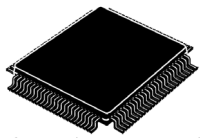
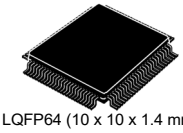
32-bit MCU family built on the Power Architecture® for automotive body electronics applications

Datasheet – production data



LQFP100 (14 x 14 x 1.4 mm)



LQFP64 (10 x 10 x 1.4 mm)

Features

- AEC-Q100 qualified
- High-performance up to 48 MHz e200z0h CPU
  - 32-bit Power Architecture® technology CPU
  - Variable length encoding (VLE)
- Memory
  - Up to 256 KB Code Flash with ECC
  - Up to 64 (4x16) KB Data Flash with ECC
  - Up to 16 KB SRAM with ECC
- Interrupts
  - 16 priority levels
  - Non-maskable interrupt (NMI)
  - Up to 38 external interrupts including 18 wakeup lines
- 16-channel eDMA
- GPIOs: 45 (LQFP64), 79 (LQFP100)
- Timer units
  - 4-channel 32-bit periodic interrupt timers
  - 4-channel 32-bit system timer module
  - System watchdog timer
  - 32-bit real-time clock timer
- 16-bit counter time-triggered I/Os
  - Up to 28 channels with PWM/MC/IC/OC
  - 5 independent counters
  - 27-channels with ADC trigger capability
- 12-bit analog-to-digital converter (ADC) with up to 33 channels
  - Up to 61 channels via external multiplexing
  - Individual conversion registers
  - Cross triggering unit (CTU)
- Dedicated diagnostic module for lighting
  - Advanced PWM generation
  - Time-triggered diagnostics
  - PWM-synchronized ADC measurements
- Communications interfaces
  - 1 FlexCAN interface (2.0B active) with 32 message buffers
  - 3 LINFlex/UART, 1 with DMA capability
  - 2 DSPI
- Clock generation
  - 4 to 16 MHz fast external crystal oscillator
  - 16 MHz fast internal RC oscillator
  - 128 kHz slow internal RC oscillator
  - Software-controlled FMPLL
  - Clock monitoring unit
- Exhaustive debugging capability
  - Nexus1 on all packages
  - Nexus2+ available on emulation device (SPC560B64B2-ENG)
- On-chip CAN/UART bootstrap loader
- Low power capabilities
  - Several low power mode configurations
  - Ultra-low power standby with RTC, SRAM and CAN monitoring
  - Fast wakeup schemes
- Single 5 V or 3.3 V supply
- Operates in ambient temperature range of -40 to 125 °C

1 Introduction

1.1 Document overview

This document describes the device features and highlights the important electrical and physical characteristics.

1.2 Description

These 32-bit automotive microcontrollers are a family of system-on-chip (SoC) devices designed to be central to the development of the next wave of central vehicle body controller, smart junction box, front module, peripheral body, door control and seat control applications.

This family is one of a series of next-generation integrated automotive microcontrollers based on the Power Architecture technology and designed specifically for embedded applications.

The advanced and cost-efficient e200z0h host processor core of this automotive controller family complies with the Power Architecture technology and only implements the VLE (variable-length encoding) APU (auxiliary processing unit) and provides improved code density. It operates at speed of up to 48 MHz and offers high performance processing optimized for low power consumption. It capitalizes on the available development infrastructure of current power architecture devices and is supported with software drivers, operating systems and configuration code to assist with the user's implementations.

The device platform has a single level of memory hierarchy and can support a wide range of on-chip static random access memory (SRAM) and internal flash memory.

Table 3 summarizes the functions of all the blocks present in the SPC560D30x and SPC560D40x series of microcontrollers. Note that the presence and number of blocks varies by device and package.

Table 3. SPC560D30x and SPC560D40x series block summary

Block	Function
Analog-to-digital converter (ADC)	Multi-channel, 12-bit analog-to-digital converter
Boot assist module (BAM)	A block of read-only memory containing VLE code which is executed according to the boot mode of the device
Clock generation module (MC_CGM)	Provides logic and control required for the generation of system and peripheral clocks
Clock monitor unit (CMU)	Monitors clock source (internal and external) integrity
Cross triggering unit (CTU)	Enables synchronization of ADC conversions with a timer event from the eMIOS or PIT
Crossbar switch (XBAR)	Supports simultaneous connections between two master ports and three slave ports. The crossbar supports a 32-bit address bus width and a 64-bit data bus width.
Deserial serial peripheral interface (DSPI)	Provides a synchronous serial interface for communication with external devices
Enhanced direct memory access (eDMA)	Performs complex data transfers with minimal intervention from a host processor via "*n*" programmable channels.
Enhanced modular input output system (eMIOS)	Provides the functionality to generate or measure events
Error correction status module (ECSM)	Provides a myriad of miscellaneous control functions for the device including program-visible information about configuration and revision levels, a reset status register, wakeup control for exiting sleep modes, and optional features such as information on memory errors reported by error-correcting codes
Flash memory	Provides non-volatile storage for program code, constants and variables
FlexCAN (controller area network)	Supports the standard CAN communications protocol
Frequency-modulated phase-locked loop (FMPLL)	Generates high-speed system clocks and supports programmable frequency modulation
Internal multiplexer (IMUX) SIU subblock	Allows flexible mapping of peripheral interface on the different pins of the device
Interrupt controller (INTC)	Provides priority-based preemptive scheduling of interrupt requests
JTAG controller (JTAGC)	Provides the means to test chip functionality and connectivity while remaining transparent to system logic when not in test mode
LINFlex controller	Manages a high number of LIN (Local Interconnect Network protocol) messages efficiently with a minimum of CPU load
Mode entry module (MC_ME)	Provides a mechanism for controlling the device operational mode and mode transition sequences in all functional states. It also manages the power control unit, reset generation module, clock generation module, and holds the configuration, control and status registers accessible for applications
Non-maskable interrupt (NMI)	Handles external events which produces an immediate response, such as power down detection

Table 3. SPC560D30x and SPC560D40x series block summary (continued)

Block	Function
Periodic interrupt timer (PIT)	Produces periodic interrupts and triggers
Power control unit (MC_PCU)	Reduces the overall power consumption by disconnecting parts of the device from the power supply via a power switching device; device components are grouped into sections called “power domains” which are controlled by the PCU
Real-time counter (RTC)	Provides a free-running counter and interrupt generation capability that can be used for timekeeping applications
Reset generation module (MC_RGM)	Centralizes reset sources and manages the device reset sequence of the device
Static random-access memory (SRAM)	Provides storage for program code, constants, and variables
System integration unit lite (SIUL)	Provides control over all the electrical pad controls and up 32 ports with 16-bits of bidirectional, general-purpose input and output signals and supports up to 32 external interrupts with trigger event configuration
System status and configuration module (SSCM)	Provides system configuration and status data (such as memory size and status, device mode and security status), device identification data, debug status port enable and selection, and bus and peripheral abort enable/disable
System timer module (STM)	Provides a set of output compare events to support AUTOSAR (Automotive Open System Architecture) and operating system tasks
Software watchdog timer (SWT)	Provides protection from runaway code
Wakeup unit (WKPU)	Supports up to 18 external sources that can generate interrupts or wakeup events, of which one can cause non-maskable interrupt requests or wakeup events.

3 Package pinouts and signal descriptions

3.1 Package pinouts

The available LQFP pinouts are provided in the following figures. For pin signal descriptions, refer to *Table 6*.

Figure 2 shows the SPC560D30x and SPC560D40x in the LQFP100 package.

Figure 2. LQFP100 LQFP pin configuration (top view)

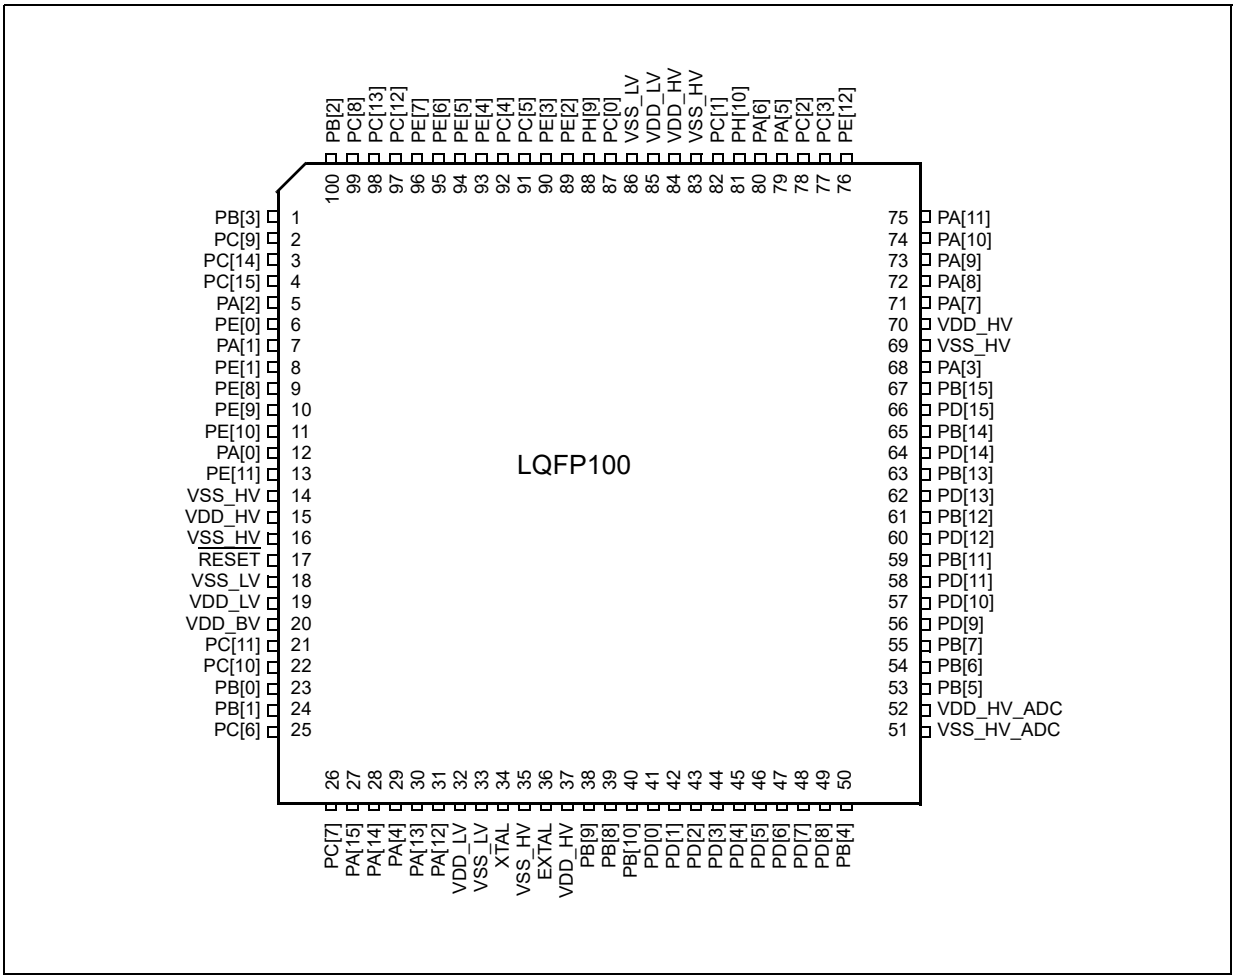

Figure 3 shows the SPC560D30x and SPC560D40x in the LQFP64 package.

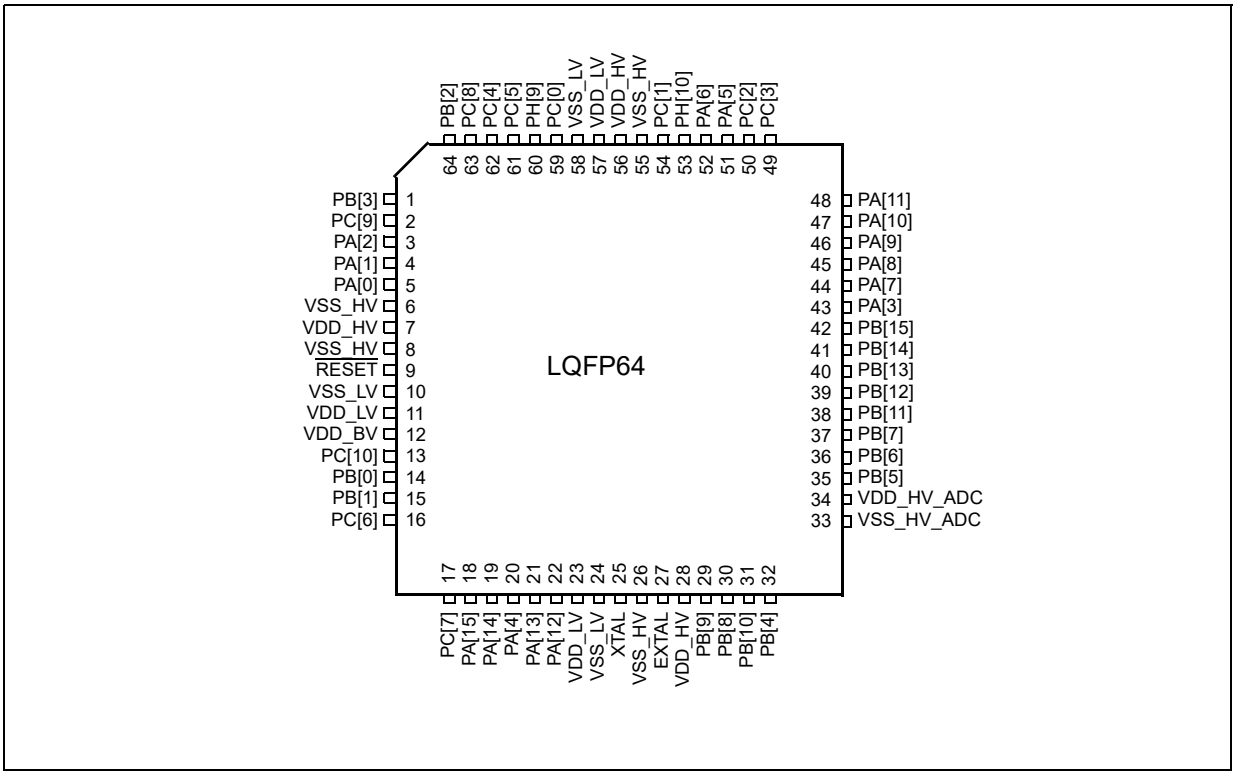
Figure 3. LQFP64 LQFP pin configuration (top view)



3.2 Pad configuration during reset phases

All pads have a fixed configuration under reset.

During the power-up phase, all pads are forced to tristate.

After power-up phase, all pads are forced to tristate with the following exceptions:

- PA[9] (FAB) is pull-down. Without external strong pull-up the device starts fetching from flash.
- PA[8] (ABS[0]) is pull-up.
- RESET pad is driven low. This is pull-up only after PHASE2 reset completion.
- JTAG pads (TCK, TMS and TDI) are pull-up while TDO remains tristate.
- Precise ADC pads (PB[7:4] and PD[11:0]) are left tristate (no output buffer available).
- Main oscillator pads (EXTAL, XTAL) are tristate.

3.3 Voltage supply pins

Voltage supply pins are used to provide power to the device. Two dedicated pins are used for 1.2 V regulator stabilization.

Table 4. Voltage supply pin descriptions

Port pin	Function	Pin number	
		LQFP64	LQFP100
VDD_HV	Digital supply voltage	7, 28, 34, 56	15, 37, 52, 70, 84
VSS_HV	Digital ground	6, 8, 26, 33, 55	14, 16, 35, 51, 69, 83
VDD_LV	1.2 V decoupling pins. Decoupling capacitor must be connected between these pins and the nearest V_{SS_LV} pin(1)	11, 23, 57	19, 32, 85
VSS_LV	1.2 V decoupling pins. Decoupling capacitor must be connected between these pins and the nearest V_{DD_LV} pin(1)	10, 24, 58	18, 33, 86
VDD_BV	Internal regulator supply voltage	12	20

1. A decoupling capacitor must be placed between each of the three VDD_LV/VSS_LV supply pairs to ensure stable voltage (refer the *Section 4.5: Recommended operating conditions* in the device datasheet for details).

3.4 Pad types

In the device the following types of pads are available for system pins and functional port pins:

S = Slow (1)

M = Medium (1) (2)

F = Fast (1) (2)

I = Input only with analog feature (1)

J = Input/Output (‘S’ pad) with analog feature

X = Oscillator

3.5 System pins

The system pins are listed in *Table 5*.

1. Refer, *Section 4.7: I/O pad electrical characteristics* in the device datasheet for details.
2. All medium and fast pads are in slow configuration by default at reset and can be configured as fast or medium (see the PCR[SRC] description in the device reference manual).

Table 5. System pin descriptions

Port pin	Function	I/O direction	Pad type	RESET configuration	Pin number	
					LQFP64	LQFP100
$\overline{\text{RESET}}$	Bidirectional reset with Schmitt-Trigger characteristics and noise filter	I/O	M	Input, weak pull-up only after PHASE2	9	17
EXTAL	Analog output of the oscillator amplifier circuit, when the oscillator is not in bypass mode. Analog input for the clock generator when the oscillator is in bypass mode(1)	I/O	X	Tristate	27	36
XTAL	Analog input of the oscillator amplifier circuit. Needs to be grounded if oscillator is used in bypass mode(1)	I	X	Tristate	25	34

1. Refer to the relevant section of the device datasheet.

3.6 Functional ports

The functional port pins are listed in *Table 6*.

1. Alternate functions are chosen by setting the values of the PCR.PA bitfields inside the SIUL module. PCR.PA = 00 ® AF0; PCR.PA = 01 ® AF1; PCR.PA = 10 ® AF2; PCR.PA = 11 ® AF3. This is intended to select the output functions; to use one of the input functions, the PCR.IBE bit must be written to ‘1’, regardless of the values selected in the PCR.PA bitfields. For this reason, the value corresponding to an input only function is reported as “—”.
2. Multiple inputs are routed to all respective modules internally. The input of some modules must be configured by setting the values of the PSMIO.PADSELx bitfields inside the SIUL module.
3. All WKPU pins also support external interrupt capability. See “wakeup unit” chapter of the device reference manual for further details.
4. NMI has higher priority than alternate function. When NMI is selected, the PCR.AF field is ignored.
5. “Not applicable” because these functions are available only while the device is booting. Refer to “BAM” chapter of the device reference manual for details.
6. Out of reset all the functional pins except PC[0:1] and PH[9:10] are available to the user as GPIO.
   PC[0:1] are available as JTAG pins (TDI and TDO respectively).
   PH[9:10] are available as JTAG pins (TCK and TMS respectively).
   If the user configures these JTAG pins in GPIO mode the device is no longer compliant with IEEE 1149.1 2001.

4 Electrical characteristics

4.1 Introduction

This section contains electrical characteristics of the device as well as temperature and power considerations.

This product contains devices to protect the inputs against damage due to high static voltages. However, it is advisable to take precautions to avoid application of any voltage higher than the specified maximum rated voltages.

To enhance reliability, unused inputs can be driven to an appropriate logic voltage level (V_{DD} or V_{SS}). This can be done by the internal pull-up or pull-down, which is provided by the product for most general purpose pins.

The parameters listed in the following tables represent the characteristics of the device and its demands on the system.

In the tables where the device logic provides signals with their respective timing characteristics, the symbol “CC” for Controller Characteristics is included in the Symbol column.

In the tables where the external system must provide signals with their respective timing characteristics to the device, the symbol “SR” is for System Requirement is included in the Symbol column.

4.2 Parameter classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding, the classifications listed in *Table 7* are used and the parameters are tagged accordingly in the tables where appropriate.

Table 7. Parameter classifications

Classification tag	Tag description
P	Those parameters are guaranteed during production testing on each individual device.
C	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
T	Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category.
D	Those parameters are derived mainly from simulations.

Note: The classification is shown in the column labeled “C” in the parameter tables where appropriate.

4.3 NVUSRO register

Bit values in the Non-Volatile User Options (NVUSRO) Register control portions of the device configuration, namely electrical parameters such as high voltage supply and oscillator margin, as well as digital functionality (watchdog enable/disable after reset).

For a detailed description of the NVUSRO register, refer to the device reference manual.

4.3.1 NVUSRO[PAD3V5V] field description

The DC electrical characteristics are dependent on the PAD3V5V bit value. *Table 8* shows how NVUSRO[PAD3V5V] controls the device configuration.

Table 8. PAD3V5V field description

Value (1)	Description
0	High voltage supply is 5.0 V
1	High voltage supply is 3.3 V

1. Default manufacturing value is ‘1’. Value can be programmed by customer in Shadow Flash.

4.3.2 NVUSRO[OSCILLATOR_MARGIN] field description

The fast external crystal oscillator consumption is dependent on the OSCILLATOR_MARGIN bit value. *Table 9* shows how NVUSRO[OSCILLATOR_MARGIN] controls the device configuration.

Table 9. OSCILLATOR_MARGIN field description

Value (1)	Description
0	Low consumption configuration (4 MHz/8 MHz)
1	High margin configuration (4 MHz/16 MHz)

1. Default manufacturing value is ‘1’. Value can be programmed by customer in Shadow Flash.

4.3.3 NVUSRO[WATCHDOG_EN] field description

The watchdog enable/disable configuration after reset is dependent on the WATCHDOG_EN bit value. *Table 10* shows how NVUSRO[WATCHDOG_EN] controls the device configuration.

Table 10. WATCHDOG_EN field description

Value (1)	Description
0	Disable after reset
1	Enable after reset

1. Default manufacturing value is ‘1’. Value can be programmed by customer in Shadow Flash.

4.4 Absolute maximum ratings

I_{INJSUM}	SR	Absolute sum of all injected input currents during overload condition	—	–50	50	mA
I_{AVGSEG}	SR	Sum of all the static I/O current within a supply segment (1)	V_{DD} = 5.0 V ± 10%, PAD3V5V = 0	—	70	mA
			V_{DD} = 3.3 V ± 10%, PAD3V5V = 1	—	64	
I_{CORELV}	SR	Low voltage static current sink through VDD_BV	—	—	150	mA
$T_{STORAGE}$	SR	Storage temperature	—	–55	150	°C

1. Supply segments are described in *Section 4.7.5: I/O pad current specification*.

Note: Stresses exceeding the recommended absolute maximum ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification are not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. During overload conditions (V_{IN} > V_{DD} or V_{IN} < V_{SS}), the voltage on pins with respect to ground (V_{SS}) must not exceed the recommended values.

1. 100 nF capacitance needs to be provided between each V_{DD}/V_{SS} pair.
2. 330 nF capacitance needs to be provided between each V_{DD_LV}/V_{SS_LV} supply pair.
3. 470 nF capacitance needs to be provided between V_{DD_BV} and the nearest V_{SS_LV} (higher value may be needed depending on external regulator characteristics).
4. 100 nF capacitance needs to be provided between V_{DD_ADC}/V_{SS_ADC} pair.
5. Full electrical specification cannot be guaranteed when voltage drops below 3.0 V. In particular, ADC electrical characteristics and I/Os DC electrical specification may not be guaranteed. When voltage drops below V_{LVDHVL}, device is reset.
6. Guaranteed by device validation.
7. Minimum value of TV_{DD} must be guaranteed until V_{DD} reaches 2.6 V (maximum value of V_{PORH}).

TV_{DD}	SR	—	V_{DD} slope to ensure correct power up(6)	—	3.0(7)	250 x 10^3 (0.25 [V/ µs])	V/ s

1. 100 nF capacitance needs to be provided between each V_{DD}/V_{SS} pair.
2. Full device operation is guaranteed by design when the voltage drops below 4.5 V down to 3.6 V. However, certain analog electrical characteristics will not be guaranteed to stay within the stated limits.
3. 330 nF capacitance needs to be provided between each V_{DD_LV}/V_{SS_LV} supply pair.
4. 470 nF capacitance needs to be provided between V_{DD_BV} and the nearest V_{SS_LV} (higher value may be needed depending on external regulator characteristics).
5. 100 nF capacitance needs to be provided between V_{DD_ADC}/V_{SS_ADC} pair.
6. Guaranteed by device validation.
7. Minimum value of TV_{DD} must be guaranteed until V_{DD} reaches 2.6 V (maximum value of V_{PORH}).

Note: SRAM data retention is guaranteed with V_{DD_LV} not below 1.08 V.

1. V_{DD} = 3.3 V ± 10% / 5.0 V ± 10%, T_A = –40 to 125 °C
2. Junction-to-ambient thermal resistance determined per JEDEC JESD51-3 and JESD51-7. Thermal test board meets JEDEC specification for this package. When Greek letters are not available, the symbols are typed as R_{thJA}.
3. Junction-to-board thermal resistance determined per JEDEC JESD51-8. Thermal test board meets JEDEC specification for the specified package. When Greek letters are not available, the symbols are typed as R_{thJB}.
4. Junction-to-case at the top of the package determined using MIL-STD 883 Method 1012.1. The cold plate temperature is used for the case temperature. Reported value includes the thermal resistance of the interface layer. When Greek letters are not available, the symbols are typed as R_{thJC}.

Note: Thermal characteristics are targets based on simulation that are subject to change per device characterization.

4.6.2 Power considerations

The average chip-junction temperature, T_J, in degrees Celsius, may be calculated using *Equation 1*:

Equation 1 $T_J = T_A + (P_D \times R_{\theta JA})$

Where:

T_A is the ambient temperature in °C.

$R_{\theta JA}$ is the package junction-to-ambient thermal resistance, in °C/W.

P_D is the sum of P_{INT} and $P_{I/O}$ ($P_D = P_{INT} + P_{I/O}$).

P_{INT} is the product of I_{DD} and V_{DD}, expressed in watts. This is the chip internal power.

$P_{I/O}$ represents the power dissipation on input and output pins; user determined.

Most of the time for the applications, $P_{I/O} < P_{INT}$ and may be neglected. On the other hand, $P_{I/O}$ may be significant, if the device is configured to continuously drive external modules and/or memories.

An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is given by:

Equation 2 $P_D = K / (T_J + 273\ °C)$

Therefore, solving equations *1* and *2*:

Equation 3 $K = P_D \times (T_A + 273\ °C) + R_{\theta JA} \times P_D^2$

Where:

K is a constant for the particular part, which may be determined from *Equation 3* by measuring P_D (at equilibrium) for a known T_A. Using this value of K, the values of P_D and T_J may be obtained by solving equations *1* and *2* iteratively for any value of T_A.

4.7 I/O pad electrical characteristics

4.7.1 I/O pad types

The device provides four main I/O pad types depending on the associated alternate functions:

- Slow pads — These pads are the most common pads, providing a good compromise between transition time and low electromagnetic emission.
- Medium pads — These pads provide transition fast enough for the serial communication channels with controlled current to reduce electromagnetic emission.
- Input only pads — These pads are associated to ADC channels (ADC_P[X]) providing low input leakage.

Medium pads can use slow configuration to reduce electromagnetic emission except for PC[1], that is medium only, at the cost of reducing AC performance.

4.7.2 I/O input DC characteristics

Table 15 provides input DC electrical characteristics as described in *Figure 4*.

2. In the range from 40 to 1000 ns, pulses can be filtered or not filtered, according to the operating temperature and voltage.

4.7.3 I/O output DC characteristics

The following tables provide DC characteristics for bidirectional pads:

- *Table 16* provides weak pull figures. Both pull-up and pull-down resistances are supported.
- *Table 17* provides output driver characteristics for I/O pads when in SLOW configuration.
- *Table 18* provides output driver characteristics for I/O pads when in MEDIUM configuration.

4.7.5 I/O pad current specification

The I/O pads are distributed across the I/O supply segment. Each I/O supply segment is associated to a V_{DD}/V_{SS} supply pair as described in *Table 20*.

Table 21 provides I/O consumption figures.

In order to ensure device reliability, the average current of the I/O on a single segment should remain below the I_{AVGSEG} maximum value.

4.9 Power management electrical characteristics

4.9.1 Voltage regulator electrical characteristics

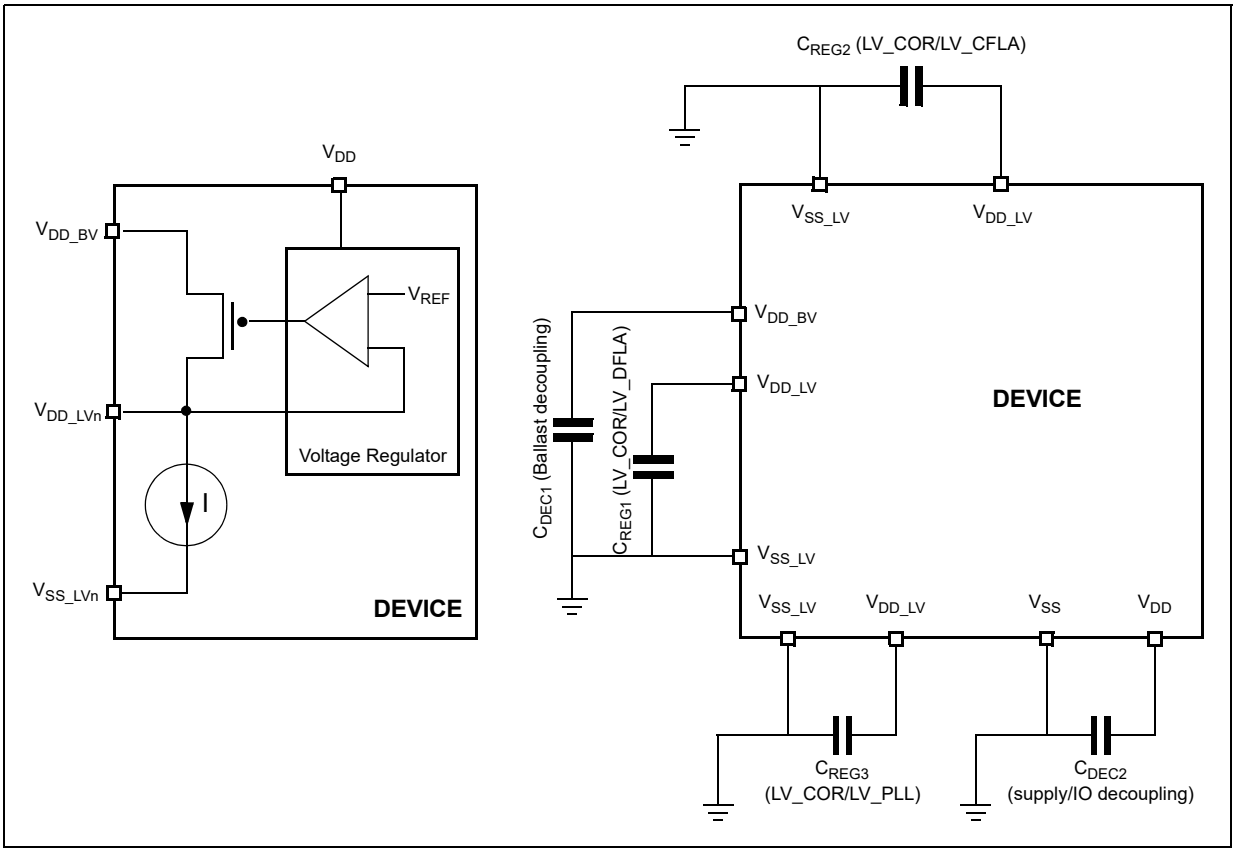
The device implements an internal voltage regulator to generate the low voltage core supply V_{DD_LV} from the high voltage ballast supply V_{DD_BV}. The regulator itself is supplied by the common I/O supply V_{DD}. The following supplies are involved:

- HV: High voltage external power supply for voltage regulator module. This must be provided externally through V_{DD} power pin.
- BV: High voltage external power supply for internal ballast module. This must be provided externally through V_{DD_BV} power pin. Voltage values should be aligned with V_{DD}.
- LV: Low voltage internal power supply for core, FMPLL and flash digital logic. This is generated by the internal voltage regulator but provided outside to connect stability

capacitor. It is further split into four main domains to ensure noise isolation between critical LV modules within the device:

– LV_COR: Low voltage supply for the core. It is also used to provide supply for FMPLL through double bonding.
– LV_CFLA: Low voltage supply for code flash module. It is supplied with dedicated ballast and shorted to LV_COR through double bonding.
– LV_DFLA: Low voltage supply for data flash module. It is supplied with dedicated ballast and shorted to LV_COR through double bonding.
– LV_PLL: Low voltage supply for FMPLL. It is shorted to LV_COR through double bonding.

Figure 7. Voltage regulator capacitance connection



The internal voltage regulator requires external capacitance (C_{REGn}) to be connected to the device in order to provide a stable low voltage digital supply to the device. Capacitances should be placed on the board as near as possible to the associated pins. Care should also be taken to limit the serial inductance of the board to less than 5 nH.

Each decoupling capacitor must be placed between each of the three V_{DD_LV}/V_{SS_LV} supply pairs to ensure stable voltage (see *Section 4.5: Recommended operating conditions*).

I_{DD_BV}	CC	D	In-rush average current on V_{DD_BV} during power-up[5]	—	—	—	300[6]	mA

1. V_{DD} = 3.3 V ± 10% / 5.0 V ± 10%, T_A = –40 to 125 °C, unless otherwise specified.
2. This capacitance value is driven by the constraints of the external voltage regulator supplying the V_{DD_BV} voltage. A typical value is in the range of 470 nF.
3. This value is acceptable to guarantee operation from 4.5 V to 5.5 V.

4. External regulator and capacitance circuitry must be capable of providing I_{DD_BV} while maintaining supply V_{DD_BV} in operating range.
5. In-rush average current is seen only for short time during power-up and on standby exit (maximum 20 µs, depending on external capacitances to be loaded).
6. The duration of the in-rush current depends on the capacitance placed on LV pins. BV decoupling capacitors must be sized accordingly. Refer to I_{MREG} value for minimum amount of current to be provided in cc.

4.9.2 Low voltage detector electrical characteristics

The device implements a power-on reset (POR) module to ensure correct power-up initialization, as well as five low voltage detectors (LVDs) to monitor the V_{DD} and the V_{DD_LV} voltage while device is supplied:

- POR monitors V_{DD} during the power-up phase to ensure device is maintained in a safe reset state (refer to RGM Destructive Event Status (RGM_DES) Register flag F_POR in device reference manual)
- LVDHV3 monitors V_{DD} to ensure device reset below minimum functional supply (refer to RGM Destructive Event Status (RGM_DES) Register flag F_LVD27 in device reference manual)
- LVDHV3B monitors V_{DD_BV} to ensure device reset below minimum functional supply (refer to RGM Destructive Event Status (RGM_DES) Register flag F_LVD27_VREG in device reference manual)
- LVDHV5 monitors V_{DD} when application uses device in the 5.0 V ± 10% range (refer to RGM Functional Event Status (RGM_FES) Register flag F_LVD45 in device reference manual)

4.10 Power consumption

Table 26 provides DC electrical characteristics for significant application modes. These values are indicative values; actual consumption depends on the application.

		D			T_A = 55 °C	—	75	—	
		D			T_A = 85 °C	—	180	700	
		D			T_A = 105 °C	—	315	1000	
		P			T_A = 125 °C	—	560	1700	

1. V_{DD} = 3.3 V ± 10% / 5.0 V ± 10%, T_A = –40 to 125 °C, unless otherwise specified.
2. Running consumption does not include I/Os toggling which is highly dependent on the application. The given value is thought to be a worst case value with all peripherals running, and code fetched from code flash while modify operation ongoing on data flash. Notice that this value can be significantly reduced by application: switch off not used peripherals (default), reduce peripheral frequency through internal prescaler, fetch from RAM most used functions, use low power mode when possible.
3. Higher current may be sinked by device during power-up and standby exit. Refer to in-rush average current on *Table 24*.
4. RUN current measured with typical application with accesses on both flash memory and SRAM.
5. Only for the “P” classification: Code fetched from SRAM: serial IPs CAN and LIN in loop-back mode, DSPI as Master, PLL as system clock (3 × Multiplier) peripherals on (eMIOS/CTU/ADC) and running at maximum frequency, periodic SW/WDG timer reset enabled.
6. Data flash power down. Code flash in low power. SIRC (128 kHz) and FIRC (16 MHz) on. 10 MHz XTAL clock. FlexCAN: 0 ON (clocked but no reception or transmission). LINFlex: instances: 0, 1, 2 ON (clocked but no reception or transmission), instance: 3 clocks gated. eMIOS: instance: 0 ON (16 channels on PA[0]–PA[11] and PC[12]–PC[15]) with PWM 20 kHz, instance: 1 clock gated. DSPI: instance: 0 (clocked but no communication). RTC/API ON.PIT ON. STM ON. ADC ON but no conversion except 2 analog watchdogs.
7. Only for the “P” classification: No clock, FIRC (16 MHz) off, SIRC (128 kHz) on, PLL off, HPVreg off, ULPVreg/LPVreg on. All possible peripherals off and clock gated. Flash in power down mode.
8. When going from RUN to STOP mode and the core consumption is > 6 mA, it is normal operation for the main regulator module to be kept on by the on-chip current monitoring circuit. This is most likely to occur with junction temperatures exceeding 125°C and under these circumstances, it is possible for the current to initially exceed the maximum STOP specification by up to 2 mA. After entering stop, the application junction temperature will reduce to the ambient level and the main regulator will be automatically switched off when the load current is below 6 mA.
9. Only for the “P” classification: ULPVreg on, HP/LPVreg off, 16 KB SRAM on, device configured for minimum consumption, all possible modules switched off.

4.11 Flash memory electrical characteristics

The data flash operation depends strongly on the code flash operation. If code flash is switched-off, the data flash is disabled.

4.11.1 Program/Erase characteristics

Table 27 shows the program and erase characteristics.

Table 27. Program and erase specifications (code flash)

1. V_{DD} = 3.3 V ± 10% / 5.0 V ± 10%, T_A = –40 to 125 °C, unless otherwise specified.
2. Data flash does not support low-power mode.
3. If code flash is already switched-on.

4.12 Electromagnetic compatibility (EMC) characteristics

Susceptibility tests are performed on a sample basis during product characterization.

4.12.1 Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user apply EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

- Software recommendations – The software flowchart must include the management of runaway conditions such as:
  - Corrupted program counter
  - Unexpected reset
  - Critical data corruption (control registers...)
- Prequalification trials – Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the reset pin or the oscillator pins for 1 second.

  To complete these trials, ESD stress can be applied directly on the device. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see the application note *Software Techniques For Improving Microcontroller EMC Performance* (AN1015)).

4.12.2 Electromagnetic interference (EMI)

The product is monitored in terms of emission based on a typical application. This emission test conforms to the IEC 61967-1 standard, which specifies the general conditions for EMI measurements.

Table 33. EMI radiated emission measurement

					± 2% PLL frequency modulation	—	—	14	dBµV

Note: EMI testing and I/O port waveforms per IEC 61967-1, -2, -4
For information on conducted emission and susceptibility measurement (norm IEC 61967-4), please contact your local marketing representative.

4.12.3 Absolute maximum ratings (electrical sensitivity)

Based on two different tests (ESD and LU) using specific measurement methods, the product is stressed in order to determine its performance in terms of electrical sensitivity.

Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to the each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n + 1) supply pin). This test conforms to the AEC-Q100-002/-003/-011 standard. For more details, refer to the application note *Electrostatic Discharge Sensitivity Measurement* (AN1181).

Table 34. ESD absolute maximum ratings

Symbol		C	Ratings	Conditions	Class	Max value	Unit
$V_{ESD(HBM)}$	CC	T	Electrostatic discharge voltage (Human Body Model)	T_A = 25 °C conforming to AEC-Q100-002	H1C	2000	V
$V_{ESD(MM)}$	CC	T	Electrostatic discharge voltage (Machine Model)	T_A = 25 °C conforming to AEC-Q100-003	M2	200	V
$V_{ESD(CDM)}$	CC	T	Electrostatic discharge voltage (Charged Device Model)	T_A = 25 °C conforming to AEC-Q100-011	C3A	500	V
						750 (corners)	V

Note: All ESD testing is in conformity with CDF-AEC-Q100 Stress Test Qualification for Automotive Grade Integrated Circuits.
A device will be defined as a failure if after exposure to ESD pulses the device no longer meets the device specification requirements. Complete DC parametric and functional testing shall be performed per applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

Static latch-up (LU)

Two complementary static tests are required on six parts to assess the latch-up performance:

- A supply overvoltage is applied to each power supply pin.
- A current injection is applied to each input, output and configurable I/O pin.

These tests are compliant with the EIA/JESD 78 IC latch-up standard.

Table 35. Latch-up results

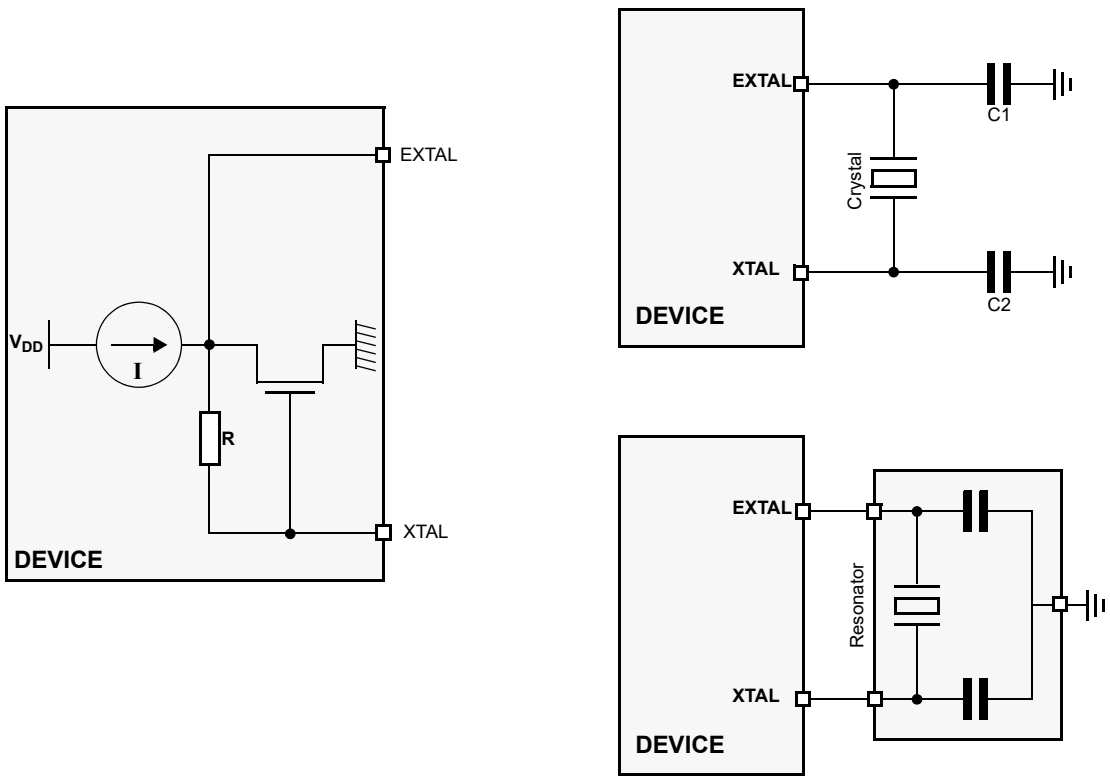
Symbol		C	Parameter	Conditions	Class
LU	CC	T	Static latch-up class	T_A = 125 °C conforming to JESD 78	II level A

4.13 Fast external crystal oscillator (4 to 16 MHz) electrical characteristics

The device provides an oscillator/resonator driver. *Figure 9* describes a simple model of the internal oscillator driver and provides an example of a connection for an oscillator or a resonator.

Table 36 provides the parameter description of 4 MHz to 16 MHz crystals used for the design simulations.

Figure 9. Crystal oscillator and resonator connection scheme



Notes:
1. XTAL/EXTAL must not be directly used to drive external circuits
2. A series resistor may be required, according to the crystal oscillator supplier recommendations.

2. PLLIN clock retrieved directly from FXOSC clock. Input characteristics are granted when oscillator is used in functional mode. When bypass mode is used, oscillator input clock should verify f_{PLLIN} and Δ_{PLLIN}.
3. Frequency modulation is considered ±4%.

4.15 Fast internal RC oscillator (16 MHz) electrical characteristics

The device provides a 16 MHz fast internal RC oscillator (FIRC). This is used as the default clock at the power-up of the device.

4.17.2 Input impedance and ADC accuracy

In the following analysis, the input circuit corresponding to the precise channels is considered.

To preserve the accuracy of the A/D converter, it is necessary that analog input pins have low AC impedance. Placing a capacitor with good high frequency characteristics at the input pin of the device can be effective: the capacitor should be as large as possible, ideally infinite. This capacitor contributes to attenuating the noise present on the input pin; furthermore, it sources charge during the sampling phase, when the analog signal source is a high-impedance source.

A real filter can typically be obtained by using a series resistance with a capacitor on the input pin (simple RC filter). The RC filtering may be limited according to the value of source

impedance of the transducer or circuit supplying the analog signal to be measured. The filter at the input pins must be designed taking into account the dynamic characteristics of the input signal (bandwidth) and the equivalent input impedance of the ADC itself.

In fact a current sink contributor is represented by the charge sharing effects with the sampling capacitance: being C_S and C_{p2} substantially two switched capacitances, with a frequency equal to the conversion rate of the ADC, it can be seen as a resistive path to ground. For instance, assuming a conversion rate of 1 MHz, with C_S+C_{p2} equal to 3 pF, a resistance of 330 kΩ is obtained (R_{EQ} = 1 / (f_c × (C_S+C_{p2})), where f_c represents the conversion rate at the considered channel). To minimize the error induced by the voltage partitioning between this resistance (sampled voltage on C_S+C_{p2}) and the sum of R_S + R_F, the external circuit must be designed to respect the *Equation 4*:

Equation 4

$$V_A \bullet \frac{R_S + R_F}{R_{EQ}} < \frac{1}{2} LSB$$

Equation 4 generates a constraint for external network design, in particular on a resistive path.

R_{AD}: Sampling switch impedance

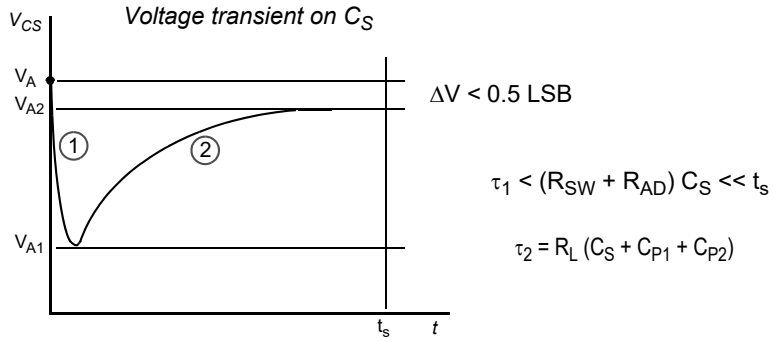
C_P: Pin capacitance (two contributions, C_{P1}, C_{P2} and C_{P3})

C_S: Sampling capacitance

A second aspect involving the capacitance network shall be considered. Assuming the three capacitances C_F, C_{P1} and C_{P2} are initially charged at the source voltage V_A (refer to the equivalent circuit in *Figure 13*): A charge sharing phenomenon is installed when the sampling phase is started (A/D switch close).

Figure 14. Transient behavior during sampling phase



In particular two different transient periods can be distinguished:

1. A first and quick charge transfer from the internal capacitance C_{P1} and C_{P2} to the sampling capacitance C_S occurs (C_S is supposed initially completely discharged): considering a worst case (since the time constant in reality would be faster) in which C_{P2} is reported in parallel to C_{P1} (call $C_P = C_{P1} + C_{P2}$), the two capacitances C_P and C_S are in series, and the time constant is

Equation 5

$$\tau_1 = (R_{SW} + R_{AD}) \bullet \frac{C_P \bullet C_S}{C_P + C_S}$$

Equation 5 can again be simplified considering only C_S as an additional worst condition. In reality, the transient is faster, but the A/D converter circuitry has been designed to be robust also in the very worst case: the sampling time t_s is always much longer than the internal time constant:

Equation 6

$$\tau_1 < (R_{SW} + R_{AD}) \bullet C_S \ll t_s$$

The charge of C_{P1} and C_{P2} is redistributed also on C_S, determining a new value of the voltage V_{A1} on the capacitance according to the *Equation 7*:

Equation 7

$$V_{A1} \bullet (C_S + C_{P1} + C_{P2}) = V_A \bullet (C_{P1} + C_{P2})$$

2. A second charge transfer involves also C_F (that is typically bigger than the on-chip capacitance) through the resistance R_L: again considering the worst case in which C_{P2} and C_S were in parallel to C_{P1} (since the time constant in reality would be faster), the time constant is:

Equation 8

$$\tau_2 < R_L \bullet (C_S + C_{P1} + C_{P2})$$

In this case, the time constant depends on the external circuit: in particular imposing that the transient is completed well before the end of sampling time t_s, a constraints on R_L sizing is obtained:

Equation 9

$$10 \bullet \tau_2 = 10 \bullet R_L \bullet (C_S + C_{P1} + C_{P2}) < t_s$$

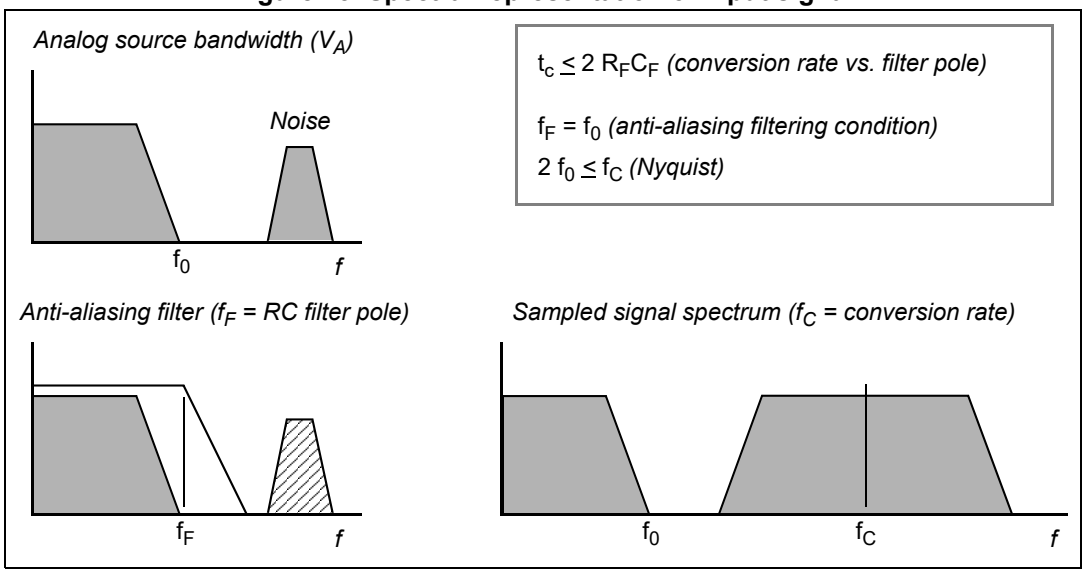
Of course, R_L shall be sized also according to the current limitation constraints, in combination with R_S (source impedance) and R_F (filter resistance). Being C_F definitively bigger than C_{P1}, C_{P2} and C_S, then the final voltage V_{A2} (at the end of the charge transfer transient) will be much higher than V_{A1}. *Equation 10* must be respected (charge balance assuming now C_S already charged at V_{A1}):

Equation 10

$$V_{A2} \bullet (C_S + C_{P1} + C_{P2} + C_F) = V_A \bullet C_F + V_{A1} \bullet (C_{P1} + C_{P2} + C_S)$$

The two transients above are not influenced by the voltage source that, due to the presence of the $R_F C_F$ filter, is not able to provide the extra charge to compensate the voltage drop on C_S with respect to the ideal source V_A; the time constant $R_F C_F$ of the filter is very high with respect to the sampling time (t_s). The filter is typically designed to act as anti-aliasing.

Figure 15. Spectral representation of input signal



Calling f_0 the bandwidth of the source signal (and as a consequence the cut-off frequency of the anti-aliasing filter, f_F), according to the Nyquist theorem the conversion rate f_C must be at least $2f_0$; it means that the constant time of the filter is greater than or at least equal to twice the conversion period (t_c). Again the conversion period t_c is longer than the sampling time t_s, which is just a portion of it, even when fixed channel continuous conversion mode is selected (fastest conversion rate at a specific channel): in conclusion it is evident that the time constant of the filter $R_F C_F$ is definitively much higher than the sampling time t_s, so the charge level on C_S cannot be modified by the analog signal source during the time in which the sampling switch is closed.

The considerations above lead to impose new constraints on the external circuit, to reduce the accuracy error due to the voltage drop on C_S; from the two charge balance equations above, it is simple to derive *Equation 11* between the ideal and real sampled voltage on C_S:

Equation 11

$$\frac{V_{A2}}{V_A} = \frac{C_{P1} + C_{P2} + C_F}{C_{P1} + C_{P2} + C_F + C_S}$$

From this formula, in the worst case (when V_A is maximum, that is for instance 5 V), assuming to accept a maximum error of half a count, a constraint is evident on C_F value:

Equation 12

$$C_F > 2048 \bullet C_S$$

1. V_{DD} = 3.3 V ± 10% / 5.0 V ± 10%, T_A = –40 to 125 °C, unless otherwise specified.

2. Analog and digital V_{SS} **must** be common (to be tied together externally).
3. V_{AINx} may exceed V_{SS_ADC} and V_{DD_ADC} limits, remaining on absolute maximum ratings, but the results of the conversion will be clamped respectively to 0x000 or 0xFFF.
4. Duty cycle is ensured by using system clock without prescaling. When ADCLKSEL = 0, the duty cycle is ensured by internal divider by 2.
5. During the sampling time the input capacitance C_S can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within t_S. After the end of the sampling time t_S, changes of the analog input voltage have no effect on the conversion result. Values for the sample clock t_S depend on programming.
6. This parameter does not include the sampling time t_S, but only the time for determining the digital result and the time to load the result's register with the conversion result.

1. Maximum is reached when CSn pad is configured as SLOW pad while SCK pad is configured as MEDIUM pad.
2. The t_{CSC} delay value is configurable through a register. When configuring t_{CSC} (using PCSSCK and CSSCK fields in DSPI_CTARx registers), delay between internal CS and internal SCK must be higher than Δt_{CSC} to ensure positive t_{CSCext}.
3. The t_{ASC} delay value is configurable through a register. When configuring t_{ASC} (using PASC and ASC fields in DSPI_CTARx registers), delay between internal CS and internal SCK must be higher than Δt_{ASC} to ensure positive t_{ASCext}.
4. This delay value corresponds to SMPL_PT = 00b which is bit field 9 and 8 of DSPI_MCR.

18-Feb-2010	2	Updated the following tables: - Absolute maximum ratings - Low voltage power domain electrical characteristics; - On-chip peripherals current consumption - DSPI characteristics; - JTAG characteristics; - ADC conversion characteristics; Inserted a note on “Flash power supply DC characteristics” section.
10-Aug-2010	3	“Features” section: Updated information concerning eMIOS, ADC, LINFlex, Nexus and low power capabilities “SPC560D30x and SPC560D40x device comparison” table: updated the “Execution speed” row “SPC560D30x and SPC560D40x series block diagram” figure: – updated max number of Crossbar Switches – updated Legend “SPC560D30x and SPC560D40x series block summary” table: added contents concernig the eDMA block “LQFP100 pin configuration (top view)” figure: – removed alternate functions – updated supply pins “LQFP64 pin configuration (top view)” figure: removed alternate functions Added “Pin muxing” section “NVUSRO register” section: Deleted “NVUSRO[WATCHDOG_EN] field description“ section “Recommended operating conditions (3.3 V)” table: – TV_{DD}: deleted min value – In footnote No. 3, changed capacitance value between V_{DD_BV} and V_{SS_LV} “Recommended operating conditions (5.0 V)” table: deleted TV_{DD} min value “LQFP thermal characteristics” table: changed $R_{\theta JC}$ values “I/O input DC electrical characteristics” table: – W_{FI}: updated max value – W_{NFI}: updated min value “I/O consumption” table: removed I_{DYNSEG} row Added “I/O weight” table “Program and erase specifications (Code Flash)” table: deleted T_{Bank_C} row

Table 49. Document revision history (continued)

Date	Revision	Changes
10-Aug-2010	3 (cont.)	Updated the following tables: – “Voltage regulator electrical characteristics” – “Low voltage monitor electrical characteristics” – “Low voltage power domain electrical characteristics” – “Start-up time/Switch-off time” – “Fast external crystal oscillator (4 to 16 MHz) electrical characteristics” – “FMPLL electrical characteristics” – “Fast internal RC oscillator (16 MHz) electrical characteristics” – “ADC conversion characteristics” – “On-chip peripherals current consumption” – “DSPI characteristics” “DSPI characteristics” section: removed “DSPI PCS strobe (PCSS) timing” figure Updated “Order codes” table Added “Order codes for engineering samples” table Updated “Commercial product code structure” table
16-Sep-2011	4	Formatting and editorial changes throughout Device comparison table: for the “Total timer I/O eMIOS”, changed “13 ch” to “14 ch” SPC560D30/SPC560D40 series block summary: – added definition for “AUTOSAR” acronym – changed “System watchdog timer” to “Software watchdog timer” LQFP64 pin configuration (top view): changed pin 6 from VPP_TEST to VSS_HV Added section “Pad configuration during reset phases” Added section “Voltage supply pins” Added section “Pad types” Added section “System pins” Renamed and updated section “Functional ports” (was previously section “Pin muxing”); update includes replacing all instances of WKUP with WKPU (WKPU is the correct abbreviation for Wakeup Unit) Section “NVUSRO register”: edited content to separate configuration into electrical parameters and digital functionality Added section “NVUSRO[WATCHDOG_EN] field description” Absolute maximum ratings: Removed “C” column from table Replaced “TBD” with “—” in T_{VDD} min value cell of 3.3 V and 5 V recommended operating conditions tables LQFP thermal characteristics: removed $R_{\theta JB}$ single layer board conditions; updated footnote 4 I/O input DC electrical characteristics: removed footnote “All values need to be confirmed during device validation”; updated I_{LKG} characteristics

Table 49. Document revision history (continued)

Date	Revision	Changes
16-Sep-2011	4 (cont.)	MEDIUM configuration output buffer electrical characteristics: changed “I_{OH} = 100 µA” to “I_{OL} = 100 µA” in V_{OL} conditions I/O consumption: replaced instances of “Root medium square” with “Root mean square” Updated section “Voltage regulator electrical characteristics” Section “Low voltage detector electrical characteristics”: changed title (was “Voltage monitor electrical characteristics”); added a fifth LVD (LVDHV3B); added event status flag names found in RGM chapter of device reference manual to POR module and LVD descriptions; replaced instances of “Low voltage monitor” with “Low voltage detector”; deleted note referencing power domain No. 2 (this domain is not present on the device); updated electrical characteristics table Updated and renamed section “Power consumption” (was previously section “Low voltage domain power consumption”) Program and erase specifications (code flash): updated symbols; updated t_{esus} values Updated Flash memory read access timing EMI radiated emission measurement: updated S_{EMI} values Updated FMPLL electrical characteristics Crystal oscillator and resonator connection scheme: inserted footnote about possibly requiring a series resistor Fast internal RC oscillator (16 MHz) electrical characteristics: updated t_{FIRCSU} values Section “Input impedance and ADC accuracy”: changed “V_A/V_{A2}” to “V_{A2}/V_A” in Equation 13 ADC conversion characteristics: – updated conditions for sampling time V_{DD} = 5.0 V – updated conditions for conversion time V_{DD} = 5.0 V Updated Abbreviations Removed Order codes tables.
01-Dec-2011	5	Replaced “TBD” with “8.21 mA” in $I_{DD\_HV(FLASH)}$ cell of On-chip peripherals current consumption table

Table 49. Document revision history (continued)

Date	Revision	Changes
04-Feb-2013	6	Removed all instances of table footnote “All values need to be confirmed during device validation” Section 4.1: Introduction, removed Caution note. Table 12: Recommended operating conditions (3.3 V), added minimum value of TVDD and footnote about it. Table 13: Recommended operating conditions (5.0 V), added minimum value of TVDD and footnote about it. Updated Section 4.17.2: Input impedance and ADC accuracy In Table 24, changed VLVDHV3L, VLVDHV3BL from 2.7 V to 2.6 V. Revised the Table 29: Flash module life Updated Table 44: DSPI characteristics, to add specifications 7 and 8, tPCSC and tPASC. Inserted Figure 24: DSPI PCS strobe (PCSS) timing
17-Sep-2013	7	Updated Disclaimer.
01-Nov-2018	8	Removed the following two tables: – Order codes – Order codes for engineering samples

OCEAN CHIPS
Океан Электроники
Поставка электронных компонентов

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «**JONHON**», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «**FORSTAR**».

AVIC JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
