

MICROCHIP

dsPIC33EVXXXGM00X/10X FAMILY

16-Bit, 5V Digital Signal Controllers with PWM, SENT, Op Amps and Advanced Analog Features

Operating Conditions

- 4.5V to 5.5V, -40°C to +85°C, DC to 70 MIPS
- 4.5V to 5.5V, -40°C to +125°C, DC to 60 MIPS
- 4.5V to 5.5V, -40°C to +150°C, DC to 40 MIPS

Core: 16-Bit dsPIC33E CPU

- Code-Efficient (C and Assembly) Architecture
- 16-Bit Wide Data Path
- Two 40-Bit Wide Accumulators
- Single-Cycle (MAC/MPY) with Dual Data Fetch
- Single-Cycle, Mixed-Sign MUL plus Hardware Divide
- 32-Bit Multiply Support
- Intermediate Security for Memory:
 - Provides a Boot Flash Segment in addition to the existing General Flash Segment
- Error Code Correction (ECC) for Flash
- Added Two Alternate Register Sets for Fast Context Switching

Clock Management

- Internal, 15% Low-Power RC (LPRC) – 32 kHz
- Internal, 1% Fast RC (FRC) – 7.37 MHz
- Internal, 10% Backup FRC (BFRC) – 7.37 MHz
- Programmable PLLs and Oscillator Clock Sources
- Fail-Safe Clock Monitor (FSCM)
- Additional FSCM Source (BFRC), Intended to Provide a Clock Fail Switch Source for the System Clock
- Independent Watchdog Timer (WDT)
- System Windowed Watchdog Timer (DMT)
- Fast Wake-up and Start-up

Power Management

- Low-Power Management modes (Sleep, Idle and Doze)
- Power Consumption Minimized Executing NOP String
- Integrated Power-on Reset (POR) and Brown-out Reset (BOR)
- 0.5 mA/MHz Dynamic Current (typical)
- 50 μ A at +25°C IPD Current (typical)

PWM

- Up to Six Pulse-Width Modulation (PWM) Outputs (three generators)
- Primary Master Time Base Inputs allow Time Base Synchronization from Internal/External Sources
- Dead Time for Rising and Falling Edges
- 7.14 ns PWM Resolution
- PWM Support for:
 - DC/DC, AC/DC, inverters, Power Factor Correction (PFC) and lighting
 - Brushless Direct Current (BLDC), Permanent Magnet Synchronous Motor (PMSM), AC Induction Motor (ACIM), Switched Reluctance Motor (SRM)
 - Programmable Fault inputs
 - Flexible trigger configurations for Analog-to-Digital conversion
 - Supports PWM lock, PWM output chopping and dynamic phase shifting

Advanced Analog Features

- ADC module:
 - Configurable as 10-bit, 1.1 Msps with four S&H or 12-bit, 500 ksps with one S&H
 - Up to 36 analog inputs
- Flexible and Independent ADC Trigger Sources
- Up to Four Op Amp/Comparators with Direct Connection to the ADC module:
 - Additional dedicated comparator and 7-bit Digital-to-Analog Converter (DAC)
 - Two comparator voltage reference outputs
 - Programmable references with 128 voltage points
 - Programmable blanking and filtering
- Charge Time Measurement Unit (CTMU):
 - Supports mTouch[®] capacitive touch sensing
 - Provides high-resolution time measurement (1 ns)
 - On-chip temperature measurement
 - Temperature sensor diode
 - Nine sources of edge input triggers (CTED1, CTED2, OCPWM, TMR1, SYSCLK, OSCLK, FRC, BFRC and LPRC)

dsPIC33EVXXGM00X/10X FAMILY

Timers/Output Compare/Input Capture

- Nine General Purpose Timers:
 - Five 16-bit and up to two 32-bit timers/counters; Timer3 can provide ADC trigger
- Four Output Compare modules Configurable as Timers/Counters
- Four Input Capture modules

Communication Interfaces

- Two Enhanced Addressable Universal Asynchronous Receiver/Transmitter (UART) modules (6.25 Mbps):
 - With support for LIN/J2602 bus and IrDA®
 - High and low speed (SCI)
- Two SPI modules (15 Mbps):
 - 25 Mbps data rate without using PPS
- One I²C module (up to 1 Mbaud) with SMBus Support
- Two SENT J2716 (Single-Edge Nibble Transmission-Transmit/Receive) module for Automotive Applications
- One CAN module:
 - 32 buffers, 16 filters and three masks

Direct Memory Access (DMA)

- 4-Channel DMA with User-Selectable Priority Arbitration
- UART, Serial Peripheral Interface (SPI), ADC, Input Capture, Output Compare and Controller Area Network (CAN)

Input/Output

- GPIO Registers to Support Selectable Slew Rate I/Os
- Peripheral Pin Select (PPS) to allow Function Remap
- Sink/Source: 8 mA or 12 mA, Pin-Specific for Standard VOH/VOL
- Selectable Open-Drain, Pull-ups and Pull-Downs
- Change Notice Interrupts on All I/O Pins

Qualification and Class B Support

- AEC-Q100 REVG (Grade 1: -40°C to +125°C) Compliant
- AEC-Q100 REVG (Grade 0: -40°C to +150°C) Compliant
- Class B Safety Library, IEC 60730

Class B Fault Handling Support

- Backup FRC
- Windowed WDT uses LPRC
- Windowed Deadman Timer (DMT) uses System Clock (System Windowed Watchdog Timer)
- H/W Clock Monitor Circuit
- Oscillator Frequency Monitoring through CTMU (OSCI, SYSCLK, FRC, BFRC, LPRC)
- Dedicated PWM Fault Pin
- Lockable Clock Configuration

Debugger Development Support

- In-Circuit and In-Application Programming
- Three Complex and Five Simple Breakpoints
- Trace and Run-Time Watch

dsPIC33EVXXXGM00X/10X PRODUCT FAMILIES

The device names, pin counts, memory sizes and peripheral availability of each device are listed in [Table 1](#). The following pages show the devices' pinout diagrams.

TABLE 1: dsPIC33EVXXXGM00X/10X FAMILY DEVICES

| Device | Program Memory Bytes | SRAM Bytes | CAN | DMA Channels | 16-Bit Timers (T1) | 32-Bit Timers | Input Capture | Output Compare | PWM | UART | SPI | I ² C | SENT | 10/12-Bit ADC | ADC Inputs | Op Amp/Comparators | CTMU | Security | Peripheral Pin Select (PPS) | General Purpose I/O (GPIO) | External Interrupts | Pins | Packages | | | | | | | | | | | | | | | | | | | | |

dsPIC33EVXXXGM00X/10X FAMILY

Pin Diagrams

28-Pin SPDIP/SOIC/SSOP^(1,2,3)

- Note 1:** The RPN/RPI pins can be used by any remappable peripheral with some limitation. See [Section 11.5 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and information on limitations.
- 2:** Every I/O port pin (RAX-RGX) can be used as a Change Notification pin (CNAX-CNGX). See [Section 11.0 “I/O Ports”](#) for more information.
- 3:** If the op amp is selected when OPAEN (CMxCON<10>) = 1, the OAx input is used; otherwise, the ANx input is used.

dsPIC33EVXXXGM00X/10X FAMILY

Pin Diagrams (Continued)

28-Pin QFN-S^(1,2,3,4)

- Note 1:** The RPN/RPIN pins can be used by any remappable peripheral with some limitation. See [Section 11.5 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and information on limitations.
- 2:** Every I/O port pin (RAX-RGx) can be used as a Change Notification pin (CNAX-CNGx). See [Section 11.0 “I/O Ports”](#) for more information.
- 3:** If the op amp is selected when OPAEN (CMxCON<10>) = 1, the OAx input is used; otherwise, the ANx input is used.
- 4:** The metal pad at the bottom of the device is not connected to any pins and is recommended to be connected to Vss externally.

dsPIC33EVXXGM00X/10X FAMILY

Pin Diagrams (Continued)

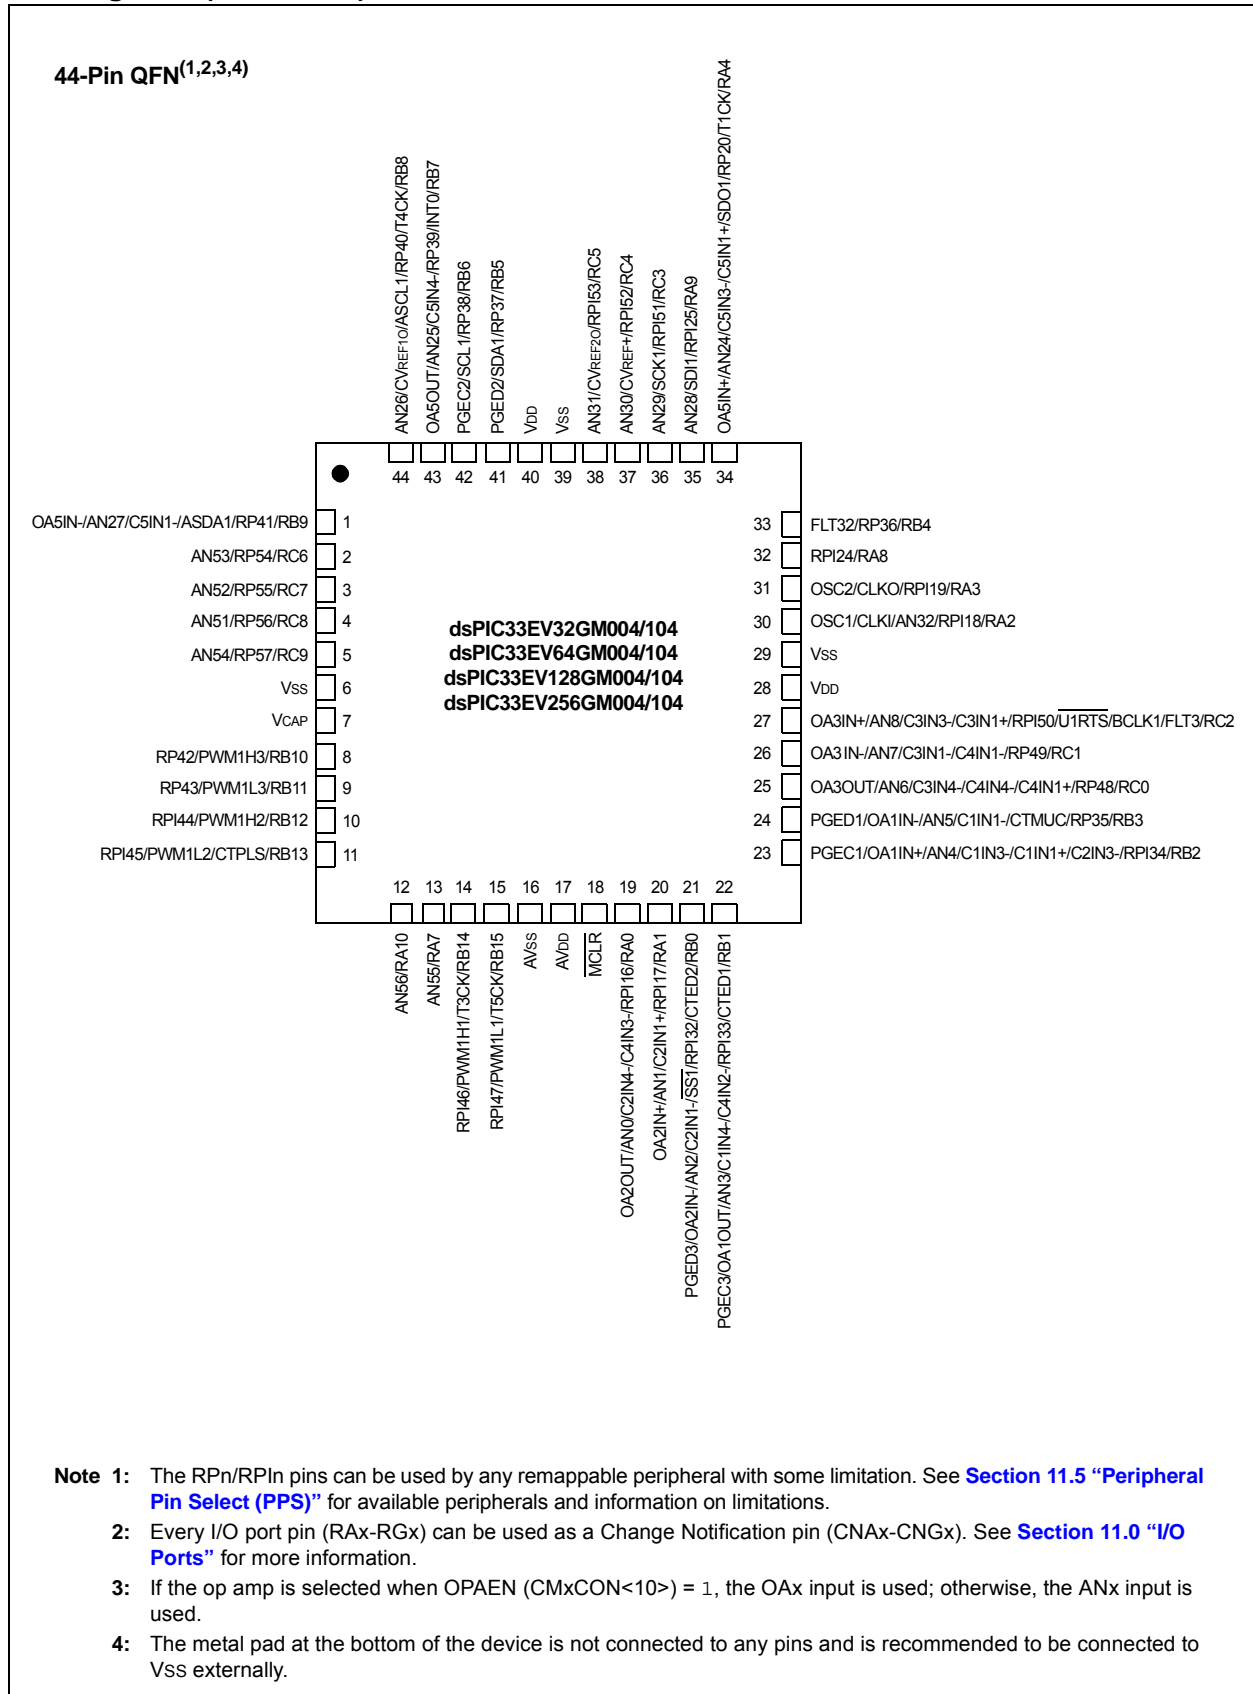

44-Pin TQFP^(1,2,3)

- Note 1:** The RPN/RPI pins can be used by any remappable peripheral with some limitation. See [Section 11.5 “Peripheral Pin Select \(PPS\)”](#) for available peripherals and information on limitations.
- Note 2:** Every I/O port pin (RAX-RGx) can be used as a Change Notification pin (CNAX-CNGx). See [Section 11.0 “I/O Ports”](#) for more information.
- Note 3:** If the op amp is selected when OPAEN (CMxCON<10>) = 1, the OAx input is used; otherwise, the ANx input is used.

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at docerrors@microchip.com. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

Customer Notification System

Register on our web site at www.microchip.com to receive the most current information on all of our products.

dsPIC33EVXXGM00X/10X FAMILY

Referenced Sources

This device data sheet is based on the following individual chapters of the *“dsPIC33/PIC24 Family Reference Manual”*, which are available from the Microchip web site (www.microchip.com). The following documents should be considered as the general reference for the operation of a particular module or device feature:

- **“Introduction”** (DS70573)
- **“CPU”** (DS70359)
- **“Data Memory”** (DS70595)

dsPIC33EVXXGM00X/10X FAMILY

1.0 DEVICE OVERVIEW

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section in the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

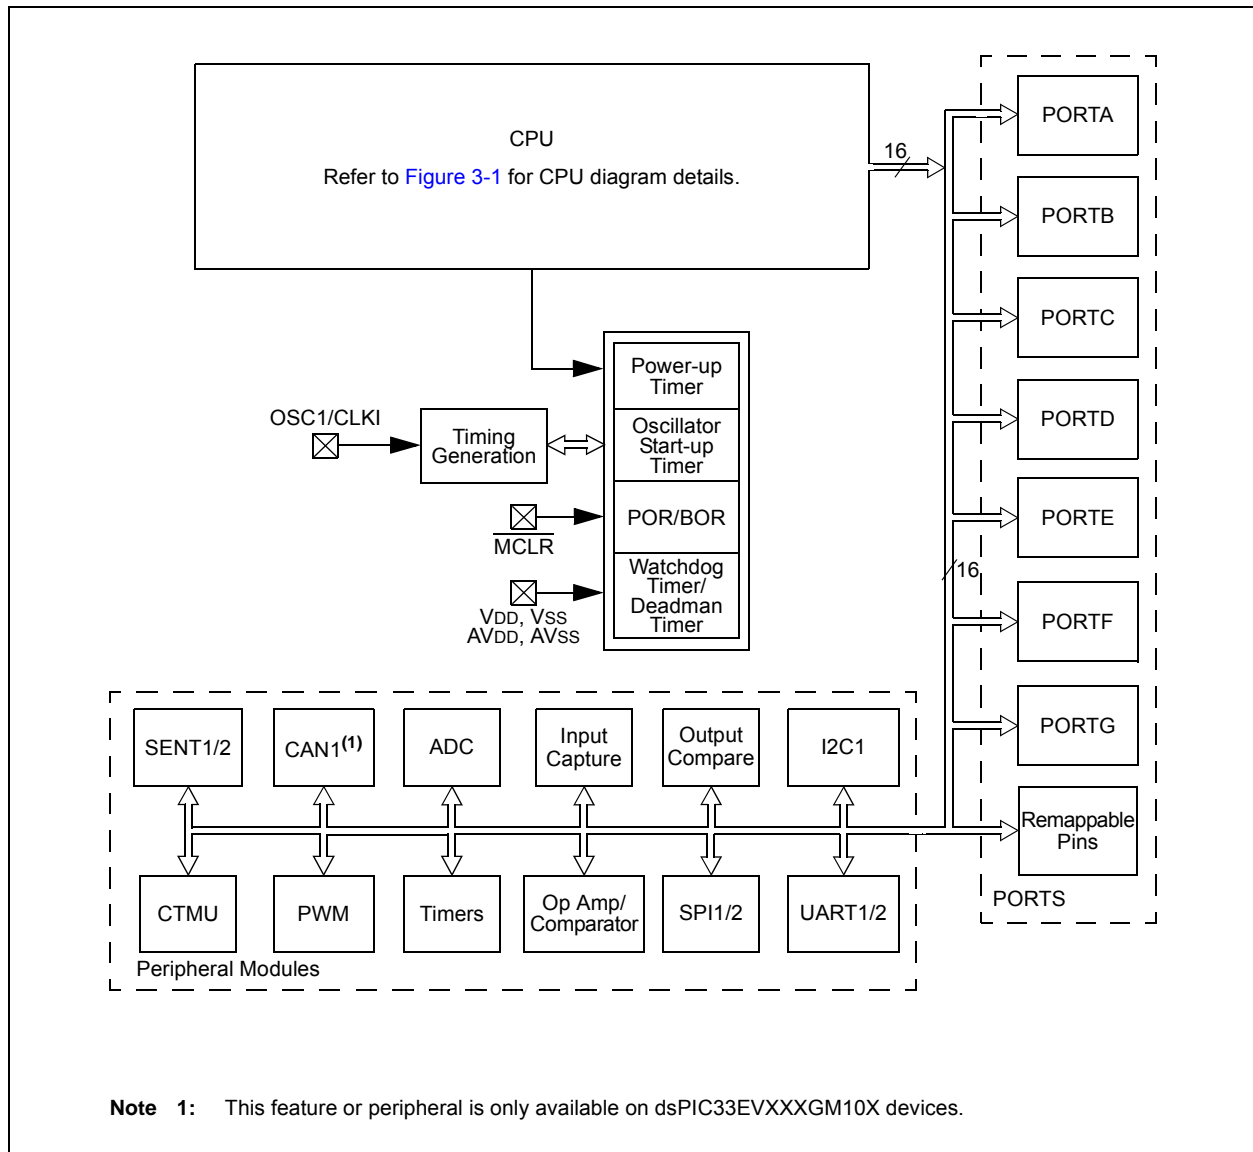

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

This document contains device-specific information for the dsPIC33EVXXGM00X/10X family Digital Signal Controller (DSC) devices.

dsPIC33EVXXGM00X/10X family devices contain extensive Digital Signal Processor (DSP) functionality with a high-performance, 16-bit MCU architecture.

Figure 1-1 shows a general block diagram of the core and peripheral modules. Table 1-1 lists the functions of the various pins shown in the pinout diagrams.

FIGURE 1-1: dsPIC33EVXXGM00X/10X FAMILY BLOCK DIAGRAM

Note 1: This feature or peripheral is only available on dsPIC33EVXXGM10X devices.

dsPIC33EVXXGM00X/10X FAMILY

TABLE 1-1: PINOUT I/O DESCRIPTIONS

| Pin Name | Pin Type | Buffer Type | PPS | Description |
|--|----------|-------------|-----|--|
| AN0-AN19 AN24-AN32 AN48, AN49 AN51-AN56 | I | Analog | No | Analog input channels. |
| CLKI | I | ST/ CMOS | No | External clock source input. Always associated with OSC1 pin function. |
| CLKO | O | — | No | Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes. Always associated with OSC2 pin function. |
| OSC1 | I | ST/ CMOS | No | Oscillator crystal input. ST buffer when configured in RC mode; CMOS otherwise. |
| OSC2 | I/O | — | No | Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes. |
| REFCLKO | O | — | Yes | Reference clock output. |
| IC1-IC4 | I | ST | Yes | Capture Inputs 1 to 4. |
| OCFA | I | ST | Yes | Compare Fault A input (for compare channels). |
| OC1-OC4 | O | — | Yes | Compare Outputs 1 to 4. |
| INT0 | I | ST | No | External Interrupt 0. |
| INT1 | I | ST | Yes | External Interrupt 1. |
| INT2 | I | ST | Yes | External Interrupt 2. |
| RA0-RA4, RA7-RA12 | I/O | ST | Yes | PORTA is a bidirectional I/O port. |
| RB0-RB15 | I/O | ST | Yes | PORTB is a bidirectional I/O port. |
| RC0-RC13, RC15 | I/O | ST | Yes | PORTC is a bidirectional I/O port. |
| RD5-RD6, RD8 | I/O | ST | Yes | PORTD is a bidirectional I/O port. |
| RE12-RE15 | I/O | ST | Yes | PORTE is a bidirectional I/O port. |
| RF0-RF1 | I/O | ST | No | PORTF is a bidirectional I/O port. |
| RG6-RG9 | I/O | ST | Yes | PORTG is a bidirectional I/O port. |
| T1CK | I | ST | No | Timer1 external clock input. |
| T2CK | I | ST | Yes | Timer2 external clock input. |
| T3CK | I | ST | No | Timer3 external clock input. |
| T4CK | I | ST | No | Timer4 external clock input. |
| T5CK | I | ST | No | Timer5 external clock input. |
| CTPLS | O | ST | No | CTMU pulse output. |
| CTED1 | I | ST | No | CTMU External Edge Input 1. |
| CTED2 | I | ST | No | CTMU External Edge Input 2. |
| U1CTS | I | ST | Yes | UART1 Clear-to-Send. |
| U1RTS | O | — | Yes | UART1 Ready-to-Send. |
| U1RX | I | ST | Yes | UART1 receive. |
| U1TX | O | — | Yes | UART1 transmit. |
| U2CTS | I | ST | Yes | UART2 Clear-to-Send. |
| U2RTS | O | — | Yes | UART2 Ready-to-Send. |
| U2RX | I | ST | Yes | UART2 receive. |
| U2TX | O | — | Yes | UART2 transmit. |
| SCK1 | I/O | ST | No | Synchronous serial clock input/output for SPI1. |
| SDI1 | I | ST | No | SPI1 data in. |
| SDO1 | O | — | No | SPI1 data out. |
| SS1 | I/O | ST | No | SPI1 slave synchronization or frame pulse I/O. |

Legend: CMOS = CMOS compatible input or output Analog = Analog input P = Power
 ST = Schmitt Trigger input with CMOS levels O = Output I = Input
 PPS = Peripheral Pin Select TTL = TTL input buffer

dsPIC33EVXXGM00X/10X FAMILY

TABLE 1-1: PINOUT I/O DESCRIPTIONS (CONTINUED)

| Pin Name | Pin Type | Buffer Type | PPS | Description |
|--|----------|-------------|-----------|--|
| SCK2 | I/O | ST | Yes | Synchronous serial clock input/output for SPI2. |
| SDI2 | I | ST | Yes | SPI2 data in. |
| SDO2 | O | — | Yes | SPI2 data out. |
| SS2 | I/O | ST | Yes | SPI2 slave synchronization or frame pulse I/O. |
| SCL1 | I/O | ST | No | Synchronous serial clock input/output for I2C1. |

2.0 GUIDELINES FOR GETTING STARTED WITH 16-BIT DIGITAL SIGNAL CONTROLLERS

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section in the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

2.1 Basic Connection Requirements

Getting started with the dsPIC33EVXXGM00X/10X family of 16-bit microcontrollers (MCUs) requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names, which must always be connected:

- All VDD and VSS pins (see **Section 2.2 “Decoupling Capacitors”**)
- All AVDD and AVSS pins (regardless if ADC module is not used) (see **Section 2.2 “Decoupling Capacitors”**)
- VCAP (see **Section 2.3 “CPU Logic Filter Capacitor Connection (VCAP)”**)
- MCLR pin (see **Section 2.4 “Master Clear (MCLR) Pin”**)
- PGECx/PGEDx pins used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes (see **Section 2.5 “ICSP Pins”**)
- OSC1 and OSC2 pins when external oscillator source is used (see **Section 2.6 “External Oscillator Pins”**)

Note: The AVDD and AVSS pins must be connected, regardless of the ADC voltage reference source.

2.2 Decoupling Capacitors

The use of decoupling capacitors on every pair of power supply pins, such as VDD, VSS, AVDD and AVSS, is required.

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** A value of 0.1 μF (100 nF), 10V-20V is recommended. This capacitor should be a Low Equivalent Series Resistance (low-ESR), and have resonance frequency in the range of 20 MHz and higher. It is recommended to use ceramic capacitors.
- **Placement on the Printed Circuit Board (PCB):** The decoupling capacitors should be placed as close to the pins as possible. It is recommended to place the capacitors on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is within one-quarter inch (6 mm) in length.
- **Handling high-frequency noise:** If the board is experiencing high-frequency noise, above tens of MHz, add a second ceramic-type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 μF to 0.001 μF . Place this second capacitor next to the primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible. For example, 0.1 μF in parallel with 0.001 μF .
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum, thereby reducing the PCB track inductance.

dsPIC33EVXXXGM00X/10X FAMILY

FIGURE 2-1: RECOMMENDED MINIMUM CONNECTION

2.2.1 TANK CAPACITORS

On boards with power traces running longer than six inches in length, it is suggested to use a tank capacitor for integrated circuits including DSCs to supply a local power source. The value of the tank capacitor should be determined based on the trace resistance that connects the power supply source to the device, and the maximum current drawn by the device in the application. In other words, select the tank capacitor so that it meets the acceptable voltage sag at the device. Typical values range from 4.7 µF to 47 µF.

2.3 CPU Logic Filter Capacitor Connection (VCAP)

A low-ESR (<1 Ohms) capacitor is required on the VCAP pin, which is used to stabilize the internal voltage regulator output. The VCAP pin must not be connected to VDD, and must have a capacitor greater than 4.7 µF (10 µF is recommended), with at least a 16V rating connected to the ground. The type can be ceramic or tantalum. See [Section 30.0 "Electrical Characteristics"](#) for additional information.

The placement of this capacitor should be close to the VCAP pin. It is recommended that the trace length should not exceed one-quarter inch (6 mm).

2.4 Master Clear (MCLR) Pin

The MCLR pin provides two specific device functions:

- Device Reset
- Device Programming and Debugging

During device programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the MCLR pin. Consequently, specific voltage levels (VIH and VIL) and fast signal transitions must not be adversely affected. Therefore, specific values of R and C will need to be adjusted based on the application and PCB requirements.

For example, as shown in [Figure 2-1](#), it is recommended that the capacitor, C, be isolated from the MCLR pin during programming and debugging operations.

Place the components as shown in [Figure 2-2](#) within one-quarter inch (6 mm) from the MCLR pin.

FIGURE 2-2: EXAMPLE OF MCLR PIN CONNECTIONS

2.5 ICSP Pins

The PGECx and PGEDx pins are used for ICSP and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not exceeding 100 Ohms.

Pull-up resistors, series diodes and capacitors on the PGECx and PGEDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin Voltage Input High (VIH) and Voltage Input Low (VIL) requirements.

Ensure that the “Communication Channel Select” (i.e., PGECx/PGEDx pins) programmed into the device matches the physical connections for the ICSP to MPLAB® PICKit™ 3, MPLAB ICD 3 or MPLAB REAL ICE™.

For more information on MPLAB ICD 2, ICD 3 and REAL ICE connection requirements, refer to the following documents that are available on the Microchip web site (www.microchip.com).

- “Using MPLAB® ICD 3” (poster) (DS51765)
- “MPLAB® ICD 3 Design Advisory” (DS51764)
- “MPLAB® REAL ICE™ In-Circuit Emulator User’s Guide” (DS51616)
- “Using MPLAB® REAL ICE™ In-Circuit Emulator” (poster) (DS51749)

2.6 External Oscillator Pins

Many DSCs have options for at least two oscillators: a high-frequency primary oscillator and a low-frequency secondary oscillator. For more information, see **Section 9.0 “Oscillator Configuration”**.

The oscillator circuit should be placed on the same side of the board as the device. Also, place the oscillator circuit close to the respective oscillator pins, not exceeding one-half inch (12 mm) distance between them. The load capacitors should be placed next to the oscillator itself, on the same side of the board. Use a grounded copper pour around the oscillator circuit to isolate them from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed as shown in [Figure 2-3](#).

FIGURE 2-3: SUGGESTED PLACEMENT OF THE OSCILLATOR CIRCUIT

2.7 Oscillator Value Conditions on Device Start-up

If the PLL of the target device is enabled and configured for the device start-up oscillator, the maximum oscillator source frequency must be limited to $5 \text{ MHz} < F_{\text{IN}} < 13.6 \text{ MHz}$ to comply with device PLL start-up conditions. This intends that, if the external oscillator frequency is outside this range, the application must start up in the FRC mode first. The default PLL settings after a POR with an oscillator frequency outside this range will violate the device operating speed.

Once the device powers up, the application firmware can initialize the PLL SFRs, CLKDIV and PLLFBD, to a suitable value, and then perform a clock switch to the Oscillator + PLL clock source.

Note: Clock switching must be enabled in the device Configuration Word.

2.8 Unused I/Os

Unused I/O pins should be configured as outputs and driven to a logic low state.

Alternatively, connect a 1k to 10k resistor between Vss and unused pins, and drive the output to logic low.

dsPIC33EVXXGM00X/10X FAMILY

NOTES:

3.0 CPU

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “CPU” (DS70359) in the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The CPU has a 16-bit (data) modified Harvard architecture with an enhanced instruction set, including significant support for digital signal processing. The CPU has a 24-bit instruction word with a variable length opcode field. The Program Counter (PC) is 23 bits wide and addresses up to 4M x 24 bits of user program memory space.

An instruction prefetch mechanism helps maintain throughput and provides predictable execution. Most instructions execute in a single-cycle effective execution rate, with the exception of instructions that change the program flow, the double-word move (MOV.D) instruction, PSV accesses and the table instructions. Overhead-free program loop constructs are supported using the DO and REPEAT instructions, both of which are interruptible at any point.

3.1 Registers

The dsPIC33EVXXGM00X/10X family devices have sixteen, 16-bit Working registers in the programmer's model. Each of the Working registers can act as a Data, Address or Address Offset register. The sixteenth Working register (W15) operates as a Software Stack Pointer for interrupts and calls.

In addition, the dsPIC33EVXXGM00X/10X devices include two alternate Working register sets, which consist of W0 through W14. The alternate registers can be made persistent to help reduce the saving and restoring of register content during Interrupt Service Routines (ISRs). The alternate Working registers can be assigned to a specific Interrupt Priority Level (IPL1 through IPL6) by configuring the CTXTx<2:0> bits in the FALTREG Configuration register.

The alternate Working registers can also be accessed manually by using the CTXTSWP instruction.

The CCTXI<2:0> and MCTXI<2:0> bits in the CTXTSTAT register can be used to identify the current, and most recent, manually selected Working register sets.

3.2 Instruction Set

The device instruction set has two classes of instructions: the MCU class of instructions and the DSP class of instructions. These two instruction classes are seamlessly integrated into the architecture and execute from a single execution unit. The instruction set includes many addressing modes and was designed for optimum C compiler efficiency.

3.3 Data Space Addressing

The Base Data Space can be addressed as 4K words or 8 Kbytes and is split into two blocks, referred to as X and Y data memory. Each memory block has its own independent Address Generation Unit (AGU). The MCU class of instructions operates solely through the X memory AGU, which accesses the entire memory map as one linear Data Space. On dsPIC33EV devices, certain DSP instructions operate through the X and Y AGUs to support dual operand reads, which splits the data address space into two parts. The X and Y Data Space boundary is device-specific.

The upper 32 Kbytes of the Data Space (DS) memory map can optionally be mapped into Program Space (PS) at any 16K program word boundary. The Program-to-Data Space mapping feature, known as Program Space Visibility (PSV), lets any instruction access Program Space as if it were Data Space. Moreover, the Base Data Space address is used in conjunction with a Data Space Read or Write Page register (DSRPAG or DSWPAG) to form an Extended Data Space (EDS) address. The EDS can be addressed as 8M words or 16 Mbytes. For more information on EDS, PSV and table accesses, refer to “Data Memory” (DS70595) and “dsPIC33E/PIC24E Program Memory” (DS70000613) in the “dsPIC33/PIC24 Family Reference Manual”.

On dsPIC33EV devices, overhead-free circular buffers (Modulo Addressing) are supported in both X and Y address spaces. The Modulo Addressing removes the software boundary checking overhead for DSP algorithms. The X AGU Circular Addressing can be used with any of the MCU class of instructions. The X AGU also supports Bit-Reversed Addressing to greatly simplify input or output data reordering for radix-2 FFT algorithms. [Figure 3-1](#) illustrates the block diagram of the dsPIC33EVXXGM00X/10X family devices.

3.4 Addressing Modes

The CPU supports these addressing modes:

- Inherent (no operand)
- Relative
- Literal
- Memory Direct
- Register Direct
- Register Indirect

Each instruction is associated with a predefined addressing mode group, depending upon its functional requirements. As many as six addressing modes are supported for each instruction.

FIGURE 3-1: dsPIC33EVXXGM00X/10X FAMILY CPU BLOCK DIAGRAM

dsPIC33EVXXGM00X/10X FAMILY

3.5 Programmer's Model

The programmer's model for the dsPIC33EVXXGM00X/10X family is shown in [Figure 3-2](#). All registers in the programmer's model are memory-mapped and can be manipulated directly by instructions. [Table 3-1](#) lists a description of each register.

In addition to the registers contained in the programmer's model, the dsPIC33EVXXGM00X/10X family devices contain control registers for Modulo Addressing and Bit-Reversed Addressing, and interrupts. These registers are described in subsequent sections of this document.

All registers associated with the programmer's model are memory-mapped, as shown in [Table 4-1](#).

TABLE 3-1: PROGRAMMER'S MODEL REGISTER DESCRIPTIONS

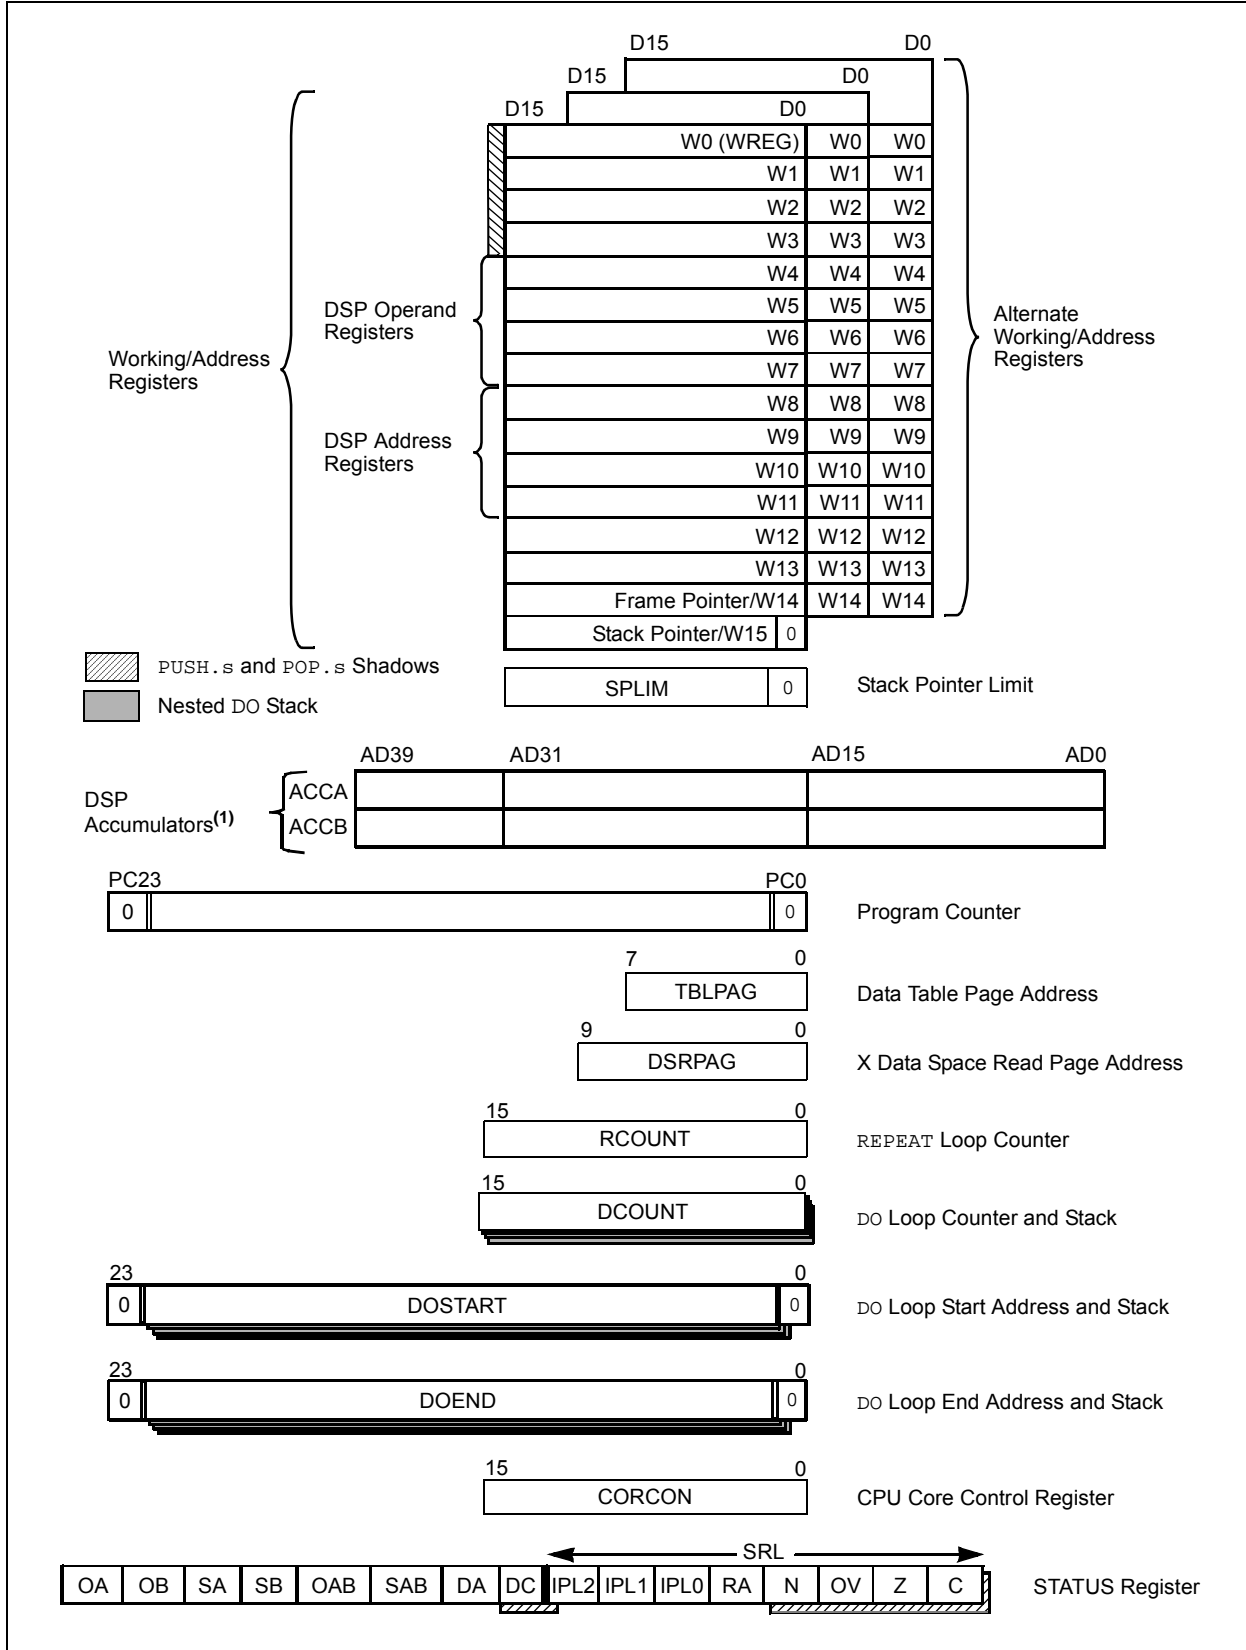

| Register(s) Name | Description |
|---|---|
| W0 through W15 ⁽¹⁾ | Working Register Array |
| W0 through W14 ⁽¹⁾ | Alternate Working Register Array 1 |
| W0 through W14 ⁽¹⁾ | Alternate Working Register Array 2 |
| ACCA, ACCB | 40-Bit DSP Accumulators |
| PC | 23-Bit Program Counter |
| SR | ALU and DSP Engine STATUS Register |
| SPLIM | Stack Pointer Limit Value Register |
| TBLPAG | Table Memory Page Address Register |
| DSRPAG | Extended Data Space (EDS) Read Page Register |
| RCOUNT | REPEAT Loop Counter Register |
| DCOUNT | DO Loop Count Register |
| DOSTARTH ⁽²⁾ , DOSTARTL ⁽²⁾ | DO Loop Start Address Register (High and Low) |
| DOENDH, DOENDL | DO Loop End Address Register (High and Low) |
| CORCON | Contains DSP Engine, DO Loop Control and Trap Status bits |

Note 1: Memory-mapped W0 through W14 represents the value of the register in the currently active CPU context.

2: The DOSTARTH and DOSTARTL registers are read-only.

dsPIC33EVXXGM00X/10X FAMILY

3.7 Arithmetic Logic Unit (ALU)

The dsPIC33EVXXGM00X/10X family ALU is 16 bits wide and is capable of addition, subtraction, bit shifts and logic operations. Unless otherwise mentioned, arithmetic operations are two's complement in nature. Depending on the operation, the ALU can affect the values of the Carry (C), Zero (Z), Negative (N), Overflow (OV) and Digit Carry (DC) Status bits in the SR register. The C and DC Status bits operate as Borrow and Digit Borrow bits, respectively, for subtraction operations.

The ALU can perform 8-bit or 16-bit operations, depending on the mode of the instruction that is used. The data for the ALU operation can come from the W register array or from the data memory, depending on the addressing mode of the instruction. Similarly, the output data from the ALU can be written to the W register array or a data memory location.

For information on the SR bits affected by each instruction, refer to the "16-bit MCU and DSC Programmer's Reference Manual" (DS70157).

The core CPU incorporates hardware support for both multiplication and division. This includes a dedicated hardware multiplier and support hardware for 16-bit divisor division.

3.7.1 MULTIPLIER

Using the high-speed, 17-bit x 17-bit multiplier, the ALU supports unsigned, signed or mixed-sign operation in several MCU multiplication modes:

- 16-bit x 16-bit signed
- 16-bit x 16-bit unsigned
- 16-bit signed x 5-bit (literal) unsigned
- 16-bit signed x 16-bit unsigned
- 16-bit unsigned x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit signed
- 8-bit unsigned x 8-bit unsigned

3.7.2 DIVIDER

The divide block supports 32-bit/16-bit and 16-bit/16-bit signed and unsigned integer divide operations with the following data sizes:

- 32-bit signed/16-bit signed divide
- 32-bit unsigned/16-bit unsigned divide
- 16-bit signed/16-bit signed divide
- 16-bit unsigned/16-bit unsigned divide

The quotient for all divide instructions ends up in W0 and the remainder in W1. The 16-bit signed and unsigned DIV instructions can specify any W register for both the 16-bit divisor (Wn) and any W register (aligned) pair (W(m + 1):Wm) for the 32-bit dividend. The divide algorithm takes the single-cycle per bit of the divisor, so both 32-bit/16-bit and 16-bit/16-bit instructions take the same number of cycles to execute.

3.8 DSP Engine

The DSP engine consists of a high-speed, 17-bit x 17-bit multiplier, a 40-bit barrel shifter and a 40-bit adder/subtractor (with two target accumulators, round and saturation logic).

The DSP engine can also perform inherent accumulator-to-accumulator operations that require no additional data. These instructions are ADD, SUB and NEG.

The DSP engine has options selected through bits in the CPU Core Control register (CORCON) as follows:

- Fractional or Integer DSP Multiply (IF)
- Signed, Unsigned or Mixed-Sign DSP Multiply (US)
- Conventional or Convergent Rounding (RND)
- Automatic Saturation On/Off for ACCA (SATA)
- Automatic Saturation On/Off for ACCB (SATB)
- Automatic Saturation On/Off for Writes to Data Memory (SATDW)
- Accumulator Saturation mode Selection (ACCSAT)

TABLE 3-2: DSP INSTRUCTIONS SUMMARY

| Instruction | Algebraic Operation | ACC Write Back |
|-------------|-----------------------|----------------|
| CLR | $A = 0$ | Yes |
| ED | $A = (x - y)^2$ | No |
| EDAC | $A = A + (x - y)^2$ | No |
| MAC | $A = A + (x \cdot y)$ | Yes |
| MAC | $A = A + x^2$ | No |
| MOVSAC | No change in A | Yes |
| MPY | $A = x \cdot y$ | No |
| MPY | $A = x^2$ | No |
| MPY.N | $A = -x \cdot y$ | No |
| MSC | $A = A - x \cdot y$ | Yes |

dsPIC33EVXXGM00X/10X FAMILY

4.0 MEMORY ORGANIZATION

Note: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “dsPIC33E/PIC24E Program Memory” (DS70000613) in the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

The dsPIC33EVXXGM00X/10X family architecture features separate program and data memory spaces and buses. This architecture also allows the direct access of program memory from the Data Space (DS) during code execution.

4.1 Program Address Space

The program address memory space of the dsPIC33EVXXGM00X/10X family devices is 4M instructions. The space is addressable by a 24-bit value derived either from the 23-bit PC, during program execution or from table operation, or from DS remapping, as described in [Section 4.7 “Interfacing Program and Data Memory Spaces”](#).

User application access to the program memory space is restricted to the lower half of the address range (0x000000 to 0x02ABFF). The exception is the use of the TBLRD operations, which use TBLPAG<7> to read Device ID sections of the configuration memory space and the TBLWT operations, which are used to set up the write latches located in configuration memory space.

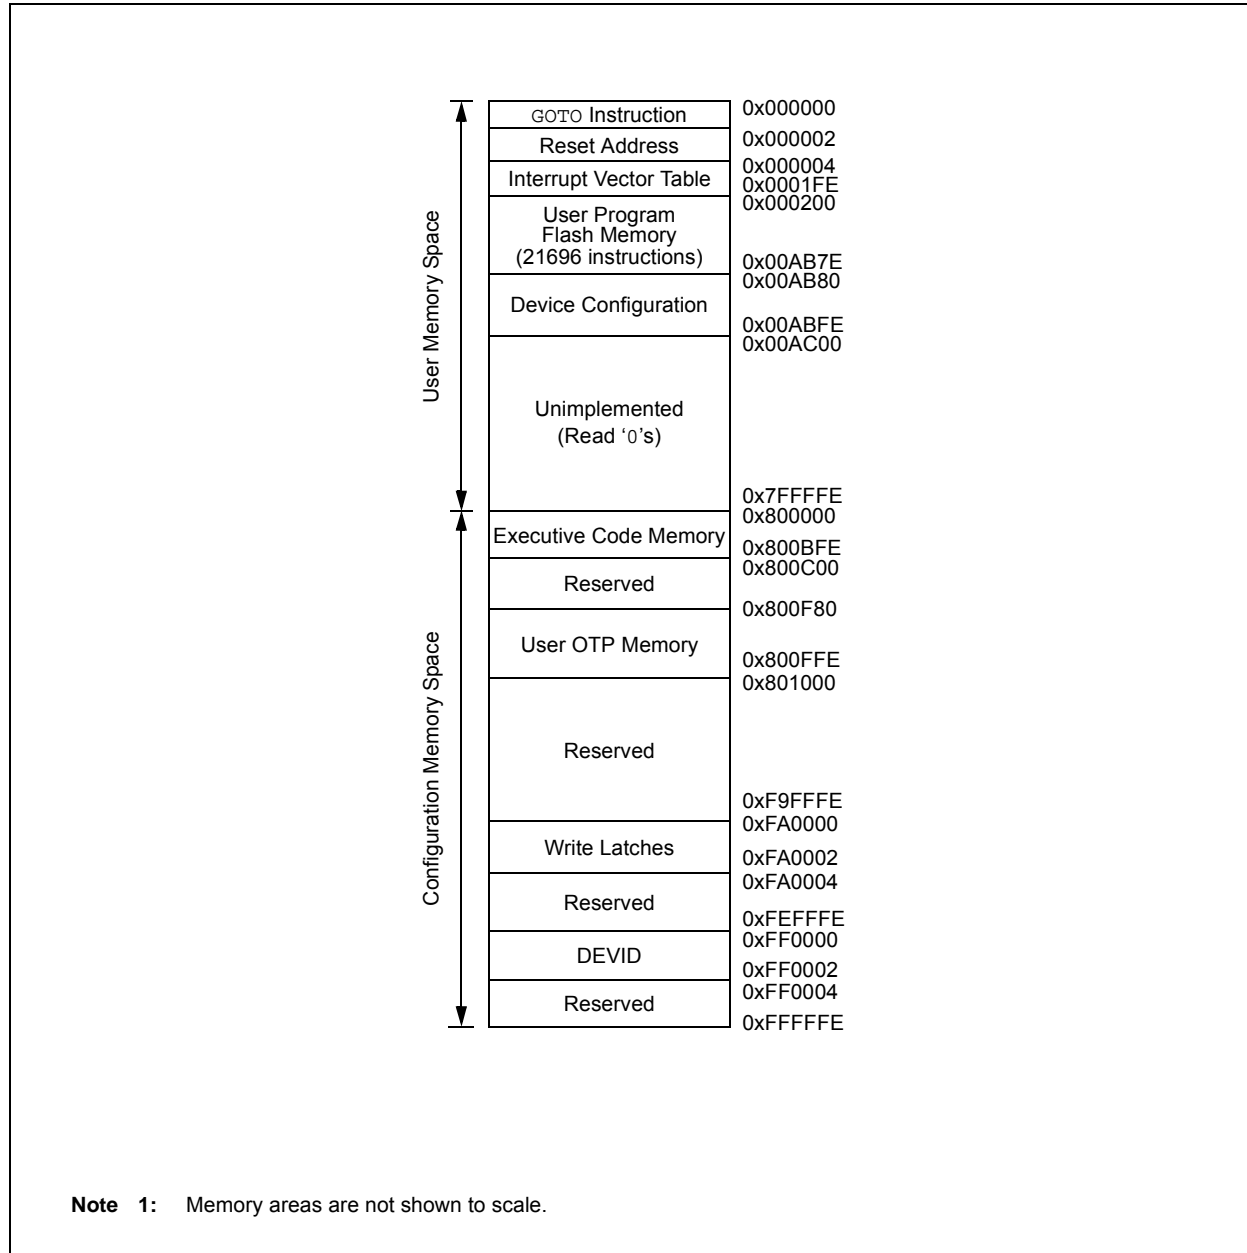

The program memory maps, which are presented by the device family and memory size, are shown in [Figure 4-1](#) through [Figure 4-4](#).

dsPIC33EVXXGM00X/10X FAMILY

4.1.1 PROGRAM MEMORY ORGANIZATION

The program memory space is organized in word-addressable blocks. Although it is treated as 24 bits wide, it is more appropriate to think of each address of the program memory as a lower and upper word, with the upper byte of the upper word being unimplemented. The lower word always has an even address, while the upper word has an odd address (see Figure 4-5).

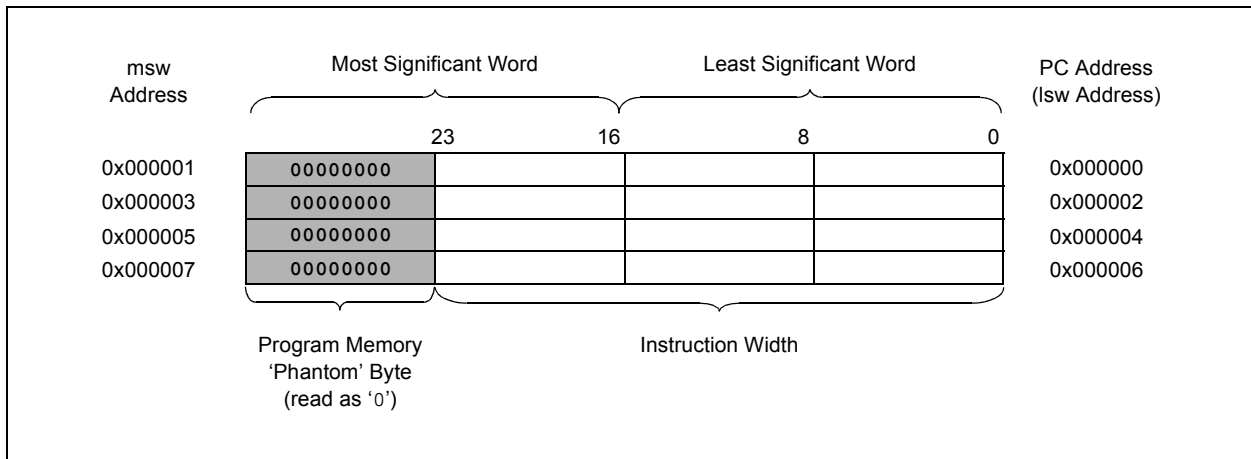

Program memory addresses are always word-aligned on the lower word and addresses are incremented or decremented by two during the code execution. This arrangement provides compatibility with the Data Memory Space Addressing and makes data in the program memory space accessible.

4.1.2 INTERRUPT AND TRAP VECTORS

All dsPIC33EVXXGM00X/10X family devices reserve the addresses between 0x000000 and 0x000200 for hard-coded program execution vectors. A hardware Reset vector is provided to redirect code execution from the default value of the PC on device Reset to the actual start of code. A GOTO instruction is programmed by the user application at address, 0x000000 of Flash memory, with the actual address for the start of code at address, 0x000002 of Flash memory.

For more information on the Interrupt Vector Tables, see Section 7.1 “Interrupt Vector Table”.

FIGURE 4-5: PROGRAM MEMORY ORGANIZATION

dsPIC33EVXXGM00X/10X FAMILY

4.2 Data Address Space

The dsPIC33EVXXGM00X/10X family CPU has a separate, 16-bit wide data memory space. The Data Space (DS) is accessed using separate Address Generation Units (AGUs) for read and write operations. The data memory maps, which are presented by device family and memory size, are shown in Figure 4-6 and Figure 4-8.

All Effective Addresses (EAs) in the data memory space are 16 bits wide and point to bytes within the DS. This arrangement gives a Base Data Space address range of 64 Kbytes or 32K words.

The Base Data Space address is used in conjunction with a Data Space Read or Write Page register (DSRPAG or DSWPAG) to form an Extended Data Space (EDS), which has a total address range of 16 Mbytes.

dsPIC33EVXXGM00X/10X family devices implement up to 20 Kbytes of data memory (4 Kbytes of data memory for Special Function Registers and up to 16 Kbytes of data memory for RAM). If an EA points to a location outside of this area, an all zero word or byte is returned.

4.2.1 DATA SPACE WIDTH

The data memory space is organized in byte-addressable, 16-bit wide blocks. Data is aligned in data memory and registers as 16-bit words, but all DS EAs resolve to bytes. The Least Significant Bytes (LSBs) of each word have even addresses, while the Most Significant Bytes (MSBs) have odd addresses.

4.2.2 DATA MEMORY ORGANIZATION AND ALIGNMENT

To maintain backward compatibility with PIC[®] MCU devices and improve Data Space memory usage efficiency, the dsPIC33EVXXGM00X/10X family instruction set supports both word and byte operations. As a consequence of byte accessibility, all the Effective Address calculations are internally scaled to step through word-aligned memory. For example, the core recognizes that Post-Modified Register Indirect Addressing mode [Ws++] results in a value of Ws + 1 for byte operations and Ws + 2 for word operations.

A data byte read, reads the complete word that contains the byte, using the LSb of any EA to determine which byte to select. The selected byte is placed onto the LSB of the data path. That is, data memory and registers are organized as two parallel, byte-wide entities with shared (word) address decode, but separate write lines. Data byte writes only write to the corresponding side of the array or register that matches the byte address.

All word accesses must be aligned to an even address. Misaligned word data fetches are not supported, therefore, care must be taken when mixing byte and word operations or translating from 8-bit MCU code. If a misaligned read or write is attempted, an address error trap is generated. If the error occurred on a read, the instruction underway is completed. If the error occurred on a write, the instruction is executed but the write does not occur. In either case, a trap is then executed, allowing the system and/or user application to examine the machine state prior to execution of the address Fault.

All byte loads into any W register are loaded into the LSB; the MSB is not modified.

A Sign-Extend (SE) instruction is provided to allow user applications to translate 8-bit signed data to 16-bit signed values. Alternatively, for 16-bit unsigned data, user applications can clear the MSB of any W register by executing a Zero-Extend (ZE) instruction on the appropriate address.

4.2.3 SFR SPACE

The first 4 Kbytes of the Near Data Space, from 0x0000 to 0x0FFF, is primarily occupied by Special Function Registers (SFRs). These are used by the dsPIC33EVXXGM00X/10X family core and peripheral modules for controlling the operation of the device.

SFRs are distributed among the modules that they control and are generally grouped together by module. Much of the SFR space contains unused addresses; these are read as '0'.

| |
|---|
| Note: The actual set of peripheral features and interrupts varies by the device. Refer to the corresponding device tables and pinout diagrams for device-specific information. |
|---|

4.2.4 NEAR DATA SPACE

The 8-Kbyte area, between 0x0000 and 0x1FFF, is referred to as the Near Data Space. Locations in this space are directly addressable through a 13-bit absolute address field within all memory direct instructions. Additionally, the whole DS is addressable using MOV instructions, which support Memory Direct Addressing mode with a 16-bit address field, or by using Indirect Addressing mode using a Working register as an Address Pointer.

4.2.5 X AND Y DATA SPACES

The dsPIC33EVXXXGM00X/10X family core has two Data Spaces: X and Y. These Data Spaces can be considered either separate (for some DSP instructions) or as one unified, linear address range (for MCU instructions). The Data Spaces are accessed using two Address Generation Units (AGUs) and separate data paths. This feature allows certain instructions to concurrently fetch two words from RAM, thereby enabling efficient execution of DSP algorithms, such as Finite Impulse Response (FIR) filtering and Fast Fourier Transform (FFT).

The X DS is used by all instructions and supports all addressing modes. The X DS has separate read and write data buses. The X read data bus is the read data path for all instructions that view the DS as combined X and Y address space. It is also the X data prefetch path for the dual operand DSP instructions (MAC class).

The Y DS is used in concert with the X DS by the MAC class of instructions (CLR, ED, EDAC, MAC, MOVSAC, MPY, MPY.N and MSC) to provide two concurrent data read paths.

Both the X and Y Data Spaces support Modulo Addressing mode for all instructions, subject to addressing mode restrictions. Bit-Reversed Addressing mode is only supported for writes to the X Data Space.

All data memory writes, including in DSP instructions, view Data Space as combined X and Y address space. The boundary between the X and Y Data Spaces is device-dependent and is not user-programmable.

dsPIC33EVXXGM00X/10X FAMILY

4.3.1 PAGED MEMORY SCHEME

The dsPIC33EVXXGM00X/10X family architecture extends the available DS through a paging scheme, which allows the available DS to be accessed using MOV instructions in a linear fashion for pre- and post-modified Effective Addresses (EAs). The upper half of the Base Data Space address is used in conjunction with the Data Space Page registers, the 10-bit Data Space Read Page register (DSRPAG) or the 9-bit Data Space Write Page register (DSWPAG), to form an EDS address, or Program Space Visibility (PSV) address.

The Data Space Page registers are located in the SFR space. Construction of the EDS address is shown in Figure 4-9 and Figure 4-10. When DSRPAG<9> = 0 and the base address bit, EA<15> = 1, the DSRPAG<8:0> bits are concatenated onto EA<14:0> to form the 24-bit EDS read address. Similarly, when the base address bit, EA<15> = 1, the DSWPAG<8:0> bits are concatenated onto EA<14:0> to form the 24-bit EDS write address.

FIGURE 4-9: EXTENDED DATA SPACE (EDS) READ ADDRESS GENERATION

FIGURE 4-10: EXTENDED DATA SPACE (EDS) WRITE ADDRESS GENERATION

The paged memory scheme provides access to multiple 32-Kbyte windows in the EDS and PSV memory. The Data Space Page registers, $DSxPAG$, in combination with the upper half of the Data Space address, can provide up to 16 Mbytes of additional address space in the EDS and 8 Mbytes ($DSRPAG$ only) of PSV address space. The paged data memory space is shown in [Figure 4-11](#).

The Program Space (PS) can be accessed with a $DSRPAG$ of 0x200 or greater. Only reads from PS are supported using the $DSRPAG$. Writes to PS are not supported, therefore, the $DSWPAG$ is dedicated to DS, including EDS. The Data Space and EDS can be read from and written to using $DSRPAG$ and $DSWPAG$, respectively.

FIGURE 4-11: PAGED DATA MEMORY SPACE

dsPIC33EVXXGM00X/10X FAMILY

Allocating different Page registers for read and write access allows the architecture to support data movement between different pages in the data memory. This is accomplished by setting the DSRPAG register value to the page from which you want to read, and configure the DSWPAG register to the page to which it needs to be written. Data can also be moved from different PSV to EDS pages by configuring the DSRPAG and DSWPAG registers to address PSV and EDS space, respectively. The data can be moved between pages by a single instruction.

When an EDS or PSV page overflow or underflow occurs, EA<15> is cleared as a result of the register indirect EA calculation. An overflow or underflow of the EA in the EDS or PSV pages can occur at the page boundaries when:

- The initial address, prior to modification, addresses an EDS or a PSV page.
- The EA calculation uses Pre- or Post-Modified Register Indirect Addressing. However, this does not include Register Offset Addressing.

In general, when an overflow is detected, the DSxPAG register is incremented and the EA<15> bit is set to keep the base address within the EDS or PSV window. When an underflow is detected, the DSxPAG register is decremented and the EA<15> bit is set to keep the base address within the EDS or PSV window. This creates a linear EDS and PSV address space, but only when using the Register Indirect Addressing modes.

Exceptions to the operation described above arise when entering and exiting the boundaries of Page 0, EDS and PSV spaces. [Table 4-43](#) lists the effects of overflow and underflow scenarios at different boundaries.

In the following cases, when an overflow or underflow occurs, the EA<15> bit is set and the DSxPAG is not modified; therefore, the EA will wrap to the beginning of the current page:

- Register Indirect with Register Offset Addressing
- Modulo Addressing
- Bit-Reversed Addressing

TABLE 4-43: OVERFLOW AND UNDERFLOW SCENARIOS AT PAGE 0, EDS AND PSV SPACE BOUNDARIES^(2,3,4)

| O/U, R/W | Operation | Before | | | After | | |
|----------|----------------------------|----------------|-----------|---------------------|----------------|-----------|----------------------------|
| | | DSxPAG | DS EA<15> | Page Description | DSxPAG | DS EA<15> | Page Description |
| O, Read | [++Wn] or [Wn++] | DSRPAG = 0x1FF | 1 | EDS: Last Page | DSRPAG = 0x1FF | 0 | See Note 1 |
| O, Read | | DSRPAG = 0x2FF | 1 | PSV: Last lsw Page | DSRPAG = 0x300 | 1 | PSV: First MSB Page |
| O, Read | | DSRPAG = 0x3FF | 1 | PSV: Last MSB Page | DSRPAG = 0x3FF | 0 | See Note 1 |
| O, Write | | DSWPAG = 0x1FF | 1 | EDS: Last Page | DSWPAG = 0x1FF | 0 | See Note 1 |
| U, Read | [--Wn] or [Wn--] | DSRPAG = 0x001 | 1 | PSV Page | DSRPAG = 0x001 | 0 | See Note 1 |
| U, Read | | DSRPAG = 0x200 | 1 | PSV: First lsw Page | DSRPAG = 0x200 | 0 | See Note 1 |
| U, Read | | DSRPAG = 0x300 | 1 | PSV: First MSB Page | DSRPAG = 0x2FF | 1 | PSV: Last lsw Page |

Legend: O = Overflow, U = Underflow, R = Read, W = Write

Note 1: The Register Indirect Addressing now addresses a location in the Base Data Space (0x0000-0x8000).

2: An EDS access with DSxPAG = 0x000 will generate an address error trap.

3: Only reads from PS are supported using DSRPAG. An attempt to write to PS using DSWPAG will generate an address error trap.

4: Pseudolinear Addressing is not supported for large offsets.

dsPIC33EVXXGM00X/10X FAMILY

4.3.2 EXTENDED X DATA SPACE

The lower portion of the base address space range, between 0x0000 and 0x2FFF, is always accessible regardless of the contents of the Data Space Page registers; it is indirectly addressable through the register indirect instructions. It can be regarded as being located in the default EDS Page 0 (i.e., EDS address range of 0x000000 to 0x002FFF with the base address bit, EA<15> = 0, for this address range). However, Page 0 cannot be accessed through the upper 32 Kbytes, 0x8000 to 0xFFFF, of Base Data Space, in combination with DSRPAG = 0x000 or DSWPAG = 0x000. Consequently, the DSRPAG and DSWPAG registers are initialized to 0x001 at Reset.

Note 1: DSxPAG should not be used to access Page 0. An EDS access with DSxPAG set to 0x000 will generate an address error trap.

2: Clearing the DSxPAG in software has no effect.

The remaining pages, including both EDS and PSV pages, are only accessible using the DSRPAG or DSWPAG registers in combination with the upper 32 Kbytes, 0x8000 to 0xFFFF, of the base address, where the base address bit, EA<15> = 1.

For example, when DSRPAG = 0x001 or DSWPAG = 0x001, accesses to the upper 32 Kbytes, 0x8000 to 0xFFFF of the Data Space, will map to the EDS address range of 0x008000 to 0x00FFFF. When DSRPAG = 0x002 or DSWPAG = 0x002, accesses to the upper 32 Kbytes of the Data Space will map to the EDS address range of 0x010000 to 0x017FFF and so on, as shown in the EDS memory map in [Figure 4-12](#).

For more information on the PSV page access using Data Space Page registers, refer to **Section 5.0 “Program Space Visibility from Data Space”** in **“dsPIC33E/PIC24E Program Memory”** (DS70000613) of the *“dsPIC33/PIC24 Family Reference Manual”*.

FIGURE 4-12: EDS MEMORY MAP

4.3.3 DATA MEMORY ARBITRATION AND BUS MASTER PRIORITY

EDS accesses from bus masters in the system are arbitrated.

The arbiter for data memory (including EDS) arbitrates between the CPU, the DMA and the MPLAB[®] ICD module. In the event of coincidental access to a bus by the bus masters, the arbiter determines which bus master access has the highest priority. The other bus masters are suspended and processed after the highest priority. The access of the bus by the bus master with the highest priority.

By default, the CPU is Bus Master 0 (M0) with the highest priority and the MPLAB ICD is Bus Master 4 (M4) with the lowest priority. The remaining bus master (DMA Controller) is allocated to M3 (M1 and M2 are reserved and cannot be used). The user application may raise or lower the priority of the DMA Controller to be above that of the CPU by setting the appropriate bits in the EDS Bus Master Priority Control (MSTRPR) register. All bus masters with raised priorities will maintain the same priority relationship relative to each other (i.e., M1 being highest and M3 being lowest, with M2 in between). Also, all the bus masters with priorities

below that of the CPU maintain the same priority relationship relative to each other. The priority schemes for bus masters with different MSTRPR values are listed in [Table 4-44](#).

[Figure 4-13](#) shows the arbiter architecture.

The bus master priority control allows the user application to manipulate the real-time response of the system, either statically during initialization or dynamically in response to real-time events.

TABLE 4-44: DATA MEMORY BUS ARBITER PRIORITY

| Priority | MSTRPR<15:0> Bit Setting ⁽¹⁾ | |
|--------------|---|-----------|
| | 0x0000 | 0x0020 |
| M0 (highest) | CPU | DMA |
| M1 | Reserved | CPU |
| M2 | Reserved | Reserved |
| M3 | DMA | Reserved |
| M4 (lowest) | MPLAB [®] ICD | MPLAB ICD |

Note 1: All other values of MSTRPR<15:0> are reserved.

FIGURE 4-13: ARBITER ARCHITECTURE

dsPIC33EVXXGM00X/10X FAMILY

4.3.4 SOFTWARE STACK

The W15 register serves as a dedicated Software Stack Pointer (SSP) and is automatically modified by exception processing, subroutine calls and returns; however, W15 can be referenced by any instruction in the same manner as all other W registers. This simplifies reading, writing and manipulating the SSP (for example, creating stack frames).

Note: To protect against misaligned stack accesses, W15<0> is fixed to '0' by the hardware.

W15 is initialized to 0x1000 during all Resets. This address ensures that the SSP points to valid RAM in all dsPIC33EVXXGM00X/10X family devices and permits stack availability for non-maskable trap exceptions. These can occur before the SSP is initialized by the user software. You can reprogram the SSP during initialization to any location within the Data Space.

The SSP always points to the first available free word and fills the software stack, working from lower toward higher addresses. Figure 4-14 illustrates how it pre-decrements for a stack pop (read) and post-increments for a stack push (writes).

When the PC is pushed onto the stack, PC<15:0> are pushed onto the first available stack word, then PC<22:16> are pushed into the second available stack word. For a PC push during any CALL instruction, the MSB of the PC is zero-extended before the push, as shown in Figure 4-14. During exception processing, the MSB of the PC is concatenated with the lower 8 bits of the CPU STATUS Register (SR). This allows the contents of SRL to be preserved automatically during interrupt processing.

Note 1: To maintain system SSP (W15) coherency, W15 is never subject to (EDS) paging, and is therefore, restricted to an address range of 0x0000 to 0xFFFF. The same applies to the W14 when used as a Stack Frame Pointer (SFA = 1).

2: As the stack can be placed in, and can access X and Y spaces, care must be taken regarding its use, particularly with regard to local automatic variables in a 'C' development environment.

FIGURE 4-14: CALL STACK FRAME

4.4 Instruction Addressing Modes

The addressing modes shown in Table 4-45 form the basis of the addressing modes optimized to support the specific features of the individual instructions. The addressing modes provided in the MAC class of instructions differ from those in the other instruction types.

4.4.1 FILE REGISTER INSTRUCTIONS

Most file register instructions use a 13-bit address field (f) to directly address data present in the first 8192 bytes of data memory (Near Data Space). Most file register instructions employ a Working register, W0, which is denoted as WREG in these instructions. The destination is typically either the same file register or WREG (with the exception of the MUL instruction), which writes the result to a register or register pair. The MOV instruction allows additional flexibility and can access the entire Data Space.

4.4.2 MCU INSTRUCTIONS

The three-operand MCU instructions are of the form:

Operand 3 = Operand 1 <function> Operand 2

where, Operand 1 is always a Working register (that is, the addressing mode can only be Register Direct), which is referred to as Wb. Operand 2 can be a W register fetched from data memory or a 5-bit literal. The result location can be either a W register or a data memory location. The following addressing modes are supported by MCU instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-Modified
- Register Indirect Pre-Modified
- 5-Bit or 10-Bit Literal

Note: Not all instructions support all of the addressing modes given above. Individual instructions can support different subsets of these addressing modes.

TABLE 4-45: FUNDAMENTAL ADDRESSING MODES SUPPORTED

| Addressing Mode | Description |
|---|---|
| File Register Direct | The address of the file register is specified explicitly. |
| Register Direct | The contents of a register are accessed directly. |
| Register Indirect | The contents of Wn form the Effective Address (EA). |
| Register Indirect Post-Modified | The contents of Wn form the EA. Wn is post-modified (incremented or decremented) by a constant value. |
| Register Indirect Pre-Modified | Wn is pre-modified (incremented or decremented) by a signed constant value to form the EA. |
| Register Indirect with Register Offset (Register Indexed) | The sum of Wn and Wb forms the EA. |
| Register Indirect with Literal Offset | The sum of Wn and a literal forms the EA. |

4.4.3 MOVE AND ACCUMULATOR INSTRUCTIONS

Move instructions and the DSP accumulator class of instructions provide a greater addressing flexibility than other instructions. In addition to the addressing modes supported by most MCU instructions, move and accumulator instructions also support Register Indirect with Register Offset Addressing mode, also referred to as Register Indexed mode.

Note: For the `MOV` instructions, the addressing mode specified in the instruction can differ for the source and destination EA. However, the 4-bit Wb (Register Offset) field is shared by both source and destination (but typically only used by one).

In summary, the following addressing modes are supported by move and accumulator instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-Modified
- Register Indirect Pre-Modified
- Register Indirect with Register Offset (Indexed)
- Register Indirect with Literal Offset
- 8-Bit Literal
- 16-Bit Literal

Note: Not all instructions support all the addressing modes given above. Individual instructions may support different subsets of these addressing modes.

4.4.4 MAC INSTRUCTIONS

The dual source operand DSP instructions (`CLR`, `ED`, `EDAC`, `MAC`, `MPY`, `MPY.N`, `MOVSA` and `MSC`), also referred to as `MAC` instructions, use a simplified set of addressing modes to allow the user application to effectively manipulate the Data Pointers through register indirect tables.

The Two-Source Operand Prefetch registers must be members of the set, {W8, W9, W10, W11}. For data reads, W8 and W9 are always directed to the X RAGU, and W10 and W11 are always directed to the Y AGU. The Effective Addresses generated (before and after modification) must, therefore, be valid addresses within X Data Space for W8 and W9, and Y Data Space for W10 and W11.

Note: Register Indirect with Register Offset Addressing mode is available only for W9 (in X Data Space) and W11 (in Y Data Space).

In summary, the following addressing modes are supported by the `MAC` class of instructions:

- Register Indirect
- Register Indirect Post-Modified by 2
- Register Indirect Post-Modified by 4
- Register Indirect Post-Modified by 6
- Register Indirect with Register Offset (Indexed)

4.4.5 OTHER INSTRUCTIONS

Besides the addressing modes outlined previously, some instructions use literal constants of various sizes. For example, `BRA` (Branch) instructions use 16-bit signed literals to specify the Branch destination directly, whereas the `DISI` instruction uses a 14-bit unsigned literal field. In some instructions, such as `ULNK`, the source of an operand or result is implied by the opcode itself. Certain operations, such as a `NOF`, do not have any operands.

dsPIC33EVXXGM00X/10X FAMILY

4.5 Modulo Addressing

Modulo Addressing mode is a method of providing an automated means to support circular data buffers using hardware. The objective is to remove the need for software to perform data address boundary checks when executing tightly looped code, as is typical in many DSP algorithms.

Modulo Addressing can operate in either Data or Program Space (since the Data Pointer mechanism is essentially the same for both). One circular buffer can be supported in each of the X (which also provides the pointers into Program Space) and Y Data Spaces. Modulo Addressing can operate on any W Register Pointer. However, it is not advisable to use W14 or W15 for Modulo Addressing, since these two registers are used as the SFP and SSP, respectively.

In general, any particular circular buffer can be configured to operate in only one direction, as there are certain restrictions on the buffer start address (for incrementing buffers) or end address (for decrementing buffers), based upon the direction of the buffer.

The only exception to the usage restrictions is for buffers that have a power-of-two length. As these buffers satisfy the start and end address criteria, they can operate in a Bidirectional mode (that is, address boundary checks are performed on both the lower and upper address boundaries).

4.5.1 START AND END ADDRESS

The Modulo Addressing scheme requires that a starting and ending address be specified and loaded into the 16-bit Modulo Buffer Address registers: XMODSRT, XMODEND, YMODSRT and YMODEND (see Table 4-1).

Note: Y Data Space Modulo Addressing EA calculations assume word-sized data (LSb of every EA is always clear).

The length of a circular buffer is not directly specified. It is determined by the difference between the corresponding start and end addresses. The maximum possible length of the circular buffer is 32K words (64 Kbytes).

4.5.2 W ADDRESS REGISTER SELECTION

The Modulo and Bit-Reversed Addressing Control register, MODCON<15:0>, contains enable flags, as well as a W register field to specify the W Address registers. The XWM and YWM fields select the registers that operate with Modulo Addressing:

- If XWM = 1111, X RAGU and X WAGU Modulo Addressing is disabled
- If YWM = 1111, Y AGU Modulo Addressing is disabled

The X Address Space Pointer W register (XWM) to which Modulo Addressing is to be applied is stored in MODCON<3:0> (see Table 4-1). Modulo Addressing is enabled for X Data Space when XWM is set to any value other than '1111' and the XMODEN bit (MODCON<15>) is set

The Y Address Space Pointer W register (YWM) to which Modulo Addressing is to be applied is stored in MODCON<7:4>. Modulo Addressing is enabled for Y Data Space when YWM is set to any value other than '1111' and the YMODEN bit (MODCON<14>) is set.

Figure 4-15 shows an example of Modulo Addressing operation.

FIGURE 4-15: MODULO ADDRESSING OPERATION EXAMPLE

4.5.3 MODULO ADDRESSING APPLICABILITY

Modulo Addressing can be applied to the Effective Address (EA) calculation associated with any W register. Address boundaries check for addresses equal to:

- The upper boundary addresses for incrementing buffers
- The lower boundary addresses for decrementing buffers

The address boundaries check for addresses less than or greater than the upper (for incrementing buffers) and lower (for decrementing buffers) boundary addresses (not just equal to). Address changes can, therefore, jump beyond boundaries and still be adjusted correctly.

Note: The modulo corrected Effective Address is written back to the register only when Pre-Modify or Post-Modify Addressing mode is used to compute the Effective Address. When an address offset, such as [W7 + W2] is used, Modulo Addressing correction is performed, but the contents of the register remain unchanged.

4.6 Bit-Reversed Addressing

Bit-Reversed Addressing mode is intended to simplify data reordering for radix-2 FFT algorithms. It is supported by the X AGU for data writes only.

The modifier, which can be a constant value or register contents, is regarded as having its bit order reversed. The address source and destination are kept in normal order. Thus, the only operand requiring reversal is the modifier.

4.6.1 BIT-REVERSED ADDRESSING IMPLEMENTATION

Bit-Reversed Addressing mode is enabled when all of these conditions are met:

- BWM<3:0> bits (W register selection) in the MODCON register are any value other than '1111' (the stack cannot be accessed using Bit-Reversed Addressing)
- The BREN bit is set in the XBREV register
- The addressing mode used is Register Indirect with Pre-Increment or Post-Increment

If the length of a bit-reversed buffer is $M = 2^N$ bytes, the last 'N' bits of the data buffer start address must be zeros.

XB<14:0> is the Bit-Reversed Addressing modifier, or 'pivot point', which is typically a constant. In the case of an FFT computation, its value is equal to half of the FFT data buffer size.

Note: All bit-reversed EA calculations assume word-sized data (LSb of every EA is always clear). The XB value is scaled accordingly to generate compatible (byte) addresses.

When enabled, Bit-Reversed Addressing is executed only for Register Indirect with Pre-Increment or Post-Increment Addressing and word-sized data writes. It does not function for any other addressing mode or for byte-sized data and normal addresses are generated instead. When Bit-Reversed Addressing is active, the W Address Pointer is always added to the address modifier (XB) and the offset associated with the Register Indirect Addressing mode is ignored. In addition, as word-sized data is a requirement, the LSb of the EA is ignored (and always clear).

Note: Modulo Addressing and Bit-Reversed Addressing can be enabled simultaneously using the same W register, but Bit-Reversed Addressing operation will always take precedence for data writes when enabled.

If Bit-Reversed Addressing has already been enabled by setting the BREN (XBREV<15>) bit, a write to the XBREV register should not be immediately followed by an indirect read operation using the W register that has been designated as the Bit-Reversed Pointer.

The operation of Bit-Reversed Addressing is shown in [Figure 4-16](#) and [Table 4-46](#).

dsPIC33EVXXGM00X/10X FAMILY

4.7 Interfacing Program and Data Memory Spaces

The dsPIC33EVXXGM00X/10X family architecture uses a 24-bit wide Program Space and a 16-bit wide Data Space. The architecture is also a modified Harvard scheme, meaning that data can also be present in the Program Space. To use this data successfully, it must be accessed in a way that preserves the alignment of information in both the spaces.

Aside from normal execution, the architecture of the dsPIC33EVXXGM00X/10X family devices provides two methods by which Program Space can be accessed during operation:

- Using table instructions to access individual bytes or words anywhere in the Program Space
- Remapping a portion of the Program Space into the Data Space (Program Space Visibility)

Table instructions allow an application to read or write to small areas of the program memory. This capability makes the method ideal for accessing data tables that need to be updated periodically. It also allows access to all bytes of the program word. The remapping method allows an application to access a large block of data on a read-only basis, which is ideal for look-ups from a large table of static data. The application can only access the least significant word of the program word.

Table 4-47 shows the construction of the Program Space address.

How the data is accessed from Program Space is shown in Figure 4-17.

TABLE 4-47: PROGRAM SPACE ADDRESS CONSTRUCTION

| Access Type | Access Space | Program Space Address | | | | |
|--|---------------|-------------------------------|----------|---------------|--------|-----|

dsPIC33EVXXGM00X/10X FAMILY

FIGURE 4-17: DATA ACCESS FROM PROGRAM SPACE ADDRESS GENERATION

4.7.1 DATA ACCESS FROM PROGRAM MEMORY USING TABLE INSTRUCTIONS

The `TBLRDL` and `TBLWTL` instructions offer a direct method of reading or writing the lower word of any address within the Program Space without going through the Data Space. The `TBLRDH` and `TBLWTH` instructions are the only method to read or write the upper 8 bits of a Program Space word as data.

The PC is incremented by two for each successive 24-bit program word. This allows program memory addresses to directly map to Data Space addresses. Program memory can thus be regarded as two 16-bit wide word address spaces, residing side by side, each with the same address range. The `TBLRDL` and `TBLWTL` instructions access the space that contains the least significant data word. `TBLRDH` and `TBLWTH` access the space that contains the upper data byte.

Two table instructions are provided to move byte or word-sized (16-bit) data to and from Program Space. Both function as either byte or word operations.

- `TBLRDL` (Table Read Low):
 - In Word mode, this instruction maps the lower word of the Program Space location ($P<15:0>$) to a data address ($D<15:0>$).
 - In Byte mode, either the upper or lower byte of the lower program word is mapped to the lower byte of a data address. The upper byte is selected when Byte Select is '1'; the lower byte is selected when it is '0'.

- `TBLRDH` (Table Read High):
 - In Word mode, this instruction maps the entire upper word of a program address ($P<23:16>$) to a data address. The 'phantom' byte ($D<15:8>$) is always '0'.
 - In Byte mode, this instruction maps the upper or lower byte of the program word to $D<7:0>$ of the data address, as in the `TBLRDL` instruction. The data is always '0' when the upper 'phantom' byte is selected (Byte Select = 1).

Similarly, two table instructions, `TBLWTH` and `TBLWTL`, are used to write individual bytes or words to a Program Space address. The details of their operation are explained in [Section 5.0 "Flash Program Memory"](#).

For all table operations, the area of program memory space to be accessed is determined by the Table Page register (`TBLPAG`). `TBLPAG` covers the entire program memory space of the device, including user application and configuration spaces. When `TBLPAG<7> = 0`, the table page is located in the user memory space. When `TBLPAG<7> = 1`, the page is located in configuration space. Accessing the program memory with table instructions is shown in [Figure 4-18](#).

FIGURE 4-18: ACCESSING PROGRAM MEMORY WITH TABLE INSTRUCTIONS

dsPIC33EVXXGM00X/10X FAMILY

NOTES:

5.0 FLASH PROGRAM MEMORY

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Flash Programming” (DS70609) in the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33EVXXGM00X/10X family devices contain internal Flash program memory for storing and executing application code. The memory is readable, writable and erasable during normal operation over the entire VDD range.

The Flash memory can be programmed in the following three ways:

- In-Circuit Serial Programming™ (ICSP™)
- Run-Time Self-Programming (RTSP)
- Enhanced In-Circuit Serial Programming (Enhanced ICSP)

ICSP allows for a dsPIC33EVXXGM00X/10X family device to be serially programmed while in the end application circuit. This is done with two lines for programming clock and programming data (PGECx/PGEDx) lines, and three other lines for power (VDD), ground (VSS) and Master Clear (MCLR). This allows customers to manufacture boards with unprogrammed

devices and then program the device just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

Enhanced ICSP uses an on-board bootloader, known as the Program Executive (PE), to manage the programming process. Using an SPI data frame format, the Program Executive can erase, program and verify program memory. For more information on Enhanced ICSP, refer to the specific device programming specification.

RTSP is accomplished using the TBLRD (Table Read) and TBLWT (Table Write) instructions. With RTSP, the user application can write program memory data as a double program memory word, a row of 64 instructions (192 bytes) and erase program memory in blocks of 512 instruction words (1536 bytes) at a time.

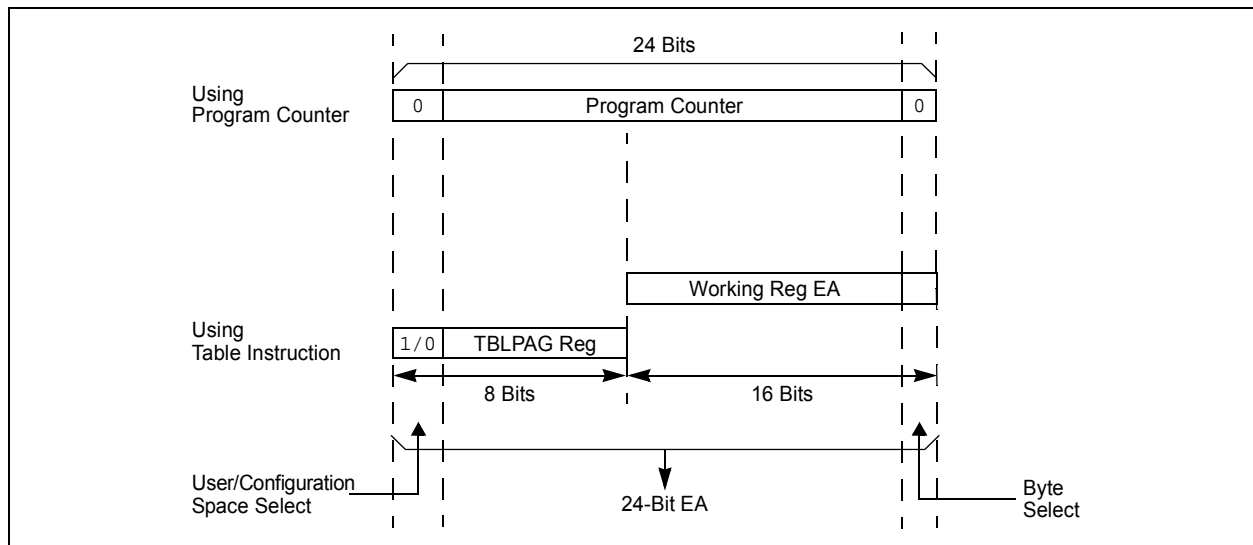

5.1 Table Instructions and Flash Programming

The Flash memory read and the double-word programming operations make use of the TBLRD and TBLWT instructions, respectively. These allow direct read and write access to the program memory space from the data memory while the device is in normal operating mode. The 24-bit target address in the program memory is formed using bits<7:0> of the TBLPAG register and the Effective Address (EA) from a W register, specified in the table instruction, as shown in **Figure 5-1**.

The TBLRDL and the TBLWTL instructions are used to read or write to bits<15:0> of the program memory. TBLRDL and TBLWTL can access program memory in both Word and Byte modes.

The TBLRDH and TBLWTH instructions are used to read or write to bits<23:16> of the program memory. TBLRDH and TBLWTH can also access program memory in Word or Byte mode.

FIGURE 5-1: ADDRESSING FOR TABLE REGISTERS

dsPIC33EVXXGM00X/10X FAMILY

5.2 RTSP Operation

RTSP allows the user application to erase a single page of memory, program a row and to program two instruction words at a time. See Table 1 in the “dsPIC33EVXXGM00X/10X Product Families” section for the page sizes of each device. memory array is organized into rows of 64 instructions or 192 bytes. RTSP allows the user application to era

The Flash program memory array is organized into rows of 64 instructions or 192 bytes. RTSP allows the user application to erase a page of program memory, which consists of eight rows (512 instructions) at a time, and to program one row or two adjacent words at a time. The 8-row erase pages and single row write rows are edge-aligned, from the beginning of program memory, on boundaries of 1536 bytes and 192 bytes, respectively. Table 30-13 in Section 30.0 “Electrical Characteristics” lists the typical erase and programming times.

The basic sequence for RTSP word programming is to use the TBLWTL and TBLWTH instructions to load two of the 24-bit instructions into the write latches found in configuration memory space. See Figure 4-1 to Figure 4-5 for write latch addresses. Programming is performed by unlocking and setting the control bits in the NVMCON register.

Row programming is performed by loading 192 bytes into data memory and then loading the address of the first byte in that row into the NVMSRCADR register. Once the write has been initiated, the device will automatically load the write latches and increment the NVMSRCADR and the NVMADR(U) registers until all bytes have been programmed. The RPDF bit (NVMCON<9>) selects the format of the stored data in RAM to be either compressed or uncompressed. See Figure 5-2 for data formatting. Compressed data helps to reduce the amount of required RAM by using the upper byte of the second word for the MSB of the second instruction.

For more information on erasing and programming the Flash memory, refer to “Flash Programming” (DS70609) in the “dsPIC33/PIC24 Family Reference Manual”.

- Note 1:** Before reprogramming either of the two words in a double-word pair, the user must erase the Flash memory page in which it is located.
- 2:** Before reprogramming any word in a row, the user must erase the Flash memory page in which it is located.

FIGURE 5-2: UNCOMPRESSED/COMPRESSED FORMAT

5.3 Programming Operations

A complete programming sequence is necessary for programming or erasing the internal Flash in RTSP mode. The processor stalls (waits) until the programming operation is finished. Setting the WR bit (NVMCON<15>) starts the operation and the WR bit is automatically cleared when the operation is finished.

5.3.1 PROGRAMMING ALGORITHM FOR FLASH PROGRAM MEMORY

Programmers can program two adjacent words (24 bits x 2) of program Flash memory at a time on every other word address boundary (0x000002, 0x000006, 0x00000A, etc.). To do this, erase the page that contains the desired address of the location the user wants to change. For protection against accidental operations, the write initiate sequence for NVMKEY must be used to allow any erase or program operation to proceed. After the programming command has been executed, the user application must wait for the programming time until programming is complete. The two instructions following the start of the programming sequence should be NOPs.

Refer to “Flash Programming” (DS70609) in the “dsPIC33/PIC24 Family Reference Manual” for details and code examples on programming using RTSP.

5.4 Error Correcting Code (ECC)

In order to improve program memory performance and durability, these devices include Error Correcting Code functionality (ECC) as an integral part of the Flash memory controller. ECC can determine the presence of single-bit errors in program data, including which bit is in error, and correct the data automatically without user intervention. ECC cannot be disabled.

When data is written to program memory, ECC generates a 7-bit Hamming code parity value for every two (24-bit) instruction words. The data is stored in blocks of 48 data bits and 7 parity bits; parity data is not memory-mapped and is inaccessible. When the data is read back, the ECC calculates the parity on it and compares it to the previously stored parity value. If a parity mismatch occurs, there are two possible outcomes:

- Single-bit errors are automatically identified and corrected on read-back. An optional device-level interrupt (ECCSBEIF) is also generated.
- Double-bit errors will generate a generic hard trap and the read data is not changed. If special exception handling for the trap is not implemented, a device Reset will also occur.

To use the single-bit error interrupt, set the ECC Single-Bit Error Interrupt Enable bit (ECCSBEIE) and configure the ECCSBEIP bits to set the appropriate interrupt priority.

Except for the single-bit error interrupt, error events are not captured or counted by hardware. This functionality can be implemented in the software application, but it is the user's responsibility to do so.

5.5 Flash Memory Resources

Many useful resources are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page contains the latest updates and additional information.

5.5.1 KEY RESOURCES

- Development Tools

5.6 Control Registers

The following five SFRs are used to read and write the program Flash memory: NVMCON, NVMKEY, NVMADR, NVMADRU and NVMSRCADR.

The NVMCON register ([Register 5-1](#)) selects the operation to be performed (page erase, word/row program, inactive panel erase) and initiates the program/erase cycle.

NVMKEY ([Register 5-4](#)) is a write-only register that is used for write protection. To start a programming or erase sequence, the user application must consecutively write 0x55 and 0xAA to the NVMKEY register.

There are two NVM Address registers: NVMADRU and NVMADR. These two registers, when concatenated, form the 24-bit Effective Address (EA) of the selected word/row for programming operations or the selected page for erase operations. The NVMADRU register is used to hold the upper 8 bits of the EA, while the NVMADR register is used to hold the lower 16 bits of the EA. For row programming operation, data to be written to program Flash memory is written into data memory space (RAM) at an address defined by the NVMSRCADR register (location of the first element in row programming data).

6.0 RESETS

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Reset” (DS70602) in the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

The Reset module combines all Reset sources and controls the device Master Reset Signal, $\overline{\text{SYSRST}}$. The following is a list of device Reset sources:

- POR: Power-on Reset
- BOR: Brown-out Reset
- $\overline{\text{MCLR}}$: Master Clear Pin Reset
- SWR: RESET Instruction
- WDTO: Watchdog Timer Time-out Reset
- CM: Configuration Mismatch Reset
- TRAPR: Trap Conflict Reset
- IOPUWR: Illegal Condition Device Reset
 - Illegal Opcode Reset
 - Uninitialized W Register Reset
 - Security Reset
 - Illegal Address Mode Reset

A simplified block diagram of the Reset module is shown in [Figure 6-1](#).

Any active source of Reset will make the $\overline{\text{SYSRST}}$ signal active. On system Reset, some of the registers associated with the CPU and peripherals are forced to a known Reset state and some are unaffected.

Note: Refer to the specific peripheral section or [Section 4.0 “Memory Organization”](#) of this device data sheet for register Reset states.

All types of device Reset set a corresponding status bit in the RCON register to indicate the type of Reset (see [Register 6-1](#)).

A POR clears all the bits, except for the POR and BOR bits (RCON<1:0>) that are set. The user application can set or clear any bit at any time during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software does not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer and device power-saving states. The function of these bits is discussed in the other sections of this device data sheet.

Note: The status bits in the RCON register should be cleared after they are read. Therefore, the next RCON register value after a device Reset is meaningful.

Note: In all types of Resets, to select the device clock source, the contents of OSCCON are initialized from the FNOSCx Configuration bits in the FOSCSEL Configuration register.

7.0 INTERRUPT CONTROLLER

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Interrupts” (DS70000600) in the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

The dsPIC33EVXXGM00X/10X family interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the dsPIC33EVXXGM00X/10X CPU. The Interrupt Vector Table (IVT) provides 246 interrupt sources (unused sources are reserved for future use) that can be programmed with different priority levels.

The interrupt controller has the following features:

- Interrupt Vector Table with up to 246 Vectors
- Alternate Interrupt Vector Table (AIVT)
- Up to Eight Processor Exceptions and Software Traps
- Seven User-Selectable Priority Levels
- Interrupt Vector Table (IVT) with a Unique Vector for Each Interrupt or Exception Source
- Fixed Priority within a Specified User Priority Level
- Fixed Interrupt Entry and Return Latencies
- Software can Generate any Peripheral Interrupt
- Alternate Interrupt Vector Table (AIVT) is available if Boot Security is Enabled and AIVTEN = 1

7.1 Interrupt Vector Table

The dsPIC33EVXXGM00X/10X family IVT, shown in [Figure 7-2](#), resides in program memory, starting at location, 000004h. The IVT contains seven non-maskable trap vectors and up to 187 sources of interrupt. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Interrupt vectors are prioritized in terms of their natural priority. This priority is linked to their position in the vector table. Lower addresses generally have a higher natural priority. For example, the interrupt associated with Vector 0 takes priority over interrupts at any other vector address.

7.2 Alternate Interrupt Vector Table

The Alternate Interrupt Vector Table (AIVT), shown in [Figure 7-1](#), is available if the Boot Segment (BS) is defined, the AIVTEN bit is set in the INTCON2 register and if the AIVTDIS Configuration bit is set to ‘1’. The AIVT begins at the start of the last page of the Boot Segment.

Note 1: This interrupt source is available on dsPIC33EVXXGM10X devices only.

dsPIC33EVXXGM00X/10X FAMILY

7.3 Reset Sequence

A device Reset is not a true exception because the interrupt controller is not involved in the Reset process. The dsPIC33EVXXGM00X/10X family devices clear their registers in response to a Reset, which forces the PC to zero. The device then begins program execution at location, 0x000000. A GOTO instruction at the Reset address can redirect program execution to the appropriate start-up routine.

Note: Any unimplemented or unused vector locations in the IVT should be programmed with the address of a default interrupt handler routine that contains a RESET instruction.

7.4 Interrupt Control and Status Registers

dsPIC33EVXXGM00X/10X family devices implement the following registers for the interrupt controller:

- INTCON1
- INTCON2
- INTCON3
- INTCON4
- IFSx
- IECx
- IPCx
- INTTREG

7.4.1 INTCON1 THROUGH INTCON4

Global interrupt control functions are controlled from the INTCON1, INTCON2, INTCON3 and INTCON4 registers.

INTCON1 contains the Interrupt Nesting Disable bit (NSTDIS), as well as the control and status flags for the processor trap sources.

The INTCON2 register controls external interrupt request signal behavior and also contains the Global Interrupt Enable bit (GIE).

INTCON3 contains the status flags for the DMT (Dead-man Timer), DMA and DO stack overflow status trap sources.

The INTCON4 register contains the ECC Double-Bit Error (ECCDBE) and Software-Generated Hard Trap (SGHT) status bit.

7.4.2 IFSx

The IFSx registers maintain all of the interrupt request flags. Each source of interrupt has a status bit, which is set by the respective peripherals or external signal and is cleared through software.

7.4.3 IECx

The IECx registers maintain all of the interrupt enable bits. These control bits are used to individually enable interrupts from the peripherals or external signals.

7.4.4 IPCx

The IPCx registers are used to set the Interrupt Priority Level (IPL) for each source of interrupt. Each user interrupt source can be assigned to one of eight priority levels.

7.4.5 INTTREG

The INTTREG register contains the associated interrupt vector number and the new CPU Interrupt Priority Level, which are latched into Vector Number (VECNUM<7:0>) and Interrupt Priority Level bit (ILR<3:0>) fields in the INTTREG register. The new Interrupt Priority Level is the priority of the pending interrupt.

The interrupt sources are assigned to the IFSx, IECx and IPCx registers in the same sequence as they are listed in [Table 7-1](#). For example, the INT0 (External Interrupt 0) is shown as having Vector Number 8 and a natural order priority of 0. Thus, the INT0IF bit is found in IFS0<0>, the INT0IE bit in IEC0<0> and the INT0IP bits in the first position of IPC0 (IPC0<2:0>).

7.4.6 STATUS/CONTROL REGISTERS

Although these registers are not specifically part of the interrupt control hardware, two of the CPU Control registers contain bits that control interrupt functionality. For more information on these registers, refer to “CPU” (DS70359) in the “dsPIC33/PIC24 Family Reference Manual”.

- The CPU STATUS Register, SR, contains the IPL<2:0> bits (SR<7:5>). These bits indicate the current CPU Interrupt Priority Level. The user software can change the current CPU Interrupt Priority Level by writing to the IPLx bits.
- The CORCON register contains the IPL3 bit which, together with IPL<2:0>, also indicates the current CPU Interrupt Priority Level. IPL3 is a read-only bit so that trap events cannot be masked by the user software.

All Interrupt registers are described in [Register 7-3](#) to [Register 7-7](#).

8.0 DIRECT MEMORY ACCESS (DMA)

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Direct Memory Access (DMA)**” (DS70348) in the “*dsPIC33/PIC24 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

The DMA Controller transfers data between Peripheral Data registers and Data Space SRAM. For the simplified DMA block diagram, refer to [Figure 8-1](#).

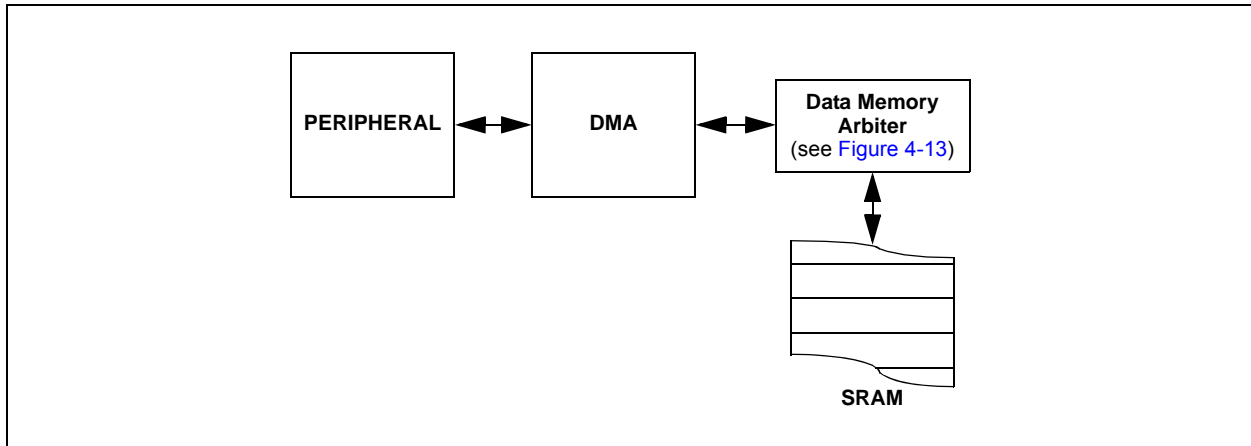

In addition, DMA can access the entire data memory space. The data memory bus arbiter is utilized when either the CPU or DMA attempts to access SRAM, resulting in potential DMA or CPU stalls.

The DMA Controller supports 4 independent channels. Each channel can be configured for transfers to or from selected peripherals. The peripherals supported by the DMA Controller include:

- CAN
- Analog-to-Digital Converter (ADC)
- Serial Peripheral Interface (SPI)
- UART
- Input Capture
- Output Compare

Refer to [Table 8-1](#) for a complete list of supported peripherals.

FIGURE 8-1: PERIPHERAL TO DMA CONTROLLER

dsPIC33EVXXGM00X/10X FAMILY

In addition, DMA transfers can be triggered by timers as well as external interrupts. Each DMA channel is unidirectional. Two DMA channels must be allocated to read and write to a peripheral. If more than one channel receives a request to transfer data, a simple fixed priority scheme, based on channel number, dictates which channel completes the transfer and which channel or channels are left pending. Each DMA channel moves a block of data, after which, it generates an interrupt to the CPU to indicate that the block is available for processing.

The DMA Controller provides these functional capabilities:

- Four DMA Channels
- Register Indirect with Post-Increment Addressing mode
- Register Indirect without Post-Increment Addressing mode

- Peripheral Indirect Addressing mode (peripheral generates destination address)
- CPU Interrupt after Half or Full Block Transfer Complete
- Byte or Word Transfers
- Fixed Priority Channel Arbitration
- Manual (software) or Automatic (peripheral DMA requests) Transfer Initiation
- One-Shot or Auto-Repeat Block Transfer modes
- Ping-Pong mode (automatic switch between two SRAM start addresses after each block transfer complete)
- DMA Request for Each Channel can be Selected from any Supported Interrupt Source
- Debug Support Features

The peripherals that can utilize DMA are listed in [Table 8-1](#).

TABLE 8-1: DMA CHANNEL TO PERIPHERAL ASSOCIATIONS

| Peripheral to DMA Association | DMAxREQ Register IRQSEL<7:0> Bits | DMAxPAD Register (Values to Read from Peripheral) | DMAxPAD Register (Values to Write to Peripheral) |

Figure 8-2 illustrates the DMA Controller block diagram.

FIGURE 8-2: DMA CONTROLLER BLOCK DIAGRAM

8.1 DMAC Controller Registers

Each DMAC Channel x (where $x = 0$ to 3) contains the following registers:

- 16-Bit DMA Channel x Control Register (DMA x CON)
- 16-Bit DMA Channel x IRQ Select Register (DMA x REQ)
- 32-Bit DMA Channel x Start Address Register A High/Low (DMA x STAH/L)
- 32-Bit DMA Channel x Start Address Register B High/Low (DMA x STBH/L)
- 16-Bit DMA Channel x Peripheral Address Register (DMA x PAD)
- 14-Bit DMA Channel x Transfer Count Register (DMA x CNT)

Additional status registers (DMAPWC, DMARQC, DMAPPS, DMALCA and DSADRH/L) are common to all DMAC channels. These status registers provide information on write and request collisions, as well as on last address and channel access information.

The DMA Interrupt Flags (DMA x IF) are located in an IFS x register in the interrupt controller. The corresponding DMA Interrupt Enable bits (DMA x IE) are located in an IEC x register in the interrupt controller and the corresponding DMA Interrupt Priority bits (DMA x IP) are located in an IPC x register in the interrupt controller.

NOTES:

dsPIC33EVXXGM00X/10X FAMILY

9.0 OSCILLATOR CONFIGURATION

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Oscillator” (DS70580) in the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

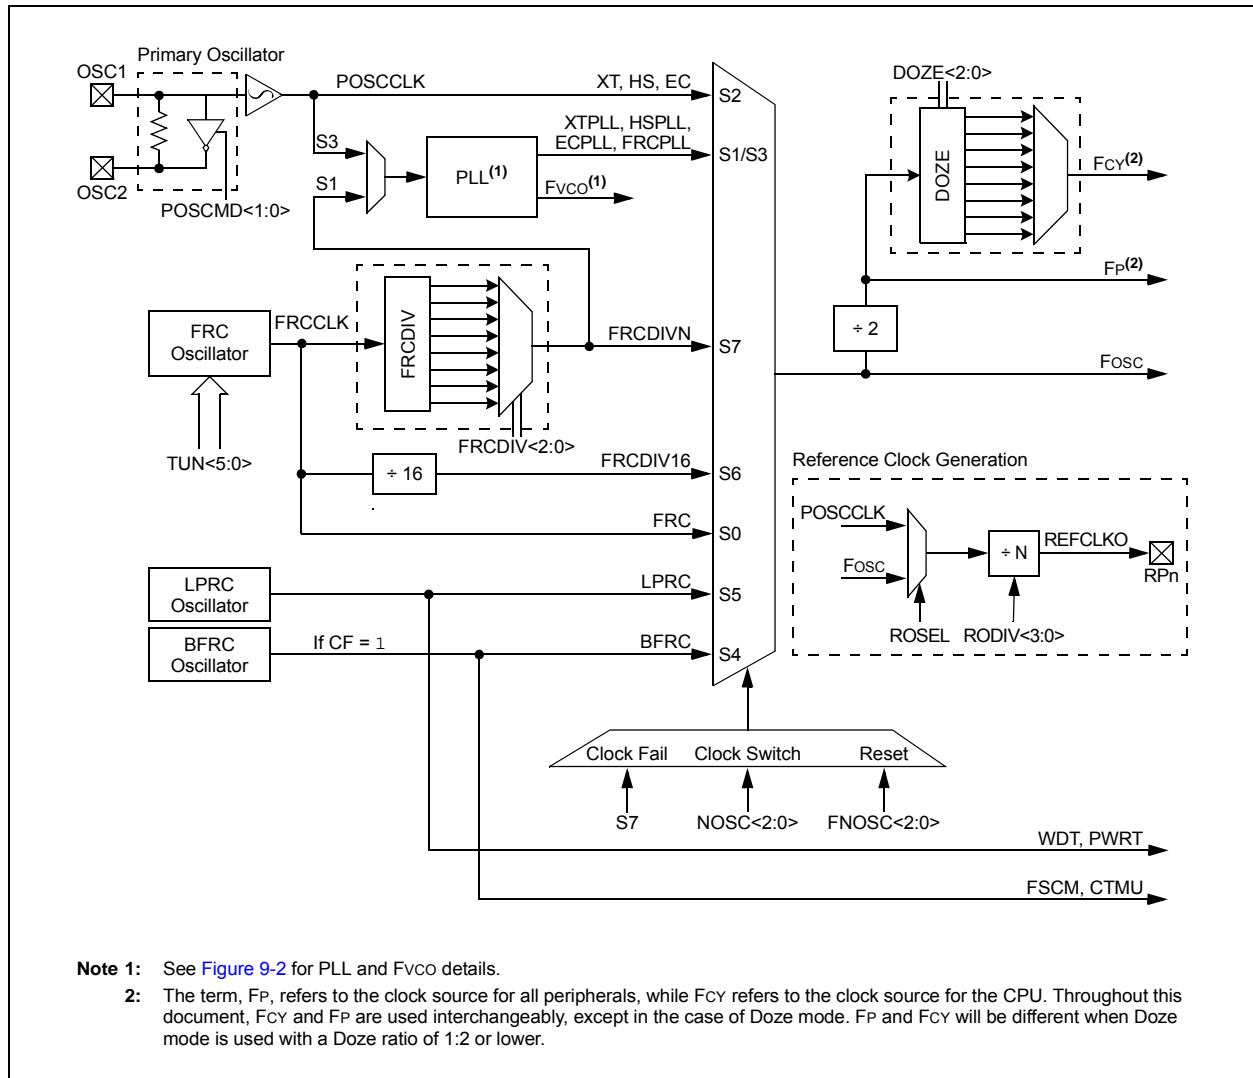

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33EVXXGM00X/10X family oscillator system provides:

- On-Chip Phase-Locked Loop (PLL) to Boost Internal Operating Frequency on Select Internal and External Oscillator Sources
- On-the-Fly Clock Switching between Various Clock Sources
- Doze mode for System Power Savings
- Fail-Safe Clock Monitor (FSCM) that Detects Clock Failure and Permits Safe Application Recovery or Shutdown.
- Backup FRC (BFRC) Function that Provides a System Clock when there is a Failure in the FRC Clock
- Configuration bits for Clock Source Selection

A simplified diagram of the oscillator system is shown in **Figure 9-1**.

FIGURE 9-1: OSCILLATOR SYSTEM DIAGRAM

Note 1: See **Figure 9-2** for PLL and Fvco details.

2: The term, Fp, refers to the clock source for all peripherals, while Fcy refers to the clock source for the CPU. Throughout this document, Fcy and Fp are used interchangeably, except in the case of Doze mode. Fp and Fcy will be different when Doze mode is used with a Doze ratio of 1:2 or lower.

dsPIC33EVXXGM00X/10X FAMILY

9.1 CPU Clocking System

The dsPIC33EVXXGM00X/10X family of devices provides the following six system clock options:

- Fast RC (FRC) Oscillator
- FRC Oscillator with Phase-Locked Loop (PLL)
- FRC Oscillator with Postscaler
- Primary (XT, HS or EC) Oscillator
- Primary Oscillator with PLL
- Low-Power RC (LPRC) Oscillator

For instruction execution speed or device operating frequency, F_{CY} , see [Equation 9-1](#).

EQUATION 9-1: DEVICE OPERATING FREQUENCY

$$F_{CY} = F_{OSC}/2$$

[Figure 9-2](#) provides the block diagram of the PLL module.

[Equation 9-2](#) provides the relationship between input frequency (F_{IN}) and output frequency (F_{OSC}).

[Equation 9-3](#) provides the relationship between input frequency (F_{IN}) and VCO frequency (F_{SYS}).

FIGURE 9-2: PLL BLOCK DIAGRAM

EQUATION 9-2: Fosc CALCULATION

$$F_{OSC} = F_{IN} \times \left(\frac{M}{N1 \times N2} \right) = F_{IN} \times \left(\frac{(PLLDIV\langle 8:0 \rangle + 2)}{(PLLPRE\langle 4:0 \rangle + 2) \times 2(PLLPOST\langle 1:0 \rangle + 1)} \right)$$

Where:

$$N1 = PLLPRE\langle 4:0 \rangle + 2$$

$$N2 = 2 \times (PLLPOST\langle 1:0 \rangle + 1)$$

$$M = PLLDIV\langle 8:0 \rangle + 2$$

EQUATION 9-3: Fvco CALCULATION

$$F_{SYS} = F_{IN} \times \left(\frac{M}{N1} \right) = F_{IN} \times \left(\frac{(PLLDIV\langle 8:0 \rangle + 2)}{(PLLPRE\langle 4:0 \rangle + 2)} \right)$$

dsPIC33EVXXGM00X/10X FAMILY

Table 9-1 provides the Configuration bits which allow users to choose between the various clock modes.

TABLE 9-1: CONFIGURATION BIT VALUES FOR CLOCK SELECTION

| Oscillator Mode | Oscillator Source | POSCMD<1:0> | FNOSC<2:0> |
|---|-------------------|-------------|------------|
| Fast RC Oscillator with Divide-by-N (FRCDIVN) ^(1,2) | Internal | xx | 111 |
| Fast RC Oscillator with Divide-by-16 (FRCDIV16) ⁽¹⁾ | Internal | xx | 110 |
| Low-Power RC Oscillator (LPRC) ⁽¹⁾ | Internal | xx | 101 |
| Primary Oscillator (HS) with PLL (HSPLL) | Primary | 10 | 011 |
| Primary Oscillator (XT) with PLL (XTPLL) | Primary | 01 | 011 |
| Primary Oscillator (EC) with PLL (ECPLL) ⁽¹⁾ | Primary | 00 | 011 |
| Primary Oscillator (HS) | Primary | 10 | 010 |
| Primary Oscillator (XT) | Primary | 01 | 010 |
| Primary Oscillator (EC) ⁽¹⁾ | Primary | 00 | 010 |
| Fast RC Oscillator (FRC) with Divide-by-N and PLL (FRCPLL) ⁽¹⁾ | Internal | xx | 001 |
| Fast RC Oscillator (FRC) ⁽¹⁾ | Internal | xx | 000 |

Note 1: OSC2 pin function is determined by the OSCIOFNC Configuration bit.

2: This is the default oscillator mode for an unprogrammed (erased) device.

| bit 7 | | | | | | bit 0 | |

| | | |
|-------------------|-------------------|--|
| Legend: | C = Clearable bit | y = Value set from Configuration bits on POR |
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared |
| | | x = Bit is unknown |

bit 15 **Unimplemented:** Read as '0'

bit 14-12 **COSC<2:0>:** Current Oscillator Selection bits (read-only)

- 111 = Fast RC Oscillator (FRC) with Divide-by-N
- 110 = Fast RC Oscillator (FRC) with Divide-by-16
- 101 = Low-Power RC Oscillator (LPRC)
- 100 = Backup FRC Oscillator (BFRC)⁽⁴⁾
- 011 = Primary Oscillator (XT, HS, EC) with PLL
- 010 = Primary Oscillator (XT, HS, EC)
- 001 = Fast RC Oscillator (FRC) Divided by N and PLL
- 000 = Fast RC Oscillator (FRC)

bit 11 **Unimplemented:** Read as '0'

bit 10-8 **NOSC<2:0>:** New Oscillator Selection bits⁽²⁾

- 111 = Fast RC Oscillator (FRC) with Divide-by-N
- 110 = Fast RC Oscillator (FRC) with Divide-by-16
- 101 = Low-Power RC Oscillator (LPRC)
- 100 = Reserved⁽⁵⁾
- 011 = Primary Oscillator (XT, HS, EC) with PLL
- 010 = Primary Oscillator (XT, HS, EC)
- 001 = Fast RC Oscillator (FRC) Divided by N and PLL
- 000 = Fast RC Oscillator (FRC)

bit 7 **CLKLOCK:** Clock Lock Enable bit

- 1 = If FCKSM0 = 1, then clock and PLL configurations are locked; if FCKSM0 = 0, then clock and PLL configurations may be modified
- 0 = Clock and PLL selections are not locked, configurations may be modified

bit 6 **IOLOCK:** I/O Lock Enable bit

- 1 = I/O lock is active
- 0 = I/O lock is not active

bit 5 **LOCK:** PLL Lock Status bit (read-only)

- 1 = Indicates that PLL is in lock or PLL start-up timer is satisfied
- 0 = Indicates that PLL is out of lock, start-up timer is in progress or PLL is disabled

Note 1: Writes to this register require an unlock sequence. Refer to “**Oscillator**” (DS70580) in the “*dsPIC33/PIC24 Family Reference Manual*” (available from the Microchip web site) for details.

2: Direct clock switches between any Primary Oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transitional clock source between the two PLL modes.

3: This register resets only on a Power-on Reset (POR).

4: COSC<2:0> bits will be set to '0b100' when FRC fails.

5: User cannot write '0b100' to NOSC<2:0>. COSC<2:0> will be set to '0b100' (BFRC) when the FRC fails.

Note 2: This pin is remappable. See [Section 11.5 “Peripheral Pin Select \(PPS\)”](#) for more information.

10.0 POWER-SAVING FEATURES

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Watchdog Timer and Power-Saving Modes**” (DS70615) in the “*dsPIC33/PIC24 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

The dsPIC33EVXXGM00X/10X devices provide the ability to manage power consumption by selectively managing clocking to the CPU and the peripherals. In general, a lower clock frequency and a reduction in the number of peripherals being clocked constitutes lower consumed power.

The dsPIC33EVXXGM00X/10X family devices can manage power consumption in the following four methods:

- Clock Frequency
- Instruction-Based Sleep and Idle modes
- Software Controlled Doze mode
- Selective Peripheral Control in Software

Combinations of these methods can be used to selectively tailor an application’s power consumption while still maintaining critical application features, such as timing-sensitive communications.

EXAMPLE 10-1: PWRSAV INSTRUCTION SYNTAX

```
PWRSAV #SLEEP_MODE    ; Put the device into Sleep mode
PWRSAV #IDLE_MODE     ; Put the device into Idle mode
```

10.1 Clock Frequency and Clock Switching

The dsPIC33EVXXGM00X/10X family devices allow a wide range of clock frequencies to be selected under application control. If the system clock configuration is not locked, users can choose low-power or high-precision oscillators by simply changing the NOSCx bits (OSCCON<10:8>). For more information on the process of changing a system clock during operation, as well as limitations to the process, see [Section 9.0 “Oscillator Configuration”](#).

10.2 Instruction-Based Power-Saving Modes

The dsPIC33EVXXGM00X/10X family devices have two special power-saving modes that are entered through the execution of a special PWRSAV instruction. Sleep mode stops clock operation and halts all code execution. Idle mode halts the CPU and code execution, but allows peripheral modules to continue operation. The assembler syntax of the PWRSAV instruction is shown in [Example 10-1](#).

Note: SLEEP_MODE and IDLE_MODE are constants defined in the Assembler Include file for the selected device.

Sleep and Idle modes can be exited as a result of an enabled interrupt, WDT time-out or a device Reset. When the device exits these modes, it is said to “wake-up”.

dsPIC33EVXXGM00X/10X FAMILY

10.2.1 SLEEP MODE

The following events occur in Sleep mode:

- The system clock source is shut down. If an on-chip oscillator is used, it is turned off.
- The device current consumption is reduced to a minimum, provided that no I/O pin is sourcing current.
- The Fail-Safe Clock Monitor does not operate, since the system clock source is disabled.
- The LPRC clock continues to run in Sleep mode if the WDT is enabled.
- The WDT, if enabled, is automatically cleared before entering Sleep mode.
- Some device features or peripherals can continue to operate. This includes items such as the Input Change Notification (ICN) on the I/O ports or peripherals that use an external clock input.
- Any peripheral that requires the system clock source for its operation is disabled.

The device wakes up from Sleep mode on any of these events:

- Any interrupt source that is individually enabled
- Any form of device Reset
- A WDT time-out

On wake-up from Sleep mode, the processor restarts with the same clock source that was active when Sleep mode was entered.

For optimal power savings, the internal regulator and the Flash regulator can be configured to go into Standby mode when Sleep mode is entered by clearing the VREGS (RCON<8>) and VREGSF (RCON<11>) bits (default configuration).

If the application requires a faster wake-up time, and can accept higher current requirements, the VREGS (RCON<8>) and VREGSF (RCON<11>) bits can be set to keep the internal regulator and the Flash regulator active during Sleep mode.

10.2.2 IDLE MODE

The following events occur in Idle mode:

- The CPU stops executing instructions.
- The WDT is automatically cleared.
- The system clock source remains active. By default, all peripheral modules continue to operate normally from the system clock source, but can also be selectively disabled (see [Section 10.4 “Peripheral Module Disable”](#)).
- If the WDT or FSCM is enabled, the LPRC also remains active.

The device wakes from Idle mode on any of these events:

- Any interrupt that is individually enabled
- Any device Reset
- A WDT time-out

On wake-up from Idle mode, the clock is reapplied to the CPU and instruction execution will begin (2-4 clock cycles later), starting with the instruction following the `PWRSVAV` instruction or the first instruction in the Interrupt Service Routine (ISR).

All peripherals also have the option to discontinue operation when Idle mode is entered to allow for increased power savings. This option is selectable in the control register of each peripheral; for example, the TSIDL bit in the Timer1 Control register (T1CON<13>).

10.2.3 INTERRUPTS COINCIDENT WITH POWER SAVE INSTRUCTIONS

Any interrupt that coincides with the execution of a `PWRSVAV` instruction is held off until entry into Sleep or Idle mode has completed. The device then wakes up either from Sleep mode or Idle mode.

10.3 Doze Mode

The preferred strategies for reducing power consumption are changing clock speed and invoking one of the power-saving modes. In some circumstances, this may not be practical. For example, it may be necessary for an application to maintain uninterrupted synchronous communication, even while it is doing nothing else. Reducing system clock speed can introduce communication errors, while using a power-saving mode can stop communications completely.

Doze mode is a simple and effective alternative method to reduce power consumption while the device is still executing code. In this mode, the system clock continues to operate from the same source and at the same speed. Peripheral modules continue to be clocked at the same speed, while the CPU clock speed is reduced. Synchronization between the two clock domains is maintained, allowing the peripherals to access the SFRs while the CPU executes code at a slower rate.

Doze mode is enabled by setting the DOZEN bit (CLKDIV<11>). The ratio between peripheral and core clock speed is determined by the DOZE<2:0> bits (CLKDIV<14:12>). There are eight possible configurations, from 1:1 to 1:128, with 1:1 being the default setting.

Programs can use Doze mode to selectively reduce power consumption in event-driven applications. This allows clock-sensitive functions, such as synchronous communications, to continue without interruption while the CPU Idles, waiting for something to invoke an interrupt routine. An automatic return to full-speed CPU operation on interrupts can be enabled by setting the ROI bit (CLKDIV<15>). By default, interrupt events have no effect on Doze mode operation.

For example, suppose the device is operating at 20 MIPS and the CAN module has been configured for 500 kbps, based on this device operating speed. If the device is placed in Doze mode, with a clock frequency ratio of 1:4, the CAN module continues to communicate at the required bit rate of 500 kbps, but the CPU now starts executing instructions at a frequency of 5 MIPS.

10.4 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled, using the appropriate PMD_x control bit, the peripheral is in a minimum power consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers do not have any effect and read values are invalid.

A peripheral module is enabled only if both the associated bit in the PMD_x register is cleared and the peripheral is supported by the specific dsPIC[®] DSC variant. If the peripheral is present in the device, it is enabled in the PMD_x register by default.

| |
|--|
| Note: If a PMD _x bit is set, the corresponding module is disabled after a delay of one instruction cycle. Similarly, if a PMD _x bit is cleared, the corresponding module is enabled after a delay of one instruction cycle (assuming the module control registers are already configured to enable module operation). |
|--|

NOTES:

11.0 I/O PORTS

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “I/O Ports” (DS70000598) in the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

Many of the device pins are shared among the peripherals and the Parallel I/O ports. All I/O input ports feature Schmitt Trigger inputs for improved noise immunity. All the pins in the device are 5V tolerant pins.

11.1 Parallel I/O (PIO) Ports

Generally, a Parallel I/O port that shares a pin with a peripheral is subservient to the peripheral. The peripheral’s output buffer data and control signals are provided to a pair of multiplexers. The multiplexers select whether the peripheral or the associated port has ownership of the output data and control signals of

the I/O pin. The logic also prevents “loop through”, in which a port’s digital output can drive the input of a peripheral that shares the same pin. **Figure 11-1** illustrates how ports are shared with other peripherals and the associated I/O pin to which they are connected.

When a peripheral is enabled and the peripheral is actively driving an associated pin, the use of the pin as a general purpose output pin is disabled. The I/O pin can be read, but the output driver for the parallel port bit is disabled. If a peripheral is enabled, but the peripheral is not actively driving a pin, that pin can be driven by a port.

All port pins have eight registers directly associated with their operation as digital I/O. The Data Direction register (TRISx) determines whether the pin is an input or an output. If the Data Direction register bit is a ‘1’, then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the latch (LATx), read the latch; writes to the latch, write the latch. Reads from the port (PORTx), read the port pins, while writes to the port pins, write the latch.

Any bit and its associated data and control registers that are not valid for a particular device are disabled. This means that the corresponding LATx and TRISx registers, and the port pin are read as zeros.

When a pin is shared with another peripheral or function that is defined as an input only, it is nevertheless regarded as a dedicated port, because there is no other competing source of output.

FIGURE 11-1: BLOCK DIAGRAM OF A TYPICAL SHARED PORT STRUCTURE

dsPIC33EVXXGM00X/10X FAMILY

11.1.1 OPEN-DRAIN CONFIGURATION

In addition to the PORTx, LATx and TRISx registers for data control, port pins can also be individually configured for either digital or open-drain outputs. This is controlled by the Open-Drain Control x register (ODCx) associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs other than VDD by using external pull-up resistors. The maximum open-drain voltage allowed on any pin is the same as the maximum VIH specification for that particular pin.

See Table 30-10 in Section 30.0 “Electrical Characteristics” for the maximum VIH specification of each pin.

11.2 Configuring Analog and Digital Port Pins

The ANSELx registers control the operation of the analog port pins. The port pins that are to function as analog inputs or outputs must have their corresponding ANSELx and TRISx bits set. In order to use port pins for I/O functionality with digital modules, such as timers, UARTs, etc., the corresponding ANSELx bits must be cleared.

The ANSELx register has a default value of 0xFFFF. Therefore, all pins that share analog functions are analog (not digital) by default.

Pins with analog functions affected by the ANSELx registers are listed with a buffer type of analog in the Pinout I/O Descriptions table (see Table 1-1 in Section 1.0 “Device Overview”).

If the TRISx bit is cleared (output) while the ANSELx bit is set, the digital output level (VOH or VOL) is converted by an analog peripheral, such as the ADC module or comparator module.

When the PORTx register is read, all pins configured as analog input channels are read as cleared (a low level).

Pins configured as digital inputs do not convert an analog input. Analog levels on any pin defined as a digital input (including the ANx pins) can cause the input buffer to consume current that exceeds the device specifications.

11.2.1 I/O PORT WRITE/READ TIMING

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically, this instruction would be a NOP, as shown in Example 11-1.

11.3 Input Change Notification (ICN)

The Input Change Notification function (ICN) of the I/O ports allows devices to generate interrupt requests to the processor in response to a Change-of-State (COS) on selected input pins. This feature can detect input Change-of-States, even in Sleep mode, when the clocks are disabled. Every I/O port pin can be selected (enabled) for generating an interrupt request on a Change-of-State.

Three control registers are associated with the ICN functionality of each I/O port. The CNENx registers contain the ICN interrupt enable control bits for each of the input pins. Setting any of these bits enables an ICN interrupt for the corresponding pins.

Each I/O pin also has a weak pull-up and a weak pull-down connected to it. The pull-ups and pull-downs act as a current source or sink source connected to the pin, and eliminate the need for external resistors when push button or keypad devices are connected. The pull-ups and pull-downs are enabled separately using the CNPUx and the CNPDx registers, which contain the control bits for each of the pins. Setting any of the control bits enables the weak pull-ups and/or pull-downs for the corresponding pins.

Note: The pull-ups and pull-downs on ICN pins should always be disabled when the port pin is configured as a digital output.

EXAMPLE 11-1: PORT WRITE/READ EXAMPLE

```
MOV    0xFF00, W0    ; Configure PORTB<15:8>
                        ; as inputs
MOV    W0, TRISB     ; and PORTB<7:0>
                        ; as outputs
NOP                                ; Delay 1 cycle
BTSS   PORTB, #13    ; Next Instruction
```

11.4 Slew Rate Selection

The slew rate selection feature allows the device to have control over the slew rate selection on the required I/O pin which supports this feature. For this purpose, for each I/O port, there are two registers: SR1x and SR0x, which configure the selection of the slew rate. The register outputs are directly connected to the associated I/O pins, which support the slew rate selection function. The SR1x register specifies the MSb and the SR0x register provides the LSb of the 2-bit field that selects the desired slew rate. For example, slew rate selections for PORTA are as follows:

EXAMPLE 11-2: SLEW RATE SELECTIONS FOR PORTA

| |
|--|
| SR1Ax, SR0Ax = 00 = Fastest Slew rate |
| SR1Ax, SR0Ax = 01 = 4x slower Slew rate |
| SR1Ax, SR0Ax = 10 = 8x slower Slew rate |
| SR1Ax, SR0Ax = 11 = 16x slower Slew rate |

11.5 Peripheral Pin Select (PPS)

A major challenge in general purpose devices is providing the largest possible set of peripheral features while minimizing the conflict of features on I/O pins. The challenge is even greater on low pin count devices. In an application where more than one peripheral needs to be assigned to a single pin, inconvenient workarounds in application code, or a complete redesign, may be the only option.

The Peripheral Pin Select (PPS) configuration provides an alternative to these choices by enabling peripheral set selection and their placement on a wide range of I/O pins. By increasing the pinout options available on a particular device, users can better tailor the device to their entire application, rather than trimming the application to fit the device.

The PPS configuration feature operates over a fixed subset of digital I/O pins. Users may independently map the input and/or output of most digital peripherals to any one of these I/O pins. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping after it has been established.

11.5.1 AVAILABLE PINS

The number of available pins is dependent on the particular device and its pin count. Pins that support the PPS feature include the designation, “RPn” or “RPI_n”, in their full pin designation, where “n” is the remappable pin number. “RP” is used to designate pins that support both remappable input and output functions, while “RPI” indicates pins that support remappable input functions only.

11.5.2 AVAILABLE PERIPHERALS

The peripherals managed by the PPS are all digital only peripherals. These include general serial communications (UART and SPI), general purpose timer clock inputs, timer related peripherals (input capture and output compare) and Interrupt-on-Change (IOC) inputs.

In comparison, some digital only peripheral modules are never included in the PPS feature, because the peripheral's function requires special I/O circuitry on a specific port and cannot be easily connected to multiple pins. These modules include I²C and the PWM. A similar requirement excludes all modules with analog inputs, such as the ADC Converter.

A key difference between the remappable and non-remappable peripherals is that the remappable peripherals are not associated with a default I/O pin. The peripheral must always be assigned to a specific I/O pin before it can be used. In contrast, the non-remappable peripherals are always available on a default pin, assuming that the peripheral is active and not conflicting with another peripheral.

When a remappable peripheral is active on a given I/O pin, it takes priority over all the other digital I/O and digital communication peripherals associated with the pin. Priority is given regardless of the type of peripheral that is mapped. Remappable peripherals never take priority over any analog functions associated with the pin.

11.5.3 CONTROLLING PERIPHERAL PIN SELECT

The PPS features are controlled through two sets of SFRs: one to map the peripheral inputs and the other to map the outputs. Because they are separately controlled, a particular peripheral's input and output (if the peripheral has both) can be placed on any selectable function pin without constraint.

The association of a peripheral to a peripheral-selectable pin is handled in two different ways, depending on whether an input or output is being mapped.

11.5.4 INPUT MAPPING

The inputs of the PPS options are mapped on the basis of the peripheral. That is, a control register associated with a peripheral dictates the pin it will be mapped to. The RPI_n registers are used to configure peripheral input mapping (see [Table 11-1](#) and [Register 11-1](#) through [Register 11-17](#)). Each register contains sets of 8-bit fields, with each set associated with one of the remappable peripherals. Programming a given peripheral's bit field with an appropriate 8-bit value maps the RPn pin with the corresponding value to that peripheral. For any given device, the valid range of values for any bit field corresponds to the maximum number of Peripheral Pin Selects supported by the device.

dsPIC33EVXXXGM00X/10X FAMILY

For example, [Figure 11-2](#) shows the remappable pin selection for the U1RX input.

FIGURE 11-2: REMAPPABLE INPUT FOR U1RX

11.5.4.1 Virtual Connections

dsPIC33EVXXXGM00X/10X family devices support virtual (internal) connections to the output of the op amp/comparator module (see [Figure 25-1](#) in [Section 25.0 “Op Amp/Comparator Module”](#)).

These devices provide six virtual output pins (RPV0-RPV5) that correspond to the outputs of six peripheral pin output remapper blocks (RP176-RP181). The six virtual remapper outputs (RP176-RP181) are not connected to actual pins. The six virtual pins may be read by any of the input remappers as inputs, RPI176-RPI181. These virtual pins can be used to connect the internal peripherals, whose signals are of significant use to the other peripherals, but these output signals are not present on the device pin.

Virtual connections provide a simple way of inter-peripheral connection without utilizing a physical pin. For example, by setting the FLT1R<7:0> bits of the RPINR12 register to the value of 'b0000001', the output of the analog comparator, C1OUT, will be connected to the PWM Fault 1 input, which allows the analog comparator to trigger PWM Faults without the use of an actual physical pin on the device.

Note 1: These are virtual pins. See [Section 11.5.4.1 “Virtual Connections”](#) for more information on selecting this pin assignment.

11.5.5 OUTPUT MAPPING

In contrast to inputs, the outputs of the PPS options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPORx registers are used to control output mapping. Like the RPINRx registers, each register contains sets of 6-bit fields, with each set associated with one RPn pin (see [Register 11-18](#) to [Register 11-31](#)). The value of the bit field corresponds to one of the peripherals and that peripheral's output is mapped to the pin (see [Table 11-3](#) and [Figure 11-3](#)).

A null output is associated with the Output register Reset value of '0'. This is done to ensure that remappable outputs remain disconnected from all output pins by default.

FIGURE 11-3: MULTIPLEXING REMAPPABLE OUTPUT FOR RPn

dsPIC33EVXXGM00X/10X FAMILY

11.5.5.1 Mapping Limitations

The control schema of the peripheral select pins is not limited to a small range of fixed peripheral configurations. There are no mutual or hardware-enforced lockouts between any of the peripheral mapping SFRs. Literally any combination of peripheral mappings

across any or all of the RPn pins is possible. This includes both many-to-one, and one-to-many mappings of peripheral inputs and outputs to pins. While such mappings may be technically possible from a configuration point of view, they may not be supportable from an electrical point of view.

TABLE 11-3: OUTPUT SELECTION FOR REMAPPABLE PINS (RPn)

| Function | RPnR<5:0> | Output Name |
|------------------|-----------|---|
| Default Port | 000000 | RPn tied to Default Pin |
| U1TX | 000001 | RPn tied to UART1 Transmit |

11.6 High-Voltage Detect (HVD)

dsPIC33EVXXGM00X/10X devices contain High-Voltage Detection (HVD) which monitors the VCAP voltage. The HVD is used to monitor the VCAP supply voltage to ensure that an external connection does not raise the value above a safe level (~2.4V). If high core voltage is detected, all I/Os are disabled and put in a tri-state condition. The device remains in this I/O tri-state condition as long as the high-voltage condition is present.

11.7 I/O Helpful Tips

1. In some cases, certain pins, as defined in [Table 30-10](#) under “Injection Current”, have internal protection diodes to VDD and VSS. The term, “Injection Current”, is also referred to as “Clamp Current”. On designated pins with sufficient external current-limiting precautions by the user, I/O pin input voltages are allowed to be greater or less than the data sheet absolute maximum ratings, with respect to the VSS and VDD supplies. Note that when the user application forward biases either of the high or low side internal input clamp diodes that the resulting current being injected into the device, that is clamped internally by the VDD and VSS power rails, may affect the ADC accuracy by four to six counts.
2. I/O pins that are shared with any analog input pin (i.e., ANx) are always analog pins by default after any Reset. Consequently, configuring a pin as an analog input pin automatically disables the digital input pin buffer and any attempt to read the digital input level by reading PORTx or LATx will always return a ‘0’, regardless of the digital logic level on the pin. To use a pin as a digital I/O pin on a shared ANx pin, the user application needs to configure the Analog Pin Configuration registers in the I/O ports module (i.e., ANSELx) by setting the appropriate bit that corresponds to that I/O port pin to a ‘0’.

Note: Although it is not possible to use a digital input pin when its analog function is enabled, it is possible to use the digital I/O output function, TRISx = 0x0, while the analog function is also enabled. However, this is not recommended, particularly if the analog input is connected to an external analog voltage source, which would create signal contention between the analog signal and the output pin driver.

3. Most I/O pins have multiple functions. Referring to the device pin diagrams in this data sheet, the priorities of the functions allocated to any pins are indicated by reading the pin name, from left-to-right. The left most function name takes precedence over any function to its right in the naming convention; for example, AN16/T2CK/T7CK/RC1. This indicates that AN16 is the highest priority in this example and will supersede all other functions to its right in the list. Those other functions to its right, even if enabled, would not work as long as any other function to its left was enabled. This rule applies to all of the functions listed for a given pin.
4. Each pin has an internal weak pull-up resistor and pull-down resistor that can be configured using the CNPUs and CNPDx registers, respectively. These resistors eliminate the need for external resistors in certain applications. The internal pull-up is up to $\sim(V_{DD} - 0.8)$, not VDD. This value is still above the minimum V_{IH} of CMOS and TTL devices.
5. When driving LEDs directly, the I/O pin can source or sink more current than what is specified in the V_{OH}/I_{OH} and V_{OL}/I_{OL} DC characteristic specifications. The respective I_{OH} and I_{OL} current rating only applies to maintaining the corresponding output at or above the V_{OH} , and at or below the V_{OL} levels. However, for LEDs, unlike digital inputs of an externally connected device, they are not governed by the same minimum V_{IH}/V_{IL} levels. An I/O pin output can safely sink or source any current less than that listed in the absolute maximum rating section of this data sheet. For example:

$$V_{OH} = 4.4V \text{ at } I_{OH} = -8 \text{ mA and } V_{DD} = 5V$$

The maximum output current sourced by any 8 mA I/O pin = 12 mA.

LED source current, <12 mA, is technically permitted. For more information, refer to the V_{OH}/I_{OH} specifications in [Section 30.0 “Electrical Characteristics”](#).

dsPIC33EVXXGM00X/10X FAMILY

6. The PPS pin mapping rules are as follows:
- Only one “output” function can be active on a given pin at any time, regardless if it is a dedicated or remappable function (one pin, one output).
 - It is possible to assign a “remappable output” function to multiple pins and externally short or tie them together for increased current drive.
 - If any “dedicated output” function is enabled on a pin, it will take precedence over any remappable “output” function.
 - If any “dedicated digital” (input or output) function is enabled on a pin, any number of “input” remappable functions can be mapped to the same pin.
 - If any “dedicated analog” function(s) are enabled on a given pin, “digital input(s)” of any kind will all be disabled, although a single “digital output”, at the user’s cautionary discretion, can be enabled and active as long as there is no signal contention with an external analog input signal. For example, it is possible for the ADC to convert the digital output logic level, or to toggle a digital output on a comparator or ADC input provided there is no external analog input, such as for a built-in self-test.
 - Any number of “input” remappable functions can be mapped to the same pin(s) at the same time, including to any pin with a single output from either a dedicated or remappable “output”.
 - The TRISx registers control only the digital I/O output buffer. Any other dedicated or remappable active “output” will automatically override the TRISx setting. The TRISx register does not control the digital logic “input” buffer. Remappable digital “inputs” do not automatically override TRISx settings, which means that the TRISx bit must be set to input for pins with only remappable input function(s) assigned
 - All analog pins are enabled by default after any Reset and the corresponding digital input buffer on the pin is disabled. Only the Analog Pin Select registers control the digital input buffer, not the TRISx register. The user must disable the analog function on a pin using the Analog Pin Select registers in order to use any “digital input(s)” on a corresponding pin; no exceptions.

dsPIC33EVXXGM00X/10X FAMILY

NOTES:

12.0 TIMER1

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Timers” (DS70362) in the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

The Timer1 module is a 16-bit timer that can operate as a free-running, interval timer/counter.

The Timer1 module has the following unique features over other timers:

- Can be Operated in Asynchronous Counter mode from an External Clock Source
- The Timer1 External Clock Input (T1CK) can Optionally be Synchronized to the Internal Device Clock and the Clock Synchronization is Performed after the Prescaler

A block diagram of Timer1 is shown in [Figure 12-1](#).

The Timer1 module can operate in one of the following modes:

- Timer mode
- Gated Timer mode
- Synchronous Counter mode
- Asynchronous Counter mode

In Timer and Gated Timer modes, the input clock is derived from the internal instruction cycle clock (FCY). In Synchronous and Asynchronous Counter modes, the input clock is derived from the external clock input at the T1CK pin.

The Timer modes are determined by the following bits:

- Timer Clock Source Control bit (TCS): T1CON<1>
- Timer Synchronization Control bit (TSYNC): T1CON<2>
- Timer Gate Control bit (TGATE): T1CON<6>

Timer control bit settings for different operating modes are given in [Table 12-1](#).

TABLE 12-1: TIMER MODE SETTINGS

| Mode | TCS | TGATE | TSYNC |
|----------------------|-----|-------|-------|
| Timer | 0 | 0 | x |
| Gated Timer | 0 | 1 | x |
| Synchronous Counter | 1 | x | 1 |
| Asynchronous Counter | 1 | x | 0 |

 0 = Internal clock (FP)
- bit 0 **Unimplemented:** Read as '0'

Note 1: When Timer1 is enabled in External Synchronous Counter mode (TCS = 1, TSYNC = 1, TON = 1), any attempts by user software to write to the TMR1 register are ignored.

13.0 TIMER2/3 AND TIMER4/5

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Timers**” (DS70362) in the “*dsPIC33/PIC24 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

These modules are 32-bit timers, which can also be configured as four independent, 16-bit timers with selectable operating modes.

As a 32-bit timer, Timer2/3 and Timer4/5 operate in the following three modes:

- Two Independent 16-Bit Timers (e.g., Timer2 and Timer3) with all 16-Bit Operating modes (except Asynchronous Counter mode)
- Single 32-Bit Timer
- Single 32-Bit Synchronous Counter

They also support these features:

- Timer Gate Operation
- Selectable Prescaler Settings
- Timer Operation during Idle and Sleep modes
- Interrupt on a 32-Bit Period Register Match
- Time Base for Input Capture and Output Compare Modules
- ADC1 Event Trigger (Timer2/3 only)

Individually, all four of the 16-bit timers can function as synchronous timers or counters. They also offer the features listed previously, except for the event trigger; this is implemented only with Timer2/3. The operating modes and enabled features are determined by setting the appropriate bit(s) in the T2CON, T3CON, T4CON and T5CON registers. T2CON and T4CON are shown in generic form in [Register 13-1](#). The T3CON and T5CON registers are shown in [Register 13-2](#).

For 32-bit timer/counter operation, Timer2 and Timer4 are the least significant word (lsw). Timer3 and Timer5 are the most significant word (msw) of the 32-bit timers.

Note: For 32-bit operation, the T3CON and T5CON control bits are ignored. Only the T2CON and T4CON control bits are used for setup and control. Timer2 and Timer4 clock and gate inputs are utilized for the 32-bit timer modules, but an interrupt is generated with the Timer3 and Timer5 interrupt flags.

Block diagrams for the Type B and Type C timers are shown in [Figure 13-1](#) and [Figure 13-2](#), respectively.

A block diagram for an example 32-bit timer pair (Timer2/3 and Timer4/5) is shown in [Figure 13-3](#).

Note: Only Timer2, Timer3, Timer4 and Timer5 can trigger a DMA data transfer.

- 3:** The TyCK pin is not available on all timers. See the “[Pin Diagrams](#)” section for the available pins.

dsPIC33EVXXGM00X/10X FAMILY

NOTES:

14.0 DEADMAN TIMER (DMT)

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Deadman Timer (DMT)**” (DS70005155) in the “*dsPIC33/PIC24 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The primary function of the Deadman Timer (DMT) is to reset the processor in the event of a software malfunction. The DMT, which works on the system clock, is a free-running instruction fetch timer, which is clocked whenever an instruction fetch occurs, until a count match occurs. Instructions are not fetched when the processor is in Sleep mode.

DMT can be enabled in the Configuration fuse or by software in the DMTCON register by setting the ON bit. The DMT consists of a 32-bit counter with a time-out count match value, as specified by the two 16-bit Configuration Fuse registers: FDMTCNTL and FDMTCNTH.

A DMT is typically used in mission-critical, and safety-critical applications, where any single failure of the software functionality and sequencing must be detected.

Figure 14-1 shows a block diagram of the Deadman Timer module.

15.0 INPUT CAPTURE

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Input Capture” (DS70000352) in the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The input capture module is useful in applications requiring frequency (period) and pulse measurement. The dsPIC33EVXXGM00X/10X family devices support 4 input capture channels.

Key features of the input capture module include:

- Hardware-Configurable for 32-Bit Operation in All Modes by Cascading Two Adjacent modules
- Synchronous and Trigger Modes of Output Compare Operation, with up to 31 User-Selectable Trigger/Sync Sources Available
- A 4-Level FIFO Buffer for Capturing and Holding Timer Values for Several Events
- Configurable Interrupt Generation
- Up to Six Clock Sources Available for Each Module, Driving a Separate Internal 16-Bit Counter

Figure 15-1 shows a block diagram of the Input capture module.

16.0 OUTPUT COMPARE

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Output Compare” (DS70005157) in the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

sources for its time base. The module compares the value of the timer with the value of one or two Compare registers, depending on the operating mode selected. The state of the output pin changes when the timer value matches the Compare register value. The output compare module generates either a single output pulse, or a sequence of output pulses, by changing the state of the output pin on the compare match events. The output compare module can also generate interrupts on compare match events and trigger DMA data transfers.

Figure 16-1 shows a block diagram of the output compare module.

Note: For more information on OCxR and OCxRS register restrictions, refer to the “Output Compare” (DS70005157) section in the “dsPIC33/PIC24 Family Reference Manual”.

The dsPIC33EVXXGM00X/10X family devices support up to 4 output compare modules. The output compare module can select one of eight available clock

Note 1: Do not use the OCx module as its own synchronization or trigger source.

2: When the OCy module is turned off, it sends a trigger out signal. If the OCx module uses the OCy module as a trigger source, the OCy module must be unselected as a trigger source prior to disabling it.

dsPIC33EVXXGM00X/10X FAMILY

NOTES:

17.0 HIGH-SPEED PWM MODULE

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**High-Speed PWM**” (DS70645) in the “*dsPIC33/PIC24 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33EVXXGM00X/10X family devices support a dedicated Pulse-Width Modulation (PWM) module with up to 6 outputs.

The high-speed PWMx module consists of the following major features:

- Three PWM Generators
- Two PWM Outputs per PWM Generator
- Individual Period and Duty Cycle for each PWM Pair
- Duty Cycle, Dead Time, Phase Shift and Frequency Resolution of 8.32 ns
- Independent Fault and Current-Limit Inputs for Six PWM Outputs
- Redundant Output
- Center-Aligned PWM mode
- Output Override Control
- Chop mode (also known as Gated mode)
- Special Event Trigger
- Prescaler for Input Clock
- PWMxL and PWMxH Output Pin Swapping
- Independent PWM Frequency, Duty Cycle and Phase-Shift Changes for each PWM Generator
- Dead-Time Compensation
- Enhanced Leading-Edge Blanking (LEB) Functionality
- Frequency Resolution Enhancement
- PWM Capture Functionality

Note: In Edge-Aligned PWM mode, the duty cycle, dead time, phase shift and frequency resolution are 8.32 ns at 60 MIPS.

The high-speed PWMx module contains up to three PWM generators. Each PWM generator provides two PWM outputs: PWMxH and PWMxL. The master time base generator provides a synchronous signal as a common time base to synchronize the various PWM outputs. The individual PWM outputs are available on the output pins of the device. The input Fault signals and current-limit signals, when enabled, can monitor and protect the system by placing the PWM outputs into a known “safe” state.

Each PWMx can generate a trigger to the ADC module to sample the analog signal at a specific instance during the PWM period. In addition, the high-speed PWMx module also generates a Special Event Trigger to the ADC module based on the master time base.

The high-speed PWMx module can synchronize itself with an external signal or can act as a synchronizing source to any external device. The SYNC11 input pin, that utilizes PPS, can synchronize the high-speed PWMx module with an external signal. The SYNC01 pin is an output pin that provides a synchronous signal to an external device.

Figure 17-1 illustrates an architectural overview of the high-speed PWMx module and its interconnection with the CPU and other peripherals.

17.1 PWM Faults

The PWMx module incorporates multiple external Fault inputs as follows:

- FLT1 and FLT2, available on 28-pin, 44-pin and 64-pin packages, which are remappable using the PPS feature
- FLT3, available on 44-pin and 64-pin packages, which is available as a fixed pin
- FLT4-FLT8, available on 64-pin packages, which are available as fixed pins
- FLT32 is available on a fixed pin on all devices

These Faults provide a safe and reliable way to safely shut down the PWM outputs when the Fault input is asserted.

17.1.1 PWM FAULTS AT RESET

During any Reset event, the PWMx module maintains ownership of the Class B Fault, FLT32. At Reset, this Fault is enabled in Latched mode to ensure the fail-safe power-up of the application. The application software must clear the PWM Fault before enabling the high-speed motor control PWMx module. To clear the Fault condition, the FLT32 pin must first be pulled low externally or the internal pull-down resistor in the CNPDx register can be enabled.

Note: The Fault mode may be changed using the FLTMOD<1:0> bits (FCLCONx<1:0>), regardless of the state of FLT32.

dsPIC33EVXXGM00X/10X FAMILY

17.1.2 WRITE-PROTECTED REGISTERS

On dsPIC33EVXXGM00X/10X family devices, write protection is implemented for the IOCONx and FCLCONx registers. The write protection feature prevents any inadvertent writes to these registers. This protection feature can be controlled by the PWMLOCK Configuration bit (FDEVOPT<0>). The default state of the write protection feature is enabled (PWMLOCK = 1). The write protection feature can be disabled by configuring PWMLOCK = 0.

To gain write access to these locked registers, the user application must write two consecutive values (0xABCD and 0x4321) to the PWMKEY register to perform the unlock operation. The write access to the IOCONx or FCLCONx registers must be the next SFR access following the unlock process. There can be no other SFR accesses during the unlock process and subsequent write access. To write to both the IOCONx and FCLCONx registers requires two unlock operations.

The correct unlocking sequence is described in [Example 17-1](#).

EXAMPLE 17-1: PWM1 WRITE-PROTECTED REGISTER UNLOCK SEQUENCE

```
; FLT32 pin must be pulled low externally in order to clear and disable the fault
; Writing to FCLCON1 register requires unlock sequence

mov #0xabcd, w10      ; Load first unlock key to w10 register
mov #0x4321, w11      ; Load second unlock key to w11 register
mov #0x0000, w0        ; Load desired value of FCLCON1 register in w0
mov w10, PWMKEY       ; Write first unlock key to PWMKEY register
mov w11, PWMKEY       ; Write second unlock key to PWMKEY register
mov w0, FCLCON1       ; Write desired value to FCLCON1 register

; Set PWM ownership and polarity using the IOCON1 register
; Writing to IOCON1 register requires unlock sequence

mov #0xabcd, w10      ; Load first unlock key to w10 register
mov #0x4321, w11      ; Load second unlock key to w11 register
mov #0xF000, w0        ; Load desired value of IOCON1 register in w0
mov w10, PWMKEY       ; Write first unlock key to PWMKEY register
mov w11, PWMKEY       ; Write second unlock key to PWMKEY register
mov w0, IOCON1        ; Write desired value to IOCON1 register
```

NOTES:

18.0 SERIAL PERIPHERAL INTERFACE (SPI)

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Serial Peripheral Interface (SPI)**” (DS70005185) in the “*dsPIC33/PIC24 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Serial Peripheral Interface (SPI) module is a synchronous serial interface, useful for communicating with other peripheral or microcontroller devices. These peripheral devices can be serial EEPROMs, shift registers, display drivers, ADC Converters, etc. The SPI module is compatible with the Motorola® SPI and SIOP interfaces.

The dsPIC33EVXXGM00X/10X device family offers two SPI modules on a single device, SPI1 and SPI2, that are functionally identical. Each SPI module includes an eight-word FIFO buffer and allows DMA bus connections. When using the SPI module with DMA, FIFO operation can be disabled.

Note: In this section, the SPI modules are referred to together as SPIx, or separately as SPI1 and SPI2. Special Function Registers follow a similar notation. For example, SPIxCON refers to the control register for the SPI1 and SPI2 modules.

The SPI1 module uses dedicated pins which allow for a higher speed when using SPI1. The SPI2 module takes advantage of the Peripheral Pin Select (PPS) feature to allow for greater flexibility in pin configuration of this module, but results in a lower maximum speed. See **Section 30.0 “Electrical Characteristics”** for more information.

The SPIx serial interface consists of the following four pins:

- SDIx: Serial Data Input
- SDOx: Serial Data Output
- SCKx: Shift Clock Input or Output
- \overline{SSx} /FSYNCx: Active-Low Slave Select or Frame Synchronization I/O Pulse

Note: All of the 4 pins of the SPIx serial interface must be configured as digital in the ANSELx registers.

The SPIx module can be configured to operate with two, three or four pins. In 3-pin mode, \overline{SSx} is not used. In 2-pin mode, neither SDOx nor \overline{SSx} is used.

Figure 18-1 illustrates the block diagram of the SPIx module in Standard and Enhanced modes.

dsPIC33EVXXXGM00X/10X FAMILY

FIGURE 18-1: SPIx MODULE BLOCK DIAGRAM

18.1 SPI Helpful Tips

1. In Frame mode, if there is a possibility that the master may not be initialized before the slave:
 - a) If FRMPOL (SPIxCON2<13>) = 1, use a pull-down resistor on \overline{SSx} .
 - b) If FRMPOL = 0, use a pull-up resistor on \overline{SSx} .

Note: This insures that the first frame transmission after initialization is not shifted or corrupted.

2. In Non-Framed 3-Wire mode (i.e., not using \overline{SSx} from a master):
 - a) If CKP (SPIxCON1<6>) = 1, always place a pull-up resistor on \overline{SSx} .
 - b) If CKP = 0, always place a pull-down resistor on \overline{SSx} .

Note: This will insure that during power-up and initialization, the master/slave will not lose sync due to an errant SCKx transition that would cause the slave to accumulate data shift errors, for both transmit and receive, appearing as corrupted data.

3. FRMEN (SPIxCON2<15>) = 1 and SSEN (SPIxCON1<7>) = 1 are exclusive and invalid. In Frame mode, SCKx is continuous and the Frame Sync pulse is active on the \overline{SSx} pin, which indicates the start of a data frame.

Note: Not all third-party devices support Frame mode timing. For more information, refer to the SPI specifications in [Section 30.0 “Electrical Characteristics”](#).

4. In Master mode only, set the SMP bit (SPIxCON1<9>) to a '1' for the fastest SPI data rate possible. The SMP bit can only be set at the same time or after the MSTEN bit (SPIxCON1<5>) is set.

To avoid invalid slave read data to the master, the user's master software must ensure enough time for slave software to fill its write buffer before the user application initiates a master write/read cycle. It is always advisable to preload the SPIxBUF Transmit register in advance of the next master transaction cycle. SPIxBUF is transferred to the SPIx Shift register and is empty once the data transmission begins.

REGISTER 18-1: SPIxSTAT: SPIx STATUS AND CONTROL REGISTER (CONTINUED)

- bit 1 **SPITBF:** SPIx Transmit Buffer Full Status bit
1 = Transmit has not yet started, the SPIxTXB bit is full
0 = Transmit has started, the SPIxTXB bit is empty
Standard Buffer mode:
Automatically set in hardware when the core writes to the SPIxBUF location, loading SPIxTXB. Automatically cleared in hardware when the SPIx module transfers data from SPIxTXB to SPIxSR.
Enhanced Buffer mode:
Automatically set in the hardware when the CPU writes to the SPIxBUF location, loading the last available buffer location. Automatically cleared in hardware when a buffer location is available for a CPU write operation.
- bit 0 **SPIRBF:** SPIx Receive Buffer Full Status bit
1 = Receive is complete, the SPIxRXB bit is full
0 = Receive is incomplete, the SPIxRXB bit is empty
Standard Buffer mode:
Automatically set in the hardware when SPIx transfers data from SPIxSR to SPIxRXB. Automatically cleared in hardware when the core reads the SPIxBUF location, reading SPIxRXB.
Enhanced Buffer mode:
Automatically set in hardware when SPIx transfers data from SPIxSR to the buffer, filling the last unread buffer location. Automatically cleared in hardware when a buffer location is available for a transfer from SPIxSR.

19.0 INTER-INTEGRATED CIRCUIT (I²C)

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Inter-Integrated Circuit™ (I²C™)**” (DS70000195) in the “*dsPIC33/PIC24 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33EVXXGM00X/10X family of devices contains one Inter-Integrated Circuit (I²C) module, I2C1.

The I²C module provides complete hardware support for both Slave and Multi-Master modes of the I²C serial communication standard, with a 16-bit interface.

The I²C module has the following 2-pin interface:

- The SCLx pin is clock.
- The SDAx pin is data.

The I²C module offers the following key features:

- I²C Interface Supporting Both Master and Slave modes of Operation
- I²C Slave mode Supports 7 and 10-Bit Addressing
- I²C Master mode Supports 7 and 10-Bit Addressing
- I²C Port allows Bidirectional Transfers between Master and Slaves
- Serial Clock Synchronization for I²C Port can be used as a Handshake Mechanism to Suspend and Resume Serial Transfer (SCLREL control)
- I²C Supports Multi-Master Operation, Detects Bus Collision and Arbitrates Accordingly
- Support for Address Bit Masking up to Lower 7 Bits
- I²C Slave Enhancements:
 - SDAx hold time selection of SMBus (300 ns or 150 ns)
 - Start/Stop bit interrupt enables

Figure 19-1 shows a block diagram of the I²C module.

19.1 I²C Baud Rate Generator

The Baud Rate Generator (BRG) used for I²C mode operation is used to set the SCL clock frequency for 100 kHz, 400 kHz and 1 MHz. The BRG reload value is contained in the I2CxBRG register. The BRG will automatically begin counting on a write to the I2CxTRN register.

Equation 19-1 and Equation 19-2 provide the BRG reload formula and F_{SCL} frequency, respectively.

EQUATION 19-1: BRG FORMULA

$$I2CxBRG = \left(\left(\frac{1}{F_{SCL}} - Delay \right) \times \frac{FCY}{2} \right) - 2$$

Where:

Delay varies from 110 ns to 130 ns.

EQUATION 19-2: F_{SCL} FREQUENCY

$$F_{SCL} = FCY / ((I2CxBRG + 2) * 2)$$

| | | x = Bit is unknown |

- bit 15 **I2CEN:** I2Cx Enable bit (writable from SW only)
 1 = Enables the I²C module and configures the SDAx and SCLx pins as serial port pins
 0 = Disables the I²C module and all I²C pins are controlled by port functions
- bit 14 **Unimplemented:** Read as '0'
- bit 13 **I2CSIDL:** I2Cx Stop in Idle Mode bit
 1 = Discontinues module operation when the device enters Idle mode
 0 = Continues module operation in Idle mode
- bit 12 **SCLREL:** SCLx Release Control bit (I²C Slave mode only)⁽¹⁾
 Module resets and (I2CEN = 0) sets SCLREL = 1.
If STREN = 0:⁽²⁾
 1 = Releases clock
 0 = Forces clock low (clock stretch)
If STREN = 1:
 1 = Releases clock
 0 = Holds clock low (clock stretch); user may program this bit to '0', clock stretch at the next SCLx low
- bit 11 **STRICT:** Strict I²C Reserved Address Rule Enable bit
 1 = Strict reserved addressing is enforced
 In Slave mode, the device does not respond to reserved address space and addresses falling in that category are NACKed.
 0 = Reserved addressing would be Acknowledged
 In Slave mode, the device will respond to an address falling in the reserved address space. When there is a match with any of the reserved addresses, the device will generate an ACK.
- bit 10 **A10M:** 10-Bit Slave Address Flag bit
 1 = I2CxADD is a 10-bit slave address
 0 = I2CxADD is a 7-bit slave address
- bit 9 **DISSLW:** Slew Rate Control Disable bit
 1 = Slew rate control is disabled for Standard Speed mode (100 kHz, also disabled for 1 MHz mode)
 0 = Slew rate control is enabled for High-Speed mode (400 kHz)
- bit 8 **SMEN:** SMBus Input Levels Enable bit
 1 = Enables the input logic so thresholds are compliant with the SMBus specification
 0 = Disables the SMBus-specific inputs

Note 1: Automatically cleared to '0' at the beginning of slave transmission; automatically cleared to '0' at the end of slave reception.

2: Automatically cleared to '0' at the beginning of slave transmission.

REGISTER 19-1: I2CxCON1: I2Cx CONTROL REGISTER 1 (CONTINUED)

- bit 7 **GCEN:** General Call Enable bit (I²C Slave mode only)
1 = Enables interrupt when a general call address is received in I2CxRSR; module is enabled for reception
0 = General call address is disabled.
- bit 6 **STREN:** SCLx Clock Stretch Enable bit
In I²C Slave mode only, used in conjunction with the SCLREL bit.
1 = Enables clock stretching
0 = Disables clock stretching
- bit 5 **ACKDT:** Acknowledge Data bit
In I²C Master mode, during Master Receive mode. The value that will be transmitted when the user initiates an Acknowledge sequence at the end of a receive.
In I²C Slave mode when AHEN = 1 or DHEN = 1. The value that the slave will transmit when it initiates an Acknowledge sequence at the end of an address or data reception.
1 = NACK is sent
0 = ACK is sent
- bit 4 **ACKEN:** Acknowledge Sequence Enable bit
In I²C Master mode only; applicable during Master Receive mode.
1 = Initiates Acknowledge sequence on SDAx and SCLx pins, and transmits ACKDT data bit
0 = Acknowledge sequence is Idle
- bit 3 **RCEN:** Receive Enable bit (I²C Master mode only)
1 = Enables Receive mode for I²C, automatically cleared by hardware at the end of 8-bit receive data byte
0 = Receive sequence is not in progress
- bit 2 **PEN:** Stop Condition Enable bit (I²C Master mode only)
1 = Initiates Stop condition on SDAx and SCLx pins
0 = Stop condition is Idle
- bit 1 **RSEN:** Restart Condition Enable bit (I²C Master mode only)
1 = Initiates Restart condition on SDAx and SCLx pins
0 = Restart condition is Idle
- bit 0 **SEN:** Start Condition Enable bit (I²C Master mode only)
1 = Initiates Start condition on SDAx and SCLx pins
0 = Start condition is Idle

Note 1: Automatically cleared to '0' at the beginning of slave transmission; automatically cleared to '0' at the end of slave reception.

2: Automatically cleared to '0' at the beginning of slave transmission.

- bit 15-7 **Unimplemented:** Read as '0'
- bit 6 **PCIE:** Stop Condition Interrupt Enable bit (I²C Slave mode only).
 1 = Enables interrupt on detection of Stop condition
 0 = Stop detection interrupts are disabled
- bit 5 **SCIE:** Start Condition Interrupt Enable bit (I²C Slave mode only)
 1 = Enables interrupt on detection of Start or Restart conditions
 0 = Start detection interrupts are disabled
- bit 4 **BOEN:** Buffer Overwrite Enable bit (I²C Slave mode only)
 1 = The I2CxRCV register bit is updated and an ACK is generated for a received address/data byte,
 ignoring the state of the I2COV bit only if the RBF bit = 0
 0 = The I2CxRCV register bit is only updated when I2COV is clear
- bit 3 **SDAHT:** SDAx Hold Time Selection bit
 1 = Minimum of 300 ns hold time on SDAx after the falling edge of SCLx
 0 = Minimum of 100 ns hold time on SDAx after the falling edge of SCLx
- bit 2 **SBCDE:** Slave Mode Bus Collision Detect Enable bit (I²C Slave mode only)
 If, on the rising edge of SCLx, SDAx is sampled low when the module is outputting a high state, the
 BCL bit is set and the bus goes Idle. This Detection mode is only valid during data and ACK transmit
 sequences.
 1 = Slave bus collision interrupts are enabled
 0 = Slave bus collision interrupts are disabled
- bit 1 **AHEN:** Address Hold Enable bit (I²C Slave mode only)
 1 = Following the 8th falling edge of SCLx for a matching received address byte; the SCLREL bit
 (I2CxCON1<12>) will be cleared and the SCLx will be held low
 0 = Address holding is disabled
- bit 0 **DHEN:** Data Hold Enable bit (I²C Slave mode only)
 1 = Following the 8th falling edge of SCLx for a received data byte; slave hardware clears the SCLREL
 bit (I2CxCON1<12>) and the SCLx is held low
 0 = Data holding is disabled

NOTES:

20.0 SINGLE-EDGE NIBBLE TRANSMISSION (SENT)

Note 1: This data sheet summarizes the features of this group of dsPIC33EVXXGM00X/10X family devices. It is not intended to be a comprehensive reference source. For more information on Single-Edge Nibble Transmission, refer to “**Single-Edge Nibble Transmission (SENT) Module**” (DS70005145) in the “*dsPIC33/PIC24 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

20.1 Module Introduction

The Single-Edge Nibble Transmission (SENT) module is based on the SAE J2716, “*SENT – Single-Edge Nibble Transmission for Automotive Applications*”. The SENT protocol is a one-way, single wire time modulated serial communication, based on successive falling edges. It is intended for use in applications where high-resolution sensor data needs to be communicated from a sensor to an Engine Control Unit (ECU).

The SENTx module has the following major features:

- Selectable Transmit or Receive mode
- Synchronous or Asynchronous Transmit modes
- Automatic Data Rate Synchronization
- Optional Automatic Detection of CRC Errors in Receive mode
- Optional Hardware Calculation of CRC in Transmit mode
- Support for Optional Pause Pulse Period
- Data Buffering for One Message Frame
- Selectable Data Length for Transmit/Receive from 3 to 6 Nibbles
- Automatic Detection of Framing Errors

SENT protocol timing is based on a predetermined time unit, T_{TICK} . Both the transmitter and receiver must be preconfigured for T_{TICK} , which can vary from 3 to 90 μs . A SENT message frame starts with a Sync pulse. The purpose of the Sync pulse is to allow the receiver to calculate the data rate of the message encoded by the transmitter. The SENT specification allows messages to be validated with up to a 20% variation in T_{TICK} . This allows for the transmitter and receiver to run from different clocks that may be inaccurate, and drift with time and temperature. The data nibbles are 4 bits in length and are encoded as the data value + 12 ticks. This yields a 0 value of 12 ticks and the maximum value, 0xF, of 27 ticks.

A SENT message consists of the following:

- A synchronization/calibration period of 56 tick times
- A status nibble of 12-27 tick times
- Up to six data nibbles of 12-27 tick times
- A CRC nibble of 12-27 tick times
- An optional pause pulse period of 12-768 tick times

[Figure 20-1](#) shows a block diagram of the SENTx module.

[Figure 20-2](#) shows the construction of a typical 6-nibble data frame, with the numbers representing the minimum or maximum number of tick times for each section.

dsPIC33EVXXXGM00X/10X FAMILY

FIGURE 20-1: SENTx MODULE BLOCK DIAGRAM

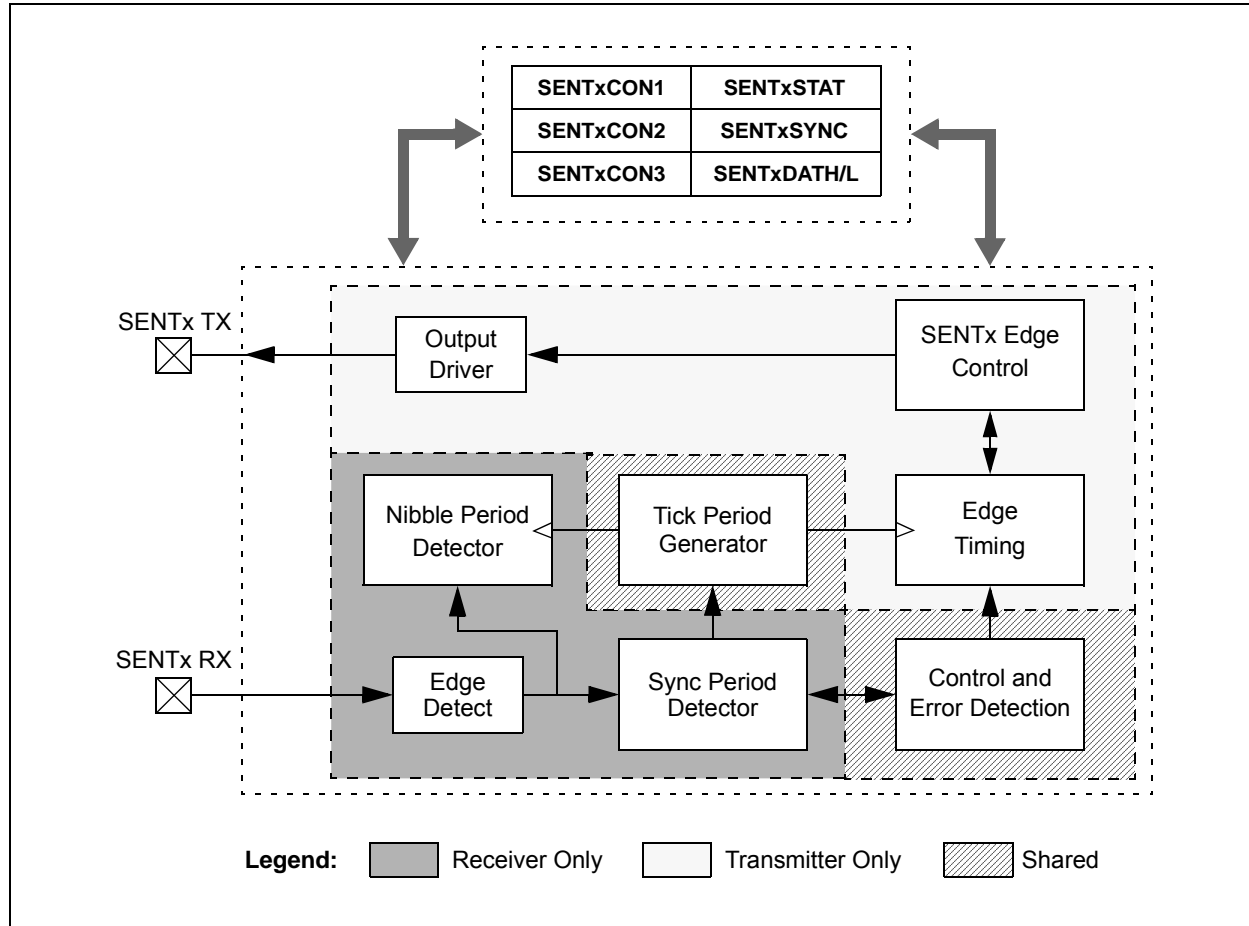

FIGURE 20-2: SENTx PROTOCOL DATA FRAMES

20.2 Transmit Mode

By default, the SENTx module is configured for transmit operation. The module can be configured for continuous asynchronous message frame transmission, or alternatively, for Synchronous mode triggered by software. When enabled, the transmitter will send a Sync followed by the appropriate number of data nibbles, an optional CRC and optional pause pulse. The tick period used by the SENTx transmitter is set by writing a value to the TICKTIME<15:0> (SENTxCON2<15:0>) bits. The tick period calculations are shown in [Equation 20-1](#).

EQUATION 20-1: TICK PERIOD CALCULATION

$$TICKTIME<15:0> = \frac{T_{TICK}}{T_{CLK}} - 1$$

An optional pause pulse can be used in Asynchronous mode to provide a fixed message frame time period. The frame period used by the SENTx transmitter is set by writing a value to the FRAMETIME<15:0> (SENTxCON3<15:0>) bits. The formulas used to calculate the value of frame time are shown in [Equation 20-2](#).

EQUATION 20-2: FRAME TIME CALCULATIONS

$$FRAMETIME<15:0> = T_{TICK}/T_{FRAME}$$

$$FRAMETIME<15:0> \geq 122 + 27N$$

$$FRAMETIME<15:0> \geq 848 + 12N$$

Where:

T_{FRAME} = Total time of the message from ms

N = The number of data nibbles in message, 1-6

Note: The module will not produce a pause period with less than 12 ticks, regardless of the FRAMETIME<15:0> value. FRAMETIME<15:0> values beyond 2047 will have no effect on the length of a data frame.

20.2.1 TRANSMIT MODE CONFIGURATION

20.2.1.1 Initializing the SENTx Module:

Perform the following steps to initialize the module:

1. Write RCVEN (SENTxCON1<11>) = 0 for Transmit mode.
2. Write TXM (SENTxCON1<10>) = 0 for Asynchronous Transmit mode or TXM = 1 for Synchronous mode.
3. Write NIBCNT<2:0> (SENTxCON1<2:0>) for the desired data frame length.
4. Write CRCEN (SENTxCON1<8>) for hardware or software CRC calculation.
5. Write PPP (SENTxCON1<7>) for optional pause pulse.
6. If PPP = 1, write TFRAME to SENTxCON3.
7. Write SENTxCON2 with the appropriate value for desired tick period.
8. Enable interrupts and set interrupt priority.
9. Write initial status and data values to SENTxDATH/L.
10. If CRCEN = 0, calculate CRC and write the value to CRC<3:0> (SENTxDATL<3:0>).
11. Set the SNTEN (SENTxCON1<15>) bit to enable the module.

User software updates to SENTxDATH/L must be performed after the completion of the CRC and before the next message frame's status nibble. The recommended method is to use the message frame completion interrupt to trigger data writes.

dsPIC33EVXXGM00X/10X FAMILY

20.3 Receive Mode

The module can be configured for receive operation by setting the RCVEN (SENTxCON1<11>) bit. The time between each falling edge is compared to SYNCMIN<15:0> (SENTxCON3<15:0>) and SYNCMAX<15:0> (SENTxCON2<15:0>), and if the measured time lies between the minimum and maximum limits, the module begins to receive data. The validated Sync time is captured in the SENTxSYNC register and the tick time is calculated. Subsequent falling edges are verified to be within the valid data width and the data is stored in the SENTxDATH/L register. An interrupt event is generated at the completion of the message and the user software should read the SENTx Data register before the reception of the next nibble. The equation for SYNCMIN<15:0> and SYNCMAX<15:0> is shown in Equation 20-3.

EQUATION 20-3: SYNCMIN<15:0> AND SYNCMAX<15:0> CALCULATIONS

$$TICK = TCLK \cdot (TICKTIME<15:0> + 1)$$

$$FRAMETIME<15:0> = TICK/TFRAME$$

$$SyncCount = 8 \times FRCV \times TICK$$

$$SYNCMIN<15:0> = 0.8 \times SyncCount$$

$$SYNCMAX<15:0> = 1.2 \times SyncCount$$

$$FRAMETIME<15:0> \geq 122 + 27N$$

$$FRAMETIME<15:0> \geq 848 + 12N$$

Where:

$TFRAME$ = Total time of the message from ms

N = The number of data nibbles in message, 1-6

$FRCV$ = $FCY \times$ prescaler

$TCLK$ = $FCY/Prescaler$

For $TICK = 3.0 \mu s$ and $FCLK = 4 \text{ MHz}$, $SYNCMIN<15:0> = 76$.

Note: To ensure a Sync period can be identified, the value written to SYNCMIN<15:0> must be less than the value written to SYNCMAX<15:0>.

20.3.1 RECEIVE MODE CONFIGURATION

20.3.1.1 Initializing the SENTx Module:

Perform the following steps to initialize the module:

1. Write RCVEN (SENTxCON1<11>) = 1 for Receive mode.
2. Write NIBCNT<2:0> (SENTxCON1<2:0>) for the desired data frame length.
3. Write CRCEN (SENTxCON1<8>) for hardware or software CRC validation.
4. Write PPP (SENTxCON1<7>) = 1 if pause pulse is present.
5. Write SENTxCON2 with the value of SYNCMAXx (Nominal Sync Period + 20%).
6. Write SENTxCON3 with the value of SYNCMINx (Nominal Sync Period - 20%).
7. Enable interrupts and set interrupt priority.
8. Set the SNTEN (SENTxCON1<15>) bit to enable the module.

The data should be read from the SENTxDATH/L register after the completion of the CRC and before the next message frame's status nibble. The recommended method is to use the message frame completion interrupt trigger.

NOTES:

21.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

Note 1: This data sheet summarizes the features of the dsPIC33EVXXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Universal Asynchronous Receiver Transmitter (UART)**” (DS70000582) in the “*dsPIC33/PIC24 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33EVXXXGM00X/10X family of devices contains two UART modules.

The Universal Asynchronous Receiver Transmitter (UART) module is one of the serial I/O modules available in the dsPIC33EVXXXGM00X/10X device family. The UART is a full-duplex, asynchronous system that can communicate with peripheral devices, such as personal computers, LIN/J2602, RS-232 and RS-485 interfaces. The module also supports a

hardware flow control option with the \overline{UxCTS} and \overline{UxRTS} pins, and also includes an IrDA® encoder and decoder.

Note: Hardware flow control using \overline{UxRTS} and \overline{UxCTS} is not available on all pin count devices. See the “**Pin Diagrams**” section for availability.

The primary features of the UARTx module are:

- Full-Duplex, 8 or 9-Bit Data Transmission through the $UxTX$ and $UxRX$ Pins
- Even, Odd or No Parity Options (for 8-bit data)
- One or Two Stop Bits
- Hardware Flow Control Option with \overline{UxCTS} and \overline{UxRTS} Pins
- Fully Integrated Baud Rate Generator with 16-Bit Prescaler
- Baud Rates Ranging from 4.375 Mbps to 67 bps at 16x mode at 70 MIPS
- Baud Rates Ranging from 17.5 Mbps to 267 bps at 4x mode at 70 MIPS
- 4-Deep First-In First-Out (FIFO) Transmit Data Buffer
- 4-Deep FIFO Receive Data Buffer
- Parity, Framing and Buffer Overrun Error Detection
- Support for 9-Bit mode with Address Detect (9th bit = 1)
- Transmit and Receive Interrupts
- A Separate Interrupt for All UART Error Conditions

FIGURE 21-1: UARTx SIMPLIFIED BLOCK DIAGRAM

21.1 UART Helpful Tips

1. In multi-node direct connect UART networks, UART receive inputs react to the complementary logic level defined by the URXINV bit (UxMODE<4>), which defines the Idle state, the default of which is logic high (i.e., URXINV = 0). Because remote devices do not initialize at the same time, it is likely that one of the devices, because the RX line is floating, will trigger a Start bit detection and will cause the first byte received, after the device has been initialized, to be invalid. To avoid this situation, the user should use a pull-up or pull-down resistor on the RX pin, depending on the value of the URXINV bit.
 - a) If URXINV = 0, use a pull-up resistor on the RX pin.
 - b) If URXINV = 1, use a pull-down resistor on the RX pin.
2. The first character received on wake-up from Sleep mode, caused by activity on the UxRX pin of the UART module, will be invalid. In Sleep mode, peripheral clocks are disabled. By the time the oscillator system has restarted and stabilized from Sleep mode, the baud rate bit sampling clock, relative to the incoming UxRX bit timing, is no longer synchronized, resulting in the first character being invalid. This is to be expected.

22.0 CONTROLLER AREA NETWORK (CAN) MODULE (dsPIC33EVXXGM10X DEVICES ONLY)

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Enhanced Controller Area Network (ECAN™)**” (DS70353) in the “*dsPIC33/PIC24 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

22.1 Overview

The Controller Area Network (CAN) module is a serial interface, useful for communicating with other CAN modules or microcontroller devices. This interface/protocol was designed to allow communications within noisy environments. The dsPIC33EVXXGM10X devices contain one CAN module.

The CAN module is a communication controller implementing the CAN 2.0 A/B protocol, as defined in the BOSCH CAN specification. The module supports CAN 1.2, CAN 2.0A, CAN 2.0B Passive and CAN 2.0B Active versions of the protocol. The module implementation is a full CAN system. The CAN specification is not covered within this data sheet. The reader can refer to the BOSCH CAN specification for further details.

The CAN module features are as follows:

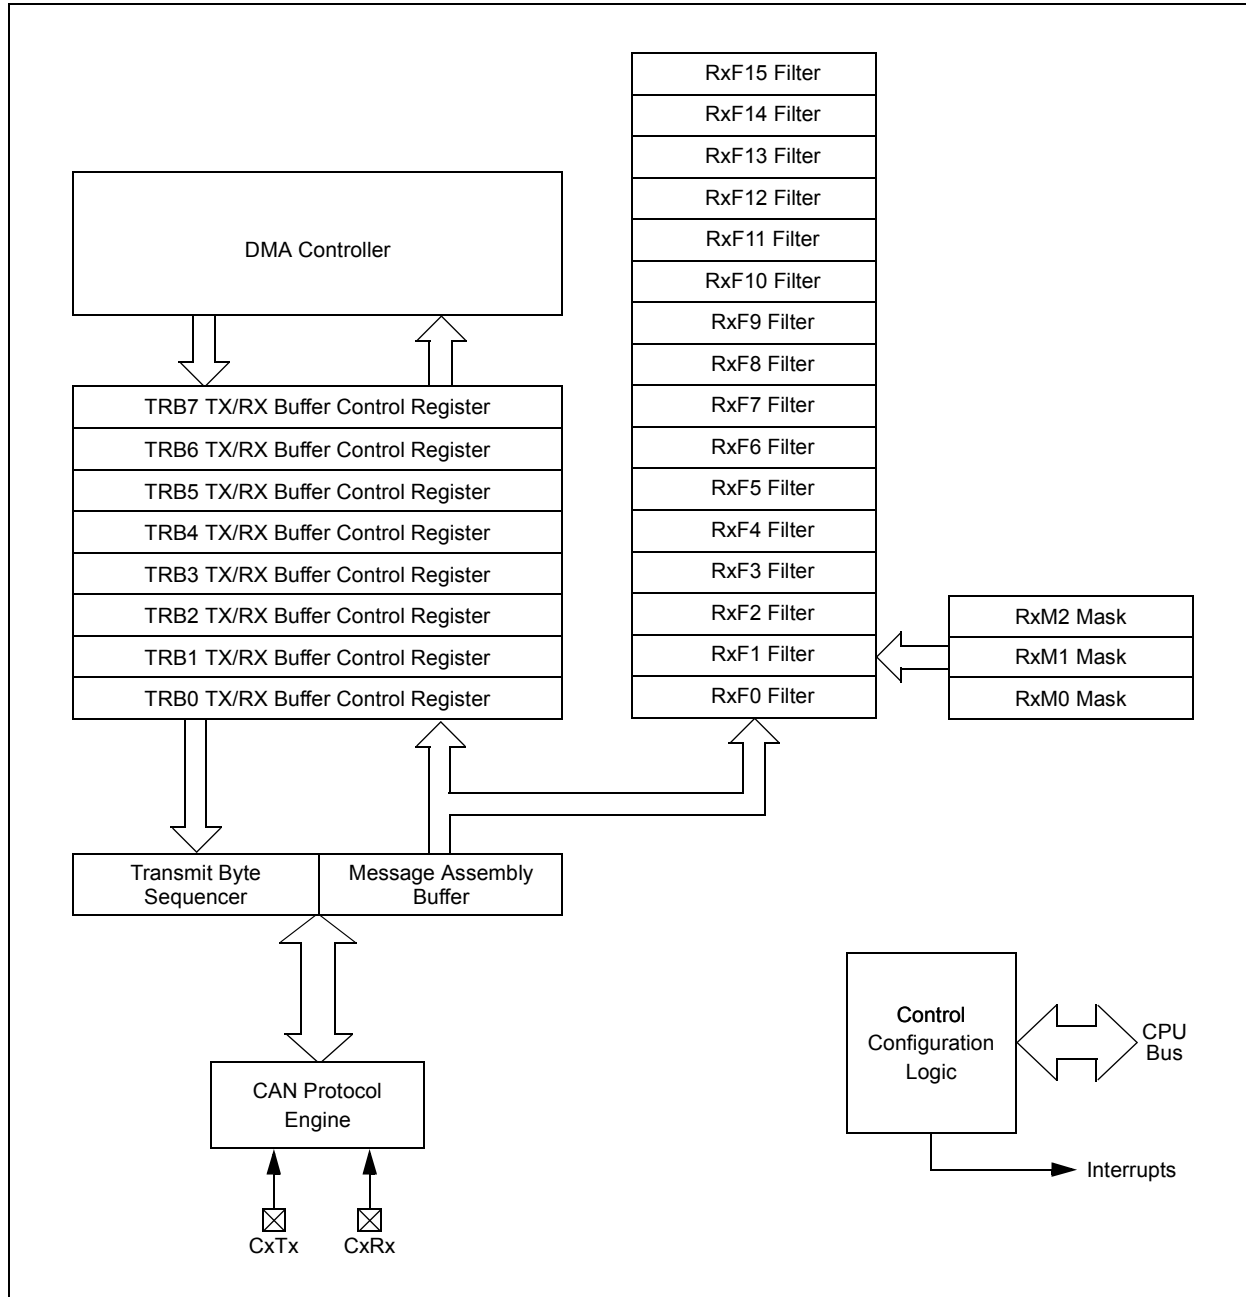

- Implementation of the CAN Protocol, CAN 1.2, CAN 2.0A and CAN 2.0B
- Standard and Extended Data Frames
- 0 to 8-Byte Data Length
- Programmable Bit Rate, up to 1 Mbit/sec
- Automatic Response to Remote Transmission Requests
- Up to Eight Transmit Buffers with Application Specified Prioritization and Abort Capability (each buffer can contain up to 8 bytes of data)
- Up to 32 Receive Buffers (each buffer can contain up to 8 bytes of data)
- Up to 16 Full (Standard/Extended Identifier) Acceptance Filters
- Three Full Acceptance Filter Masks
- DeviceNet™ Addressing Support
- Programmable Wake-up Functionality with Integrated Low-Pass Filter
- Programmable Loopback Mode Supports Self-Test Operation
- Signaling through Interrupt Capabilities for All CAN Receiver and Transmitter Error States
- Programmable Clock Source
- Programmable Link to Input Capture 2 (IC2) module for Timestamping and Network Synchronization
- Low-Power Sleep and Idle Modes

The CAN bus module consists of a protocol engine and message buffering/control. The CAN protocol engine handles all functions for receiving and transmitting messages on the CAN bus. Messages are transmitted by first loading the appropriate data registers. Status and errors can be checked by reading the appropriate registers. Any message detected on the CAN bus is checked for errors, and then matched against filters to see if it should be received and stored in one of the Receive registers.

[Figure 22-1](#) shows a block diagram of the CANx module.

dsPIC33EVXXGM00X/10X FAMILY

FIGURE 22-1: CANx MODULE BLOCK DIAGRAM

22.2 Modes of Operation

The CANx module can operate in one of several operation modes selected by the user. These modes include:

- Initialization mode
- Disable mode
- Normal Operation mode
- Listen Only mode
- Listen All Messages mode
- Loopback mode

Modes are requested by setting the REQOP<2:0> bits (CxCTRL1<10:8>). Entry into a mode is Acknowledged by monitoring the OPMODE<2:0> bits (CxCTRL1<7:5>). The module does not change the mode and the OPMODEx bits until a change in mode is acceptable, generally during bus Idle time, which is defined as at least 11 consecutive recessive bits.

 10 = High intermediate message priority
 01 = Low intermediate message priority
 00 = Lowest message priority

Note 1: This bit is cleared when TXREQm is set.

Note: The buffers, SID, EID, DLC, Data Field and Receive Status registers, are located in DMA RAM.

dsPIC33EVXXGM00X/10X FAMILY

22.4 CAN Message Buffers

CAN Message Buffers are part of RAM memory. They are not CAN Special Function Registers. The user application must directly write into the RAM area that is configured for CAN Message Buffers. The location and size of the buffer area is defined by the user application.

bit 12-8 **FILHIT<4:0>**: Filter Hit Code bits⁽¹⁾
 Encodes number of filter that resulted in writing this buffer.

bit 7-0 **Unimplemented:** Read as '0'

Note 1: Only written by module for receive buffers, unused for transmit buffers.

23.0 CHARGE TIME MEASUREMENT UNIT (CTMU)

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Charge Time Measurement Unit (CTMU)**” (DS70661) in the “*dsPIC33/PIC24 Family Reference Manual*”, which is available on the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

Together with other on-chip analog modules, the CTMU can be used to precisely measure time, measure capacitance, measure relative changes in capacitance or generate output pulses that are independent of the system clock.

The CTMU module is ideal for interfacing with capacitive-based sensors. The CTMU is controlled through three registers: CTMUCON1, CTMUCON2 and CTMUICON. CTMUCON1 and CTMUCON2 enable the module and control edge source selection, edge source polarity selection and edge sequencing. The CTMUICON register controls the selection and trim of the current source.

The Charge Time Measurement Unit (CTMU) is a flexible analog module that provides accurate differential time measurement between pulse sources, as well as asynchronous pulse generation. Its key features include:

- Nine Edge Input Trigger Sources
- Polarity Control for Each Edge Source
- Control of Edge Sequence
- Control of Response to Edges
- Time Measurement Resolution Down to 200 ps
- Accurate Current Source Suitable for Capacitive Measurement
- On-Chip Temperature Measurement using a Built-in Diode
- Pulse Generation Generates a Pulse using the C1INB Comparator Input and Outputs the Pulse onto the CTPLS Remappable Output

| — | — | — | — | — | — | — | — |
| bit 7 | | | | | | | bit 0 |

Legend:

| | | |
|-------------------|------------------|------------------------------------|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared |
| | | x = Bit is unknown |

- bit 15 **CTMUEN:** CTMU Enable bit
1 = Module is enabled
0 = Module is disabled
- bit 14 **Unimplemented:** Read as '0'
- bit 13 **CTMUSIDL:** CTMU Stop in Idle Mode bit
1 = Discontinues module operation when the device enters Idle mode
0 = Continues module operation in Idle mode
- bit 12 **TGEN:** Time Generation Enable bit⁽²⁾
1 = Edge delay generation is enabled
0 = Edge delay generation is disabled
- bit 11 **EDGEN:** Edge Enable bit
1 = Hardware modules are used to trigger edges (TMRx, CTEDx, etc.)
0 = Software is used to trigger edges (manual set of EDGxSTAT)
- bit 10 **EDGSEQEN:** Edge Sequence Enable bit
1 = Edge 1 event must occur before Edge 2 event can occur
0 = No edge sequence is needed
- bit 9 **IDISSEN:** Analog Current Source Control bit⁽¹⁾
1 = Analog current source output is grounded
0 = Analog current source output is not grounded
- bit 8 **CTTRIG:** ADC Trigger Control bit
1 = CTMU triggers the ADC start of conversion
0 = CTMU does not trigger the ADC start of conversion
- bit 7-0 **Unimplemented:** Read as '0'

Note 1: The ADC module Sample-and-Hold (S&H) capacitor is not automatically discharged between sample/conversion cycles. Any software using the ADC as part of a capacitance measurement must discharge the ADC capacitor before conducting the measurement. The IDISSEN bit, when set to '1', performs this function. The ADC must be sampling while the IDISSEN bit is active to connect the discharge sink to the capacitor array.

2: If the TGEN bit is set to '1', then the CMP1 module should be selected as the Edge 2 source in the EDG2SELx bits field; otherwise, the module will not function.

- Note 1:** This current range is not available for use with the internal temperature measurement diode.
Note 2: Refer to the CTMU Current Source Specifications (Table 30-53) in Section 30.0 “Electrical Characteristics” for the current range selection values.
Note 3: Current sources are not generated when 12-Bit ADC mode is chosen. Current sources are active only when 10-Bit ADC mode is chosen.

24.0 10-BIT/12-BIT ANALOG-TO-DIGITAL CONVERTER (ADC)

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Analog-to-Digital Converter (ADC)**” (DS70621) in the “*dsPIC33/PIC24 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Analog-to-Digital (ADC) module in the dsPIC33EVXXGM00X/10X family devices supports up to 36 analog input channels.

The ADC module can be configured by the user as either a 10-bit, 4 Sample-and-Hold (S&H) ADC (default configuration) or a 12-bit, 1 S&H ADC.

Note: The ADC module needs to be disabled before modifying the AD12B bit.

24.1 Key Features

24.1.1 10-BIT ADC CONFIGURATION

The 10-bit ADC configuration has the following key features:

- Successive Approximation (SAR) Conversion
- Conversion Speeds of up to 1.1 Msps
- Up to 36 Analog Input Pins
- Connections to Four Internal Op Amps
- Connections to the Charge Time Measurement Unit (CTMU) and Temperature Measurement Diode
- Simultaneous Sampling of:
 - Up to four analog input pins
 - Four op amp outputs
- Combinations of Analog Inputs and Op Amp Outputs
- Automatic Channel Scan mode
- Selectable Conversion Trigger Source
- Selectable Buffer Fill modes
- Four Result Alignment Options (signed/unsigned, fractional/integer)
- Operation during CPU Sleep and Idle Modes

24.1.2 12-BIT ADC CONFIGURATION

The 12-bit ADC configuration supports all the features listed previously, with the exception of the following:

- In the 12-bit configuration, conversion speeds of up to 500 ksps are supported
- There is only one S&H amplifier in the 12-bit configuration. Therefore, simultaneous sampling of multiple channels is not supported.

The ADC has up to 36 analog inputs. The analog inputs, AN32 through AN63, are multiplexed, thus providing flexibility in using any of these analog inputs in addition to the analog inputs, AN0 through AN31. Since AN32 through AN63 are multiplexed, do not use two channels simultaneously, since it may result in erroneous output from the module. These analog inputs are shared with op amp inputs and outputs, comparator inputs and external voltage references. When op amp/comparator functionality is enabled, the analog input that shares that pin is no longer available. The actual number of analog input pins and op amps depends on the specific device.

A block diagram of the ADC module with connection options is shown in [Figure 24-1](#). [Figure 24-2](#) shows a block diagram of the ADC conversion clock period.

FIGURE 24-1: ADCx MODULE BLOCK DIAGRAM WITH CONNECTION OPTIONS FOR ANx PINS AND OP AMPS

This diagram depicts all of the available ADC connection options to the four S&H amplifiers, which are designated: CH0, CH1, CH2 and CH3.

The ANx analog pins or op amp outputs are connected to the CH0-CH3 amplifiers through the multiplexers, controlled by the SFR control bits, CH0Sx, CH0Nx, CH123Sx and CH123Nx.

Note 1: Channels 1, 2 and 3 are not applicable for the 12-bit mode of operation.
Note 2: When ADDMAEN (ADxCON4<8>) = 0, ADC1BUF0-ADC1BUFF are used.
Note 3: When ADDMAEN (ADxCON4<8>) = 1 enabling DMA, only ADC1BUF0 is used.

dsPIC33EVXXGM00X/10X FAMILY

24.2 ADC Helpful Tips

1. The SMP1x control bits in the ADxCON2 registers:
 - a) Determine when the ADC interrupt flag is set and an interrupt is generated, if enabled.
 - b) When the CSCNA bit in the ADxCON2 register is set to '1', this determines when the ADC analog scan channel list, defined in the ADxCSSL/ADxCSSH registers, starts over from the beginning.
 - c) When the DMA peripheral is not used (ADDMAEN = 0), this determines when the ADC Result Buffer Pointer to ADC1BUF0-ADC1BUFF gets reset back to the beginning at ADC1BUF0.
 - d) When the DMA peripheral is used (ADDMAEN = 1), this determines when the DMA Address Pointer is incremented after a sample/conversion operation. ADC1BUF0 is the only ADC buffer used in this mode. The ADC Result Buffer Pointer to ADC1BUF0-ADC1BUFF gets reset back to the beginning at ADC1BUF0. The DMA address is incremented after completion of every 32nd sample/conversion operation. Conversion results are stored in the ADC1BUF0 register for transfer to RAM using the DMA peripheral.
2. When the DMA module is disabled (ADDMAEN = 0), the ADC has 16 result buffers. ADC conversion results are stored sequentially in ADC1BUF0-ADC1BUFF, regardless of which analog inputs are being used subject to the SMP1x bits and the condition described in 1.c) above. There is no relationship between the ANx input being measured and which ADC buffer (ADC1BUF0-ADC1BUFF) that the conversion results will be placed in.
3. When the DMA module is enabled (ADDMAEN = 1), the ADC module has only 1 ADC result buffer (i.e., ADCxBUF0) per ADC peripheral and the ADC conversion result must be read, either by the CPU or DMA Controller, before the next ADC conversion is complete to avoid overwriting the previous value.
4. The DONE bit (ADxCON1<0>) is only cleared at the start of each conversion and is set at the completion of the conversion, but remains set indefinitely, even through the next sample phase until the next conversion begins. If application code is monitoring the DONE bit in any kind of software loop, the user must consider this behavior because the CPU code execution is faster than the ADC. As a result, in Manual Sample mode, particularly where the user's code is setting the SAMP bit (ADxCON1<1>), the DONE bit should also be cleared by the user application just before setting the SAMP bit.
5. Enabling op amps, comparator inputs and external voltage references can limit the availability of analog inputs (ANx pins). For example, when Op Amp 2 is enabled, the pins for AN0, AN1 and AN2 are used by the op amp's inputs and output. This negates the usefulness of Alternate Input mode since the MUX A selections use AN0-AN2. Carefully study the ADC block diagram to determine the configuration that will best suit your application. For configuration examples, refer to "**Analog-to-Digital Converter (ADC)**" (DS70621) in the "*dsPIC33/PIC24 Family Reference Manual*".

000 = PWM Generator 1 primary trigger compare ends sampling and starts conversion
If SSRCG = 0:
111 = Internal counter ends sampling and starts conversion (auto-convert)
110 = CTMU ends sampling and starts conversion
101 = Reserved
100 = Timer5 compare ends sampling and starts conversion
011 = PWM primary Special Event Trigger ends sampling and starts conversion
010 = Timer3 compare ends sampling and starts conversion
001 = Active transition on the INTO pin ends sampling and starts conversion
000 = Clearing the Sample bit (SAMP) ends sampling and starts conversion (Manual mode)
- bit 4 **SSRCG**: Sample Trigger Source Group bit
See SSRC<2:0> for details.
- bit 3 **SIMSAM**: Simultaneous Sample Select bit (only applicable when CHPS<1:0> = 01 or 1x)
In 12-Bit Mode (AD12B = 1), SIMSAM is Unimplemented and is Read as '0':
1 = Samples CH0, CH1, CH2, CH3 simultaneously (when CHPS<1:0> = 1x) or samples CH0 and CH1 simultaneously (when CHPS<1:0> = 01)
0 = Samples multiple channels individually in sequence
- bit 2 **ASAM**: ADCx Sample Auto-Start bit
1 = Sampling begins immediately after last conversion; SAMP bit is auto-set
0 = Sampling begins when SAMP bit is set
- bit 1 **SAMP**: ADCx Sample Enable bit
1 = ADCx Sample-and-Hold amplifiers are sampling
0 = ADCx Sample-and-Hold amplifiers are holding
If ASAM = 0, software can write '1' to begin sampling. Automatically set by hardware if ASAM = 1. If SSRC<2:0> = 000, software can write '0' to end sampling and start conversion. If SSRC<2:0> ≠ 000, automatically cleared by hardware to end sampling and start conversion.
- bit 0 **DONE**: ADCx Conversion Status bit⁽¹⁾
1 = ADCx conversion cycle is completed.
0 = ADCx conversion has not started or is in progress
Automatically set by hardware when conversion is complete. Software can write '0' to clear DONE bit status (software not allowed to write '1'). Clearing this bit does NOT affect any operation in progress. Automatically cleared by hardware at the start of a new conversion.

Note 1: Do not clear the DONE bit in software if auto-sample is enabled (ASAM = 1).

25.0 OP AMP/COMPARATOR MODULE

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “Op Amp/Comparator” (DS70000357) in the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33EVXXGM00X/10X family devices contain up to five comparators that can be configured in various ways. CMP1, CMP2, CMP3 and CMP5 also have the option to be configured as op amps, with the output being brought to an external pin for gain/filtering connections. As shown in **Figure 25-1**, individual comparator options are specified by the comparator module’s Special Function Register (SFR) control bits.

The following options allow users to:

- Select the Edge for Trigger and Interrupt Generation
- Configure the Comparator Voltage Reference
- Configure Output Blanking and Masking
- Configure as a Comparator or Op Amp (CMP1, CMP2, CMP3 and CMP5 only)

Note: Not all op amp/comparator input/output connections are available on all devices. See the “Pin Diagrams” section for available connections.

26.0 COMPARATOR VOLTAGE REFERENCE

Note 1: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to “**Op Amp/Comparator**” (DS70000357) in the “*dsPIC33/PIC24 Family Reference Manual*”, which is available from the Microchip web site (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

26.1 Configuring the Comparator Voltage Reference

The comparator voltage reference module is controlled through the CVRxCON registers ([Register 26-1](#) and [Register 26-2](#)). The comparator voltage reference provides a range of output voltages with 128 distinct levels. The comparator reference supply voltage can come from either VDD and VSS, or the external CVREF+ and AVSS pins. The voltage source is selected by the CVRSS bit (CVRxCON<11>). The settling time of the comparator voltage reference must be considered when changing the CVREF output.

27.0 SPECIAL FEATURES

Note: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

The dsPIC33EVXXGM00X/10X family devices include several features intended to maximize application flexibility and reliability, and minimize cost through elimination of external components. These are:

- Flexible Configuration
- Watchdog Timer (WDT)
- Code Protection and CodeGuard™ Security
- In-Circuit Serial Programming™ (ICSP™)
- In-Circuit Emulation

27.1 Configuration Bits

In dsPIC33EVXXGM00X/10X family devices, the Configuration bytes are implemented as volatile memory. This means that configuration data must be programmed each time the device is powered up. Configuration data is stored at the top of the on-chip program memory space, known as the Flash Configuration bytes. Their specific locations are shown in [Table 27-1](#). The configuration data is automatically loaded from the Flash Configuration bytes to the proper Configuration Shadow registers during device Resets.

Note: Configuration data is reloaded on all types of device Resets.

When creating applications for these devices, users should always specifically allocate the location of the Flash Configuration bytes for configuration data in their code for the compiler. This is to ensure that program code is not stored in this address when the code is compiled.

The upper 2 bytes of all Flash Configuration Words in program memory should always be ‘1111 1111 1111 1111’. This makes them appear to be NOP instructions in the remote event that their locations are ever executed by accident. Since Configuration bits are not implemented in the corresponding locations, writing ‘1’s to these locations has no effect on device operation.

Note: Performing a page erase operation on the last page of program memory clears the Flash Configuration bytes, enabling code protection as a result. Therefore, users should avoid performing page erase operations on the last page of program memory.

The Configuration Flash bytes map is shown in [Table 27-1](#).

dsPIC33EVXXXGM00X/10X FAMILY

27.2 User OTP Memory

Locations, 800F80h-800FFEh, are a One-Time-Programmable (OTP) memory area. The user OTP words can be used for storing product information, such as serial numbers, system manufacturing dates, manufacturing lot numbers and other application-specific information.

27.3 On-Chip Voltage Regulator

All of the dsPIC33EVXXXGM00X/10X family devices power their core digital logic at a nominal 1.8V. This can create a conflict for designs that are required to operate at a higher typical voltage, such as 5.0V. To simplify system design, all devices in the dsPIC33EVXXXGM00X/10X family incorporate an on-chip regulator that allows the device to run its core logic from VDD.

The regulator provides power to the core from the other VDD pins. A low-ESR (less than 1 Ohm) capacitor (such as tantalum or ceramic) must be connected to the VCAP pin (see Figure 27-1). This helps to maintain the stability of the regulator. The recommended value for the filter capacitor is provided in Table 30-5, located in Section 30.0 “Electrical Characteristics”.

Note: It is important for the low-ESR capacitor to be placed as close as possible to the VCAP pin.

FIGURE 27-1: CONNECTIONS FOR THE ON-CHIP VOLTAGE REGULATOR^(1,2,3)

27.4 Brown-out Reset (BOR)

The Brown-out Reset (BOR) module is based on an internal voltage reference circuit that monitors the regulated supply voltage, VCAP. The main purpose of the BOR module is to generate a device Reset when a brown-out condition occurs. Brown-out conditions are generally caused by glitches on the AC mains (for example, missing portions of the AC cycle waveform due to bad power transmission lines or voltage sags due to excessive current draw when a large inductive load is turned on).

A BOR generates a Reset pulse, which resets the device. The BOR selects the clock source based on the device Configuration bit values (FNOSC<2:0> and POSCMD<1:0>).

If an oscillator mode is selected, the BOR activates the Oscillator Start-up Timer (OST). The system clock is held until OST expires. If the PLL is used, the clock is held until the LOCK bit (OSCCON<5>) is ‘1’.

Concurrently, the Power-up Timer (PWRT) Time-out (TPWRT) is applied before the internal Reset is released. If TPWRT = 0 and a crystal oscillator is being used, then a nominal delay of TFSCM is applied. The total delay in this case is TFSCM. Refer to Parameter SY35 in Table 30-22 of Section 30.0 “Electrical Characteristics” for specific TFSCM values.

The BOR status bit (RCON<1>) is set to indicate that a BOR has occurred. The BOR circuit continues to operate while in Sleep or Idle mode and resets the device should VDD fall below the BOR threshold voltage.

27.5 Watchdog Timer (WDT)

For dsPIC33EVXXGM00X/10X family devices, the WDT is driven by the LPRC oscillator. When the WDT is enabled, the clock source is also enabled.

27.5.1 PRESCALER/POSTSCALER

The nominal WDT clock source from LPRC is 32 kHz. This feeds a prescaler that can be configured for either 5-bit (divide-by-32) or 7-bit (divide-by-128) operation. The prescaler is set by the WDTPRE Configuration bit. With a 32 kHz input, the prescaler yields a WDT Time-out Period (TWDT), as shown in Parameter SY12 in Table 30-22.

A variable postscaler divides down the WDT prescaler output and allows for a wide range of time-out periods. The postscaler is controlled by the WDTPOST<3:0> Configuration bits (FWDT<3:0>), which allow the selection of 16 settings, from 1:1 to 1:32,768. Using the prescaler and postscaler, time-out periods ranging from 1 ms to 131 seconds can be achieved.

The WDT, prescaler and postscaler are reset:

- On any device Reset
- On the completion of a clock switch, whether invoked by software (i.e., setting the OSWEN bit after changing the NOSCx bits) or by hardware (i.e., Fail-Safe Clock Monitor)
- When a PWRSAV instruction is executed (i.e., Sleep or Idle mode is entered)
- When the device exits Sleep or Idle mode to resume normal operation
- By a CLRWDT instruction during normal execution

Note: The CLRWDT and PWRSAV instructions clear the prescaler and postscaler counts when executed.

27.5.2 SLEEP AND IDLE MODES

If the WDT is enabled, it continues to run during Sleep or Idle modes. When the WDT time-out occurs, the device wakes the device and code execution continues from where the PWRSAV instruction was executed. The corresponding SLEEP or IDLE bit (RCON<3:2>) needs to be cleared in software after the device wakes up.

27.5.3 ENABLING WDT

The WDT is enabled or disabled by the FWDTEN<1:0> Configuration bits in the FWDT Configuration register. When the FWDTEN<1:0> Configuration bits are set, the WDT is always enabled.

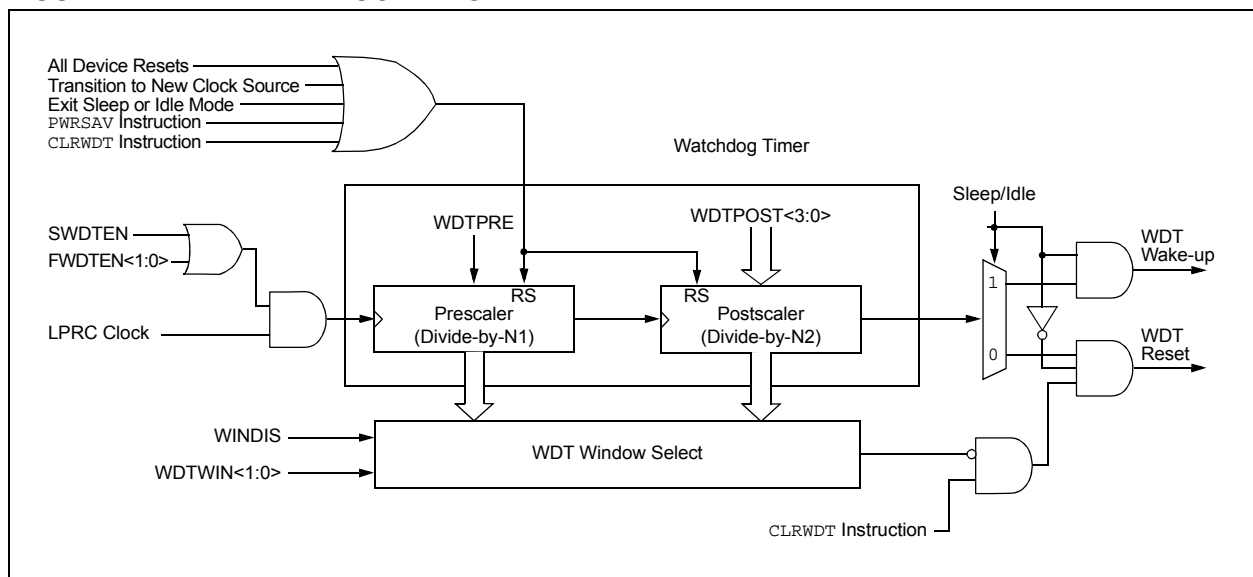

The WDT can be optionally controlled in software when the FWDTENx Configuration bits have been programmed to '00'. The WDT is enabled in software by setting the SWDTEN control bit (RCON<5>). The SWDTEN control bit is cleared on any device Reset. The software WDT option allows the user application to enable the WDT for critical code segments and disable the WDT during non-critical segments for maximum power savings.

The WDT flag bit, WDTO (RCON<4>), is not automatically cleared following a WDT time-out. To detect subsequent WDT events, the flag must be cleared in software.

27.5.4 WDT WINDOW

The Watchdog Timer has an optional Windowed mode enabled by programming the WINDIS bit in the WDT Configuration register (FWDT<7>). In the Windowed mode (WINDIS = 0), the WDT should be cleared based on the settings in the programmable Watchdog Timer Window (WDTWIN<1:0>) select bits.

FIGURE 27-2: WDT BLOCK DIAGRAM

dsPIC33EVXXXGM00X/10X FAMILY

27.6 In-Circuit Serial Programming

The dsPIC33EVXXXGM00X/10X family devices can be serially programmed while in the end application circuit. This is done with two lines for clock and data, and three other lines for power, ground and the programming sequence. Serial programming allows customers to manufacture boards with unprogrammed devices and then program the device just before shipping the product. Serial programming also allows the most recent firmware or a custom firmware to be programmed. Refer to “*dsPIC33EVXXXGM00X/10X Families Flash Programming Specification*” (DS70005137) for details about In-Circuit Serial Programming™ (ICSP™).

Any of the following three pairs of programming clock/data pins can be used:

- PGEC1 and PGED1
- PGEC2 and PGED2
- PGEC3 and PGED3

27.7 In-Circuit Debugger

When MPLAB® ICD 3 or REAL ICE™ is selected as a debugger, the in-circuit debugging functionality is enabled. This function allows simple debugging functions when used with MPLAB X IDE. Debugging functionality is controlled through the PGECx (Emulation/Debug Clock) and PGEDx (Emulation/Debug Data) pin functions.

Any of the following three pairs of debugging clock/data pins can be used:

- PGEC1 and PGED1
- PGEC2 and PGED2
- PGEC3 and PGED3

To use the in-circuit debugger function of the device, the design must implement ICSP connections to MCLR, VDD, VSS and the PGECx/PGEDx pin pair. In addition, when the feature is enabled, some of the resources are not available for general use. These resources include the first 80 bytes of data RAM and two I/O pins (PGECx and PGEDx).

27.8 Code Protection and CodeGuard™ Security

The dsPIC33EVXXXGM00X/10X family devices offer Intermediate CodeGuard Security that supports General Segment (GS) security, Boot Segment (BS) security and Configuration Segment (CS) security. This feature helps protect individual Intellectual Properties.

Note: Refer to “**CodeGuard™ Intermediate Security**” (DS70005182) in the “*dsPIC33/PIC24 Family Reference Manual*” for further information on usage, configuration and operation of CodeGuard Security.

28.0 INSTRUCTION SET SUMMARY

Note: This data sheet summarizes the features of the dsPIC33EVXXGM00X/10X family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the “dsPIC33/PIC24 Family Reference Manual”, which is available from the Microchip web site (www.microchip.com).

The dsPIC33EV instruction set is almost identical to that of the dsPIC30F and dsPIC33F.

Most instructions are a single program memory word (24 bits). Only three instructions require two program memory locations.

Each single-word instruction is a 24-bit word, divided into an 8-bit opcode, which specifies the instruction type and one or more operands, which further specify the operation of the instruction.

The instruction set is highly orthogonal and is grouped into following five basic categories:

- Word or byte-oriented operations
- Bit-oriented operations
- Literal operations
- DSP operations
- Control operations

Table 28-1 lists the general symbols used in describing the instructions.

The dsPIC33E instruction set summary in Table 28-2 lists all the instructions, along with the Status Flags affected by each instruction.

Most word or byte-oriented W register instructions (including barrel shift instructions) have the following three operands:

- The first source operand, which is typically a register ‘Wb’ without any address modifier
- The second source operand, which is typically a register ‘Ws’ with or without an address modifier
- The destination of the result, which is typically a register ‘Wd’ with or without an address modifier

However, word or byte-oriented file register instructions have two operands:

- The file register specified by the value ‘f’
- The destination, which could be either the file register ‘f’ or the W0 register, which is denoted as ‘WREG’

Most bit-oriented instructions (including simple rotate/shift instructions) have two operands:

- The W register (with or without an address modifier) or file register (specified by the value of ‘Ws’ or ‘f’)
- The bit in the W register or file register (specified by a literal value or indirectly by the contents of register ‘Wb’)

The literal instructions that involve data movement can use some of the following operands:

- A literal value to be loaded into a W register or file register (specified by ‘k’)
- The W register or file register where the literal value is to be loaded (specified by ‘Wb’ or ‘f’)

However, literal instructions that involve arithmetic or logical operations use some of the following operands:

- The first source operand, which is a register ‘Wb’ without any address modifier
- The second source operand, which is a literal value
- The destination of the result (only if not the same as the first source operand), which is typically a register ‘Wd’ with or without an address modifier

The MAC class of DSP instructions can use some of the following operands:

- The accumulator (A or B) to be used (required operand)
- The W registers to be used as the two operands
- The X and Y address space prefetch operations
- The X and Y address space prefetch destinations
- The accumulator write-back destination

The other DSP instructions do not involve any multiplication and can include:

- The accumulator to be used (required)
- The source or destination operand (designated as Wso or Wdo, respectively) with or without an address modifier
- The amount of shift specified by a W register ‘Wn’ or a literal value

The control instructions can use some of the following operands:

- A program memory address
- The mode of the Table Read and Table Write instructions

dsPIC33EVXXGM00X/10X FAMILY

Most instructions are a single word. Certain double-word instructions are designed to provide all the required information in these 48 bits. In the second word, the 8 MSBs are '0's. If this second word is executed as an instruction (by itself), it executes as a NOP.

The double-word instructions execute in two instruction cycles.

Most single-word instructions are executed in a single instruction cycle, unless a conditional test is true, or the Program Counter is changed as a result of the instruction, or a PSV or Table Read is performed. In

these cases, the execution takes multiple instruction cycles with the additional instruction cycle(s) executed as a NOP. Certain instructions that involve skipping over the subsequent instruction require either two or three cycles if the skip is performed, depending on whether the instruction being skipped is a single-word or two-word instruction. Moreover, double-word moves require two cycles.

Note: For more details on the instruction set, refer to the "16-bit MCU and DSC Programmer's Reference Manual" (DS70157).

TABLE 28-1: SYMBOLS USED IN OPCODE DESCRIPTIONS

| Field | Description |
|-----------------|---|
| #text | Means literal defined by "text" |
| (text) | Means "content of text" |
| [text] | Means "the location addressed by text" |
| { } | Optional field or operation |
| a ∈ {b, c, d} | a is selected from the set of values b, c, d |
| <n:m> | Register bit field |
| .b | Byte mode selection |
| .d | Double-Word mode selection |
| .S | Shadow register select |
| .w | Word mode selection (default) |
| Acc | One of two accumulators {A, B} |
| AWB | Accumulator Write-Back Destination Address register ∈ {W13, [W13]+ = 2} |
| bit4 | 4-bit bit selection field (used in word-addressed instructions) ∈ {0...15} |
| C, DC, N, OV, Z | MCU Status bits: Carry, Digit Carry, Negative, Overflow, Sticky Zero |
| Expr | Absolute address, label or expression (resolved by the linker) |
| f | File register address ∈ {0x0000...0x1FFF} |
| lit1 | 1-bit unsigned literal ∈ {0,1} |
| lit4 | 4-bit unsigned literal ∈ {0...15} |
| lit5 | 5-bit unsigned literal ∈ {0...31} |
| lit8 | 8-bit unsigned literal ∈ {0...255} |
| lit10 | 10-bit unsigned literal ∈ {0...255} for Byte mode, {0:1023} for Word mode |
| lit14 | 14-bit unsigned literal ∈ {0...16384} |
| lit16 | 16-bit unsigned literal ∈ {0...65535} |
| lit23 | 23-bit unsigned literal ∈ {0...8388608}; LSb must be '0' |
| None | Field does not require an entry, can be blank |
| OA, OB, SA, SB | DSP Status bits: ACCA Overflow, ACCB Overflow, ACCA Saturate, ACCB Saturate |
| PC | Program Counter |
| Slit10 | 10-bit signed literal ∈ {-512...511} |
| Slit16 | 16-bit signed literal ∈ {-32768...32767} |
| Slit6 | 6-bit signed literal ∈ {-16...16} |
| Wb | Base W register ∈ {W0...W15} |
| Wd | Destination W register ∈ { Wd, [Wd], [Wd++], [Wd--], [++Wd], [--Wd] } |
| Wdo | Destination W register ∈ { Wnd, [Wnd], [Wnd++], [Wnd--], [++Wnd], [--Wnd], [Wnd+Wb] } |
| Wm,Wn | Dividend, Divisor Working register pair (Direct Addressing) |

dsPIC33EVXXGM00X/10X FAMILY

TABLE 28-1: SYMBOLS USED IN OPCODE DESCRIPTIONS (CONTINUED)

| Field | Description |
|-------|---|
| Wm*Wm | Multiplicand and Multiplier Working register pair for Square instructions $\in \{W4 * W4, W5 * W5, W6 * W6, W7 * W7\}$ |

Note: Read and Read-Modify-Write (e.g., bit operations and logical operations) on non-CPU SFRs incur an additional instruction cycle.

29.0 DEVELOPMENT SUPPORT

The PIC® microcontrollers (MCU) and dsPIC® digital signal controllers (DSC) are supported with a full range of software and hardware development tools:

- Integrated Development Environment
 - MPLAB® X IDE Software
- Compilers/Assemblers/Linkers
 - MPLAB XC Compiler
 - MPASM™ Assembler
 - MPLINK™ Object Linker/
MPLIB™ Object Librarian
 - MPLAB Assembler/Linker/Librarian for
Various Device Families
- Simulators
 - MPLAB X SIM Software Simulator
- Emulators
 - MPLAB REAL ICE™ In-Circuit Emulator
- In-Circuit Debuggers/Programmers
 - MPLAB ICD 3
 - PICKit™ 3
- Device Programmers
 - MPLAB PM3 Device Programmer
- Low-Cost Demonstration/Development Boards,
Evaluation Kits and Starter Kits
- Third-party development tools

29.1 MPLAB X Integrated Development Environment Software

The MPLAB X IDE is a single, unified graphical user interface for Microchip and third-party software, and hardware development tool that runs on Windows®, Linux and Mac OS® X. Based on the NetBeans IDE, MPLAB X IDE is an entirely new IDE with a host of free software components and plug-ins for high-performance application development and debugging. Moving between tools and upgrading from software simulators to hardware debugging and programming tools is simple with the seamless user interface.

With complete project management, visual call graphs, a configurable watch window and a feature-rich editor that includes code completion and context menus, MPLAB X IDE is flexible and friendly enough for new users. With the ability to support multiple tools on multiple projects with simultaneous debugging, MPLAB X IDE is also suitable for the needs of experienced users.

Feature-Rich Editor:

- Color syntax highlighting
- Smart code completion makes suggestions and provides hints as you type
- Automatic code formatting based on user-defined rules
- Live parsing

User-Friendly, Customizable Interface:

- Fully customizable interface: toolbars, toolbar buttons, windows, window placement, etc.
- Call graph window

Project-Based Workspaces:

- Multiple projects
- Multiple tools
- Multiple configurations
- Simultaneous debugging sessions

File History and Bug Tracking:

- Local file history feature
- Built-in support for Bugzilla issue tracker

dsPIC33EVXXGM00X/10X FAMILY

29.2 MPLAB XC Compilers

The MPLAB XC Compilers are complete ANSI C compilers for all of Microchip's 8, 16, and 32-bit MCU and DSC devices. These compilers provide powerful integration capabilities, superior code optimization and ease of use. MPLAB XC Compilers run on Windows, Linux or MAC OS X.

For easy source level debugging, the compilers provide debug information that is optimized to the MPLAB X IDE.

The free MPLAB XC Compiler editions support all devices and commands, with no time or memory restrictions, and offer sufficient code optimization for most applications.

MPLAB XC Compilers include an assembler, linker and utilities. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. MPLAB XC Compiler uses the assembler to produce its object file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility

29.3 MPASM Assembler

The MPASM Assembler is a full-featured, universal macro assembler for PIC10/12/16/18 MCUs.

The MPASM Assembler generates relocatable object files for the MPLINK Object Linker, Intel® standard HEX files, MAP files to detail memory usage and symbol reference, absolute LST files that contain source lines and generated machine code, and COFF files for debugging.

The MPASM Assembler features include:

- Integration into MPLAB X IDE projects
- User-defined macros to streamline assembly code
- Conditional assembly for multipurpose source files
- Directives that allow complete control over the assembly process

29.4 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK Object Linker combines relocatable objects created by the MPASM Assembler. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB Object Librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

- Efficient linking of single libraries instead of many smaller files
- Enhanced code maintainability by grouping related modules together
- Flexible creation of libraries with easy module listing, replacement, deletion and extraction

29.5 MPLAB Assembler, Linker and Librarian for Various Device Families

MPLAB Assembler produces relocatable machine code from symbolic assembly language for PIC24, PIC32 and dsPIC DSC devices. MPLAB XC Compiler uses the assembler to produce its object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility

29.6 MPLAB X SIM Software Simulator

The MPLAB X SIM Software Simulator allows code development in a PC-hosted environment by simulating the PIC MCUs and dsPIC DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB X SIM Software Simulator fully supports symbolic debugging using the MPLAB XC Compilers, and the MPASM and MPLAB Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

29.7 MPLAB REAL ICE In-Circuit Emulator System

The MPLAB REAL ICE In-Circuit Emulator System is Microchip's next generation high-speed emulator for Microchip Flash DSC and MCU devices. It debugs and programs all 8, 16 and 32-bit MCU, and DSC devices with the easy-to-use, powerful graphical user interface of the MPLAB X IDE.

The emulator is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with either a connector compatible with in-circuit debugger systems (RJ-11) or with the new high-speed, noise tolerant, Low-Voltage Differential Signal (LVDS) interconnection (CAT5).

The emulator is field upgradable through future firmware downloads in MPLAB X IDE. MPLAB REAL ICE offers significant advantages over competitive emulators including full-speed emulation, run-time variable watches, trace analysis, complex breakpoints, logic probes, a ruggedized probe interface and long (up to three meters) interconnection cables.

29.8 MPLAB ICD 3 In-Circuit Debugger System

The MPLAB ICD 3 In-Circuit Debugger System is Microchip's most cost-effective, high-speed hardware debugger/programmer for Microchip Flash DSC and MCU devices. It debugs and programs PIC Flash microcontrollers and dsPIC DSCs with the powerful, yet easy-to-use graphical user interface of the MPLAB IDE.

The MPLAB ICD 3 In-Circuit Debugger probe is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with a connector compatible with the MPLAB ICD 2 or MPLAB REAL ICE systems (RJ-11). MPLAB ICD 3 supports all MPLAB ICD 2 headers.

29.9 PICkit 3 In-Circuit Debugger/Programmer

The MPLAB PICkit 3 allows debugging and programming of PIC and dsPIC Flash microcontrollers at a most affordable price point using the powerful graphical user interface of the MPLAB IDE. The MPLAB PICkit 3 is connected to the design engineer's PC using a full-speed USB interface and can be connected to the target via a Microchip debug (RJ-11) connector (compatible with MPLAB ICD 3 and MPLAB REAL ICE). The connector uses two device I/O pins and the Reset line to implement in-circuit debugging and In-Circuit Serial Programming™ (ICSP™).

29.10 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at VDDMIN and VDDMAX for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages, and a modular, detachable socket assembly to support various package types. The ICSP cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PIC devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices, and incorporates an MMC card for file storage and data applications.

dsPIC33EVXXXGM00X/10X FAMILY

29.11 Demonstration/Development Boards, Evaluation Kits, and Starter Kits

A wide variety of demonstration, development and evaluation boards for various PIC MCUs and dsPIC DSCs allows quick application development on fully functional systems. Most boards include prototyping areas for adding custom circuitry and provide application firmware and source code for examination and modification.

The boards support a variety of features, including LEDs, temperature sensors, switches, speakers, RS-232 interfaces, LCD displays, potentiometers and additional EEPROM memory.

The demonstration and development boards can be used in teaching environments, for prototyping custom circuits and for learning about various microcontroller applications.

In addition to the PICDEM™ and dsPICDEM™ demonstration/development board series of circuits, Microchip has a line of evaluation kits and demonstration software for analog filter design, KEELOQ® security ICs, CAN, IrDA®, PowerSmart battery management, SEEVAL® evaluation system, Sigma-Delta ADC, flow rate sensing, plus many more.

Also available are starter kits that contain everything needed to experience the specified device. This usually includes a single application and debug capability, all on one board.

Check the Microchip web page (www.microchip.com) for the complete list of demonstration, development and evaluation kits.

29.12 Third-Party Development Tools

Microchip also offers a great collection of tools from third-party vendors. These tools are carefully selected to offer good value and unique functionality.

- Device Programmers and Gang Programmers from companies, such as SoftLog and CCS
- Software Tools from companies, such as Gimpel and Trace Systems
- Protocol Analyzers from companies, such as Saleae and Total Phase
- Demonstration Boards from companies, such as MikroElektronika, Digilent® and Olimex
- Embedded Ethernet Solutions from companies, such as EZ Web Lynx, WIZnet and IPLogika®

dsPIC33EVXXGM00X/10X FAMILY

30.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of dsPIC33EVXXGM00X/10X family electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the dsPIC33EVXXGM00X/10X family are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these or any other conditions above the parameters indicated in the operation listings of this specification is not implied.

Absolute Maximum Ratings⁽¹⁾

| | |
|--|-----------------|
| Ambient temperature under bias | -40°C to +125°C |
| Storage temperature | -65°C to +160°C |
| Voltage on VDD with respect to VSS | -0.3V to +6.0V |
| Voltage on VCAP with respect to VSS | 1.62V to 1.98V |
| Maximum current out of VSS pin | 350 mA |
| Maximum current into VDD pin ⁽²⁾ | 350 mA |
| Maximum current sunk by any I/O pin..... | 20 mA |
| Maximum current sourced by I/O pin | 18 mA |
| Maximum current sourced/sunk by all ports ⁽²⁾ | 200 mA |

Note 1: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

2: Maximum allowable current is a function of device maximum power dissipation (see [Table 30-2](#)).

dsPIC33EVXXXGM00X/10X FAMILY

30.1 DC Characteristics

TABLE 30-1: OPERATING MIPS vs. VOLTAGE

| Characteristic | VDD Range (in Volts) | Temperature Range (in °C) | Maximum MIPS |
|----------------|-------------------------------|------------------------------|------------------------------|
| | | | dsPIC33EVXXXGM00X/10X Family |
| I-Temp | 4.5V to 5.5V ^(1,2) | -40°C to +85°C | 70 |
| E-Temp | 4.5V to 5.5V ^(1,2) | -40°C to +125°C | 60 |

Note 1: Device is functional at $V_{BORMIN} < V_{DD} < V_{DDMIN}$. Analog modules: ADC, op amp/comparator and comparator voltage reference will have degraded performance. Device functionality is tested but not characterized. Refer to Parameter **BO10** in [Table 30-12](#) for the minimum and maximum BOR values.

2: When BOR is enabled, the device will work from 4.7V to 5.5V.

Note 1: Customer operating voltage range is specified as: 4.5V to 5.5V.

TABLE 30-2: THERMAL OPERATING CONDITIONS

| Rating | Symbol | Min. | Typ. | Max. | Unit |
|--|-------------------|-------------------------------------|------|------|------|
| Industrial Temperature Devices: | | | | | |
| Operating Junction Temperature Range | TJ | -40 | — | +125 | °C |
| Operating Ambient Temperature Range | TA | -40 | — | +85 | °C |
| Extended Temperature Devices: | | | | | |
| Operating Junction Temperature Range | TJ | -40 | — | +140 | °C |
| Operating Ambient Temperature Range | TA | -40 | — | +125 | °C |
| Power Dissipation: Internal Chip Power Dissipation: $P_{INT} = V_{DD} \times (I_{DD} - \sum I_{OH})$ I/O Pin Power Dissipation: $I/O = \sum (\{V_{DD} - V_{OH}\} \times I_{OH}) + \sum (V_{OL} \times I_{OL})$ | PD | P _{INT} + P _{I/O} | | | W |
| Maximum Allowed Power Dissipation | PD _{MAX} | $(T_J - T_A) / \theta_{JA}$ | | | W |

TABLE 30-3: THERMAL PACKAGING CHARACTERISTICS

| Characteristic | Symbol | Typ. | Max. | Unit | Notes |
|--|---------------|------|------|------|-------|
| Package Thermal Resistance, 64-Pin QFN, 9x9x0.9 mm | θ_{JA} | 28.0 | — | °C/W | 1 |
| Package Thermal Resistance, 64-Pin TQFP, 10x10x1 mm | θ_{JA} | 48.3 | — | °C/W | 1 |
| Package Thermal Resistance, 44-Pin QFN, 8x8 mm | θ_{JA} | 29.0 | — | °C/W | 1 |
| Package Thermal Resistance, 44-Pin TQFP, 10x10x1 mm | θ_{JA} | 49.8 | — | °C/W | 1 |
| Package Thermal Resistance, 28-Pin QFN-S, 6x6x0.9 mm | θ_{JA} | 30.0 | — | °C/W | 1 |
| Package Thermal Resistance, 28-Pin SOIC, 7.50 mm | θ_{JA} | 69.7 | — | °C/W | 1 |
| Package Thermal Resistance, 28-Pin SSOP, 5.30 mm | θ_{JA} | 71.0 | — | °C/W | 1 |
| Package Thermal Resistance, 28-Pin SPDIP, 300 mil | θ_{JA} | 60.0 | — | °C/W | 1 |

Note 1: Junction to ambient thermal resistance, Theta-JA (θ_{JA}) numbers are achieved by package simulations.

dsPIC33EVXXGM00X/10X FAMILY

TABLE 30-4: DC TEMPERATURE AND VOLTAGE SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions (see Note 3): 4.5V to 5.5V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------------|--------|---|---|---------------------|------|-------|---|
| Param No. | Symbol | Characteristic | Min. | Typ. ⁽¹⁾ | Max. | Units | Conditions |
| Operating Voltage | | | | | | | |
| DC10 | VDD | Supply Voltage⁽³⁾ | VBOR | — | 5.5 | V | |
| DC12 | VDR | RAM Data Retention Voltage⁽²⁾ | 1.8 | — | — | V | |
| DC16 | VPOR | VDD Start Voltage to Ensure Internal Power-on Reset Signal | — | — | VSS | V | |
| DC17 | SVDD | VDD Rise Rate to Ensure Internal Power-on Reset Signal | 1.0 | — | — | V/ms | 0V-5.0V in 5 ms |
| DC18 | VCORE | VDD Core Internal Regulator Voltage | 1.62 | 1.8 | 1.98 | V | Voltage is dependent on load, temperature and VDD |

Note 1: Data in “Typ.” column is at 5.0V, +25°C unless otherwise stated.

2: This is the limit to which VDD may be lowered without losing RAM data.

3: VDD voltage must remain at VSS for a minimum of 200 μs to ensure POR.

TABLE 30-5: FILTER CAPACITOR (CEFC) SPECIFICATIONS

| Standard Operating Conditions (unless otherwise stated): Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | | | | |
|---|--------|--|------|------|------|-------|--|
| Param No. | Symbol | Characteristics | Min. | Typ. | Max. | Units | Comments |
| | CEFC | External Filter Capacitor Value ⁽¹⁾ | 4.7 | 10 | — | μF | Capacitor must have a low series resistance (< 1Ω) |

Note 1: Typical VCAP Voltage = 1.8 volts when VDD ≥ VDDMIN.

dsPIC33EVXXXGM00X/10X FAMILY

TABLE 30-6: DC CHARACTERISTICS: OPERATING CURRENT (IDD)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended | | |
|--|---------------------|------|---|------------|-----------------|
| Param. | Typ. ⁽²⁾ | Max. | Units | Conditions | |
| Operating Current (IDD)⁽¹⁾ | | | | | |
| DC20d | 4.5 | 5.5 | mA | -40°C | 5.0V 10 MIPS |
| DC20a | 4.65 | 5.6 | mA | +25°C | |
| DC20b | 4.85 | 6.0 | mA | +85°C | |
| DC20c | 5.6 | 7.2 | mA | +125°C | |
| DC22d | 8.6 | 10.6 | mA | -40°C | 5.0V 20 MIPS |
| DC22a | 8.8 | 10.8 | mA | +25°C | |
| DC22b | 9.1 | 11.1 | mA | +85°C | |
| DC22c | 9.8 | 12.6 | mA | +125°C | |
| DC23d | 16.8 | 18.5 | mA | -40°C | 5.0V 40 MIPS |
| DC23a | 17.2 | 19.0 | mA | +25°C | |
| DC23b | 17.55 | 19.2 | mA | +85°C | |
| DC23c | 18.3 | 21.0 | mA | +125°C | |
| DC24d | 25.15 | 28.0 | mA | -40°C | 5.0V 60 MIPS |
| DC24a | 25.5 | 28.0 | mA | +25°C | |
| DC24b | 25.5 | 28.0 | mA | +85°C | |
| DC24c | 25.55 | 28.5 | mA | +125°C | |
| DC25d | 29.0 | 31.0 | mA | -40°C | 5.0V 70 MIPS |
| DC25a | 28.5 | 31.0 | mA | +25°C | |
| DC25b | 28.3 | 31.0 | mA | +85°C | |

Note 1: IDD is primarily a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. The test conditions for all IDD measurements are as follows:

- Oscillator is configured in EC mode and external clock is active, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as outputs and driving low
- $\overline{\text{MCLR}} = V_{\text{DD}}$, WDT and FSCM are disabled
- CPU, SRAM, program memory and data memory are operational
- No peripheral modules are operating or being clocked (defined PMDx bits are all ones)
- CPU executing

```
while(1)
{
NOP();
}
```

2: Data in "Typ." column is at 5.0V, +25°C unless otherwise stated.

dsPIC33EVXXGM00X/10X FAMILY

TABLE 30-7: DC CHARACTERISTICS: IDLE CURRENT (IDLE)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | |
|--|---------------------|------|---|------------|-----------------|
| Parameter No. | Typ. ⁽²⁾ | Max. | Units | Conditions | |
| Idle Current (IDLE)⁽¹⁾ | | | | | |
| DC40d | 1.25 | 2 | mA | -40°C | 5.0V 10 MIPS |
| DC40a | 1.25 | 2 | mA | +25°C | |
| DC40b | 1.5 | 2.6 | mA | +85°C | |
| DC40c | 1.5 | 2.6 | mA | +125°C | |
| DC42d | 2.3 | 3 | mA | -40°C | 5.0V 20 MIPS |
| DC42a | 2.3 | 3 | mA | +25°C | |
| DC42b | 2.6 | 3.45 | mA | +85°C | |
| DC42c | 2.6 | 3.85 | mA | +125°C | |
| DC44d | 6.9 | 8 | mA | -40°C | 5.0V 70 MIPS |
| DC44a | 6.9 | 8 | mA | +25°C | |
| DC44b | 7.25 | 8.6 | mA | +85°C | |

Note 1: Base Idle current (IDLE) is measured as follows:

- CPU core is off, oscillator is configured in EC mode and external clock is active, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as outputs and driving low
- $\overline{\text{MCLR}} = \text{VDD}$, WDT and FSCM are disabled
- No peripheral modules are operating or being clocked (defined PMDx bits are all ones)
- The NVMSIDL bit (NVMCON<12>) = 1 (i.e., Flash regulator is set to standby while the device is in Idle mode)
- The VREGSF bit (RCON<11>) = 0 (i.e., Flash regulator is set to standby while the device is in Sleep mode)

2: Data in “Typ.” column is at 5.0V, +25°C unless otherwise stated.

dsPIC33EVXXXGM00X/10X FAMILY

TABLE 30-8: DC CHARACTERISTICS: POWER-DOWN CURRENT (IPD)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | |
|---|---------------------|------|---|------------|
| Parameter No. | Typ. ⁽²⁾ | Max. | Units | Conditions |
| Power-Down Current (IPD) – dsPIC33EVXXXGM00X/10X⁽¹⁾ | | | | |
| DC60d | 9.25 | 30 | μA | -40°C |
| DC60a | 15.75 | 35 | μA | +25°C |
| DC60b | 67.75 | 250 | μA | +85°C |
| DC60c | 270 | 750 | μA | +125°C |
| DC61d | 1 | 7 | μA | -40°C |
| DC61a | 1.25 | 8 | μA | +25°C |
| DC61b | 3.5 | 12 | μA | +85°C |
| DC61c | 5 | 15 | μA | +125°C |

Note 1: IPD (Sleep) current is measured as follows:

- CPU core is off, oscillator is configured in EC mode and external clock is active, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as outputs and driving low
- $\overline{\text{MCLR}} = V_{\text{DD}}$, WDT and FSCM are disabled
- All peripheral modules are disabled (PMDx bits are all ones)
- The VREGS bit (RCON<8>) = 0 (i.e., core regulator is set to standby while the device is in Sleep mode)
- The VREGSF bit (RCON<11>) = 0 (i.e., Flash regulator is set to standby while the device is in Sleep mode)

2: Data in “Typ.” column is at 5.0V, +25°C unless otherwise stated.

3: The Δ current is the additional current consumed when the module is enabled. This current should be added to the base IPD current.

| Param No. | Symbol | Characteristic | Min. | Typ. ⁽¹⁾ | Max. | Units | Conditions |
| DI10 | V _{IL} | Input Low Voltage I/O Pins | V _{SS} | — | 0.2 V _{DD} | V | |
| DI20 | V _{IH} | Input High Voltage I/O Pins | 0.75 V _{DD} | — | 5.5 | V | |
| DI30 | ICNPU | Change Notification Pull-up Current | 200 | 375 | 600 | μA | V _{DD} = 5.0V, V _{PIN} = V _{SS} |
| DI31 | ICNPD | Change Notification Pull-Down Current⁽⁷⁾ | 175 | 400 | 625 | μA | V _{DD} = 5.0V, V _{PIN} = V _{DD} |
| DI50 | I _{IL} | Input Leakage Current^(2,3) I/O Pins | -100 | — | 100 | nA | V _{SS} ≤ V _{PIN} ≤ V _{DD} , pin at high-impedance |
| DI55 | $\overline{\text{MCLR}}$ | | -700 | — | 700 | nA | V _{SS} ≤ V _{PIN} ≤ V _{DD} |
| DI56 | OSC1 | | -200 | — | 200 | nA | V _{SS} ≤ V _{PIN} ≤ V _{DD} , XT and HS modes |
| DI60a | I _{ICL} | Input Low Injection Current | 0 | — | -5 ^(4,6) | | All pins except V _{DD} , V _{SS} , AV _{DD} , AV _{SS} , $\overline{\text{MCLR}}$, V _{CAP} and RB7 |
| DI60b | I _{ICH} | Input High Injection Current | 0 | — | +5 ^(5,6) | mA | All pins except V _{DD} , V _{SS} , AV _{DD} , AV _{SS} , $\overline{\text{MCLR}}$, V _{CAP} , RB7 and all 5V tolerant pins ⁽⁵⁾ |
| DI60c | ΣI _{ICT} | Total Input Injection Current (sum of all I/O and control pins) | -20 ⁽⁷⁾ | — | +20 ⁽⁷⁾ | | Absolute instantaneous sum of all ± input injection currents from all I/O pins (I _{ICL} + I _{ICH}) ≤ ΣI _{ICT} |

Note 1: Data in “Typ.” column is at 5.0V, +25°C unless otherwise stated.

2: The leakage current on the $\overline{\text{MCLR}}$ pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current can be measured at different input voltages.

3: Negative current is defined as current sourced by the pin.

4: V_{IL} source < (V_{SS} – 0.3). Characterized but not tested.

5: Digital 5V tolerant pins cannot tolerate any “positive” input injection current from input sources > 5.5V.

6: Non-zero injection currents can affect the ADC results by approximately 4-6 counts.

7: Any number and/or combination of I/O pins not excluded under I_{ICL} or I_{ICH} conditions are permitted, provided the mathematical “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.

dsPIC33EVXXGM00X/10X FAMILY

TABLE 30-11: DC CHARACTERISTICS: I/O PIN OUTPUT SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended | | | | |
|--------------------|--------|--|---|------|------|-------|----------------------------|
| Param. | Symbol | Characteristic | Min. ⁽¹⁾ | Typ. | Max. | Units | Conditions |
| DO16 | VOL | Output Low Voltage 4x Sink Driver Pins ⁽²⁾ | — | — | 0.4 | V | IOL = 8.8 mA, VDD = 5.0V |
| DO10 | VOL | Output Low Voltage 8x Sink Driver Pins ⁽³⁾ | — | — | 0.4 | V | IOL = 10.8 mA, VDD = 5.0V |
| DO26 | VOH | Output High Voltage 4x Sink Driver Pins ⁽²⁾ | VDD – 0.6 | — | — | V | IOH = -8.3 mA, VDD = 5.0V |
| DO20 | VOH | Output High Voltage 8x Sink Driver Pins | VDD – 0.6 | — | — | V | IOH = -12.3 mA, VDD = 5.0V |

- Note 1:** Parameters are characterized, but not tested.
Note 2: Includes all I/O pins that are not 8x sink driver pins (see below).
Note 3: Includes pins, such as RA3, RA4 and RB<15:10> for 28-pin devices, RA3, RA4, RA9 and RB<15:10> for 44-pin devices and RA4, RA7, RA9, RB<15:10> and RC15 for 64-pin devices.

TABLE 30-12: ELECTRICAL CHARACTERISTICS: BOR

| DC CHARACTERISTICS | | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended | | | | |
|--------------------|--------|--|---|-------|------|-------|---|
| Param No. | Symbol | Characteristic | Min. ⁽¹⁾ | Typ. | Max. | Units | Conditions |
| BO10 | VBOR | BOR Event on VDD Transition High-to-Low | 4.15 | 4.285 | 4.4 | V | VDD (see Note 2 , Note 3 and Note 4) |

- Note 1:** Parameters are for design guidance only and are not tested in manufacturing.
Note 2: The VBOR specification is relative to the VDD.
Note 3: The device is functional at VBORMIN < VDD < VDDMIN. Analog modules: ADC, op amp/comparator and comparator voltage reference will have degraded performance. Device functionality is tested but not characterized.
Note 4: The start-up VDD must rise above 4.6V.

dsPIC33EVXXGM00X/10X FAMILY

TABLE 30-13: DC CHARACTERISTICS: PROGRAM MEMORY

| DC CHARACTERISTICS | | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|-----------------------------|--------|-----------------------------------|---|---------------------|-------|-------|--|
| Param No. | Symbol | Characteristic | Min. | Typ. ⁽¹⁾ | Max. | Units | Conditions |
| Program Flash Memory | | | | | | | |
| D130 | EP | Cell Endurance | 10,000 | — | — | E/W | -40°C to +125°C |
| D131 | VPR | VDD for Read | 4.5 | — | 5.5 | V | |
| D132b | VPEW | VDD for Self-Timed Write | 4.5 | — | 5.5 | V | |
| D134 | TRETD | Characteristic Retention | 20 | — | — | Year | Provided no other specifications are violated, -40°C to +125°C |
| D135 | IDDP | Supply Current During Programming | — | 10 | — | mA | |
| D136a | TRW | Row Write Cycle Time | 0.657 | — | 0.691 | ms | TRW = 4965 FRC cycles, TA = +85°C (see Note 2) |
| D136b | TRW | Row Write Cycle Time | 0.651 | — | 0.698 | ms | TRW = 4965 FRC cycles, TA = +125°C (see Note 2) |
| D137a | TPE | Page Erase Time | 19.44 | — | 20.44 | ms | TPE = 146893 FRC cycles, TA = +85°C (see Note 2) |
| D137b | TPE | Page Erase Time | 19.24 | — | 20.65 | ms | TPE = 146893 FRC cycles, TA = +125°C (see Note 2) |
| D138a | Tww | Word Write Cycle Time | 45.78 | — | 48.15 | µs | Tww = 346 FRC cycles, TA = +85°C (see Note 2) |
| D138b | Tww | Word Write Cycle Time | 45.33 | — | 48.64 | µs | Tww = 346 FRC cycles, TA = +125°C (see Note 2) |

Note 1: Data in “Typ.” column is at 5.0V, +25°C unless otherwise stated.

2: Other conditions: FRC = 7.3728 MHz, TUN<5:0> = b' 0111111 (for Min), TUN<5:0> = b' 100000 (for Max). This parameter depends on the FRC accuracy (see [Table 30-20](#)) and the value of the FRC Oscillator Tuning register.

TABLE 30-14: ELECTRICAL CHARACTERISTICS: INTERNAL BAND GAP REFERENCE VOLTAGE

| DC CHARACTERISTICS | | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|--------|-------------------------------------|---|------|------|-------|------------|
| Param No. | Symbol | Characteristic | Min. | Typ. | Max. | Units | Conditions |

FIGURE 30-1: LOAD CONDITIONS FOR DEVICE TIMING SPECIFICATIONS

TABLE 30-16: CAPACITIVE LOADING REQUIREMENTS ON OUTPUT PINS

| Param No. | Symbol | Characteristic | Min. | Typ. | Max. | Units | Conditions |
|-----------|--------|-----------------------|------|------|------|-------|---|
| DO50 | Cosco | OSC2 Pin | — | — | 15 | pF | In XT and HS modes, when external clock is used to drive OSC1 |
| DO56 | Cio | All I/O Pins and OSC2 | — | — | 50 | pF | EC mode |
| DO58 | CB | SCLx, SDAx | — | — | 400 | pF | In I ² C mode |

dsPIC33EVXXXGM00X/10X FAMILY

FIGURE 30-2: EXTERNAL CLOCK TIMING

TABLE 30-17: EXTERNAL CLOCK TIMING REQUIREMENTS

| AC CHARACTERISTICS | | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|---------------|--|---|---------------------|--------------|------------|-------------------------------|
| Param No. | Sym | Characteristic | Min. | Typ. ⁽¹⁾ | Max. | Units | Conditions |
| OS10 | FIN | External CLKI Frequency (External clocks allowed only in EC and ECPLL modes) | DC | — | 40 | MHz | EC |
| | | Oscillator Crystal Frequency | 3.5 10 | — — | 10 25 | MHz MHz | XT HS |
| OS20 | Tosc | Tosc = 1/Fosc | 12.5 | — | DC | ns | TA = +125°C |
| OS25 | Tcy | Instruction Cycle Time ⁽²⁾ | 25 | — | DC | ns | TA = +125°C |
| OS30 | TosL, TosH | External Clock in (OSC1) High or Low Time | 0.375 x TOSC | — | 0.625 x TOSC | ns | EC |
| OS31 | TosR, TosF | External Clock in (OSC1) Rise or Fall Time | — | — | 20 | ns | EC |
| OS40 | TckR | CLKO Rise Time ⁽³⁾ | — | 5.2 | — | ns | |
| OS41 | TckF | CLKO Fall Time ⁽³⁾ | — | 5.2 | — | ns | |
| OS42 | GM | External Oscillator Transconductance ⁽⁴⁾ | — | 12 | — | mA/V | HS, VDD = 5.0V, TA = +25°C |
| | | | — | 6 | — | mA/V | XT, VDD = 5.0V, TA = +25°C |

Note 1: Data in “Typ.” column is at 5.0V, +25°C unless otherwise stated.

2: Instruction cycle period (Tcy) equals two times the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type, under standard operating conditions, with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at “Minimum” values with an external clock applied to the OSC1 pin. When an external clock input is used, the “Maximum” cycle time limit is “DC” (no clock) for all devices.

3: Measurements are taken in EC mode. The CLKO signal is measured on the OSC2 pin.

4: This parameter is characterized but not tested in manufacturing.

dsPIC33EVXXGM00X/10X FAMILY

TABLE 30-18: PLL CLOCK TIMING SPECIFICATIONS

| AC CHARACTERISTICS | | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|--------|---|--|---------------------|------|-------|--------------------|
| Param No. | Symbol | Characteristic | Min. | Typ. ⁽¹⁾ | Max. | Units | Conditions |
| OS50 | FPLLI | PLL Voltage Controlled Oscillator (VCO) Input Frequency Range | 0.8 | — | 8.0 | MHz | ECPLL, XTPLL modes |
| OS51 | FSYS | On-Chip VCO System Frequency | 120 | — | 340 | MHz | |
| OS52 | TLOCK | PLL Start-up Time (Lock Time) | 0.9 | 1.5 | 3.1 | ms | |
| OS53 | DCLK | CLKO Stability (Jitter) ⁽²⁾ | -3 | 0.5 | 3 | % | |

Note 1: Data in “Typ.” column is at 5.0V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: This jitter specification is based on clock cycle-by-clock cycle measurements. To get the effective jitter for individual time bases or communication clocks used by the application, use the following formula:

$$\text{Effective Jitter} = \frac{DCLK}{\sqrt{\frac{FOSC}{\text{Time Base or Communication Clock}}}}$$

For example, if Fosc = 120 MHz and the SPI bit rate = 10 MHz, the effective jitter is as follows:

$$\text{Effective Jitter} = \frac{DCLK}{\sqrt{\frac{120}{10}}} = \frac{DCLK}{\sqrt{12}} = \frac{DCLK}{3.464}$$

TABLE 30-19: INTERNAL FRC ACCURACY

| AC CHARACTERISTICS | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | | |
|---|----------------|--|------|------|-------|---------------------|----------------|
| Param No. | Characteristic | Min. | Typ. | Max. | Units | Conditions | |
| Internal FRC Accuracy @ FRC Frequency = 7.37 MHz⁽¹⁾ | | | | | | | |
| F20a | FRC | -1 | 0.5 | +1 | % | -40°C ≤ TA ≤ +85°C | VDD = 4.5-5.5V |
| F20b | FRC | -2 | 1 | +2 | % | -40°C ≤ TA ≤ +125°C | VDD = 4.5-5.5V |

Note 1: Frequency calibrated at +25°C and 5.0V. TUN<5:0> bits can be used to compensate for temperature drift.

TABLE 30-20: INTERNAL LPRC ACCURACY

| AC CHARACTERISTICS | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | | |
|--|----------------|--|------|------|-------|---------------------|----------------|
| Param No. | Characteristic | Min. | Typ. | Max. | Units | Conditions | |
| LPRC @ 32.768 kHz⁽¹⁾ | | | | | | | |
| F21a | LPRC | -15 | 5 | +15 | % | -40°C ≤ TA ≤ +85°C | VDD = 4.5-5.5V |
| F21b | LPRC | -30 | 10 | +30 | % | -40°C ≤ TA ≤ +125°C | VDD = 4.5-5.5V |

Note 1: Change of LPRC frequency as VDD changes.

- 2:** Because DMA transfers use the CPU data bus, this time is dependent on other functions on the bus.

dsPIC33EVXXGM00X/10X FAMILY

NOTES:

31.0 HIGH-TEMPERATURE ELECTRICAL CHARACTERISTICS

This section provides an overview of the dsPIC33EVXXXGM00X/10X family electrical characteristics for devices operating in an ambient temperature range of -40°C to +150°C.

The specifications between -40°C to +150°C are identical to those shown in [Section 30.0 “Electrical Characteristics”](#) for operation between -40°C to +125°C, with the exception of the parameters listed in this section.

Parameters in this section begin with an H, which denotes High temperature. For example, Parameter [DC10](#) in [Section 30.0 “Electrical Characteristics”](#) is the Industrial and Extended temperature equivalent of [HDC10](#).

Absolute maximum ratings for the dsPIC33EVXXXGM00X/10X family high-temperature devices are listed below. Exposure to these maximum rating conditions for extended periods can affect device reliability. Functional operation of the device at these, or any other conditions above the parameters indicated in the operation listings of this specification, is not implied.

Absolute Maximum Ratings⁽¹⁾

| | |
|--|-----------------|
| Ambient temperature under bias ⁽²⁾ | -40°C to +150°C |
| Storage temperature | -65°C to +160°C |
| Voltage on VDD with respect to VSS | -0.3V to +6.0V |
| Maximum current out of VSS pin | 350 mA |
| Maximum current into VDD pin ⁽³⁾ | 350 mA |
| Maximum junction temperature | +155°C |
| Maximum current sunk by any I/O pin | 20 mA |
| Maximum current sourced by I/O pin | 18 mA |
| Maximum current sunk by all ports combined | 200 mA |
| Maximum current sourced by all ports combined ⁽³⁾ | 200 mA |

Note 1: Stresses above those listed under “Absolute Maximum Ratings” can cause permanent damage to the device. This is a stress rating only, and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods can affect device reliability.

2: AEC-Q100 reliability testing for devices intended to operate at +150°C is 1,000 hours. Any design in which the total operating time from +125°C to +150°C will be greater than 1,000 hours is not warranted without prior written approval from Microchip Technology Inc.

3: Maximum allowable current is a function of device maximum power dissipation (see [Table 31-2](#)).

dsPIC33EVXXGM00X/10X FAMILY

31.1 High-Temperature DC Characteristics

TABLE 31-1: OPERATING MIPS vs. VOLTAGE

| Characteristic | VDD Range (in Volts) | Temperature Range (in °C) | Max MIPS |
|----------------|-------------------------------|---------------------------|-----------------------------|
| | | | dsPIC33EVXXGM00X/10X Family |
| HDC5 | 4.5V to 5.5V ^(1,2) | -40°C to +150°C | 40 |

Note 1: Device is functional at $V_{BORMIN} < V_{DD} < V_{DDMIN}$. Analog modules, such as the ADC, op amp/comparator and comparator voltage reference, will have degraded performance. Device functionality is tested but is not characterized. Refer to Parameter **BO10** in [Table 30-12](#) for the minimum and maximum BOR values.

2: When BOR is enabled, the device will work from 4.7V to 5.5V.

TABLE 31-2: THERMAL OPERATING CONDITIONS

| Rating | Symbol | Min | Typ | Max | Unit |
|--|--------|---------------------------|-----|------|------|
| High-Temperature Devices | | | | | |
| Operating Junction Temperature Range | TJ | -40 | — | +155 | °C |
| Operating Ambient Temperature Range | TA | -40 | — | +150 | °C |
| Power Dissipation: Internal Chip Power Dissipation: $P_{INT} = V_{DD} \times (I_{DD} - \Sigma I_{OH})$ I/O Pin Power Dissipation: $I/O = \Sigma (\{V_{DD} - V_{OH}\} \times I_{OH}) + \Sigma (V_{OL} \times I_{OL})$ | PD | PINT + PI/O | | | W |
| Maximum Allowed Power Dissipation | PDMAX | $(T_J - T_A)/\theta_{JA}$ | | | W |

TABLE 31-3: DC TEMPERATURE AND VOLTAGE SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions (see Note 3): 4.5V to 5.5V (unless otherwise stated) Operating temperature $-40^\circ\text{C} \leq T_A \leq +150^\circ\text{C}$ for High Temperature | | | | |
|--------------------------|--------|--|--|---------------------|------|-------|---|
| Param No. | Symbol | Characteristic | Min. | Typ. ⁽¹⁾ | Max. | Units | Conditions |
| Operating Voltage | | | | | | | |
| HDC10 | VDD | Supply Voltage⁽³⁾ | VBOR | — | 5.5 | V | |
| HDC12 | VDR | RAM Data Retention Voltage⁽²⁾ | 1.8 | — | — | V | |
| HDC16 | VPOR | VDD Start Voltage to Ensure Internal Power-on Reset Signal | — | — | VSS | V | |
| HDC17 | SVDD | VDD Rise Rate to Ensure Internal Power-on Reset Signal | 1.0 | — | — | V/ms | 0V-5.0V in 5 ms |
| HDC18 | VCORE | VDD Core Internal Regulator Voltage | 1.62 | 1.8 | 1.98 | V | Voltage is dependent on load, temperature and VDD |

Note 1: Data in “Typ.” column is at 5.0V, +25°C unless otherwise stated.

2: This is the limit to which VDD may be lowered without losing RAM data.

3: VDD voltage must remain at VSS for a minimum of 200 μs to ensure POR.

TABLE 31-8: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature | | | | |
|--------------------|-------------------|---|---|---------------------|---------------------|-------|--|
| Param No. | Symbol | Characteristic | Min. | Typ. ⁽¹⁾ | Max. | Units | Conditions |
| DI10 | V _{IL} | Input Low Voltage Any I/O Pins | V _{SS} | — | 0.2 V _{DD} | V | |
| DI20 | V _{IH} | Input High Voltage I/O Pins | 0.75 V _{DD} | — | 5.5 | V | |
| DI30 | IC _{NPU} | Change Notification Pull-up Current | 200 | 375 | 600 | μA | V _{DD} = 5.0V, V _{PIN} = V _{SS} |
| DI31 | IC _{NPD} | Change Notification Pull-Down Current⁽⁷⁾ | 175 | 400 | 625 | μA | V _{DD} = 5.0V, V _{PIN} = V _{DD} |
| DI50 | I _{IL} | Input Leakage Current^(2,3) I/O Pins | -200 | — | 200 | nA | V _{SS} ≤ V _{PIN} ≤ V _{DD} , pin at high-impedance |
| DI55 | | $\overline{\text{MCLR}}$ | -1.5 | — | 1.5 | μA | V _{SS} ≤ V _{PIN} ≤ V _{DD} |
| DI56 | | OSC1 | -300 | — | 300 | nA | V _{SS} ≤ V _{PIN} ≤ V _{DD} , XT and HS modes |
| DI60a | I _{ICL} | Input Low Injection Current | 0 | — | -5 ^(4,6) | mA | All pins except V _{DD} , V _{SS} , AV _{DD} , AV _{SS} , $\overline{\text{MCLR}}$, V _{CAP} and RB7 |
| DI60b | I _{ICH} | Input High Injection Current | 0 | — | +5 ^(5,6) | mA | All pins except V _{DD} , V _{SS} , AV _{DD} , AV _{SS} , $\overline{\text{MCLR}}$, V _{CAP} , RB7 and all 5V tolerant pins ⁽⁵⁾ |
| DI60c | ∑I _{ICT} | Total Input Injection Current (sum of all I/O and control pins) | -20 ⁽⁷⁾ | — | +20 ⁽⁷⁾ | mA | Absolute instantaneous sum of all ± input injection currents from all I/O pins (I _{ICL} + I _{ICH}) ≤ ∑I _{ICT} |

- Note 1:** Data in “Typ.” column is at 5.0V, +25°C unless otherwise stated.
- 2:** The leakage current on the $\overline{\text{MCLR}}$ pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current can be measured at different input voltages.
- 3:** Negative current is defined as current sourced by the pin.
- 4:** V_{IL} source < (V_{SS} – 0.3). Characterized but not tested.
- 5:** Digital 5V tolerant pins cannot tolerate any “positive” input injection current from input sources > 5.5V.
- 6:** Non-zero injection currents can affect the ADC results by approximately 4-6 counts.
- 7:** Any number and/or combination of I/O pins not excluded under I_{ICL} or I_{ICH} conditions are permitted, provided the mathematical “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.

dsPIC33EVXXGM00X/10X FAMILY

TABLE 31-9: DC CHARACTERISTICS: I/O PIN OUTPUT SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature | | | | |
|--------------------|--------|--|--|------|------|-------|----------------------------|
| Param No. | Symbol | Characteristic | Min. ⁽¹⁾ | Typ. | Max. | Units | Conditions |
| HDO16 | VOL | Output Low Voltage 4x Sink Driver Pins ⁽²⁾ | — | — | 0.4 | V | IOL = 8.8 mA, VDD = 5.0V |
| HDO10 | VOL | Output Low Voltage 8x Sink Driver Pins ⁽³⁾ | — | — | 0.4 | V | IOL = 10.8 mA, VDD = 5.0V |
| HDO26 | VOH | Output High Voltage 4x Sink Driver Pins ⁽²⁾ | VDD – 0.6 | — | — | V | IOH = -8.3 mA, VDD = 5.0V |
| HDO20 | VOH | Output High Voltage 8x Sink Driver Pins | VDD – 0.6 | — | — | V | IOH = -12.3 mA, VDD = 5.0V |

Note 1: Parameters are characterized but not tested.

2: Includes all I/O pins that are not 8x sink driver pins (see below).

3: Includes the pins, such as RA3, RA4 and RB<15:10> for 28-pin devices, RA3, RA4, RA9 and RB<15:10> for 44-pin devices, and RA4, RA7, RA9, RB<15:10> and RC15 for 64-pin devices.

TABLE 31-10: ELECTRICAL CHARACTERISTICS: BOR

| DC CHARACTERISTICS | | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature | | | | |
|--------------------|--------|--|--|-------|------|-------|---|
| Param No. | Symbol | Characteristic | Min. ⁽¹⁾ | Typ. | Max. | Units | Conditions |
| HBO10 | VBOR | BOR Event on VDD Transition High-to-Low | 4.15 | 4.285 | 4.4 | V | VDD (see Note 2 , Note 3 and Note 4) |

Note 1: Parameters are for design guidance only and are not tested in manufacturing.

2: The VBOR specification is relative to the VDD.

3: The device is functional at VBORMIN < VDD < VDDMIN. Analog modules: ADC, op amp/comparator and comparator voltage reference will have degraded performance. Device functionality is tested but is not characterized.

4: The start-up VDD must rise above 4.6V.

TABLE 31-11: DC CHARACTERISTICS: PROGRAM MEMORY

| DC CHARACTERISTICS | | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature | | | | |
|--------------------|--------|---|--|------|------|-------|--|
| Param No. | Symbol | Characteristic ⁽¹⁾ | Min. | Typ. | Max. | Units | Conditions |
| HD130 | EP | Program Flash Memory Cell Endurance | 10,000 | — | — | E/W | -40°C to $+150^{\circ}\text{C}$ ⁽²⁾ 1000 E/W cycles or less and no other specifications are violated |
| HD134 | TRETD | Characteristic Retention | 20 | — | — | Year | |

Note 1: These parameters are assured by design, but are not characterized or tested in manufacturing.

2: Programming of the Flash memory is allowed up to $+150^{\circ}\text{C}$.

dsPIC33EVXXGM00X/10X FAMILY

31.2 AC Characteristics and Timing Parameters

The information contained in this section defines the dsPIC33EVXXGM00X/10X family AC characteristics and timing parameters for high-temperature devices. However, all AC timing specifications in this section are the same as those in [Section 30.2 “AC Characteristics and Timing Parameters”](#), with the exception of the parameters listed in this section.

Parameters in this section begin with an H, which denotes High temperature. For example, Parameter OS53 in [Section 30.2 “AC Characteristics and Timing Parameters”](#) is the Industrial and Extended temperature equivalent of HOS53.

TABLE 31-12: TEMPERATURE AND VOLTAGE SPECIFICATIONS – AC

| | |
|---------------------------|--|
| AC CHARACTERISTICS | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ Operating voltage VDD range as described in Table 31-1 . |
|---------------------------|--|

FIGURE 31-1: LOAD CONDITIONS FOR DEVICE TIMING SPECIFICATIONS

dsPIC33EVXXGM00X/10X FAMILY

TABLE 31-13: PLL CLOCK TIMING SPECIFICATIONS

| AC CHARACTERISTICS | | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ | | | | |
|--------------------|--------|---|--|---------------------|------|-------|--------------------|
| Param No. | Symbol | Characteristic | Min. | Typ. ⁽¹⁾ | Max. | Units | Conditions |
| HOS50 | FPLLI | PLL Voltage Controlled Oscillator (VCO) Input Frequency Range | 0.8 | — | 8.0 | MHz | ECPLL, XTPLL modes |
| HOS51 | FSYS | On-Chip VCO System Frequency | 120 | — | 340 | MHz | |
| HOS52 | TLOCK | PLL Start-up Time (Lock Time) | 0.9 | 1.5 | 3.1 | ms | |
| HOS53 | DCLK | CLKO Stability (Jitter) ⁽²⁾ | -3 | 0.5 | 3 | % | |

Note 1: Data in “Typ.” column is at 5.0V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: This jitter specification is based on clock cycle-by-clock cycle measurements. To get the effective jitter for individual time bases or communication clocks used by the application, use the following formula:

$$\text{Effective Jitter} = \frac{DCLK}{\sqrt{\frac{FOSC}{\text{Time Base or Communication Clock}}}}$$

For example, if Fosc = 120 MHz and the SPI bit rate = 10 MHz, the effective jitter is as follows:

$$\text{Effective Jitter} = \frac{DCLK}{\sqrt{\frac{120}{10}}} = \frac{DCLK}{\sqrt{12}} = \frac{DCLK}{3.464}$$

TABLE 31-14: INTERNAL FRC ACCURACY

| AC CHARACTERISTICS | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ | | | | |
|---|----------------|---|-----|-----|-------|---|
| Param No. | Characteristic | Min | Typ | Max | Units | Conditions |
| Internal FRC Accuracy @ FRC Frequency = 7.3728 MHz | | | | | | |
| HF20C | FRC | -3 | 1 | +3 | % | $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ VDD = 4.5V to 5.5V |

TABLE 31-15: INTERNAL LPRC ACCURACY

| AC CHARACTERISTICS | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ | | | | |
|--|----------------|---|-----|-----|-------|---|
| Param No. | Characteristic | Min | Typ | Max | Units | Conditions |
| LPRC @ 32.768 kHz^(1,2) | | | | | | |
| HF21C | LPRC | -30 | 10 | +30 | % | $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ VDD = 4.5V to 5.5V |

Note 1: Change of LPRC frequency as VDD changes.

2: LPRC accuracy impacts the Watchdog Timer Time-out Period (TWDT1). See [Section 27.5 “Watchdog Timer \(WDT\)”](#) for more information.

TABLE 31-16: CTMU CURRENT SOURCE SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 4.5V to 5.5V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ | | | | |
|----------------------------|--------|--|--|-------|------|---------------|---|
| Param No. | Symbol | Characteristic ⁽¹⁾ | Min. | Typ. | Max. | Units | Conditions |
| CTMU Current Source | | | | | | | |
| HCTMUI1 | IOUT1 | Base Range | — | 550 | — | nA | CTMUICON<9.8> = 01 |
| HCTMUI2 | IOUT2 | 10x Range | — | 5.5 | — | μA | CTMUICON<9.8> = 10 |
| HCTMUI3 | IOUT3 | 100x Range | — | 55 | — | μA | CTMUICON<9.8> = 11 |
| HCTMUI0 | IOUT4 | 1000x Range | — | 550 | — | μA | CTMUICON<9.8> = 00 |
| HCTMUFV1 | VF | Temperature Diode Forward Voltage ⁽²⁾ | — | 0.525 | — | V | $T_A = +25^{\circ}\text{C}$, CTMUICON<9.8> = 01 |
| | | | — | 0.585 | — | V | $T_A = +25^{\circ}\text{C}$, CTMUICON<9.8> = 10 |
| | | | — | 0.645 | — | V | $T_A = +25^{\circ}\text{C}$, CTMUICON<9.8> = 11 |

Note 1: Normal value at center point of current trim range (CTMUICON<15:10> = 000000).

2: Parameters are characterized but not tested in manufacturing. Measurements are taken with the following conditions:

- $V_{REF} = AV_{DD} = 5.0\text{V}$
- ADC module configured for 10-bit mode
- ADC module configured for conversion speed of 500 ksp/s
- All PMDx bits are cleared (PMDx = 0)
- CPU executing

```
while(1)
{
  NOP();
}
```
- Device operating from the FRC with no PLL

34.0 PACKAGING INFORMATION

34.1 Package Marking Information

28-Lead SPDIP (.300")

Example

28-Lead SOIC (.300")

Example

28-Lead SSOP

Example

28-Lead QFN-S (6x6x0.9 mm)

Example

| | | |
|----------------|---|--|
| Legend: | XX...X | Customer-specific information |
| | Y | Year code (last digit of calendar year) |
| | YY | Year code (last 2 digits of calendar year) |
| | WW | Week code (week of January 1 is week '01') |
| | NNN | Alphanumeric traceability code |
| Note: | In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information. | |

dsPIC33EVXXXGM00X/10X FAMILY

34.1 Package Marking Information (Continued)

44-Lead TQFP (10x10x1 mm)

Example

44-Lead QFN (8x8 mm)

Example

64-Lead TQFP (10x10x1 mm)

Example

64-Lead QFN (9x9x0.9 mm)

Example

dsPIC33EVXXGM00X/10X FAMILY

34.2 Package Details

The following sections give the technical details of the packages.

28-Lead Skinny Plastic Dual In-Line (SP) – 300 mil Body [SPDIP]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

| Dimension Limits | Units | INCHES | | |
|----------------------------|-------|----------|-------|-------|
| | | MIN | NOM | MAX |
| Number of Pins | N | 28 | | |
| Pitch | e | .100 BSC | | |
| Top to Seating Plane | A | – | – | .200 |
| Molded Package Thickness | A2 | .120 | .135 | .150 |
| Base to Seating Plane | A1 | .015 | – | – |
| Shoulder to Shoulder Width | E | .290 | .310 | .335 |
| Molded Package Width | E1 | .240 | .285 | .295 |
| Overall Length | D | 1.345 | 1.365 | 1.400 |
| Tip to Seating Plane | L | .110 | .130 | .150 |
| Lead Thickness | c | .008 | .010 | .015 |
| Upper Lead Width | b1 | .040 | .050 | .070 |
| Lower Lead Width | b | .014 | .018 | .022 |
| Overall Row Spacing § | eB | – | – | .430 |

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. § Significant Characteristic.
3. Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed .010" per side.
4. Dimensioning and tolerancing per ASME Y14.5M.

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

| | | Units | MILLIMETERS | | |
|--------------------------|----|-------|-------------|-----|------|
| Dimension Limits | | | MIN | NOM | MAX |
| Number of Pins | N | | 28 | | |
| Pitch | e | | 1.27 BSC | | |
| Overall Height | A | - | - | - | 2.65 |
| Molded Package Thickness | A2 | 2.05 | - | - | - |
| Standoff § | A1 | 0.10 | - | - | 0.30 |
| Overall Width | E | | 10.30 BSC | | |
| Molded Package Width | E1 | | 7.50 BSC | | |
| Overall Length | D | | 17.90 BSC | | |
| Chamfer (Optional) | h | 0.25 | - | - | 0.75 |
| Foot Length | L | 0.40 | - | - | 1.27 |
| Footprint | L1 | | 1.40 REF | | |
| Lead Angle | θ | 0° | - | - | - |
| Foot Angle | φ | 0° | - | - | 8° |
| Lead Thickness | c | 0.18 | - | - | 0.33 |
| Lead Width | b | 0.31 | - | - | 0.51 |
| Mold Draft Angle Top | α | 5° | - | - | 15° |
| Mold Draft Angle Bottom | β | 5° | - | - | 15° |

Notes:

- Pin 1 visual index feature may vary, but must be located within the hatched area.
- § Significant Characteristic
- Dimension D does not include mold flash, protrusions or gate burrs, which shall not exceed 0.15 mm per end. Dimension E1 does not include interlead flash or protrusion, which shall not exceed 0.25 mm per side.
- Dimensioning and tolerancing per ASME Y14.5M
 - BSC: Basic Dimension. Theoretically exact value shown without tolerances.
 - REF: Reference Dimension, usually without tolerance, for information purposes only.
- Datums A & B to be determined at Datum H.

| Overall Length | D | 12.00 BSC | | |
| Molded Package Width | E1 | 10.00 BSC | | |
| Molded Package Length | D1 | 10.00 BSC | | |
| Lead Thickness | c | 0.09 | - | 0.20 |
| Lead Width | b | 0.17 | 0.22 | 0.27 |
| Mold Draft Angle Top | α | 11° | 12° | 13° |
| Mold Draft Angle Bottom | β | 11° | 12° | 13° |

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. Chamfers at corners are optional; size may vary.
3. Dimensions D1 and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.25mm per side.
4. Dimensioning and tolerancing per ASME Y14.5M

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

REF: Reference Dimension, usually without tolerance, for information purposes only.

NOTES:

APPENDIX A: REVISION HISTORY

Revision A (December 2013)

This is the initial version of this document.

Revision B (June 2014)

This revision incorporates the following updates:

- Sections:
 - Added [Section 31.0 “High-Temperature Electrical Characteristics”](#)
 - Updated the “[Power Management](#)” section, the “[Input/Output](#)” section, [Section 3.3 “Data Space Addressing”](#), [Section 4.2 “Data Address Space”](#), [Section 4.3.2 “Extended X Data Space”](#), [Section 4.6.1 “Bit-Reversed Addressing Implementation”](#), [Section 7.4.1 “INTCON1 through INTCON4”](#), [Section 11.7 “I/O Helpful Tips”](#)
 - Updated note in [Section 17.0 “High-Speed PWM Module”](#), [Section 18.0 “Serial Peripheral Interface \(SPI\)”](#), [Section 27.8 “Code Protection and CodeGuard™ Security”](#)
 - Updated title of [Section 20.0 “Single-Edge Nibble Transmission \(SENT\)”](#)
 - Updated [Section 34.0 “Packaging Information”](#). Deleted e3, Pb-free and Industrial (I) temperature range indication throughout the section, and updated the packaging diagrams
 - Updated the “[Product Identification System](#)” section
- Registers:
 - Updated [Register 3-2](#), [Register 7-2](#), [Register 7-6](#), [Register 9-2](#), [Register 11-3](#), [Register 14-1](#), [Register 14-3](#), [Register 14-11](#), [Register 15-1](#), [Register 22-4](#)
- Figures:
 - Added [Figure 4-6](#), [Figure 4-8](#), [Figure 4-14](#), [Figure 4-15](#), [Figure 14-1](#), [Figure 16-1](#), [Figure 17-2](#), [Figure 23-1](#), [Figure 24-1](#)
- Tables:
 - Updated [Table 1](#), [Table 27-1](#), [Table 27-2](#), [Table 30-6](#), [Table 30-7](#), [Table 30-8](#), [Table 30-9](#), [Table 30-10](#), [Table 30-11](#), [Table 30-12](#), [Table 30-38](#), [Table 30-50](#), [Table 30-53](#) and added [Table 31-11](#),
- Changes to text and formatting were incorporated throughout the document

Revision C (November 2014)

This revision incorporates the following updates:

- Sections:
 - Added note in [Section 5.2 “RTSP Operation”](#)
 - Updated “[Section 5.4 “Error Correcting Code \(ECC\)”](#)”
 - Deleted 44-Terminal Very Thin Leadless Array Package (TL) - 6x6x0.9 mm Body With Exposed Pad (VTLA).
- Registers
 - Updated [Register 7-6](#)
- Figures:
 - Updated [Figure 4-1](#), [Figure 4-3](#), [Figure 4-4](#)
- Tables:
 - Updated [Table 27-2](#), [Table 31-13](#), [Table 31-14](#), [Table 31-15](#)
 - Added [Table 31-16](#), [Table 31-17](#)

Revision D (April 2015)

This revision incorporates the following updates:

- Sections:
 - Updated the Clock Management, Timers/ Output Compare/Input Capture, Communication Interfaces and Input/Output sections at the beginning of the data sheet ([Page 1](#) and [Page 2](#)).
 - Updated all pin diagrams at the beginning of the data sheet ([Page 4](#) through [Page 9](#)).
 - Added [Section 11.6 “High-Voltage Detect \(HVD\)”](#)
 - Updated [Section 13.0 “Timer2/3 and Timer4/5”](#)
 - Corrects all Buffer heading numbers in [Section 22.4 “CAN Message Buffers”](#)
- Registers
 - Updated [Register 3-2](#), [Register 25-2](#), [Register 26-2](#)
- Figures
 - Updated [Figure 26-1](#), [Figure 30-5](#), [Figure 30-32](#)
- Tables
 - Updated [Table 1](#), [Table 4-25](#), [Table 30-10](#), [Table 30-22](#), [Table 30-53](#) and [Table 31-8](#)
- Changes to text and formatting were incorporated throughout the document

dsPIC33EVXXGM00X/10X FAMILY

Revision E (September 2016)

This revision incorporates the following updates:

- Sections:
 - Added new [Section 32.0 “Characteristics for Industrial/Extended Temperature Devices \(-40°C to +125°C\)”](#) and [Section 33.0 “Characteristics for High-Temperature Devices \(+150°C\)”](#).
 - Updated the [Qualification and Class B Support](#) section.
 - Updated [Section 27.6 “In-Circuit Serial Programming”](#).
 - Updated [Section 34.0 “Packaging Information”](#) with the addition of the 28-Lead SSOP package information and new packaging diagram revisions.
 - Updated the [“Product Identification System”](#) section with the addition of the 28-Lead SSOP package.
- Figures:
 - Updated [Figure 4-6](#).
- Registers:
 - Updated [Register 25-2](#), [Register 25-3](#), [Register 27-1](#) and [Register 27-2](#).
- Tables:
 - Updated [Table 30-7](#), [Table 30-9](#), [Table 30-39](#), [Table 30-40](#), [Table 30-41](#), [Table 30-42](#), [Table 30-43](#), [Table 30-44](#) and [Table 30-45](#).

INDEX

A

| | |
|--|----------|
| Absolute Maximum Ratings | 341 |
| AC Characteristics | 351 |
| 10-Bit ADC Conversion Requirements | 401 |

NOTES:

THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: <http://microchip.com/support>

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELoC® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
