

MAX16052/MAX16053

High-Voltage, Adjustable Sequencing/Supervisory Circuits

General Description

The MAX16052/MAX16053 are a family of small, low-power, high-voltage monitoring circuits with sequencing capability. These miniature devices offer very wide flexibility with an adjustable voltage threshold and an external capacitor-adjustable time delay. These devices are ideal for use in power-supply sequencing, reset sequencing, and power switching applications. Multiple devices can be cascaded for complex sequencing applications.

A high-impedance input (IN) with a 0.5V threshold allows an external resistive-divider to set the monitored threshold. The output (OUT) asserts high when the input voltage rises above the 0.5V threshold and the enable input (EN) is asserted high. When the voltage at IN falls below 0.495V or when the enable input is de-asserted (EN = low), the output deasserts (OUT = low). The devices provide a capacitor programmable delay time from when the voltage at IN rises above 0.5V to when the output is asserted.

The MAX16052 offers an active-high open-drain output while the MAX16053 offers an active-high push-pull output. Both devices operate from a 2.25V to 28V supply voltage and feature an active-high enable input. The MAX16052/MAX16053 are available in a tiny 6-pin SOT23 package and are fully specified over the automotive temperature range (-40°C to +125°C).

Benefits and Features

- Less External Circuitry Results in Smaller Solution Size
 - Open-Drain (28V Tolerant) Output Allows Interfacing to 12V Intermediate Bus Voltage
 - Operates from V_{CC} of 2.25V to 28V
 - Small 6-Pin SOT23 Package
- Ideal for Use in Power-Supply Sequencing, Reset Sequencing, and Power-Switching Applications
 - Active-High Logic-Enable Input
 - 1.8% Accurate Adjustable Threshold Over Temperature
- Fully Specified from -40°C to +125°C for Reliability in Extreme Temperatures
- Low Supply Current (18 μ A typ) Reduces Power Consumption

Applications

- Medical Equipment
- Intelligent Instruments
- Portable Equipment
- Computers/Servers
- Critical μ P Monitoring
- Set-Top Boxes
- Telecom

Typical Operating Circuit

Absolute Maximum Ratings

(All voltages referenced to GND.)

V_{CC}.....-0.3V to +30V
 OUT (push-pull, MAX16053).....-0.3V to (V_{CC} + 0.3V)
 OUT (open-drain, MAX16052).....-0.3V to +30V
 EN, IN-0.3V to (V_{CC} + 0.3V)
 CDELAY.....-0.3V to +6V
 Input/Output Current (all pins).....±20mA

Continuous Power Dissipation (T_A = +70°C)
 6-Pin SOT23 (derate 8.7mW/°C above +70°C).....695.7mW
 Operating Temperature Range-40°C to +125°C
 Junction Temperature.....+150°C
 Storage Temperature Range-65°C to +150°C
 Lead Temperature (soldering, 10s)+300°C
 Soldering Temperature (reflow)+260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Electrical Characteristics

(V_{CC} = 2.25V to 28V, V_{EN} = V_{CC}, T_A = T_J = -40°C to +125°C, unless otherwise specified. Typical values are at V_{CC} = 3.3V and T_A = +25°C.) (Note 1)

| | | | | MAX16053, $C_{CDELAY} = 0.047\mu F$ | | 190 | | |

Note 1: All devices are production tested at $T_A = +25^{\circ}C$. Limits over temperature are guaranteed by design.

Note 2: When V_{CC} falls below the UVLO threshold, the outputs deassert (OUT goes low). When V_{CC} falls below 1.2V, the output state cannot be determined.

Note 3: During the initial power-up, V_{CC} must exceed 2.25V for at least 0.5ms before OUT can go high.

Figure 1. MAX16052/MAX16053 Timing Diagram (C_{DELAY} = 0)

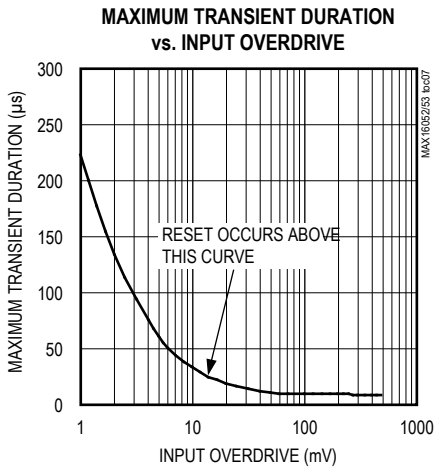

Typical Operating Characteristics

($V_{CC} = 3.3V$ and $T_A = +25^\circ C$, unless otherwise noted.)

Typical Operating Characteristics (continued)

($V_{CC} = 3.3V$ and $T_A = +25^\circ C$, unless otherwise noted.)

Pin Configuration

Pin Description

| PIN | NAME | FUNCTION |
|-----|--------------------|--|
| 1 | EN | Active-High Logic-Enable Input. Drive EN low to immediately de-assert the output to its false state (OUT = low) independent of V _{IN} . With V _{IN} above V _{TH} , drive EN high to assert the output to its true state (OUT = high) after the adjustable delay period. Connect EN to V _{CC} , if not used. |
| 2 | GND | Ground |
| 3 | IN | High-Impedance Monitor Input. Connect IN to an external resistive-divider to set the desired monitor threshold. The output changes state when V _{IN} rises above 0.5V and when V _{IN} falls below 0.495V. |
| 4 | OUT | Active-High Sequencer/Monitor Output. Open-drain (MAX16052) or push-pull (MAX16053). OUT is asserted to its true state (OUT = high) when V _{IN} is above V _{TH} and the enable input is in its true state (EN = high) after the capacitor-adjusted delay period. OUT is de-asserted to its false state (OUT = low) immediately after V _{IN} drops below 0.495V or the enable input is in its false state (EN = low). The MAX16052 open-drain output requires an external pullup resistor. |
| 5 | V _{CC} | Supply Voltage Input. Connect a 2.25V to 28V supply to V _{CC} to power the device. For noisy systems, bypass with a 0.1μF ceramic capacitor to GND. |
| 6 | C _{DELAY} | Capacitor-Adjustable Delay Input. Connect an external capacitor (C _{DELAY}) from C _{DELAY} to GND to set the IN-to-OUT and EN-to-OUT delay period. For V _{IN} rising, t _{DELAY} = (C _{DELAY} × 4.0 × 10 ⁶) + 30μs. For EN rising, t _{PROP} = (C _{DELAY} × 4.0 × 10 ⁶) + 14μs. |

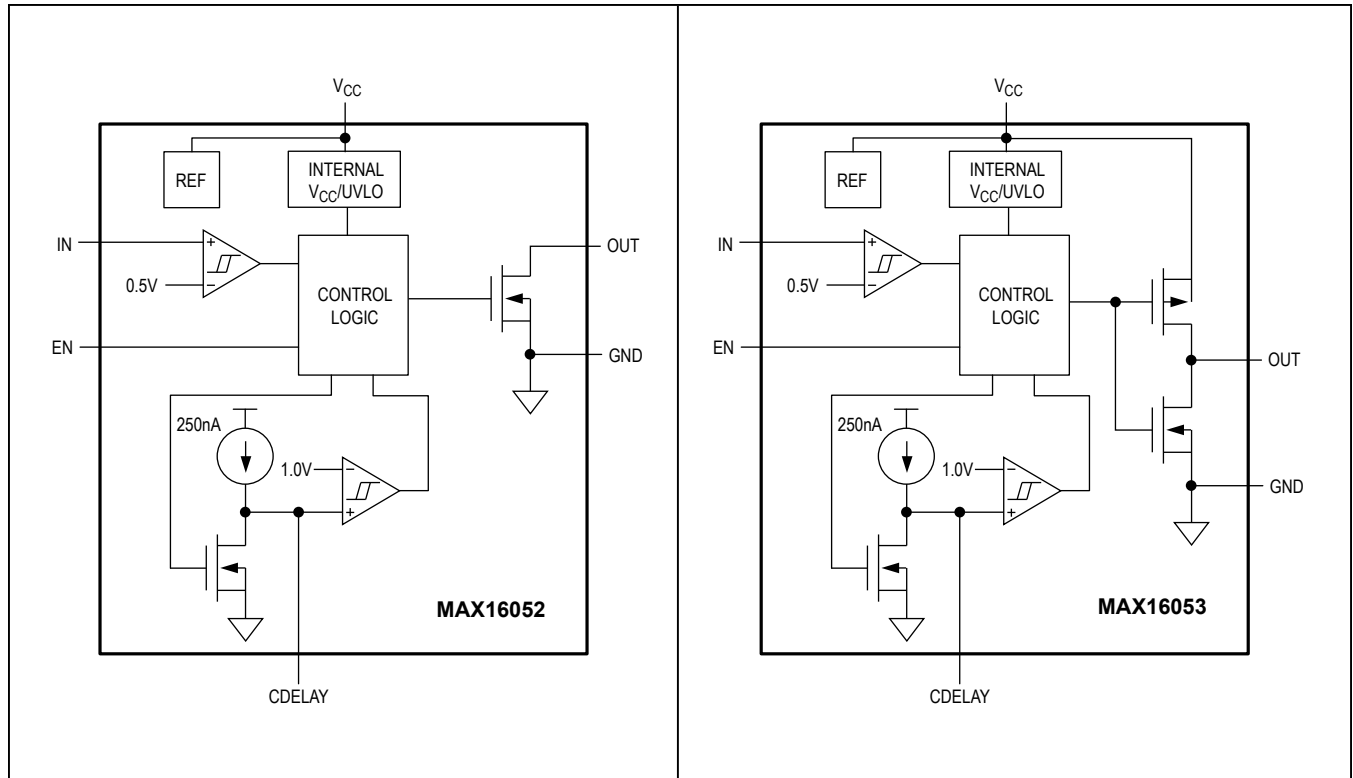

Figure 2. Simplified Functional Diagram

Detailed Description

The MAX16052/MAX16053 family of high-voltage, sequencing/supervisory circuits provide adjustable voltage monitoring for inputs down to 0.5V. These devices are ideal for use in power-supply sequencing, reset sequencing, and power-switching applications. Multiple devices can be cascaded for complex sequencing applications.

The MAX16052/MAX16053 perform voltage monitoring using a high-impedance input (IN) with an internally fixed 0.5V threshold. When the voltage at IN falls below 0.5V or when the enable input is de-asserted (EN = low) OUT goes low. When V_{IN} rises above 0.5V and the enable input is asserted (EN = high), OUT goes high after a capacitor-adjustable time delay.

With V_{IN} above 0.5V, the enable input can be used to turn on or off the output. [Table 1](#) details the output state depending on the various input and enable conditions.

Table 1. MAX16052/MAX16053

| IN | EN | OUT |
|-------------------|------|---------------------------------|
| $V_{IN} < V_{TH}$ | Low | Low |
| $V_{IN} < V_{TH}$ | High | Low |
| $V_{IN} < V_{TH}$ | Low | Low |
| $V_{IN} > V_{TH}$ | High | OUT = High Impedance (MAX16052) |
| | | OUT = V_{CC} (MAX16053) |

Supply Input (VCC)

The device operates with a V_{CC} supply voltage from 2.25V to 28V. In order to maintain a 1.8% accurate threshold at IN, V_{CC} must be above 2.25V. When V_{CC} falls below the UVLO threshold, the output deasserts low. When V_{CC} falls below 1.2V, the output state is not guaranteed. For noisy systems, connect a 0.1µF ceramic capacitor from V_{CC} to GND as close to the device as possible.

Monitor Input (IN)

Connect the center point of a resistive-divider to IN to monitor external voltages (see R1 and R2 of [Figure 4](#)). IN has a rising threshold of $V_{TH} = 0.5V$ and a falling threshold of $0.495V$ (5mV hysteresis). When V_{IN} rises above V_{TH} and EN is high, OUT goes high after the adjustable t_{DELAY} period. When V_{IN} falls below $0.495V$, OUT goes low after a $18\mu s$ delay. IN has a maximum input current of $60nA$, so large value resistors are permitted without adding significant error to the resistive-divider.

Adjustable Delay (CDELAY)

When V_{IN} rises above V_{TH} with EN high, the internal $250nA$ current source begins charging an external capacitor connected from C_{DELAY} to GND. When the voltage at C_{DELAY} reaches $1V$, the output asserts (OUT goes high). When the output asserts, C_{DELAY} is immediately discharged. Adjust the delay (t_{DELAY}) from when V_{IN} rises above V_{TH} (with EN high) to OUT going high according to the equation:

$$t_{DELAY} = C_{DELAY} \times (4 \times 10^6 \Omega) + (30\mu s)$$

where t_{DELAY} is in seconds and C_{DELAY} is in Farads.

Enable Input (EN)

The MAX16052/MAX16053 offer an active-high enable input (EN). With V_{IN} above V_{TH} , drive EN high to force OUT high after the capacitor-adjustable delay time. The EN-to-OUT delay time (t_{PROP}) can be calculated from when EN goes above the EN threshold using the equation:

$$t_{PROP} = C_{DELAY} \times (4 \times 10^6 \Omega) + (14\mu s)$$

where t_{PROP} is in seconds and C_{DELAY} is in Farads. Drive EN low to force OUT low within $300ns$ for the MAX16052 and within $400ns$ for the MAX16053.

Output (OUT)

The MAX16052 offers an active-high, open-drain output while the MAX16053 offers an active-high push-pull output. The push-pull output is referenced to V_{CC} . The open-drain output requires a pullup resistor and can be pulled up to $28V$.

Applications Information

Input Threshold

The MAX16052/MAX16053 monitor the voltage on IN with an external resistive-divider ([Figure 4](#)). R1 and R2 can have very high values to minimize current consumption due to low IN leakage currents ($60nA$ max). Set R2 to

some conveniently high value ($200k\Omega$ for $\pm 1\%$ additional variation in threshold, for example) and calculate R1 based on the desired monitored voltage using the following formula:

$$R1 = R2 \times \left[\frac{V_{MONITOR}}{V_{TH}} - 1 \right]$$

where $V_{MONITOR}$ is the desired monitored voltage and V_{TH} is the reset input threshold ($0.5V$).

Pullup Resistor Values (MAX16052 Only)

The exact value of the pullup resistor for the open-drain output is not critical, but some consideration should be made to ensure the proper logic levels when the device is sinking current. For example, if $V_{CC} = 2.25V$ and the pullup voltage is $28V$, keep the sink current less than $0.5mA$ as shown in the *Electrical Characteristics* table. As a result, the pullup resistor should be greater than $56k\Omega$. For a $12V$ pullup, the resistor should be larger than $24k\Omega$. Note that the ability to sink current is dependent on the V_{CC} supply voltage.

Ensuring a Valid OUT Down to $V_{CC} = 0V$ (Push-Pull OUT)

In applications in which OUT must be valid down to $V_{CC} = 0V$, add a pulldown resistor between OUT and GND for the push-pull output (MAX16053). The resistor sinks any stray leakage currents, holding OUT low ([Figure 3](#)). The value of the pulldown resistor is not critical; $100k\Omega$ is large enough not to load OUT and small enough to pull OUT to ground. The external pulldown cannot be used with the open-drain OUT output.

Figure 3. Ensuring OUT Valid to $V_{CC} = 0V$

Typical Application Circuits

Figure 4 through Figure 6 show typical applications for the MAX16052/MAX16053. Figure 4 shows the MAX16052 used with a pMOSFET in an overvoltage protection circuit. Figure 5 shows the MAX16053 in a low-voltage sequencing application using an nMOSFET. Figure 6 shows the MAX16053 used in a multiple output sequencing application.

Using an n-Channel Device for Sequencing

In higher power applications, using an n-channel device reduces the loss across the MOSFET as it offers a lower drain-to-source on-resistance. However, an nMOSFET

requires a sufficient V_{GS} voltage to fully enhance it for a low R_{DS_ON} . The application shown in Figure 5 shows the MAX16053 in a switch sequencing application using an nMOSFET.

Similarly, if a higher voltage is present in the system, the open-drain version can be used in the same manner.

Power-Supply Bypassing

In noisy applications, bypass V_{CC} to ground with a $0.1\mu F$ capacitor as close to the device as possible. The additional capacitor improves transient immunity. For fast-rising V_{CC} transients, additional capacitors may be required.

Maxim Integrated cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim Integrated product. No circuit patent licenses are implied. Maxim Integrated reserves the right to change the circuitry and specifications without notice at any time. The parametric values (min and max limits) shown in the *Electrical Characteristics* table are guaranteed. Other parametric values quoted in this data sheet are provided for guidance.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
