

## DESCRIPTION

The MP6400 family is the microprocessor ( $\mu$ P) supervisory circuit which can monitor and provide reset function for system voltages from 0.4V. When either the SENSE voltage falls below its threshold ( $V_{IT}$ ) or the voltage of manual reset ( $\overline{MR}$ ) is pulled to a logic low, the  $\overline{RESET}$  signal will be asserted. The reset voltage can be factory-set for standard voltage rails from 0.9V to 5V, while the MP6400DG(J)-01 reset voltage is adjustable with an external resistor divider. When SENSE voltage and  $\overline{MR}$  exceed their thresholds,  $\overline{RESET}$  is driven to a logic high after a user-programmable delay time.

The MP6400 has a very low quiescent current of 1.6 $\mu$ A typically, which makes it ideal suitable for battery-powered applications. It provides a precision reference to achieve  $\pm 1\%$  threshold accuracy. The reset delay time can be selected by a capacitor which is connected between  $C_{DELAY}$  and GND, allowing the user to select any delay time from 2.1ms to 10s. 380ms delay time is selected by connecting the  $C_{DELAY}$  pin to  $V_{CC}$ , while 24ms delay time by leaving the  $C_{DELAY}$  pin float. MP6400 is available in TSOT23 and 2mm $\times$ 2mm 6-pin QFN packages.

## FEATURES

- Fixed Threshold Voltages for Standard Voltage Rails From 0.9V to 5V and Adjustable Voltage From 0.4V are Available
- Low Quiescent Current: 1.6 $\mu$ A typ
- Power-On Reset Generator with Adjustable Delay Time: 2.1ms to 10s
- High Threshold Accuracy:  $\pm 1\%$  typ
- Manual Reset ( $\overline{MR}$ ) Input
- Open-Drain  $\overline{RESET}$  Output
- Immune to Short Negative SENSE voltage
- Guaranteed Reset Valid to  $V_{CC}=0.8V$
- 6 Pin TSOT23 and 2mm $\times$ 2mm QFN

## APPLICATIONS

- DSP or Micro controller Applications
- Laptop/Desktop Computers
- PDAs/Hand-Held Products
- Portable/Battery-Powered Products
- FPGA/ASIC Applications

All MPS parts are lead-free and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

## TYPICAL APPLICATION

## ORDERING INFORMATION

| Part Number* | Package      | Top Marking     | Free Air Temperature (T <sub>A</sub> ) |
|--------------|--------------|-----------------|----------------------------------------|
| MP6400DG-01  | QFN6 (2x2mm) | 5B              | –40°C to +85°C                         |
| MP6400DG-09  |              | AD              |                                        |
| MP6400DG-12  |              | AC              |                                        |
| MP6400DG-15  |              | Contact Factory |                                        |

| MP6400DJ-33  |              | 3S              |                                        |

\*For Tape & Reel, add suffix –Z (e.g. MP6400DG–XX-Z);

For RoHS compliant packaging, add suffix –LF (e.g. MP6400DG–XX-LF–Z).

\* For other versions, contact factory for availability.

## ABSOLUTE MAXIMUM RATINGS <sup>(1)</sup>

|                                                                     |                          |
|---------------------------------------------------------------------|--------------------------|
| Supply Voltage $V_{CC}$ .....                                       | -0.3 to 6.5 V            |
| $C_{DELAY}$ Voltage $V_{CDELAY}$ .....                              | -0.3V to $V_{CC} + 0.3V$ |
| SENSE Voltage $V_{SENSE}$ .....                                     | -0.3V to 6V              |
| All Other Pins .....                                                | -0.3V to +6.5V           |
| RESET Current $I_{RESET}$ .....                                     | 5mA                      |
| Continuous Power Dissipation ( $T_A = +25^\circ C$ ) <sup>(2)</sup> |                          |
| QFN6 (2mmx2mm) .....                                                | 2.5W                     |
| TSOT23-6 .....                                                      | 0.57W                    |
| Junction Temperature .....                                          | 150°C                    |
| Lead Temperature .....                                              | 260°C                    |
| Storage Temperature.....                                            | -65°C to +150°C          |

## Recommended Operating Conditions <sup>(3)</sup>

|                                      |                 |
|--------------------------------------|-----------------|
| Supply Voltage $V_{CC}$ .....        | 1.8V to 6V      |
| Operating Junct. Temp ( $T_J$ )..... | -40°C to +125°C |

| Thermal Resistance <sup>(4)</sup> | $\theta_{JA}$ | $\theta_{JC}$ |
|-----------------------------------|---------------|---------------|
| QFN6 (2mmx2mm) .....              | 50            | 12 ... °C/W   |
| TSOT23-6 .....                    | 220           | 110 .. °C/W   |

### Notes:

- 1) Exceeding these ratings may damage the device.
- 2) The maximum allowable power dissipation is a function of the maximum junction temperature  $T_J(MAX)$ , the junction-to-ambient thermal resistance  $\theta_{JA}$ , and the ambient temperature  $T_A$ . The maximum allowable continuous power dissipation at any ambient temperature is calculated by  $P_D(MAX) = (T_J(MAX) - T_A) / \theta_{JA}$ . Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- 3) The device is not guaranteed to function outside of its operating conditions.
- 4) Measured on JESD51-7 4-layer board.

## ELECTRICAL CHARACTERISTICS

1.8V ≤ V<sub>CC</sub> ≤ 6V, R<sub>3</sub> = 100kΩ, C<sub>3</sub> = 47pF, T<sub>A</sub> = -40°C to +85°C, Typical values are at T<sub>A</sub> = +25°C, unless otherwise noted.

**Note:**

- 7) In “MP6400DG(J)-\_\_”, the “\_\_” are placeholders for the monitored voltage levels of the devices. Desired monitored voltages are set by the suffix found in ordering information.

## PIN FUNCTIONS

| QFN Pin # | TSOT Pin # | Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|------------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6         | 1          | $\overline{\text{RESET}}$ | $\overline{\text{RESET}}$ is an open drain signal which will be asserted when the SENSE voltage drops below a preset threshold or when the manual reset ( $\overline{\text{MR}}$ ) pin drops to a logic low. The $\overline{\text{RESET}}$ delay time is programmable from 2.1ms to 10s by using external capacitors. A pull-up resistor bigger than 10k should be connected this pin to supply line, and the $\overline{\text{RESET}}$ outputting a higher voltage than $V_{CC}$ is allowable. |
| 5         | 2          | GND                       | Ground.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 4         | 3          | $\overline{\text{MR}}$    | The manual reset ( $\overline{\text{MR}}$ ) can introduce another logic signal to control the $\overline{\text{RESET}}$ . It is internally connected to $V_{CC}$ through a 90k $\Omega$ resistor.                                                                                                                                                                                                                                                                                               |
| 3         | 4          | $C_{\text{DELAY}}$        | Programmable reset delay time pin. When $C_{\text{DELAY}}$ connected to $V_{CC}$ through a resistor between 50k $\Omega$ and 200k $\Omega$ , a 380ms delay time is selected. When $C_{\text{DELAY}}$ floated, the delay time is 24ms. A capacitor bigger than 150pF connected $C_{\text{DELAY}}$ to GND could be used to get the user's programmable time from 2.1ms to 10s.                                                                                                                    |
| 2         | 5          | SENSE                     | SENSE pin is connected to the monitored system voltage. When the monitored voltage is below desired threshold, $\overline{\text{RESET}}$ is asserted.                                                                                                                                                                                                                                                                                                                                           |
| 1         | 6          | $V_{CC}$                  | Supply voltage. A 0.1uF decoupling ceramic capacitor should be put close to this pin.                                                                                                                                                                                                                                                                                                                                                                                                           |

## DETAIL DESCRIPTION

The MP6400 product family asserts a  $\overline{\text{RESET}}$  signal when either the SENSE pin voltage is lower than  $V_{IT}$  or the manual reset ( $\overline{\text{MR}}$ ) is driven low. The MP6400 family can be monitored a fixed voltage from 0.9V to 5.0V, while the MP6400DG(J)-01 can monitor any voltage above 0.4V by adjusting the external resistor divider. After both the manual reset ( $\overline{\text{MR}}$ ) and SENSE voltages exceed their thresholds, the  $\overline{\text{RESET}}$

output remains asserted for a user's programmable delay time. Two fixed  $\overline{\text{RESET}}$  delay times are user-selectable: 380ms delay time by connecting the  $C_{\text{DELAY}}$  pin to  $V_{CC}$ , and 24ms delay time by leaving the  $C_{\text{DELAY}}$  pin float. Any delay time from 2.1ms to 10s could be gotten by connecting a capacitor between  $C_{\text{DELAY}}$  and GND. The wide monitor voltage and programmable reset delay time make MP6400 product family suitable for a broad array of applications.

## TYPICAL PERFORMANCE CHARACTERISTICS

$V_{CC}=3.3V$ ,  $R_3 = 100k\Omega$ ,  $C_3 = 47pF$ ,  $T_A= -40^{\circ}C$  to  $+85^{\circ}C$ , Typical values are at  $T_A=+25^{\circ}C$ , unless otherwise noted.

Supply Current vs.  $V_{CC}$

Reset Delay Time vs.  $C_{DELAY}$

Maximum SENSE Transient Duration vs. SENSE Threshold Overdrive Voltage

Reset Delay vs. Temperature ( $C_{DELAY}=open$ )

Reset Delay vs. Temperature ( $C_{DELAY}=V_{CC}$ )

## APPLICATION INFORMATION

### Reset Output Function

The MP6400  $\overline{\text{RESET}}$  output is typically connected to the  $\overline{\text{RESET}}$  input of a microprocessor, as shown in Figure 3. When  $\overline{\text{RESET}}$  is not asserted, a pull up resistor must be connected to hold this signal high. The voltage of reset signal is allowed to be higher than  $V_{CC}$  (up to 6V) through a resistor pulling up from supply line. If the voltage is below 0.8V,  $\overline{\text{RESET}}$  output is undefined. This condition can be ignored generally because that most microprocessors do not function at this state. When both SENSE and  $\overline{\text{MR}}$  are higher than their threshold voltage,  $\overline{\text{RESET}}$  output holds logic high. Once either of the two drops below their threshold,  $\overline{\text{RESET}}$  will be asserted.

**Figure 3—Typical Application of MP6400 with Microprocessor**

From the point that  $\overline{\text{MR}}$  is again logic high and SENSE is above  $V_{IT} + V_{HYS}$  (the threshold hysteresis),  $\overline{\text{RESET}}$  will be driven to a logic high after a reset delay time. The reset delay time is programmable by  $C_{DELAY}$  pin. Due to the finite impedance of  $\overline{\text{RESET}}$  pin, the pull up resistor should be bigger than 10k $\Omega$ .

### Monitor a Voltage

The SENSE input pin is connected to the monitored system voltage directly or through a resistor network (on MP6400DJ-01). When the voltage on the pin is below  $V_{IT}$ ,  $\overline{\text{RESET}}$  is asserted. A threshold hysteresis will prevent the chip from responding perturbation on SENSE pin. A 1nF to 10nF bypass capacitor should be put on this pin to increase its immunity to noise. A typical application of the MP6400DJ-01 is shown in Figure 4. Two external resistors form a voltage divider from monitored voltage to GND. Its tap

connects to the SENSE pin. The circuit can be used to monitor any voltage higher than 0.4V.

**Figure 4—MP6400DJ-01 Monitoring a User-Defined Voltage**

### Monitor Multiple System Voltages

The manual reset ( $\overline{\text{MR}}$ ) can introduce another logic signal to control the  $\overline{\text{RESET}}$ . When  $\overline{\text{MR}}$  is a logic low ( $0.25V_{CC}$ ),  $\overline{\text{RESET}}$  will be asserted. After both SENSE and  $\overline{\text{MR}}$  are above their thresholds,  $\overline{\text{RESET}}$  will be driven to a logic high after a reset delay time. The  $\overline{\text{MR}}$  is internally connected to  $V_{CC}$  through a 90k $\Omega$  resistor so this pin can float. See how multiple system voltages are monitored by  $\overline{\text{MR}}$  in Figure 5. If the signal on  $\overline{\text{MR}}$  isn't up to  $V_{CC}$ , there will be an additional current through internal 90k $\Omega$  pull up resistor. A logic-level FET can be used to minimize the leakage, as shown in Figure 6.

**Figure 5—MP6400 Family Monitoring Multiple System Voltages**

**Figure 6—Minimizing  $I_{CC}$  When  $\overline{MR}$  Signal isn't over  $V_{CC}$  by External MOSFET**

### Programmable Reset Delay Time

The reset delay time can be programmed by  $C_{DELAY}$  configure. When  $C_{DELAY}$  is connected to VCC through a resistor between 50kΩ and 200kΩ, the delay time is 380ms. When  $C_{DELAY}$  floated, the delay time is 24ms. In addition, a capacitor connected  $C_{DELAY}$  to GND could be used to get the user's programmable delay time from 2.1ms to 10s. The three configures can be found in Figure 7(a)(b)(c).

**Figure 7—Programmable Configurations to the Reset Delay Time**

The external capacitor  $C_{DELAY}$  must be larger than 150pF. For a given delay time, the capacitor value can be calculated using the following equation:

$$C_{DELAY} \text{ (nF)} = [t_D \text{ (s)} - 4.99 \times 10^{-4} \text{ (s)}] \times 107$$

The reset delay time is determined by the charge time of external capacitor. While SENSE is above  $V_{IT}$  and  $\overline{MR}$  is a logic high, the internal 140nA current source is enabled and starts to charge the capacitor to set the delay time. When the capacitor voltage rises to 1.13V, the  $\overline{RESET}$  is de-asserted. The capacitor will be discharged when the  $\overline{RESET}$  is again asserted. Stray capacitance may cause errors of the delay time. A ceramic capacitor with low leakage is strongly recommended.

### SENSE Voltage Transients Immunity

The MP6400 can be immune to SENSE pin short negative transient. The maximum immune duration is 17μs while overdrive is 5%. A shorter negative transient can not assert the  $\overline{RESET}$  output. The effective duration is relative to the threshold overdrive, as shown in Figure 8.

**Figure 8—Maximum Transient Duration vs. Sense Threshold Overdrive Voltage**

## PACKAGE INFORMATION

### QFN6 (2mm x 2mm)

**TOP VIEW**

### BOTTOM VIEW

### SIDE VIEW

### DETAIL A

## RECOMMENDED LAND PATTERN

**NOTE:**

- 1) ALL DIMENSIONS ARE IN MILLIMETERS.
- 2) EXPOSED PADDLE SIZE DOES NOT INCLUDE MOLD FLASH.
- 3) LEAD COPLANARITY SHALL BE 0.10 MILLIMETER MAX.
- 4) JEDEC REFERENCE IS MO-229, VARIATION VCCC.
- 5) DRAWING IS NOT TO SCALE.

## TSOT23-6

**TOP VIEW**

**RECOMMENDED LAND PATTERN**

**FRONT VIEW**

**SIDE VIEW**

**DETAIL "A"**

### NOTE:

- 1) ALL DIMENSIONS ARE IN MILLIMETERS.
- 2) PACKAGE LENGTH DOES NOT INCLUDE MOLD FLASH, PROTRUSION OR GATE BURR.
- 3) PACKAGE WIDTH DOES NOT INCLUDE INTERLEAD FLASH OR PROTRUSION.
- 4) LEAD COPLANARITY (BOTTOM OF LEADS AFTER FORMING) SHALL BE 0.10 MILLIMETERS MAX.
- 5) DRAWING CONFORMS TO JEDEC MO-193, VARIATION AB.
- 6) DRAWING IS NOT TO SCALE.
- 7) PIN 1 IS LOWER LEFT PIN WHEN READING TOP MARK FROM LEFT TO RIGHT, (SEE EXAMPLE TOP MARK)

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,  
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
