EVAL BOARD USER'S MANUAL

Devices Supported

- NB3H63143G (QFN16)
- NB3V63143G (QFN16)

Introduction

The NB3x6x1xxG, which is a member of the OmniClock family, is a versatile user programmable clock generator designed by ON Semiconductor with customer experience in mind. These devices are tailored to fit in to an extensive array of applications including wearable technology, smart phones, digital cameras, E-books, portable electronics, and Internet of Things. The NB3H designated parts are powered by 3.3 V and 2.5 V supplies while NB3V parts support 1.8 V operation.

These devices are One Time Programmable (OTP), low power PLL based clock generators that accept fundamental mode parallel resonant crystals of up to 50 MHz or a single ended LVCMOS/LVTTL reference clock input of up to 200 MHz. The outputs can be configured as either three single ended LVCMOS/LVTTL outputs or a combination of one single ended output and one differential LVPECL/LVDS/HCSL/CML output. The generated clock output's frequency can range between 8 kHz to 200 MHz.

Other programmable parameters include internal crystal load capacitor, drive strength for LVCMOS outputs, output frequency modulation controls (type, depth, modulation rate), output phase inversion, and PLL bypass mode. The devices are fully functional between -40°C to $+85^{\circ}\text{C}$.

Description

NB3x6x1xxG16QFNEVK is an evaluation kit offering a convenient solution for evaluating QFN16 devices. Included are one main board, a daughter board, and a USB cable. The main board and daughter board are 4 layer boards with dedicated power and GND planes.

The daughter board plugs directly on to the main board using four 4-pin header connectors. These connectors route the signal, power and ground to the device on the daughter board. The two boards correctly plug into one another in only one orientation ensuring proper pin alignment. The daughter board has a 16QFN socket to test NB3x6x1xxG devices. A view of the main board with the 16QFN daughter board is shown in Figure 1 and 2.

The Clock Cruiser Software is the GUI software developed to be used with this evaluation kit, and can be downloaded for free from www.onsemi.com. It allows the user to set programmable parameters and generate solutions that fit application needs. These solutions can then be programmed in to device's OTP memory or be temporarily written into device registers for evaluation. For more information on using the GUI, refer to Clock Cruiser User Guide.

USING THE EVALUATION KIT

Setting Up for Programming

Skip this section if the device has been programmed already

- Securely connect the daughter board to the main board by lining up all four 4-pin connectors (J8, J12, J13, J21). The daughter board can only be

plugged in to the main board correctly in one orientation.

- Make sure that all SMA cables are unplugged from both boards.

- Set main board to initial position:

- Jumpers:

use shorting links to provide connection as in the table below: (pin 1 is indicated by a circle)

Jumper No	J26 (SEL1)	J27 (SEL0)	J24 (OE2)	J25 (OE1)	J28 (OE0)	J29 (PD#)	J19
Pin connection	2 and 3	2 and 3	2 and 3	2 and 3	2 and 3	OPEN	2 and 3

- Switches:

slide the switches to the position as in the table below: (ON is indicated in lettering on switch's case)

Switch No	SW1	SW2
Position	ON	ON

- Rotary Switches:

turn knob on all rotary switches as shown below: (the position number will be displayed in a slit on the knob)

Jumper No	U11	U12	U13	U14	U15	U16
Dial Display	1	1	1	1	1	1

- Set daughter board to initial position:

- Jumpers:

use shorting links to provide connection as in the table below: (pin 1 is indicated by a circle)

Jumper No	J31 (SEL1)	J30 (SEL0)	J29 (OE2)	J28 (OE1)	J27 (OE0)	J26 (PD#)
Shorting Link Position	OPEN	OPEN	OPEN	OPEN	OPEN	OPEN

- Switches:

slide the switches to the position as in the table below: (ON is indicated in lettering on switch's case)

Switch No	SW1	SW2	SW3
Position	ON	ON	ON

- Make sure that the Crystal is in its holder.

- Place NB3H63143G in the DUT socket U2. For pin 1 alignment refer to Figure 2

Powering Up

- Download and install Clock Cruiser GUI Software to a computer that meets or exceeds minimum requirements found on Clock Cruiser User Guide.
- Connect the evaluation kit to an USB port using the included USB cable. An LED next to the USB connector will glow red, indicating +5 V supply is available to the module.

Programming the Device : OTP or Temporary Register

Skip this section if the device has been programmed already

- Run the Clock Cruiser GUI software by clicking on the desktop short cut or from the start menu. A blue LED (D9) will light up when a connection is established. This will periodically blink as activity is conducted.
- Follow the Clock Cruiser User Guide for detailed instruction on navigating through the program.
- In the Device Programming Screen, a table indicates the summary of configurations that were selected. Verify that the Hardware Connected indicator is green and that there is no error in the log. Program the device permanently by selecting [Program OTP Memory]. To write to device registers, click [Write to Registers]. In this case, when the evaluation kit is powered down (i.e. when the USB cable is unplugged) the register memory will be reset.

NB3x6x1xxG16QFNEVK

Powering up the DUT

10. Set VDD and then VDDO for each output by using the four rotary switches (U11, U12, U13, U14) to match device configuration. Make sure that

VDDOs are less than or equal to VDD. The following table shows which on-board LDO voltage is selected depending on the switch position (see table):

Rotary Switch	Line	Voltage for Each Switch Position			
		1	2	3	4
U11	VDD	+3.3 V	+2.5 V	+1.8 V	external source
U12	VDDO0	VDD			
U13	VDDO1				
U14	VDDO2				

Connect Input Clock Source

11. Depending on the programmed configuration, select one of the following input clock sources:
- Crystal: The evaluation kit comes equipped with a 25 MHz fundamental crystal on the daughter board. If a different frequency crystal (accepts 3 M to 50 MHz) is to be used, place this crystal in its holder.
 - External Reference Clock: To use an external reference clock (3 M to 200 MHz), connect the clock to J31 SMA connector on the main board.

Set Output Termination

12. The outputs from DUT are routed to three SMA connectors on the main board (J7, J9, J23) to provide CLK0, CLK1, and CLK2 respectively. By turning the rotary switches U15 and U16, the board will automatically terminate the programmed output level for CLK0 and CLK1, according to this table:

Rotary Switch Position	U15 output for CLK0	U16 output for CLK1
1	LVC MOS	LVC MOS
2	HCSL	HCSL
3	LVPECL	LVPECL
4	CML	CML
5	LVDS	LVDS

Since CLK2 output only supports LVC MOS, the termination is fixed.

Interfacing the Output to Equipment

13. To monitor the output from the main board using test equipment such as an oscilloscope, either use SMA connectors or jumpers:
- To use the jumpers (J33, J34, J35), use a high-z probe to monitor the outputs with the live connected to jumper pin marked 0, and the other pin connected to ground. This can be used for monitoring all output types.
- To use the SMA connectors (J7, J9, J23), use high-z termination on the scope and the outputs can be monitored for all types.

Controlling the Device

14. Use control pins OE[2:0] (J24, J25, J28) to enable or disable each output individually. The logic state of each signal corresponds to the LEDs (D4, D5, D8) on the main board: the LED is lit when 'high' and off when 'low'.
15. The pins SEL[1:0] (J26, J27) are used to select one of the four programmed solutions in the device's OTP memory. The logic state of each signal corresponds to the LEDs (D6, D7) on the main board: the LED is lit when 'high' and off when 'low'.
16. PD# (J29 on main board, J26 on daughter board) is used to power down the device. The logic state of the signal corresponds to the LED (D9) on the main board: the LED is lit when 'high' and off when 'low'.
17. If the configuration written into the temporary register must to be changed, re-initialize the hardware setup by returning to step 1 of this manual. Then, either return to the previous screen on the GUI with the [back] button or restarting the program.
- Note that even when the part's OTP memory has been programmed, device's registers can be used to write other solutions for evaluation.

NB3x6x1xxG16QFNEVK

Remember:

18. Always make sure that while communicating between the GUI and the device:

On the main board

- a. Switches SW1 and SW2 are in ON position
- b. Rotary switches U15 and U16 are in position '1'

c. All SMA cables, if connected, are detached from equipment

On the daughter board

- d. Switches SW1, SW2 and SW3 are set to ON position
- e. All SMA cables, if connected, are detached from equipment

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
