = LOW), FIFO1 read (CSB = LOW, W/RB = HIGH, MBB = LOW). Data in the FIFO1 output register has been read from the FIFO.
 D = Maximum FIFO Depth = 256 for the IDT72V3624, 1,024 for the IDT72V3644.
- 4. If Port B size is word or byte, tskew2 is referenced to the rising CLKB edge that reads the last word or byte of the long word, respectively.

Figure 25. Timing for **AFA** when FIFO1 is Almost-Full (IDT Standard and FWFT Modes)

NOTES:

1. tskEw2 is the minimum time between a rising CLKB edge and a rising CLKA edge for AFB to transition HIGH in the next CLKB cycle. If the time between the rising CLKB edge and rising CLKA edge is less than tskEw2, then AFB may transition HIGH one CLKB cycle later than shown.

FIFO2 write (CSB = LOW, W/RB = LOW, MBB = LOW), FIFO2 read (CSA = LOW, W/RA = LOW, MBA = LOW). Data in the FIFO2 output register has been read from the FIFO.
 D = Maximum FIFO Depth = 256 for the IDT72V3624, 1,024 for the IDT72V3644.

4. If Port B size is word or byte, AFB is set LOW by the last word or byte write of the long word, respectively.

Figure 26. Timing for **AFB** when FIFO2 is Almost-Full (IDT Standard and FWFT Modes)

NOTE:

 If Port B is configured for word size, data can be written to the Mail1 register using A0-A17 (A18-A35 are don't care inputs). In this first case B0-B17 will have valid data (B18-B35 will be indeterminate). If Port B is configured for byte size, data can be written to the Mail1 Register using A0-A8 (A9-A35 are don't care inputs). In this second case, B0-B8 will have valid data (B9-B35 will be indeterminate).

Figure 27. Timing for Mail1 Register and **MBF1** Flag (IDT Standard and FWFT Modes)

NOTE:

1. If Port B is configured for word size, data can be written to the Mail2 Register using B0-B17 (B18-B35 are don't care inputs). In this first case A0-A17 will have valid data (A18-A35 will be indeterminate). If Port B is configured for byte size, data can be written to the Mail2 Register using B0-B8 (B9-B35 are don't care inputs). In this second case, A0-A8 will have valid data (A9-A35 will be indeterminate).

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;

- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);

- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;

- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком):

- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
