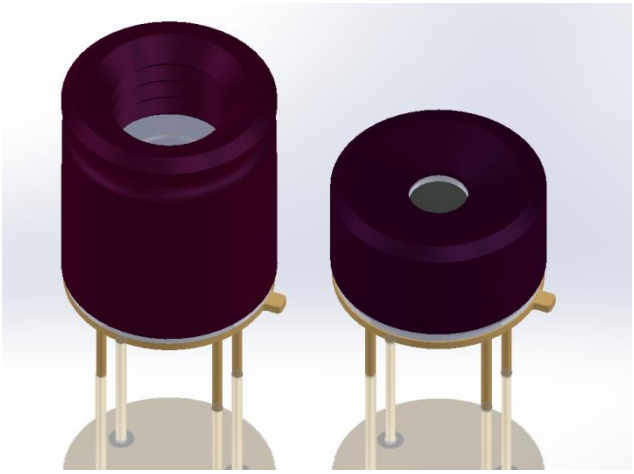
# MLX90641 16x12 IR array

Datasheet

## 1. Features and Benefits

- Small size, low cost 16x12 pixels IR array
- Easy to integrate
- Industry standard four lead TO39 package
- Factory calibrated
- Noise Equivalent Temperature Difference (NETD) 0.1K @4Hz refresh rate
- $I^2C$ compatible digital interface
- Programmable refresh rate 0.5Hz…64Hz
- 3.3V supply voltage
- Current consumption ≈ 12mA
- 2 FOV options – 55°x35° and 110°x75°
- Operating temperature -40°C ÷ 125°C
- Target temperature -40°C ÷ 300°C
- Complies with RoHS regulations



## 2. Application Examples

- High precision non-contact temperature measurements
- Microwave ovens
- Intrusion / Movement detection
- Temperature sensing element for residential, commercial and industrial building air conditioning
- Thermal Comfort sensor in automotive Air Conditioning control system
- Passenger classification
- Industrial temperature control of moving parts
- Visual IR thermometers
- Driver SW for MCU available at: https://github.com/melexis/mlx90641-library.git

## 3. Description

The MLX90641 is a fully calibrated 16x12 pixels thermal IR array in an industry standard 4-lead TO39 package with digital interface.
The MLX90641 contains 192 FIR pixels. An ambient sensor is integrated to measure the ambient temperature of the chip and supply sensor to measure the VDD. The outputs of all sensors IR, Ta and VDD are stored in internal RAM and are accessible through $I^2C$.

# 6. Pin Definitions and Descriptions

| Pin # | Name | Description |
|---|---|---|
| 1 | SDA | $I^2C$ serial data (input / output) |
| 2 | VDD | Positive supply |
| 3 | GND | Negative supply (Ground) |
| 4 | SCL | $I^2C$ serial clock (input only) |

*Table 3 Pin definition*

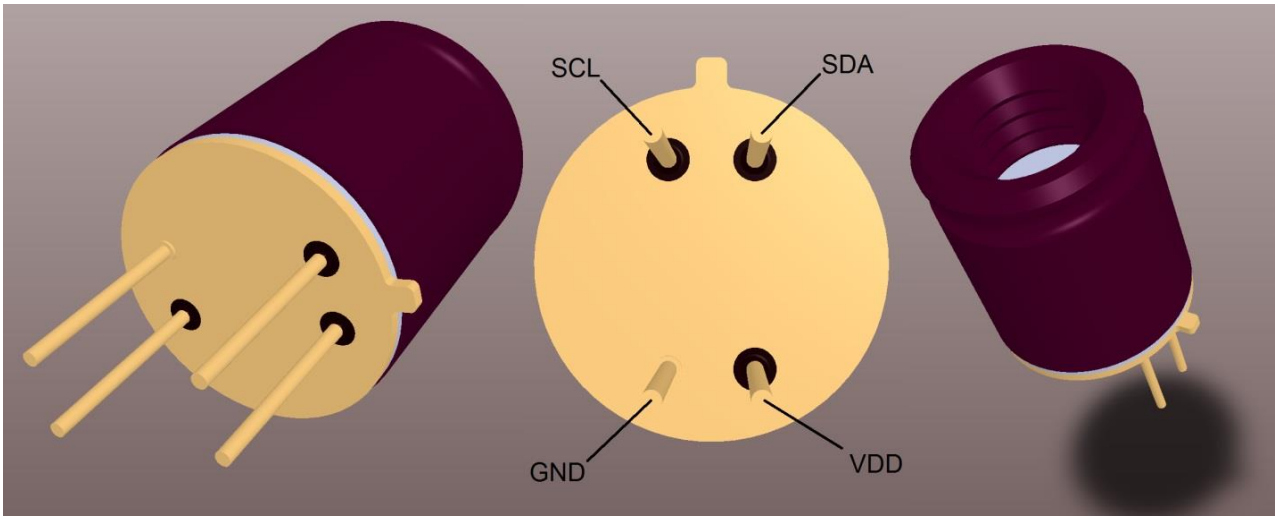

*Figure 2 MLX90641 Overview and pin description*

# 7. Absolute Maximum Ratings

| Parameter | Symbol | Min. | Typ. | Max. | Unit | Remark |
|---|---|---|---|---|---|---|
| Supply Voltage (over voltage) | $V_{DD}$ | | | 5 | V | |
| Supply Voltage (operating max voltage) | $V_{DD}$ | | | 3.6 | | |
| Reverse Voltage (each pin) | | | | -0.3 | V | |
| Operating Temperature | $T_{AMB}$ | -40 | | +125 | °C | |
| Storage Temperature | $T_{ST}$ | -40 | | +150 | °C | Not in plastic tubes |
| ESD sensitivity (AEC Q100 002) | | 4 | | | kV | |
| SDA DC sink current | | | | 40 | mA | |

*Table 4 Absolute maximum ratings*

Exceeding the absolute maximum ratings may cause permanent damage. Exposure to absolute maximum-rated conditions for extended periods may affect device reliability.

# 8. General Electrical Specifications

| Electrical Parameter | Symbol | Min. | Typ. | Max. | Unit | Condition |
|---|---|---|---|---|---|---|
| Supply Voltage | $V_{DD}$ | 3 | 3.3 | 3.6 | V | |
| Supply Current | $I_{DD}$ | 10 | 12 | 14 | mA | |
| POR level up analog | $V_{POR_UP}$ | 2.2 | | 2.6 | V | VDD rising |
| POR level down analog | $V_{POR_DOWN}$ | | | 2.55 | V | VDD falling |
| POR hysteresis | $V_{POR_hys}$ | | 50 | | mV | |
| $I^2C$ address(NOTE 3) | | 0x01 | 0x33 (default) | 0x7F | | |
| Input high voltage (SDA, SCL) | $V_{IH}$ | $0.7*V_{DD}$ | | | V | Over Ta and $V_{DD}$ |
| Input low voltage (SDA, SCL) | $V_{LOW}$ | | | $0.3*V_{DD}$ | V | Over Ta and $V_{DD}$ |
| SDA output low voltage | $V_{OL}$ | | | 0.4 | V | Over Ta and $V_{DD}$ $I_{SINK}$=3mA |
| SDA leakage | $I_{SDA_leak}$ | | | ± 10 | µA | $V_{SDA}$=3.6V, Ta=150°C |
| SCL leakage | $I_{SCL_leak}$ | | | ± 10 | µA | $V_{SCL}$=3.6V, Ta=150°C |
| SDA capacitance | $C_{SDA}$ | | | 10 | pF | |
| SCL capacitance | $C_{SCL}$ | | | 10 | pF | |
| Acknowledge setup time | $T_{SUAC(MD)}$ | | | 0.45 | µs | |
| Acknowledge hold time | $T_{DUAC(MD)}$ | | | 0.45 | µs | |
| Acknowledge setup time | $T_{SUAC(SD)}$ | | | 0.45 | µs | |
| Acknowledge hold time | $T_{DUAC(SD)}$ | | | 0.45 | µs | |
| $I^2C$ clock frequency | $F_{I2C}$ | | 0.4 | 1 | MHz | |
| Erase/write cycles | | | | 10 | times | Ta = 25°C |
| Write cell time | $T_{WRITE}$ | 5 | | | ms | |

*Table 5 Electrical specification*

***NOTE 1**: For best performance it is recommended to keep the supply voltage as accurate and stable as possible to 3.3V ± 0.05V*

***NOTE 2**: When a data in EEPROM cell to be changed an erase (write 0x0000) must be done prior to writing the new value. After each write at least 5ms delay is needed in order to writing process to take place.*

***NOTE 3**: Slave address 0x00 must be avoided.*

***NOTE 4**: According to $I^2C$ standard the max sink current is specified to be 20mA, however due to the thermal considerations (the dissipated power into the driver) the max current is limited to 10mA. This is the only parameter which does not comply with the FM+ specification.*

***NOTE 5**: Max EEPROM $I^2C$ speed operations to be done at 400kHz.*

# 9. False pixel correction

The imager can have up to 1 defective pixel, with either no output or out of specification temperature reading. These pixels are identified in the EEPROM table of the sensor and can be read out through the $I^2C$. The defective pixel result can be replaced by an interpolation of its neighboring pixels.

# 10. Detailed General Description

## 10.1. Pixel position

The array consists of 192 IR sensors (also called pixels). Each pixel is identified with its row and column position as Pix(*i*,*j*) where ***i*** is its row number (from 1 to 12) and ***j*** is its column number (from 1 to 16)

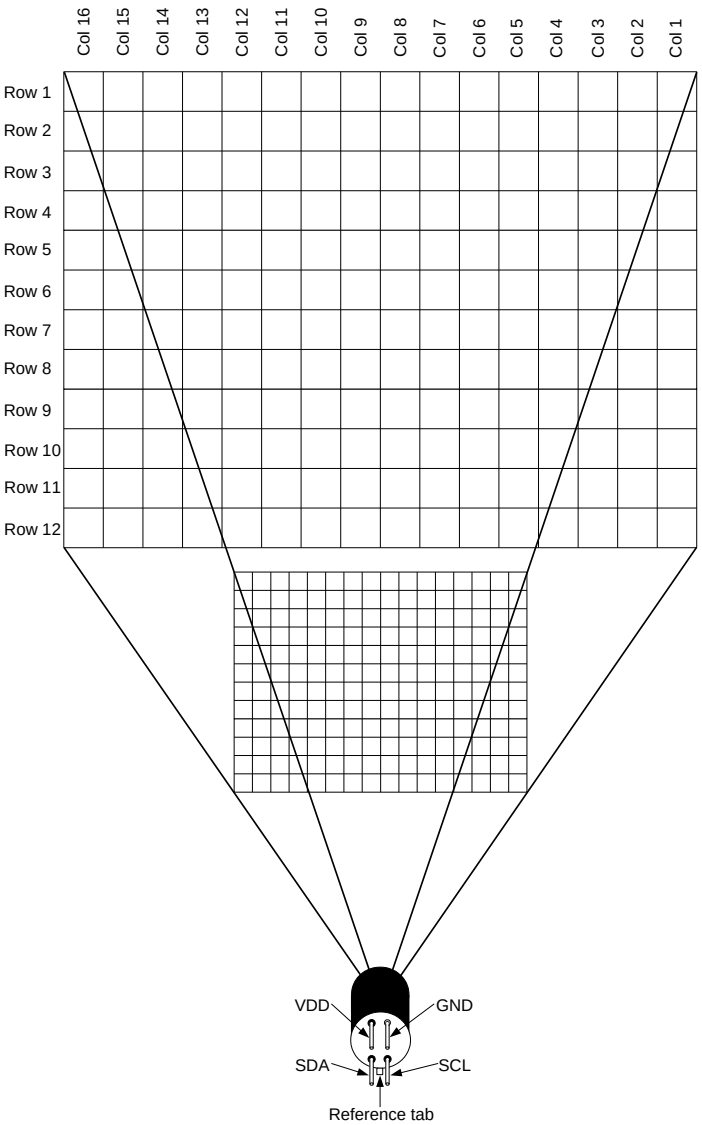

*Figure 3 Pixel in the whole FOV*

# 10.2. Communication protocol

The device use I²C protocol with support of FM+ mode (up to 1MHz clock frequency) and can be only slave on the bus.
The SDA and SCL ports are 5V tolerant and the sensor can be directly connected to a 5V I²C network.
The slave address is programmable and can have up to 127 different slave addresses (SA = 0x00 **must** be avoided).

## 10.2.1. Low level

### 10.2.1.1. Start / Stop conditions

Each communication session is initiated by a START condition and ends with a STOP condition. A START condition is initiated by a HIGH to LOW transition of the SDA while a STOP is generated by a LOW to HIGH transition. Both changes must be done while the SCL is HIGH.

### 10.2.1.2. Device addressing

The master is addressing the slave device by sending a 7-bit slave address after the START condition. The first seven bits are dedicated for the address and the 8th is Read/Write (R/W) bit. This bit indicates the direction of the transfer:

- Read (HIGH) means that the master will read the data from the slave
- Write (LOW) means that the master will send data to the slave

### 10.2.1.3. Acknowledge

During the 9th clock following every byte transfer the transmitter releases the SDA line. The receiver acknowledges (ACK) receiving the byte by pulling SDA line to low or does not acknowledge (NoACK) by letting the SDA 'HIGH'.

### 10.2.1.4. I²C command format

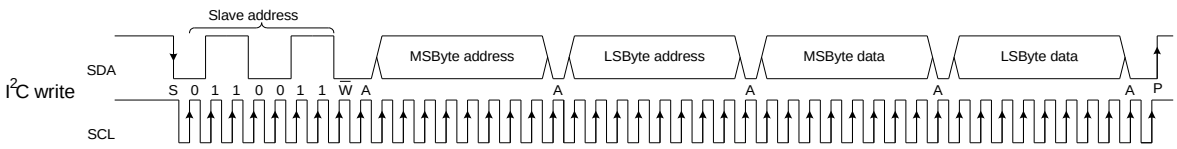

*Figure 4 I²C write command format (default SA=0x33 is used)*

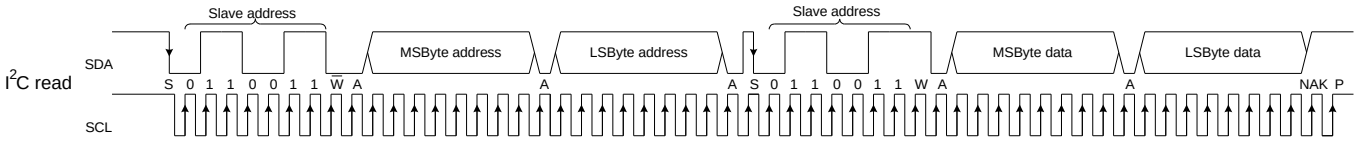

*Figure 5 I²C read command format (default SA=0x33 is used)*

# 10.3. Measurement mode

In this mode the measurements are constantly running. Depending on the selected frame rate Fps in the control register, the data for IR pixels and Ta will be updated in the RAM each $\frac{1}{F_{ps}}$ seconds. In this mode the external microcontroller has full access to the internal registers and memories of the device.

# 10.4. Refresh rate

The refresh rate is configured by “Control register 1” (0x800D) i.e. if “Refresh rate control” = 011 → 4Hz this would mean that each 250ms a new data (full frame) is available in the RAM.

NOTE: It is possible to program the desired refresh rate into device EEPROM eliminating the necessity to reconfigure the device every time it is powered on. The corresponding EEPROM cell is at address 0x240C (see Table 7)

Which subpage is updated is indicated by the “Last measured subpage” field.

It is important both subpages to be read as the necessary information for the Ta calculations is only available by combining the data from both subpages i.e. the Ta is refreshed with refresh rate twice as low as the one set in “Refresh rate control”.

When a new data (subpage) is available a dedicated bit is set to indicate this – bit 3 “New data available in RAM” in “Status register” (0x8000). It is up to the customer to reset the bit once the data is dumped.

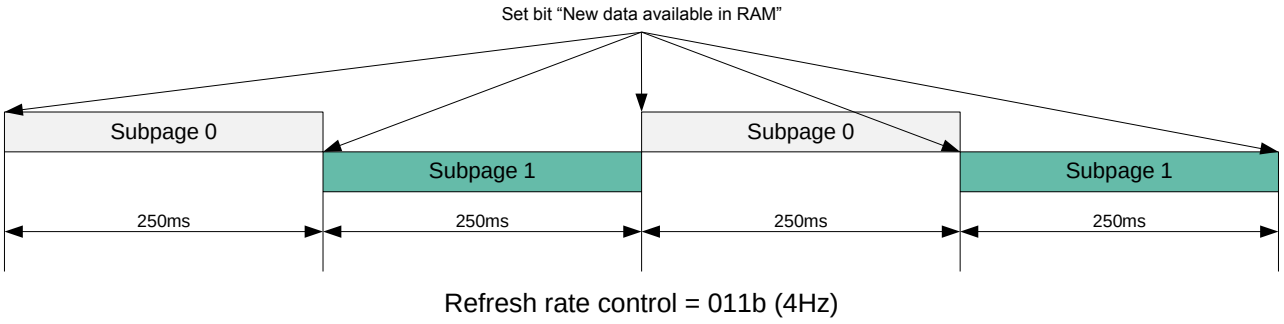

*Figure 6 Refresh rate timing*

# 10.5. Measurement flow

Following measurement flow is recommended:

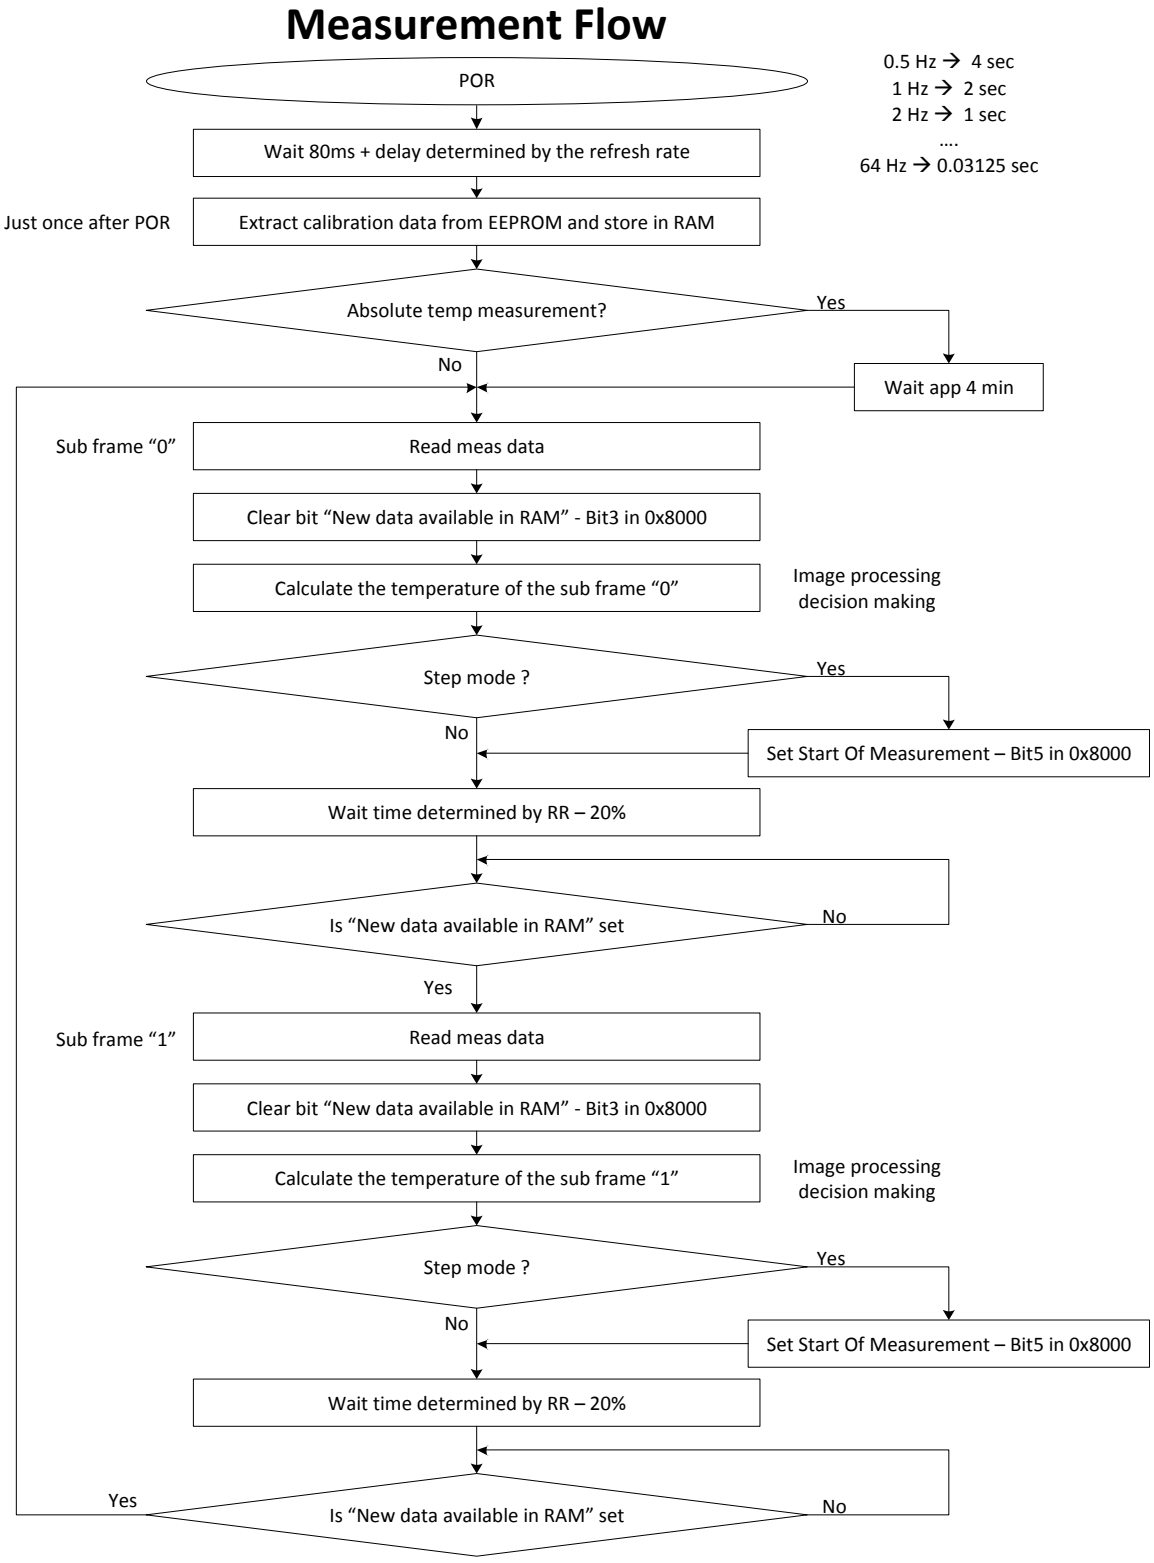

*Figure 7 Recommended measurement flow*

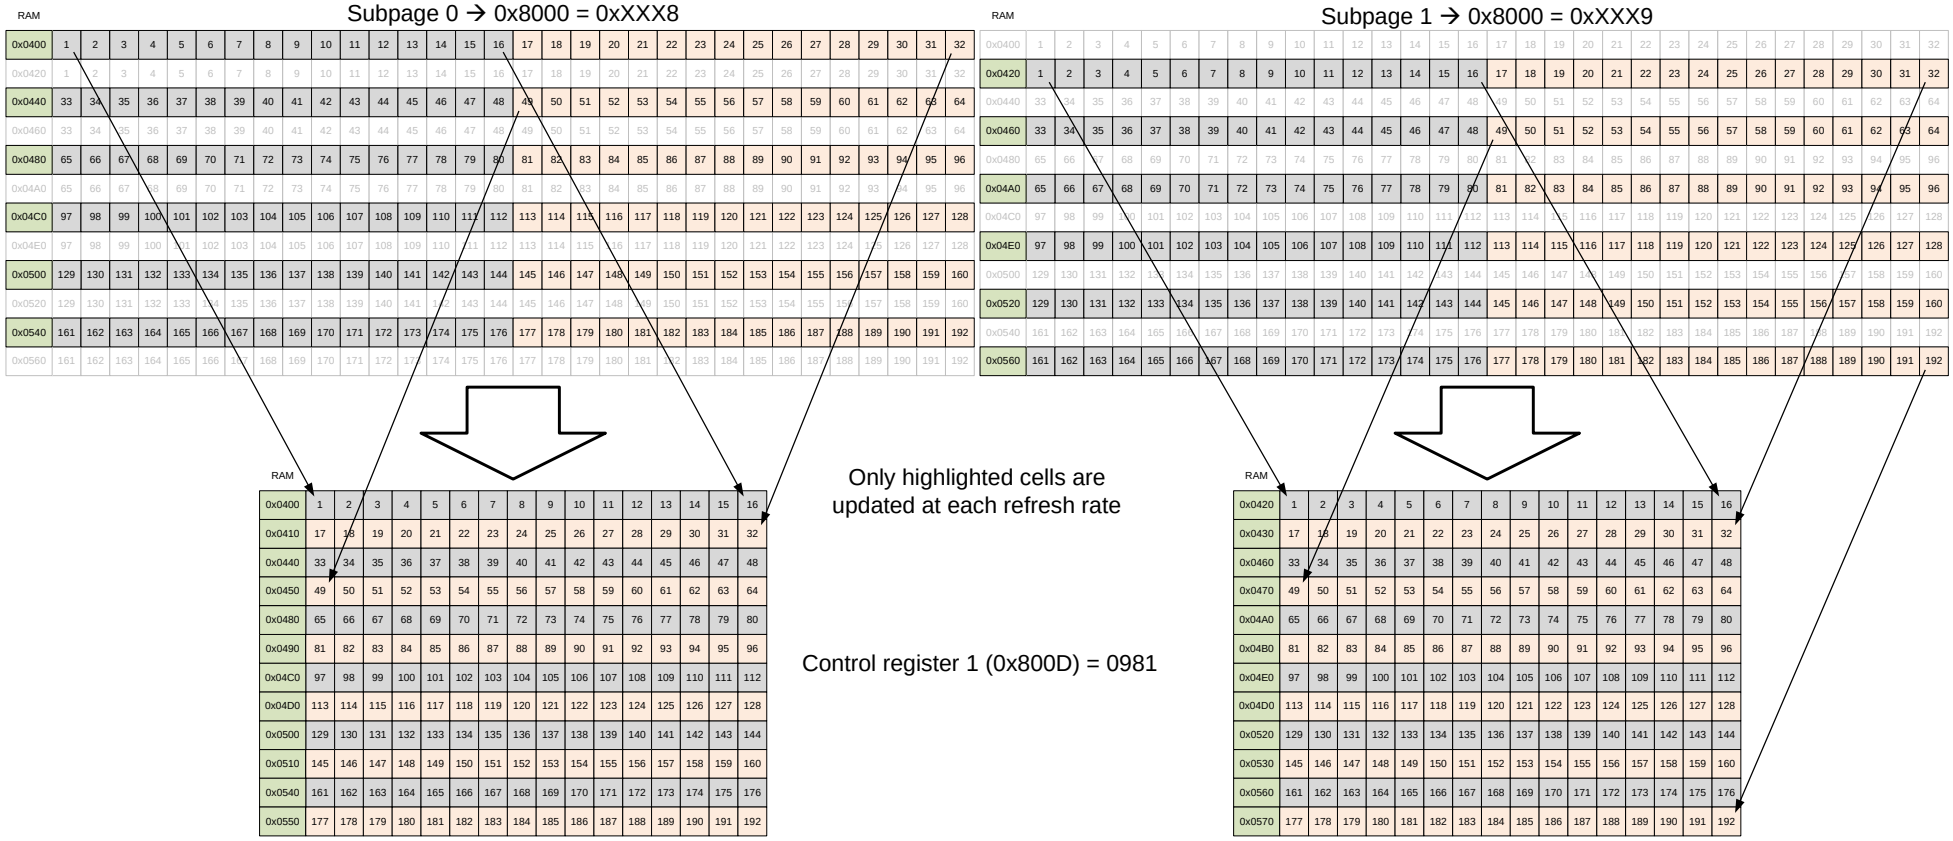

*Figure 8 TV mode reading pattern*

# 10.6. Address map

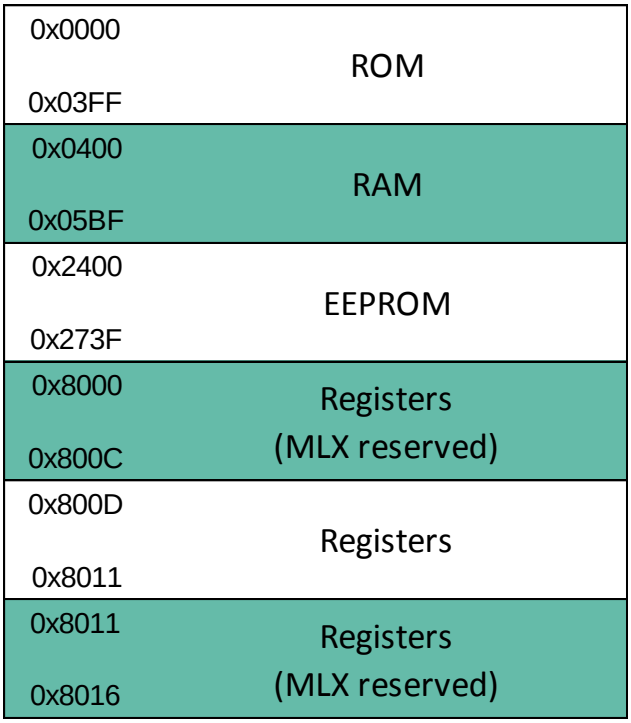

*Figure 9 MXL90641 memory map*

## 10.6.1. Internal registers

There are few internal register that are customer accessible through which the device performance may be customized:

# EEPROM

The EEPROM is used to store the calibration constants and the configuration parameters of the device

| EEPROM address | Access | Meaning |
|---|---|---|
| 0x2400 | Melexis | Melexis reserved |
| 0x2401 | Melexis | Melexis reserved |
| 0x2402 | Melexis | Melexis reserved |
| 0x2403 | Melexis | Configuration register |
| 0x2404 | Melexis | Melexis reserved |
| 0x2405 | Melexis | Melexis reserved |
| 0x2406 | Melexis | Melexis reserved |
| 0x2407 | Melexis | Device ID1 |
| 0x2408 | Melexis | Device ID2 |
| 0x2409 | Melexis | Device ID3 |
| 0x240A | Melexis | Device Options |
| 0x240B | Melexis | Melexis reserved |
| 0x240C | Customer | Control register_1 |
| 0x240D | Customer | Control register_2 |
| 0x240E | Customer | I2CConfReg |
| 0x240F | Customer | Melexis reserved / I2C_Address |

*Table 7 Configuration parameters memory*

After POR the device read dedicated EEPROM cells and transfers their content to into the control and configuration register of the device. This way the device is configured and prepared for operation. The relation between EEPROM and register address is shown here after (explanation of the bit meaning can be found in section 10.6.1 Internal registers):

| EEPROM address | Register address | Access | Name | Data [hex] |
|---|---|---|---|---|
| 0x240C | 0x800D | Customer | Control_register_1 | 0901 |
| 0x240D | 0x800E | Customer | Control_register_2 | 0000 |
| 0x240E | 0x800F | Customer | I2CConfReg | 0000 |
| 0x240F | 0x8010 | Customer | Melexis internal use (8 bit)<br>I2C_Address (8bit) | BE33 |

*Table 9 Calibration parameters memory (EEPROM - bits)*

***NOTE 1**: In case the pixel calibration data stored in EEPROM (Alpha, offset, Kta and Kv) is equal to 0x0000 this means that this particular pixels has failed and the calculation for To should not be trusted and avoided. Depending on the application, the To value for such pixels can be replaced with a default value such as -273.15°C, can be equal to Ta or one calculate an average value from the adjacent pixels.*

***NOTE 2**: The maximum number of deviating pixels is 1 (please check* False pixel correction*)*

# 11. Calculating Object Temperature

## 11.1. Restoring calibration data from EERPOM and calculations

**NOTE**: 1. All data in the EEPROM are coded as two's complement (unless otherwise noted)
2. All EEPROM cells are codded using Hamming code for proper data restoring stored in the 5 most significant bits
3. The calculation bellow are considering only the "valid" data in any particular cell ignoring the Hamming code bits
i.e. as the five significant bits of each word "0" for instance if the EEPROM content is "0x9A44" we will work with "0x0244"
In the example we are restoring calibration data for pixel (6, 9)

The polynom for the Hamming code is as follows:

P0 = D0 + D1 + D3 + D4 + D6 + D8 + D10
P1 = D0 + D2 + D3 + D5 + D6 + D9 + D10
P2 = D1 + D2 + D3 + D7 + D8 + D9 + D10
P3 = D4 + D5 + D6 + D7 + D8 + D9 + D10
P4 = D0 + D1 + D2 + D3 + D4 + D5 + D6 + D7 + D8 + D9 + D10 + P0 + P1 + P2 + P3

Where P4 is the MSBit in the word while D0…D10 are the data bits.

| B15 | B14 | B13 | B12 | B11 | B10 | B9 | B8 | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| P4 | P3 | P2 | P1 | P0 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |

*Figure 15 EEPROM Hamming and data bit meaning*

### 11.1.1. Restoring the VDD sensor parameters and VDD calculations

Following formula is used to calculate the VDD of the sensor:

$$V_{dd} = \frac{Resolution_{corr} * RAM[0x05AA] - V_{dd_{25}}}{K_{Vdd}} + 3.3$$

If $RAM[0x05AA] > 32767 \rightarrow RAM[0x05AA] = RAM[0x05AA] - 65536$

Where:

$K_{Vdd} = EE[0x2427]\ \&\ 0x07FF$

If $K_{Vdd} > 1023 \rightarrow K_{Vdd} = K_{Vdd} - 2048$

$K_{Vdd} = K_{Vdd} * 2^5$

$Vdd_{25} = EE[0x2426]\ \&\ 0x07FF$

If $Vdd_{25} > 1023 \rightarrow Vdd_{25} = Vdd_{25} - 2048$

$Vdd_{25} = Vdd_{25} * 2^5$

Where $Resolution_{corr}$ is restored in 11.1.18

## 11.1.2. Restoring the Ta sensor parameters

Following formula is used to calculate the Ta of the sensor:

$$T_a = \frac{\left(\frac{V_{PTAT_{art}}}{1+K_{V_{PTAT}}*\Delta V} - V_{PTAT_{25}}\right)}{K_{T_{PTAT}}} + 25, °C$$

Where:

$$K_{V_{PTAT}} = EE[0x242B] \,\&\, 0x07FF$$

If $K_{V_{PTAT}} > 1023 \rightarrow K_{V_{PTAT}} = K_{V_{PTAT}} - 2048$

$$K_{V_{PTAT}} = \frac{K_{V_{PTAT}}}{2^{12}}$$

$$K_{T_{PTAT}} = EE[0x242A] \,\&\, 0x07FF$$

If $K_{V_{PTAT}} > 1023 \rightarrow K_{V_{PTAT}} = K_{V_{PTAT}} - 2048$

$$K_{T_{PTAT}} = \frac{K_{T_{PTAT}}}{2^{3}}$$

$$\Delta V = \frac{RAM[0x05AA] - Vdd_{25}}{K_{Vdd}}$$

If $RAM[0x05AA] > 32767 \rightarrow RAM[0x05AA] = RAM[0x05AA] - 65536$

$$V_{PTAT_{25}} = 32 * (EE[0x2428] \,\&\, 0x07FF) + EE[0x2429] \,\&\, 0x07FF \text{ (unsigned)}$$

$$V_{PTAT_{art}} = \left(\frac{V_{PTAT}}{V_{PTAT} * Alpha_{PTAT} + V_{BE}}\right) * 2^{18}$$

Where:

$$V_{PTAT} = RAM[0x05A0]$$

If $V_{PTAT} > 32767 \rightarrow V_{PTAT} = V_{PTAT} - 65536$

$$V_{BE} = RAM[0x0580]$$

If $V_{BE} > 32767 \rightarrow V_{BE} = V_{BE} - 65536$

$$Alpha_{PTAT} = \frac{EE[0x242C] \,\&\, 0x07FF}{2^{7}}$$

## 11.1.3. Restoring the offset

There are two sets of offset data for each subpage.

$$pix_{OS_{ref_SP0}}(i,j) = Offset_{average} + offset_{SP0}(6,9) * 2^{Offset_{scale}}$$

$$pix_{OS_{ref_SP1}}(i,j) = Offset_{average} + offset_{SP1}(6,9) * 2^{Offset_{scale}}$$

$$Offset_{average} = 32 * (EE[0x2411] \,\&\, 0x07FF) + EE[0x2412] \,\&\, 0x07FF$$

If $Offset_{average} > 32767 \rightarrow Offset_{average} = Offset_{average} - 65536$

$$offset_{SP0}(6,9) = EE[0x2498] \,\&\, 0x07FF$$

If $offset_{SP0}(6,9) > 1023 \rightarrow offset_{SP0}(6,9) = offset_{SP0}(6,9) - 2048$

$$offset_{SP1}(6,9) = EE[0x26D8] \,\&\, 0x07FF$$

If $offset_{SP1}(6,9) > 1023 \rightarrow offset_{SP1}(6,9) = offset_{SP1}(6,9) - 2048$

$$Offset_{scale} = \frac{EE[0x2410] \,\&\, 0x07E0}{2^5} \text{ (unsigned)}$$

## 11.1.4. Restoring the Sensitivity $\alpha_{(i,j)}$

Sensitivity is divided into 6 ranges (1…32, 33…64 and so on) and for each range we store a reference value as follows:

Sensitivity Max value for row 1 (pixels 1…32) is stored at EEPROM address 0x241C

Sensitivity Max value for row 2 (pixels 33…64) is stored at EEPROM address 0x241D

Sensitivity Max value for row 3 (pixels 65…96) is stored at EEPROM address 0x241E

Sensitivity Max value for row 4 (pixels 97…128) is stored at EEPROM address 0x241F

Sensitivity Max value for row 5 (pixels 129…160) is stored at EEPROM address 0x2420

Sensitivity Max value for row 6 (pixels 161…192) is stored at EEPROM address 0x2421

$$\alpha_{(i,j)} = \frac{\alpha_{pixel}(6,9)}{2^{11}-1} * \alpha_{reference}$$

Where:

$$\alpha_{pixel}(6,9) = EE[0x2538] \,\&\, 0x07FF$$

$$\alpha_{reference_{row1}} = \frac{EE[0x241C] \,\&\, 0x07FF}{2^{\alpha_{scale_{row1}}}}$$

$$\alpha_{scale_{row1}} = \frac{EE[0x2419] \,\&\, 0x07E0}{2^5} + 20$$

$$\alpha_{reference_{row2}} = \frac{EE[0x241D] \,\&\, 0x07FF}{2^{\alpha_{scale_{row2}}}}$$

$$\alpha_{scale_{row2}} = EE[0x2419] \,\&\, 0x001F + 20$$

$$\alpha_{reference_{row3}} = \frac{EE[0x241E] \,\&\, 0x07FF}{2^{\alpha_{scale_{row3}}}}$$

$$\alpha_{scale_{row3}} = \frac{EE[0x241A] \,\&\, 0x07E0}{2^5} + 20$$

$$\alpha_{reference_{row4}} = \frac{EE[0x241F] \,\&\, 0x07FF}{2^{\alpha_{scale_{row4}}}}$$

$$\alpha_{scale_{row4}} = EE[0x241A] \,\&\, 0x001F + 20$$

$$\alpha_{reference_{row5}} = \frac{EE[0x2420] \,\&\, 0x07FF}{2^{\alpha_{scale_{row5}}}}$$

$$\alpha_{scale_{row5}} = \frac{EE[0x241B] \,\&\, 0x07E0}{2^5} + 20$$

$$\alpha_{reference_{row6}} = \frac{EE[0x2421] \,\&\, 0x07FF}{2^{\alpha_{scale_{row6}}}}$$

$$\alpha_{scale_{row6}} = EE[0x241B] \,\&\, 0x001F + 20$$

## 11.1.5. Restoring the Kta(i,j) coefficient

$$K_{Ta(6,9)} = \frac{K_{Ta_{EE}(6,9)} * 2^{K_{Ta_{scale2}}} + K_{Ta_{AVERAGE}}}{2^{K_{Ta_{scale1}}}}$$

Where:

$K_{Ta_{EE}(6,9)} = \frac{EE[0x2618] \,\&\, 0x07E0}{2^5}$ (depending on pixel number)

If $K_{Ta_{EE}(6,9)} > 31 \rightarrow K_{Ta_{EE}(6,9)} = K_{Ta_{EE}(6,9)} - 64$

$K_{Ta_{AVERAGE}} = EE[0x2415] \,\&\, 0x07FF$

If $K_{Ta_{AVERAGE}} > 1023 \rightarrow K_{Ta_{AVERAGE}} = K_{Ta_{AVERAGE}} - 2048$

$K_{Ta_{scale1}} = \frac{EE[0x2416] \,\&\, 0x07E0}{2^5}$ (unsigned)

$K_{Ta_{scale2}} = EE[0x2416] \,\&\, 0x001F$ (unsigned)

## 11.1.6. Restoring the Kv(i,j) coefficient

$$K_{V(6,9)} = \frac{K_{V_{EE}(6,9)} * 2^{K_{V\,scale2}} + K_{V_{AVERAGE}}}{2^{K_{V\,scale1}}}$$

Where:

$K_{V_{EE}(6,9)} = EE[0x2618] \,\&\, 0x001F$ (depending on pixel number)

If $K_{V_{EE}(6,9)} > 15 \rightarrow K_{V_{EE}(6,9)} = K_{V_{EE}(6,9)} - 32$

$K_{V_{AVERAGE}} = EE[0x2417] \,\&\, 0x07FF$

If $K_{V_{AVERAGE}} > 1023 \rightarrow K_{V_{AVERAGE}} = K_{V_{AVERAGE}} - 2048$

$K_{V\,scale1} = \frac{EE[0x2418] \,\&\, 0x07E0}{2^5}$ (unsigned)

$K_{V\,scale2} = EE[0x2418] \,\&\, 0x001F$ (unsigned)

### 11.1.7. Restoring the GAIN coefficient (common for all pixel)

$$\text{GAIN} = 32 * (EE[0x2424] \,\&\, 0x07FF) + EE[0x2425] \,\&\, 0x07FF \text{ (unsigned)}$$

### 11.1.8. Restoring the KsTa coefficient (common for all pixel)

$$KsTa = EE[0x2422] \,\&\, 0x07\text{FF}$$

$$\text{If } KsTa > 1023 \rightarrow KsTa = KsTa - 2048$$

$$KsTa = \frac{KsTa}{2^{15}}$$

### 11.1.9. Restoring corner temperatures (common for all pixel)

The information regarding corner temperatures is stored into device EEPROM and is restored as follows:

$$CT6 = EE[0x243\text{A}] \,\&\, 0x07\text{FF (unsigned)}$$

$$CT7 = EE[0x243\text{C}] \,\&\, 0x07\text{FF (unsigned)}$$

$$CT8 = EE[0x243\text{E}] \,\&\, 0x07\text{FF (unsigned)}$$

Or we can construct the temperatures for the ranges as follows:

CT1 = -40°C (hard codded) **< Range 1 >** CT2 = -20°C (hard codded) **< Range 2 >** CT3 = 0°C (hard codded) **< Range 3 >** CT4 = 80°C (hard codded) **< Range 4 >** CT5 = 120°C (hard codded) **< Range 5 >** CT6 **< Range 6 >** CT7 **< Range 7 >** CT8 **< Range 8**

### 11.1.10. Restoring the KsTo coefficient (common for all pixel)

$$KsTo_1 = \frac{EE[0x2435] \,\&\, 0x07\text{FF}}{2^{KsTo_{scale}}}$$

$$\text{If } KsTo_1 > 1023 \rightarrow KsTo_1 = KsTo_1 - 2048$$

$$KsTo_2 = \frac{EE[0x2436] \,\&\, 0x07\text{FF}}{2^{KsTo_{scale}}}$$

$$\text{If } KsTo_2 > 1023 \rightarrow KsTo_2 = KsTo_2 - 2048$$

$$KsTo_3 = \frac{EE[0x2437] \,\&\, 0x07\text{FF}}{2^{KsTo_{scale}}}$$

$$\text{If } KsTo_3 > 1023 \rightarrow KsTo_3 = KsTo_3 - 2048$$

$$KsTo_4 = \frac{EE[0x2438] \,\&\, 0x07\text{FF}}{2^{KsTo_{scale}}}$$

$$\text{If } KsTo_4 > 1023 \rightarrow KsTo_4 = KsTo_4 - 2048$$

$$KsTo_5 = \frac{EE[0x2439] \,\&\, 0x07\text{FF}}{2^{KsTo_{scale}}}$$

$$\text{If } KsTo_5 > 1023 \rightarrow KsTo_5 = KsTo_5 - 2048$$

$$KsTo_6 = \frac{EE[0x243\text{B}]\ \&\ 0x07\text{FF}}{2^{KsTo_{scale}}}$$

If $KsTo_6 > 1023 \rightarrow KsTo_6 = KsTo_6 - 2048$

$$KsTo_7 = \frac{EE[0x243\text{D}]\ \&\ 0x07\text{FF}}{2^{KsTo_{scale}}}$$

If $KsTo_7 > 1023 \rightarrow KsTo_7 = KsTo_7 - 2048$

$$KsTo_8 = \frac{EE[0x243\text{F}]\ \&\ 0x07\text{FF}}{2^{KsTo_{scale}}}$$

If $KsTo_8 > 1023 \rightarrow KsTo_8 = KsTo_8 - 2048$

Where:

$KsTo_{scale} = EE[0x2434]\ \&\ 0x07\text{FF}$ (unsigned)

## 11.1.11. Restoring sensitivity correction coefficients for each temperature range

$$Alpha_{corr_{range1}} = \frac{1}{\left(1 + KsTo1 * \left(CT2 - (CT1)\right)\right)} * Alpha_{corr_{range2}}$$

$$Alpha_{corr_{range2}} = \frac{1}{\left(1 + KsTo2 * \left(CT3 - (CT2)\right)\right)}$$

$$Alpha_{corr_{range3}} = 1$$

$$Alpha_{corr_{range4}} = \left(1 + KsTo3 * (CT4 - CT3)\right)$$

$$Alpha_{corr_{range5}} = \left(1 + KsTo4 * (CT5 - CT4)\right) * Alpha_{corr_{range4}}$$

$$Alpha_{corr_{range6}} = \left(1 + KsTo5 * (CT6 - CT5)\right) * Alpha_{corr_{range5}}$$

$$Alpha_{corr_{range7}} = \left(1 + KsTo6 * (CT7 - CT6)\right) * Alpha_{corr_{range6}}$$

$$Alpha_{corr_{range8}} = \left(1 + KsTo7 * (CT8 - CT7)\right) * Alpha_{corr_{range7}}$$

## 11.1.12. Restoring Emissivity

An emissivity parameter is stored into EEPROM and can have values from -2…1.999

$$Emissivity = EE[0x2423]\ \&\ 0x07\text{FF}$$

If $Emissivity > 1023 \rightarrow Emissivity = Emissivity - 2048$

$$Emissivity = \frac{Emissivity}{2^9}$$

Default value stored in EEPROM is $Emissivity = 1$

## 11.1.13. Restoring the Sensitivity $\alpha_{CP}$

$$\alpha_{CP} = \frac{EE[0x242D] \,\&\, 0x07FF}{2^{\alpha_{scale_CP}}}$$

Where:

$$\alpha_{scale_CP} = EE[0x242E] \,\&\, 0x07FF$$

## 11.1.14. Restoring the offset of the CP

$$Off_CP = 32 * (EE[0x242F] \,\&\, 0x07FF) + EE[0x2430] \,\&\, 0x07FF \quad \text{(signed)}$$

If $Off_CP > 32767 \rightarrow Off_CP = Off_CP - 65536$

## 11.1.15. Restoring the Kv CP coefficient

$$K_{V_{CP}} = \frac{K_{V_{CP_EE}}}{2^{K_{V_{scale}}}}$$

$$K_{V_{scale}} = \frac{EE[0x2432] \,\&\, 0x07C0}{2^6} \text{ (unsigned)}$$

Where:

$$K_{V_{CP_EE}} = EE[0x2432] \,\&\, 0x003F \text{ (signed)}$$

If $K_{V_{CP_EE}} > 31 \rightarrow K_{V_{CP_EE}} = K_{V_{CP_EE}} - 64$

## 11.1.16. Restoring the Kta CP coefficient

$$K_{Ta_{CP}} = \frac{K_{Ta_{CP_EE}}}{2^{K_{Ta_{scale_1}}}}$$

$$K_{Ta_{scale_1}} = \frac{EE[0x2431] \,\&\, 0x07C0}{2^6} \text{ (unsigned)}$$

Where:

$$K_{Ta_{CP_EE}} = EE[0x2431] \,\&\, 0x003F \text{ (signed)}$$

If $K_{Ta_{CP_EE}} > 31 \rightarrow K_{Ta_{CP_EE}} = K_{Ta_{CP_EE}} - 64$

## 11.1.17. Restoring the TGC coefficient

$$TGC = \frac{TGC_{EE}}{2^6}$$

Where:

$$TGC_{EE} = EE[0x2433] \,\&\, 0x01FF \text{ (signed)}$$

If $TGC_{EE} > 255 \rightarrow TGC_{EE} = TGC_{EE} - 512$

### 11.1.18. Restoring calibration resolution control settings

For some calculation calibration resolution is needed that is why we store this parameter into EEPROM as well.

$$Resolution_{EE} = \frac{EE[0x2433]\ \&\ 0x0600}{2^9} \text{ (unsigned)}$$

## 11.2. Temperature calculation

### 11.2.1. Example input data

#### 11.2.1.1. Example measurement data

| Input data name | Input data value |
|---|---|
| Object temperature | 80°C |
| Emissivity (ε) | 0.95 |
| Control register 1 ($Res_{ctrl}$) | 0x0901 (2 decimal) |
| RAM[0x0498] (pix(6, 9) data) | 0x03CC (972) |
| Vbe - RAM[0x0580] | 0x4C54 (19540) |
| CP - RAM[0x0588] | 0xFF97 (-105) |
| GAIN - RAM[0x058A] | 0x2606 (9734) |
| PTAT - RAM[0x05A0] | 0x06D8 (1752) |
| VDD - RAM[0x05AA] | 0xCB8A (-13430) |

*Table 10 Calculation example input data*

#### 11.2.1.2. Calibration data

| EEPROM address | Calibration parameter name | Parameter value + Ham [ hex ] | Decoded value |
|---|---|---|---|
| 0x2410 | Scale_os_r1 - 6bits<br>Scale_os_r2 - 5bits | 0x0000 | Scale_os_r1 = 0<br>Scale_os_r2 = 0 |

*Table 11 Calculation example calibration data*

## 11.2.2. Temperature calculation

After the parameters restore the temperature calculation is done using following calculation flow (assuming that the EEPROM data are already extracted):

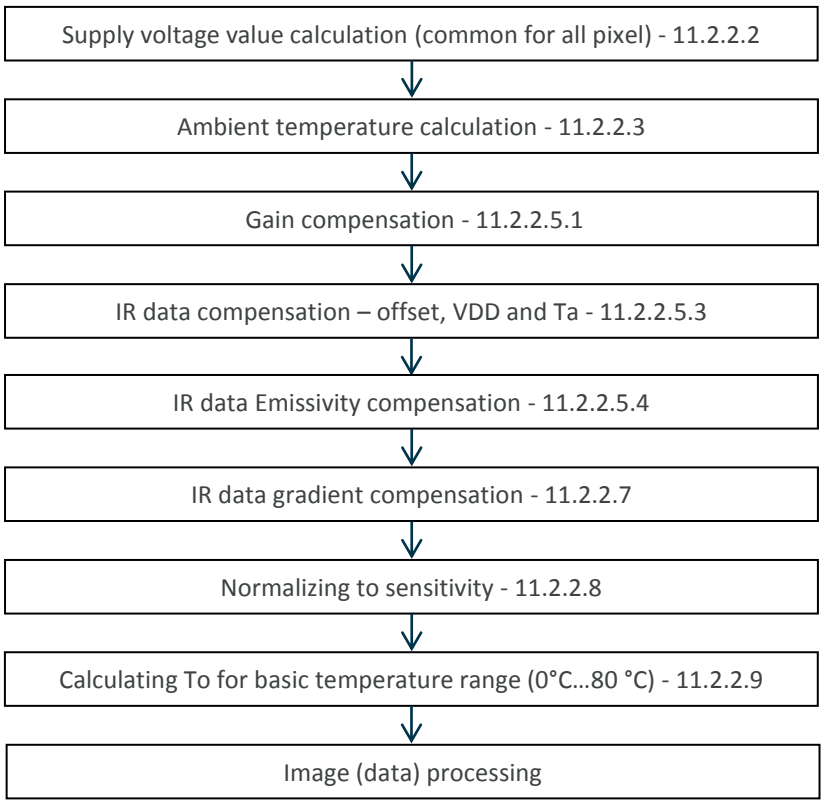

*Figure 16 To calculation flow*

For this example we calculate the temperature of pixel (12, 16) i.e. row=12 and the column=16.

Values marked with green are extracted from device EEPROM

Values marked with grey are final parameter values or are values to be used for next calculations

### 11.2.2.1. Resolution restore

The device is calibrated with default resolution setting = 2 (corresponding to ADC resolution set to 18bit see Fig 11) i.e. if the one choose to change the ADC resolution setting to a different one a correction of the data must be done. First we must restore the resolution at which the device has been calibrated which is stored at EERPOM 0x2433.

$$Resolution_{corr} = \frac{2^{Resolution_{EE}}}{2^{Resolution_{REG}}}$$

Where:

$$Resolution_{EE} = \frac{EE[0x2433] \,\&\, 0x0600}{2^9} = \frac{0xFC00 \,\&\, 0x0600}{2^9} = 0x0002 = 2 \text{ (unsigned)}$$

$$Resolution_{REG} = \frac{RAM[0x800D] \,\&\, 0x0C00}{2^{10}} = \frac{0x1901 \,\&\, 0x0C00}{2^{10}} = 0x0002 = 2 \text{ (unsigned)}$$

$$Resolution_{corr} = \frac{2^{Resolution_{EE}}}{2^{Resolution_{REG}}} = \frac{2^2}{2^2} = 1$$

In case the ADC resolution is changed the one must multiply the $Resolution_{corr}$ coefficient with the RAM data for VDD only. Please note that the data for Vbe, PTAT and IR pixels (including CP) ***must*** not be changed.

### 11.2.2.2. Supply voltage value calculation (common for all pixel)

$$V_{dd} = \frac{Resolution_{corr} * RAM[0x05AA] - V_{dd_{25}}}{K_{Vdd}} + V_{dd_0}$$

$$RAM[0x05AA] = 0xCB8A = 52106$$

If $52883 > 32767 \rightarrow RAM[0x05AA] = 52106 - 65536 = -13430$ LSB

Where:

$$K_{Vdd} = EE[0x2427] \,\&\, 0x07FF = 0xEF9E \,\&\, 0x07FF = 0x079E = 1950$$

If $1950 > 1023 \rightarrow K_{Vdd} = 1950 - 2048 = -98$

$$K_{Vdd} = K_{Vdd} * 2^5 = -98 * 32 = -3136$$

$$Vdd_{25} = EE[0x2426] \,\&\, 0x07FF = 0x2658 \,\&\, 0x07FF = 0x0658 = 1624$$

If $1624 > 1023 \rightarrow Vdd_{25} = 1624 - 2048 = -424$

$$Vdd_{25} = Vdd_{25} * 2^5 = -424 * 32 = -13568$$

$$V_{dd} = \frac{-13430 - (-13568)}{-3136} + 3.3 = \frac{138}{-3136} + 3.3 \approx -0.0440051 + 3.3 \approx 3.25599\ V$$

### 11.2.2.3. Ambient temperature calculation (common for all pixel)

$$T_a = \frac{\left(\frac{V_{PTAT_{art}}}{1+K_{V_{PTAT}}*\Delta V} - V_{PTAT_{25}}\right)}{K_{T_{PTAT}}} + 25,\ °C$$

Where:

$$K_{V_{PTAT}} = EE[0x242B] \,\&\, 0x07FF = 0x4817 \,\&\, 0x07FF = 0x0017 = 23$$

If $23 < 1023 \rightarrow K_{V_{PTAT}} = 23$

$$K_{V_{PTAT}} = \frac{K_{V_{PTAT}}}{2^{12}} = \frac{23}{4096} = 0.005615234$$

$$K_{T_{PTAT}} = EE[0x242A] \,\&\, 0x07FF = 0xE156 \,\&\, 0x07FF = 0x0156 = 342$$

If $342 < 1023 \rightarrow K_{T_{PTAT}} = 342$

$$K_{T_{PTAT}} = \frac{K_{T_{PTAT}}}{2^3} = \frac{342}{8} = 42.75$$

$$\Delta V = \frac{RAM[0x05AA] - Vdd_{25}}{K_{Vdd}}$$

$$RAM[0x05AA] = 0xCB8A = 52106$$

If $52883 > 32767 \rightarrow RAM[0x05AA] = 52106 - 65536 = -13430$ LSB

$$\Delta V = \frac{-13430 - (-13568)}{-3136} = \frac{138}{-3136} \approx -0.0440051$$

$$V_{PTAT_{25}} = 32 * (EE[0x2428] \,\&\, 0x07FF) + EE[0x2429] \,\&\, 0x07FF \text{ (unsigned)}$$

$$V_{PTAT_{25}} = 32 * (0x917F \,\&\, 0x07FF) + 0xF018 \,\&\, 0x07FF$$

$$V_{PTAT_{25}} = 32 * 0x017F + 0x0018 = 32 * 383 + 24 = 12256 + 24 = 12280$$

$$V_{PTAT_{art}} = \left(\frac{V_{PTAT}}{V_{PTAT} * Alpha_{PTAT} + V_{BE}}\right) * 2^{18}$$

Where:

$V_{PTAT} = RAM[0x05A0]$ = 0x06D8 = 1752

If $1752 < 32767 \rightarrow V_{PTAT} = 1752$

$V_{BE} = RAM[0x0580] =$ 0x4C54 $= 19540$

If $19540 < 32767 \rightarrow V_{BE} = 19540$

$$Alpha_{PTAT} = \frac{EE[0x242C] \,\&\, 0x07FF}{2^7} = \frac{0x1C80 \,\&\, 0x07FF}{2^7} = \frac{0x0480}{2^7} = \frac{1152}{128} = 9$$

$$V_{PTAT_{art}} = \left(\frac{V_{PTAT}}{V_{PTAT} * Alpha_{PTAT} + V_{BE}}\right) * 2^{18} = \left(\frac{1752}{1752 * 9 + 19540}\right) * 2^{18} = 13007.71$$

$$T_a = \frac{\left(\frac{V_{PTAT_{art}}}{1 + K_{V_{PTAT}} * \Delta V} - V_{PTAT_{25}}\right)}{K_{T_{PTAT}}} + 25 = \frac{\left(\frac{13007.71}{1 + 0.005615234 * -0.0440051} - 12280\right)}{42.75} + 25 = 17.022 + 25 \approx 42.02 \text{ °C}$$

## 11.2.2.4. Gain parameter calculation (common for all pixels)

$$K_{gain} = \frac{GAIN}{RAM[0x058A]}$$

$$RAM[0x058A] = 0x2606 = 9734$$

If $9734 < 32767 \rightarrow RAM[0x058A] = 9734$ LSB

$$GAIN = 32 * (EE[0x2424] \,\&\, 0x07FF) + EE[0x2425] \,\&\, 0x07FF \text{ (unsigned)}$$

$$GAIN = 32 * (0xF137 \,\&\, 0x07FF) + 0x7814 \,\&\, 0x07FF$$

$$GAIN = 32 * 0x0137 + 0x0014 = 32 * 311 + 20 = 9952 + 20 = 9972$$

$$K_{gain} = \frac{9972}{9734} = 1.02445038$$

## 11.2.2.5. Pixel data calculations

The pixel addressing is following the pattern described in Reading pattern as shown in Fig 5:

### 11.2.2.5.1. Gain compensation

$$pix_{gain}(6,9) = RAM[pixel\ data] * K_{gain} = RAM[0x0498] * K_{gain}$$

$$RAM[0x0498] = 0x03CC = 972$$

If $972 < 32767$ → $RAM[0x0498] = 972$

$$pix_{gain}(6,9) = 972 * 1.02445038 = 995.761767708547$$

### 11.2.2.5.2. Offset calculation

$$pix_{OS_{ref_SP0}}(6,9) = Offset_{average} + offset_{SP0}(6,9) * 2^{Offset_{scale}}$$

$$Offset_{average} = 32 * (EE[0x2411] \,\&\, 0x07FF) + EE[0x2412] \,\&\, 0x07FF$$

$$Offset_{average} = 32 * (0xB7E8 \,\&\, 0x07FF) + 0xD016 \,\&\, 0x07FF$$

$$Offset_{average} = 32 * 0x07E8 + 0x0016 = 32 * 2024 + 22 = 64768 + 22 = 64790$$

If $64790 < 32767$ → $Offset_{average} = 64790 - 65536 = -746$

$$offset_{SP0}(6,9) = EE[0x2498] \,\&\, 0x07FF = 0xF849 \,\&\, 0x07FF = 0x0049 = 73$$

If $73 < 1023$ → $offset_{SP0}(6,9) = 73$

$$Offset_{scale} = \frac{EE[0x2410] \,\&\, 0x07E0}{2^5} \text{ (unsigned)}$$

$$Offset_{scale} = \frac{0x0000 \,\&\, 0x07E0}{2^5} = \frac{0}{32} = 0$$

$$pix_{OS_{ref_SP0}}(6,9) = -746 + 73 * 2^0 = -673 \text{ LSB}$$

### 11.2.2.5.3. IR data compensation – offset, VDD and Ta

$$pix_{OS_SP0}(6,9) = pix_{gain}(6,9) - pix_{OS_{ref_SP0}} * \left(1 + K_{Ta(6,9)} * (T_a - T_{a0})\right) * \left(1 + K_{V(6,9)} * \left(V_{dd} - V_{dd_{V0}}\right)\right)$$

The same calculation must be done for the second subpage as well

$$pix_{OS_{ref_SP1}}(6,9) = Offset_{average} + offset_{SP1}(6,9) * 2^{Offset_{scale}}$$

$$offset_{SP1}(6,9) = EE[0x26D8] \,\&\, 0x07FF = 0xF847 \,\&\, 0x07FF = 0x0047 = 71$$

If $71 < 1023$ → $offset_{SP1}(6,9) = 71$

$$pix_{OS_{ref_SP1}}(6,9) = -746 + 71 * 2^0 = -671 \text{ LSB } (Offset_{average} \text{ and } Offset_{scale} \text{ are the same for both subpages})$$

$$pix_{OS_SP1}(6,9) = pix_{gain}(6,9) - pix_{OS_{ref_SP1}} * \left(1 + K_{Ta(6,9)} * (T_a - T_{a0})\right) * \left(1 + K_{V(6,9)} * \left(V_{dd} - V_{dd_{V0}}\right)\right)$$

*NOTE: In the example bellow calculation are done for subpage 0 only*

$$K_{Ta(6,9)} = \frac{K_{Ta_{EE}(6,9)} * 2^{K_{Ta_{scale2}}} + K_{Ta_{AVERAGE}}}{2^{K_{Ta_{scale1}}}}$$

Where:

$K_{Ta_{EE}(6,9)} = \frac{EE[0x2618] \,\&\, 0x07E0}{2^5}$ (depending on pixel number)

$K_{Ta_{EE}(6,9)} = \frac{0xB8C0 \,\&\, 0x07E0}{2^5} = \frac{0x00C0}{2^5} = \frac{192}{32} = 6$

If $6 < 31 \rightarrow K_{Ta_{EE}(6,9)} = 6$

$K_{Ta_{AVERAGE}} = EE[0x2415] \,\&\, 0x07FF = 0xC2FD \,\&\, 0x07FF = 02FD = 765$

If $765 < 1023 \rightarrow K_{Ta_{AVERAGE}} = 765$

$K_{Ta_{scale1}} = \frac{EE[0x2416] \,\&\, 0x07E0}{2^5}$ (unsigned)

$K_{Ta_{scale1}} = \frac{0x9A44 \,\&\, 0x07E0}{2^5} = \frac{0x0240}{2^5} = \frac{576}{32} = 18$

$K_{Ta_{scale2}} = EE[0x2416] \,\&\, 0x001F$ (unsigned)

$K_{Ta_{scale2}} = 0x1A43 \,\&\, 0x001F = 0x0003 = 3$

$$K_{Ta(6,9)} = \frac{K_{Ta_{EE}(6,9)} * 2^{K_{Ta_{scale2}}} + K_{Ta_{AVERAGE}}}{2^{K_{Ta_{scale1}}}} = \frac{6 * 2^3 + 765}{2^{18}} = 0.003101349$$

$$K_{V(6,9)} = \frac{K_{V_{EE}(6,9)} * 2^{K_{V_{scale2}}} + K_{V_{AVERAGE}}}{2^{K_{V_{scale1}}}}$$

Where:

$K_{V_{EE}(6,9)} = EE[0x2618] \,\&\, 0x001F$ (depending on pixel number)

$K_{V_{EE}(6,9)} = 0xB8C0 \,\&\, 0x001F = 0x0000 = 0$

If $0 < 15 \rightarrow K_{V_{EE}(6,9)} = 0$

$K_{V_{AVERAGE}} = EE[0x2417] \,\&\, 0x07FF$

$K_{V_{AVERAGE}} = 0xCA9A \,\&\, 0x07FF = 0x029A = 666$

If $666 < 1023 \rightarrow K_{V_{AVERAGE}} = 666$

$K_{Ta_{scale1}} = \frac{EE[0x2418] \,\&\, 0x07E0}{2^5}$ (unsigned)

$K_{Ta_{scale1}} = \frac{0x5164 \,\&\, 0x07E0}{2^5} = \frac{0x0160}{2^5} = \frac{352}{32} = 11$

$$K_{Ta_{scale2}} = EE[0x2418] \,\&\, 0x001F \text{ (unsigned)}$$

$$K_{Ta_{scale2}} = 0x5164 \,\&\, 0x001F = 0x0004 = 4$$

$$K_{V(6,9)} = \frac{K_{V_{EE}(6,9)} * 2^{K_{V scale2}} + K_{V_{AVERAGE}}}{2^{K_{V scale1}}} = \frac{0 * 2^4 + 666}{2^{11}} = 0.3251953$$

$$pix_{OS_SP0}(6,9) = pix_{gain}(6,9) - pix_{OS_{ref}} * \left(1 + K_{Ta(6,9)} * (T_a - T_{a0})\right) * \left(1 + K_{V(6,9)} * (V_{dd} - V_{dd_{V0}})\right)$$

$$pix_{OS_SP0}(6,9) = 995.761767708547 - (-673) * \left(1 + 0.00310135 * (42.02 - 25)\right) * \left(1 + 0.3251953 * (3.25599 - 3.3)\right)$$

$$pix_{OS_SP0}(6,9) = 995.761767708547 - (-673) * \left(1 + 0.00310135 * (42.02 - 25)\right) * \left(1 + 0.3251953 * (3.25599 - 3.3)\right)$$

$$pix_{OS_SP0}(6,9) = 1694.145767$$

#### 11.2.2.5.4. IR data Emissivity compensation

$$Emissivity = EE[0x2423] \,\&\, 0x07FF = 0x19E6 \,\&\, 0x07FF = 0x01E6 = 486$$

If $486 < 1023 \rightarrow Emissivity = 486$

$$Emissivity = \frac{Emissivity}{2^9} = \frac{486}{512} = 0.949218$$

### 11.2.2.6. CP data calculations

#### 11.2.2.6.1. Compensating the GAIN of CP pixel

$$pix_{gain}(6,9) = RAM[0x0588] * K_{gain}$$

$$RAM[0x0588] = 0xFF97 = 65431$$

If $65431 > 32767 \rightarrow RAM[0x0588] = 65431 - 65536 = -105$

$$CP\ pix_{gain} = -105 * 1.02445038 = -107.5672899$$

#### 11.2.2.6.2. Compensating offset, Ta and VDD of CP pixel

$$CP\ pix_{OS} = CP\ pix_{gain} - pix_{OS_{ref_CP}} * \left(1 + K_{Ta_CP} * (T_a - T_{a0})\right) * \left(1 + K_{V_CP} * (V_{dd} - V_{dd_{V0}})\right)$$

$$pix_{OS_{ref_CP}} = 32 * (EE[0x242F] \,\&\, 0x07FF) + EE[0x2430] \,\&\, 0x07FF$$

$$pix_{OS_{ref_CP}} = 32 * (0xCFFC \,\&\, 0x07FF) + 0xA009 \,\&\, 0x07FF$$

$$pix_{OS_{ref_CP}} = 32 * 0x07FC + 0x0009 = 32 * 2044 + 9 = 65408 + 9 = 65417$$

*If* $65417 < 32767 \rightarrow pix_{OS_{ref_CP}} = 65417 - 65536 = -119$

$$K_{V_{CP}} = \frac{K_{V_{CP_EE}}}{2^{K_{V scale}}} = \frac{20}{2^6} = 0.3125$$

$$K_{V_{scale}} = \frac{EE[0x2432] \,\&\, 0x07C0}{2^6} = \frac{0xF194 \,\&\, 0x07C0}{2^6} = \frac{0x0180}{2^6} = \frac{384}{2^6} = 6 \text{ (unsigned)}$$

Where:

$K_{V_{CP_EE}} = EE[0x2432]$ & $0x003F$ (signed)

$K_{V_{CP_EE}} = 0xF194$ & $0x003F = 0x0014 = 20$ (signed)

If $20 < 31 \rightarrow K_{V_{CP_EE}} = 20$

$K_{Ta_{CP}} = \frac{K_{Ta_{CP_EE}}}{2^{K_{Ta_{scale_1}}}} = \frac{19}{2^{13}} = 0.0023193359$

$K_{Ta_{scale_1}} = \frac{EE[0x2431] \,\&\, 0x07C0}{2^6} = \frac{0xBB53 \,\&\, 0x07C0}{2^6} = \frac{0x0340}{2^6} = \frac{832}{2^6} = 13$ (unsigned)

Where:

$K_{Ta_{CP_EE}} = EE[0x2431]$ & $0x003F = 0xBB53$ & $0x003F = 0x0013 = 19$ (signed)

If $19 < 31 \rightarrow K_{Ta_{CP_EE}} = 19$

$CP\ pix_{OS} = -107.5672899 - (-119) * \left(1 + 0.0023193359 * (42.02 - 25)\right) * \left(1 + 0.3125 * (3.25599 - 3.3)\right)$

$CP\ pix_{OS} = 14.42901896$

### 11.2.2.7. IR data gradient compensation

$TGC = \frac{TGC_{EE}}{2^6} = \frac{0}{2^6} = 0$

Where:

$TGC_{EE} = EE[0x2433]$ & $0x01FF = 0xFC00$ & $0x01FF = 0x0000 = 0$ (signed)

If $0 < 255 \rightarrow TGC_{EE} = 0$

$V_{IR(6,9)_{COMPENSATED}} = \frac{pix_{OS_SP_0}(6,9) - TGC * CP\ pix_{OS}}{\varepsilon} = \frac{1694.145767 - 0 * 14.42901896}{0.949218} = 1784.78049 = 1785$

### 11.2.2.8. Normalizing to sensitivity

$\alpha_{(i,j)} = \frac{\alpha_{pixel}(6,9)}{2^{11}-1} * \alpha_{reference}$

The row for the pixel is calculated as follows:

$Pixel_{row} = int\left(\frac{((16*(row_{number}-1)+column_{number})-1)}{32}\right) + 1 = int\left(\frac{((16*(6-1)+9)-1)}{32}\right) + 1 = int\left(\frac{88}{32}\right) + 1 = 3$

$\alpha_{reference_{row3}} = \frac{EE[0x241E] \,\&\, 0x07FF}{2^{\alpha_{scale_{row3}}}}$

$\alpha_{scale_{row3}} = \frac{EE[0x241A] \,\&\, 0x07E0}{2^5} + 20 = \frac{0x018C \,\&\, 0x07E0}{2^5} + 20 = \frac{0x0180}{32} + 20 = \frac{384}{32} + 20 = 32$

$\alpha_{reference_{row3}} = \frac{EE[0x241E] \,\&\, 0x07FF}{2^{\alpha_{scale_{row3}}}} = \frac{0xA5CC \,\&\, 0x07FF}{2^{32}} = \frac{0x05CC}{2^{32}} = \frac{1484}{2^{32}} = 3.45520675182343E-07$

$\alpha_{pixel}(6,9) = EE[0x2558]$ & $0x07FF = 0xFFFF$ & $0x07FF = 0x07FF = 2047$

$\alpha_{(6,9)} = \frac{\alpha_{pixel}(6,9)}{2^{11}-1} * \alpha_{reference} = \frac{2047}{2047} * 3.45520675182343E-07 = 3.45520675182343E-07$

$$\alpha_{CP} = \frac{EE[0x242D] \,\&\, 0x07FF}{2^{\alpha_{scale_{CP}}}}$$

$$\alpha_{scale_{CP}} = EE[0x242E] \,\&\, 0x07FF = 0xC826 \,\&\, 0x07FF = 0x0026 = 38$$

$$\alpha_{CP} = \frac{EE[0x242D] \,\&\, 0x07FF}{2^{38}} = \frac{0x233E \,\&\, 0x07FF}{2^{38}} = \frac{0x033E}{2^{38}} = \frac{830}{2^{38}} = 3.01952240988612E-09$$

$$KsTa = EE[0x2422] \,\&\, 0x07FF = 0x27B8 \,\&\, 0x07FF = 0x07B8 = 1976$$

If $1976 > 1023 \rightarrow KsTa = 1976 - 2048 = -72$

$$KsTa = \frac{KsTa}{2^{15}} = \frac{-72}{2^{15}} = -0.002197265625$$

$$\alpha_{comp(6,9)} = \left(\alpha_{(6,9)} - TGC * \alpha_{CP}\right) * \left(1 + K_{sTa} * (T_a - T_{a0})\right)$$

$$\alpha_{comp(6,9)} = (3.45520675182343E-07 - 0 * 3.01952240988612E-09) * \left(1 + (-0.00219) * (42.02 - 25)\right)$$

$$\alpha_{comp(6,9)} = 3.32641806639731E-07$$

## 11.2.2.9. Calculating To for basic temperature range (0°C...80 °C)

$$KsTo_3 = EE[0x2437] \,\&\, 0x07FF = 0xED22 \,\&\, 0x07FF = 0x0522 = 1314$$

If $1314 > 1023 \rightarrow KsTo_3 = 1314 - 2048 = -734$

$$KsTo_3 = \frac{-734}{2^{20}} = -0.000699997$$

Where:

$KsTo_{scale} = EE[0x2434] \,\&\, 0x07FF$ (unsigned)

$KsTo_{scale} = 0x7814 \,\&\, 0x07FF = 0x0014 = 20$

As the IR signal received by the sensor has two components:

1. IR signal emitted by the object
2. IR signal reflected from the object (the source of this signal is surrounding environment of the sensor)

In order to compensate correctly for the emissivity and achieve best accuracy we need to know the surrounding temperature which is responsible for the second component of the IR signal namely the reflected part - $T_r$. In case this $T_r$ temperature is not available and cannot be provided it might be replaced by $T_r \approx T_a - 5$.
Let's assume $T_r = 37$°C.

$$T_{a_{K^4}} = (T_a + 273.15)^4 = (42.02 + 273.15)^4 = 315.87^4 = 9866871831.80621$$

$$T_{rK4} = (T_r + 273.15)^4 = (37 + 273.15)^4 = 304.15^4 = 9253097577.685506$$

$$T_{a-r} = T_{rK4} - \frac{T_{rK4} - T_{aK4}}{\varepsilon} = 9253097577.685506 - \frac{9253097577.685506 - 9866871831.80621}{0.95} = 9899175739.92$$

$$S_{x(6,9)} = K_{sTo_3} * \sqrt[4]{\alpha_{comp(6,9)}{}^3 * V_{IR(6,9)_{COMPENSATED}} + \alpha_{comp(6,9)}{}^4 * T_{a-r}}$$

$$S_{x(6,9)} = -0.000699997 * \sqrt[4]{3.32641806639731E-07^3 * 1785 \; + 3.32641806639731E-07^4 * 9899175739.92}$$

$$S_{x(6,9)} = -8.18463664533495E-08$$

$$T_{O(6,9)} = \sqrt[4]{\frac{V_{IR(6,9)COMPENSATED}}{\alpha_{comp(6,9)} * \left(1 - K_{sTo_3} * 273.15\right) + S_{x(6,9)}} + T_{a-r}} - 273.15$$

$$T_{O(6,9)} = \sqrt[4]{\frac{1785}{3.32641806639731E-07 * \left(1 - (-0.000699997 * 273.15)\right) + -8.184636645335E-08} + 9899175739.92} - 273.15$$

$$T_{O(6,9)} = \sqrt[4]{\frac{1785}{3.143979442416E-07} + 9899175739.92} - 273.15$$

$$T_{O(6,9)} = \sqrt[4]{15576693779.3773} - 273.15 = 353.279812 - 273.15 = \mathbf{80.12}\ °C$$

### 11.2.2.9.1. Calculations for extended temperature ranges

In order to extent the object temperature range and get the best possible accuracy an additional calculation cycle is needed. We can identify 8 object temperature ranges (each temperature range has its own so called **C**orner **T**emperature – CT which is the temperature at which the range starts):

- Object temperature range 1 = -40°C … -20°C (Corner temperature for this range is -40°C and cannot be changed)
- Object temperature range 2 = -20°C … 0°C (Corner temperature for this range is -20°C and cannot be changed)
- Object temperature range 3 = 0°C … 80°C (Corner temperature for this range is 0°C and cannot be changed)
- Object temperature range 4 = 80°C … 120°C (Corner temperature for this range is 80°C and cannot be changed)
- Object temperature range 5 = 120°C … CT6°C(Corner temperature for this range is 120°C and cannot be changed)
- Object temperature range 6 = CT6°C … CT7°C
- Object temperature range 7 = CT7°C … CT8°C
- Object temperature range 8 = CT8°C …

In order to be able to carry out temperature calculation for the ranges outside of temperature range 3 (To = 0°C…80°C) an additional parameters are needed and must be extracted from the device EEPROM. Those parameters are:

- So called corner temperature (CTx) i.e. the value of temperature at the beginning of the range. Please note that the corner temperatures for range 1 is fixed to -40°C, corner temperatures for range 2 is fixed to -20°C, corner temperatures for range 3 is fixed to 0°C, corner temperatures for range 4 is fixed to 80°C , corner temperatures for range 5 is fixed to 120°C while CT6, CT7 and CT8 are adjustable
- Sensitivity slope for each range – $KsTo_x$
- $T_{O(x,y)}$ calculated in 11.2.2.9

#### 11.2.2.9.1.1. Restoring corner temperatures

The information regarding corner temperatures is stored into device EEPROM and is restored as follows:

$$CT6 = EE[0x243A] \,\&\, 0x07FF = 0x80C8 \,\&\, 0x07FF = 0x00C8 = 200°C$$

$$CT7 = EE[0x243C] \,\&\, 0x07FF = 0x4190 \,\&\, 0x07FF = 0x0190 = 400°C$$

$$CT8 = EE[0x243E] \,\&\, 0x07FF = 0xDA58 \,\&\, 0x07FF = 0x0258 = 600°C$$

Or we can construct the temperatures for the ranges as follows:

CT1 = -40°C (hard codded) **< Range 1 >** CT2 = -20°C (hard codded) **< Range 2 >** CT3 = 0°C (hard codded) **< Range 3 >** CT4 = 80°C (hard codded) **< Range 4 >** CT5 = 120°C (hard codded) **< Range 5 >** CT6 **< Range 6 >** CT7 **< Range 7 >** CT8 **< Range 8**

#### 11.2.2.9.1.2. Restoring the sensitivity slope for each range

$Ks_{To_{scale}} = 20$ has been extracted in 11.1.10

$KsTo_1 = EE[0x2435]\ \&\ 0x07FF = 0xED22\ \&\ 0x07FF = 0x0522 = 1314$

If $1314 > 1023 \rightarrow KsTo_1 = 1314 - 2048 = -734$

$$KsTo_1 = \frac{-734}{2^{20}} = -0.000699997$$

$KsTo_2 = EE[0x2436]\ \&\ 0x07FF = 0xED22\ \&\ 0x07FF = 0x0522 = 1314$

If $1314 > 1023 \rightarrow KsTo_2 = 1314 - 2048 = -734$

$$KsTo_2 = \frac{-734}{2^{20}} = -0.000699997$$

$KsTo_4 = EE[0x2438]\ \&\ 0x07FF = 0xED22\ \&\ 0x07FF = 0x0522 = 1314$

If $1314 > 1023 \rightarrow KsTo_4 = 1314 - 2048 = -734$

$$KsTo_4 = \frac{-734}{2^{20}} = -0.000699997$$

$KsTo_5 = EE[0x2439]\ \&\ 0x07FF = 0xED22\ \&\ 0x07FF = 0x0522 = 1314$

If $1314 > 1023 \rightarrow KsTo_5 = 1314 - 2048 = -734$

$$KsTo_5 = \frac{-734}{2^{20}} = -0.000699997$$

$KsTo_6 = EE[0x243B]\ \&\ 0x07FF = 0xED22\ \&\ 0x07FF = 0x0522 = 1314$

If $1314 > 1023 \rightarrow KsTo_6 = 1314 - 2048 = -734$

$$KsTo_6 = \frac{-734}{2^{20}} = -0.000699997$$

$KsTo_7 = EE[0x243D]\ \&\ 0x07FF = 0xED22\ \&\ 0x07FF = 0x0522 = 1314$

If $1314 > 1023 \rightarrow KsTo_7 = 1314 - 2048 = -734$

$$KsTo_7 = \frac{-734}{2^{20}} = -0.000699997$$

$KsTo_8 = EE[0x243F]\ \&\ 0x07FF = 0xED22\ \&\ 0x07FF = 0x0522 = 1314$

If $1314 > 1023 \rightarrow KsTo_8 = 1314 - 2048 = -734$

$$KsTo_8 = \frac{-734}{2^{20}} = -0.000699997$$

Now we can calculate sensitivity correction coefficients for each temperature range:

$$Alpha_{corr_{range1}} = \frac{1}{\left(1 + KsTo1 * \left(CT2 - (CT1)\right)\right)} * Alpha_{corr_{range2}}$$

$$Alpha_{corr_{range1}} = \frac{1}{\left(1 - 0.000699997 * \left(-20 - (-40)\right)\right)} * 1.014198721 = 1.014198721 * 1.014198721 = 1.028599$$

$$Alpha_{corr_{range2}} = \frac{1}{\left(1 + KsTo2 * \left(CT3 - (CT2)\right)\right)} = \frac{1}{\left(1 - 0.000699997 * \left(0 - (-20)\right)\right)} = 1.014198721$$

$$Alpha_{corr_{range3}} = 1$$

$$Alpha_{corr_{range4}} = \left(1 + KsTo3 * (CT4 - CT3)\right) = \left(1 - 0.000699997 * (80 - 0)\right) = 0.94400024$$

$$Alpha_{corr_{range5}} = \left(1 + KsTo4 * (CT5 - CT4)\right) * Alpha_{corr_{range4}}$$

$$Alpha_{corr_{range5}} = \left(1 - 0.000699997 * (120 - 80)\right) * 0.94400024 = 0.917568347$$

$$Alpha_{corr_{range6}} = \left(1 + KsTo5 * (CT6 - CT5)\right) * Alpha_{corr_{range5}}$$

$$Alpha_{corr_{range6}} = \left(1 - 0.000699997 * (200 - 120)\right) * 0.917568347 = 0.86618474$$

$$Alpha_{corr_{range7}} = \left(1 + KsTo6 * (CT7 - CT6)\right) * Alpha_{corr_{range6}}$$

$$Alpha_{corr_{range7}} = \left(1 - 0.000699997 * (400 - 200)\right) * 0.86618474 = 0.744919396$$

$$Alpha_{corr_{range8}} = \left(1 + KsTo7 * (CT8 - CT7)\right) * Alpha_{corr_{range7}}$$

$$Alpha_{corr_{range8}} = \left(1 - 0.000699997 * (600 - 400)\right) * 0.744919396 = 0.640631128$$

#### 11.2.2.9.1.3. Extended To range calculation

The input parameter for this calculation is the object temperature calculated in Calculating To for basic temperature range (0°C…80 °C).

If $T_{O(i,j)}$ < -20°C we are in range 1 and we will use the parameters ($Ks_{To1}$, $Alpha_{corr_{range1}}$ and $CT1 = -40°C$)
If -20°C < $T_{O(i,j)}$ < -40°C we are in range 2 and we will use the parameters ($Ks_{To2}$, $Alpha_{corr_{range2}}$ and $CT2 = -20°C$)
If 0°C < $T_{O(i,j)}$ < 80°C we are in range 3 and we will use the parameters ($Ks_{To3}$, $Alpha_{corr_{range3}}$ and $CT3 = 0°C$)
If 80°C < $T_{O(i,j)}$ < 120°C we are in range 4 and we will use the parameters ($Ks_{To4}$, $Alpha_{corr_{range4}}$ and $CT4 = 80°C$)
If 120°C < $T_{O(i,j)}$ < CT6°C we are in range 5 and we will use the parameters ($Ks_{To5}$, $Alpha_{corr_{range5}}$ and $CT5 = 120°C$)
If CT6°C < $T_{O(i,j)}$ < CT7°C we are in range 6 and we will use the parameters ($Ks_{To6}$, $Alpha_{corr_{range6}}$ and $CT6 = 200°C$)
If CT7°C < $T_{O(i,j)}$ < CT8°C we are in range 7 and we will use the parameters ($Ks_{To7}$, $Alpha_{corr_{range7}}$ and $CT7 = 400°C$)
If CT8°C < $T_{O(i,j)}$ we are in range 8 and we will use the parameters ($Ks_{To8}$, $Alpha_{corr_{range8}}$ and $CT8 = 600°C$)

$$T_{O_{extra_range}(i,j)} = \sqrt[4]{\frac{V_{IR(i,j)_{COMPENSATED}}}{\alpha_{comp(i,j)} * ALpha_{corr_{rangeX}} * \left(1 + Ks_{ToX} * \left(T_{O(i,j)} - \mathrm{CT_X}\right)\right)} + T_{a-r}} - 273.15$$

# 12. Performance graphs

## 12.1. Accuracy

### 12.1.1. Pixel accuracy

**All accuracy specifications apply under settled isothermal conditions only.**
Furthermore, the accuracy is only valid if the object fills the FOV of the sensor completely.

Parameter definitions:
***Frame accuracy*** is defined as average value of the all (768) pixels in the frame or for frame $n$ can be expressed as:

$$\overline{T_o_frame(n)} = \frac{1}{768}\sum_{m=1}^{768} T_o(m,n)$$

$$Frame\ accuracy = \overline{T_o_frame(n)} - T_{target}$$

***Non-uniformity*** is defined as the maximum deviation of each individual pixel reading vs. the absolute accuracy.

$$Non\ Uniformity = MAX\left(\left|T_o(m) - \overline{T_o_frame(n)}\right|\right)$$

***Pixel absolute accuracy*** is defined as:

$$T_{O_{accuracy(n)}} = Frame\ accuracy + Non\ Uniformity$$

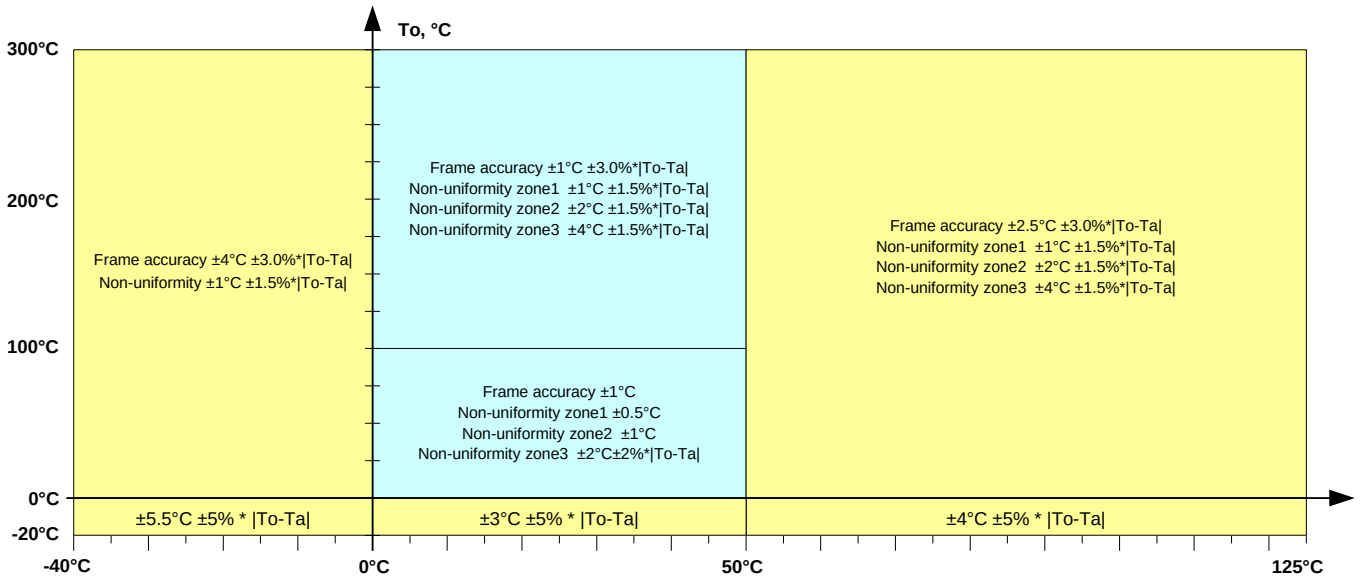

*Figure 17 Temperature absolute accuracy - MLX90641BCA*

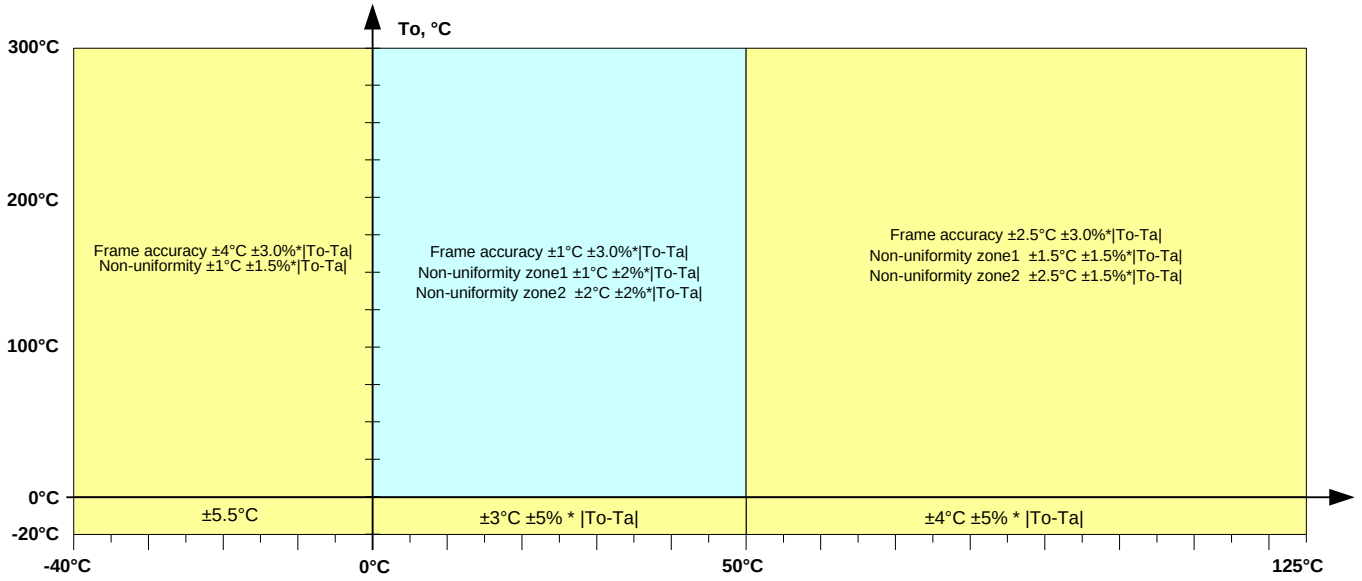

*Figure 18 Temperature absolute accuracy - MLX90641BCB*

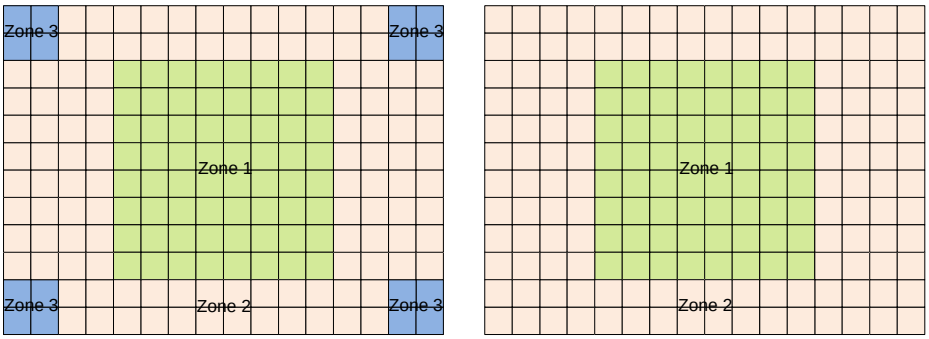

*Figure 19 Different accuracy zones depending on device type (BCA on the left and BCB on the right)*

*Example: If we assume that the sensor (BCA type, zone 1) is measuring a target at 80°C that would mean that there should be no pixel with error bigger than:*

$$T_{O_{accuracy(n)}} = Frame\ accuracy + Non\ Uniformity = \pm 1 \pm 0.5 = \pm 1.5°C$$

*NOTES:*

1) *For best performance it is recommended to keep the supply voltage as accurate and stable as possible to 3.3V ± 0.05V*
2) *As a result of long term (years) drift there can be an additional measurement deviation of ± 3°C for object temperatures around room temperature.*

## 12.1.2. Ta accuracy

Absolute accuracy for the Ta channel (die temperature):

$$T_{A_{accuracy}} = \pm 0.5°C$$

NOTE: Actual sensor surrounding temperature would be approximately 5°C lower

# 12.2. Startup time

## 12.2.1. First valid data

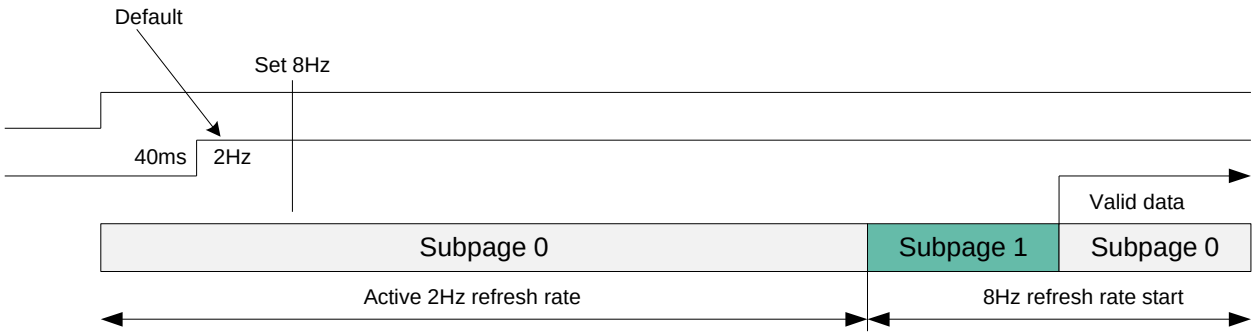
After POR the first valid data is available after (depending on the selected refresh rate) $T_{valid_data}$ which is calculated as:

$$T_{valid_data} = 80 + 2 * 500, \text{ ms} \quad \text{(Example refresh rate is 2Hz – the default value)}$$

It is always subpage 0 to be measured first after POR then subpage 1 and so on alternating.

***NOTE1**: In case one changes the refresh rate on the fly (by writing new values into device register (0x800D)) the settings will take place only after the subpage under measurement is finished.*

***NOTE2**: Although the first subpage is ready after 500ms it is necessary to have data from both subpages in order to be able to calculate the Ta meaning that the valid data are only possible after twice the refresh rate after POR.*



## 12.2.2. Thermal behavior

Although electrically the device is set and running there is thermal stabilization time necessary before the device can reach the specified accuracy – up to 3 min.

# 12.3. Noise performance and resolution

There are two bits in the configuration register that allow changing the resolution of the MLX90641 measurements. Increasing the resolution decreases the quantization noise and improves the overall noise performance. Measurement conditions for the noise are: To=Ta=25°C

NOTE: Due to the nature of the thermal infrared radiation, it is normal that the noise will decrease for high temperature and increase for lower temperatures

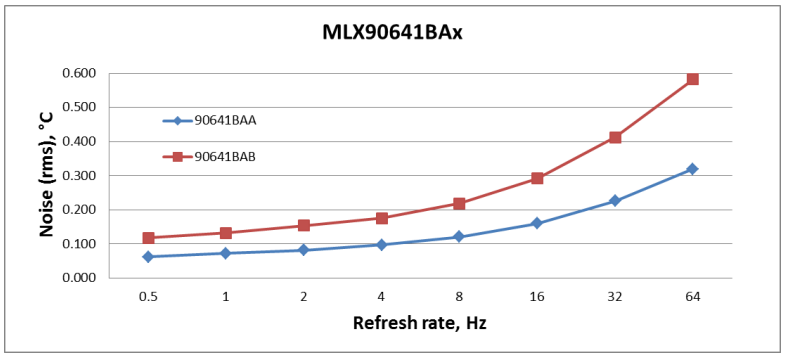


*Figure 20 MLX90641BCx noise vs refresh rate for different device types*

Not all pixels have the same noise performance. Because of the optical performance of the integrated lens, it is normal that the pixels in the corner of the frame are noisier in comparison with the pixels in the middle. The graphs bellow show the distribution of the noise density versus the pixel position in the frame (pixel number)

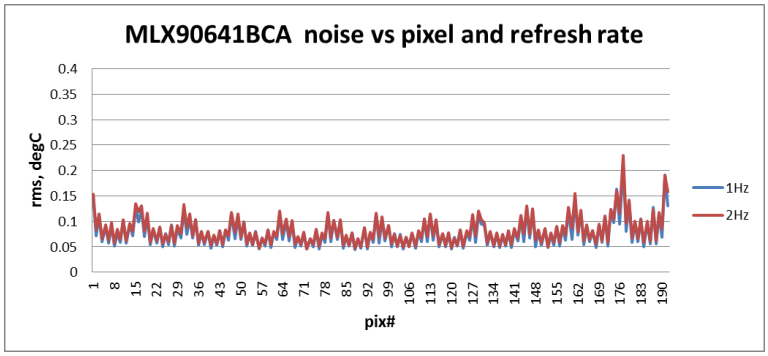

*Figure 21 MLX90641BCA noise vs pixel and refresh rate at 1Hz and 2Hz*

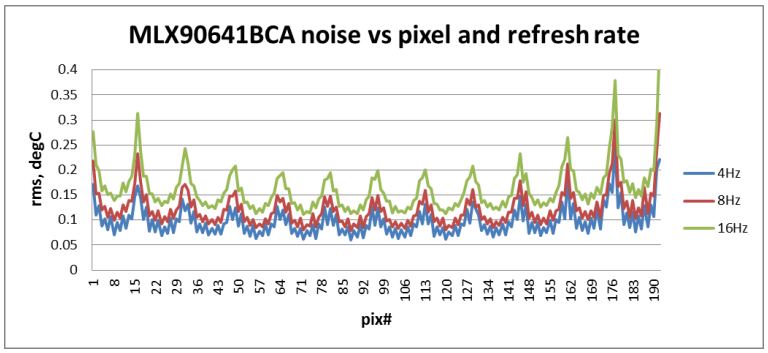

*Figure 22 MLX90641BCA noise vs pixel and refresh rate at 4Hz, 8Hz and 16Hz*

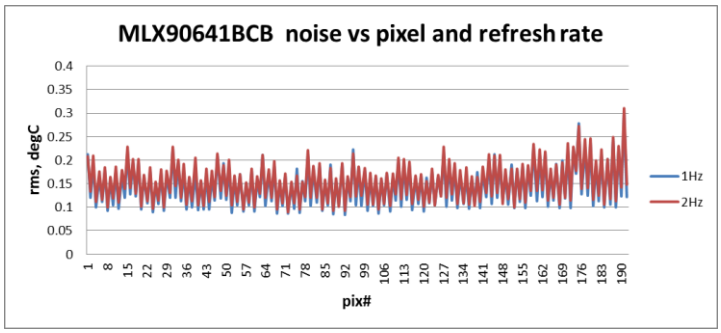

*Figure 23 MLX90641BCB noise vs pixel and refresh rate at 1Hz and 2Hz*

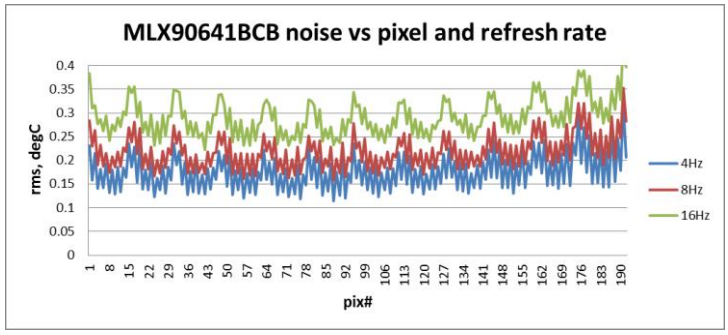

*Figure 24 MLX90641BCB noise vs pixel and refresh rate at 4Hz, 8Hz and 16Hz*

| NETD (K) | 1Hz RMS noise (temperature equivalent), all pixels | | |
|---|---|---|---|
| MLX90641 | Average | Min | Standard deviation |
| BCA | 0.07 | 0.04 | 0.03 |
| BCB | 0.15 | 0.07 | 0.05 |

*Table 12 Noise performance*

# 12.4. Field of view (FOV)

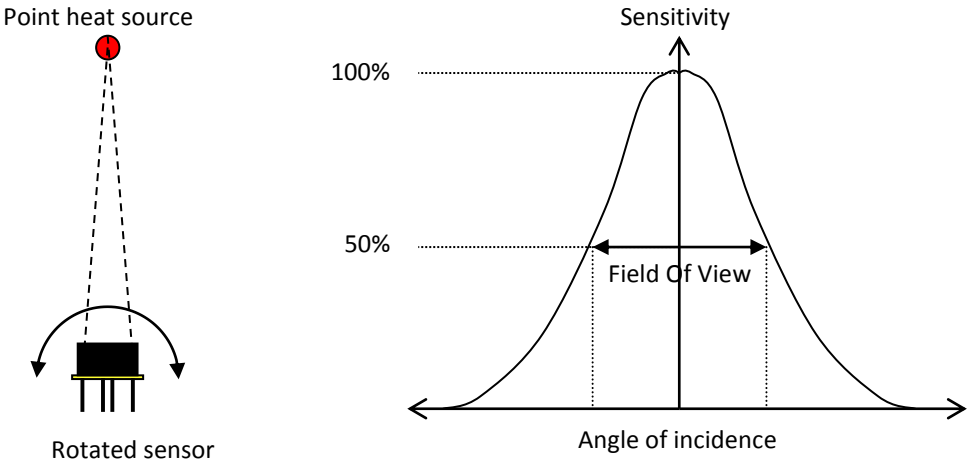

*Figure 25 Field Of View measurement*

The specified FOV is calculated for the wider direction, in this case for the 16 pixels.

| FOV | X direction | Y direction | Central pointing from normal (X & Y direction) |
|---|---|---|---|
| | Typ | Typ | Max |
| MLX90641-ESF-BCA | 110° | 75° | 5° |
| MLX90641-ESF-BCB | 55° | 35° | 3° |

*Table 13 Available FOV options*

# 13. Application information

## 13.1. Optical considerations

As this is an optical device a care must be taking such that the device performs according to the specification. One such parameter is FOV obstruction. It is paramount that the FOV in the optical path is kept clear. The external aperture is designed such to shape the FOV of the device and is installed prior calibration process thus cam be considered as part of the device which does not impact the performance but may be used as a reference for the so called “Optical free zone” – see Figure 27 hereafter.

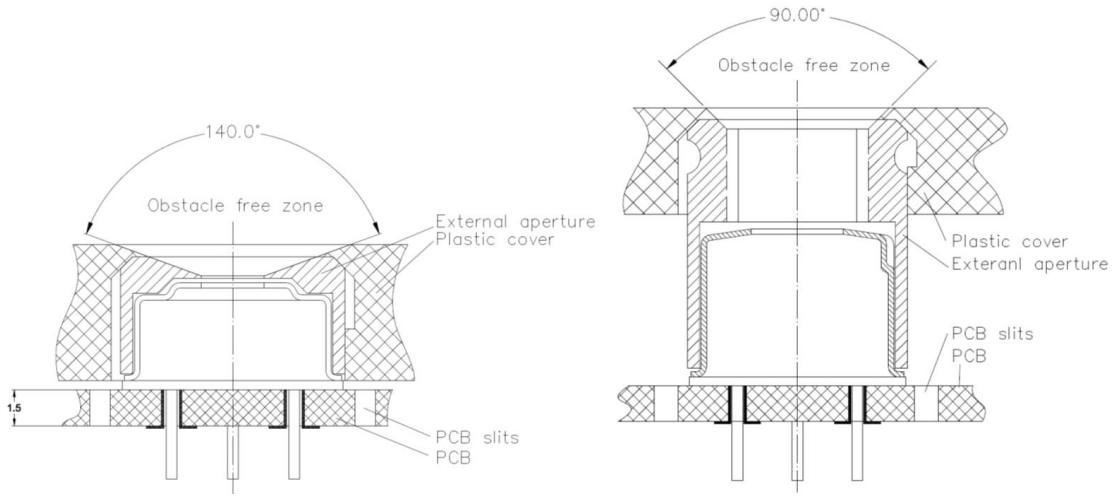

*Figure 26 Application examples concerning the optical consideration*

## 13.2. Electrical considerations

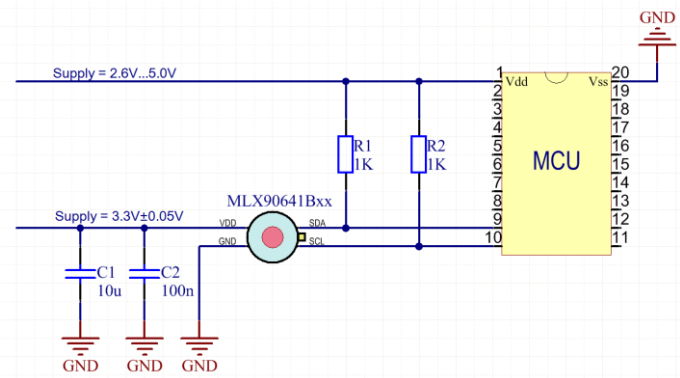

*Figure 27 MLX90641Bxx electrical connections*

As the MLX90641Bxx is fully I2C compatible it allows to have a system in which the MCU may be supplied with VDD=2.6V…5V while the sensor it’s self is supplied from separate supply VDD1=3.3V (or even left with no supply i.e. VDD=0V), **with the I2C connection running at supply voltage of the MCU.**

## 13.3. Using the device in “image mode”

In some applications may not be necessary to calculate the temperature but rather to have just and image (for instance in machine vision systems). In this case it is not necessary to carry out all calculations which would save computation time or allow the one to use weaker CPU.

In order to get thermal image only following computation flow is to be used:

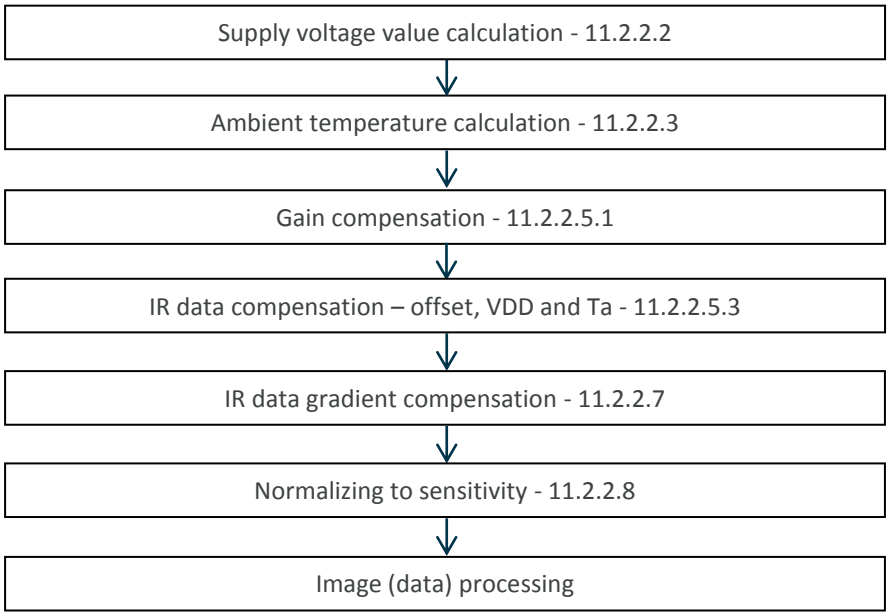

*Figure 28 Calculation flow in thermal image mode*

# 14. Application Comments

Significant **contamination** at the optical input side (sensor filter) might cause unknown additional filtering/distortion of the optical signal and therefore result in unspecified errors.

IR sensors are inherently susceptible to errors caused by **thermal gradients**. There are physical reasons for these phenomena and, in spite of the careful design of the MLX90641Bxx, it is recommended not to subject the MLX90641Bxx to heat transfer and especially transient conditions.

The MLX90641Bxx is designed and calibrated to operate as a non-contact thermometer in **settled conditions**. Using the thermometer in a very different way will result in unknown results.

**Capacitive loading** on an I2C can degrade the communication. Some improvement is possible with use of current sources compared to resistors in pull-up circuitry. Further improvement is possible with specialized commercially available bus accelerators. With the MLX90641Bxx additional improvement is possible by increasing the pull-up current (decreasing the pull-up resistor values). Input levels for I2C compatible mode have higher overall tolerance than the I2C specification, but the output low level is rather low even with the high-power I2C specification for pull-up currents. Another option might be to go for a slower communication (clock speed), as the MLX90641Bxx implements Schmidt triggers on its inputs in I2C compatible mode and is therefore not really sensitive to rise time of the bus (it is more likely the rise time to be an issue than the fall time, as far as the I2C systems are open drain with pull-up).

**Power dissipation** within the package may affect performance in two ways: by heating the “ambient” sensitive element significantly beyond the actual ambient temperature, as well as by causing gradients over the package that will inherently cause thermal gradient over the cap

**Power supply decoupling** capacitor is needed as with most integrated circuits. MLX90641Bxx is a mixed-signal device with sensors, small signal analog part, digital part and I/O circuitry. In order to keep the noise low power supply switching noise needs to be decoupled. High noise from external circuitry can also affect noise performance of the device. In many applications a 100nF SMD plus 10µF ceramic capacitors close to the Vdd and Vss pins would be a good choice. It should be noted that not only the trace to the Vdd pin needs to be short, but also the one to the Vss pin. Using MLX90641Bxx with short pins improves the effect of the power supply decoupling.

Check www.melexis.com for most recent application notes about MLX90641Bxx.

# 15. Mechanical drawings

## 15.1. FOV 55°

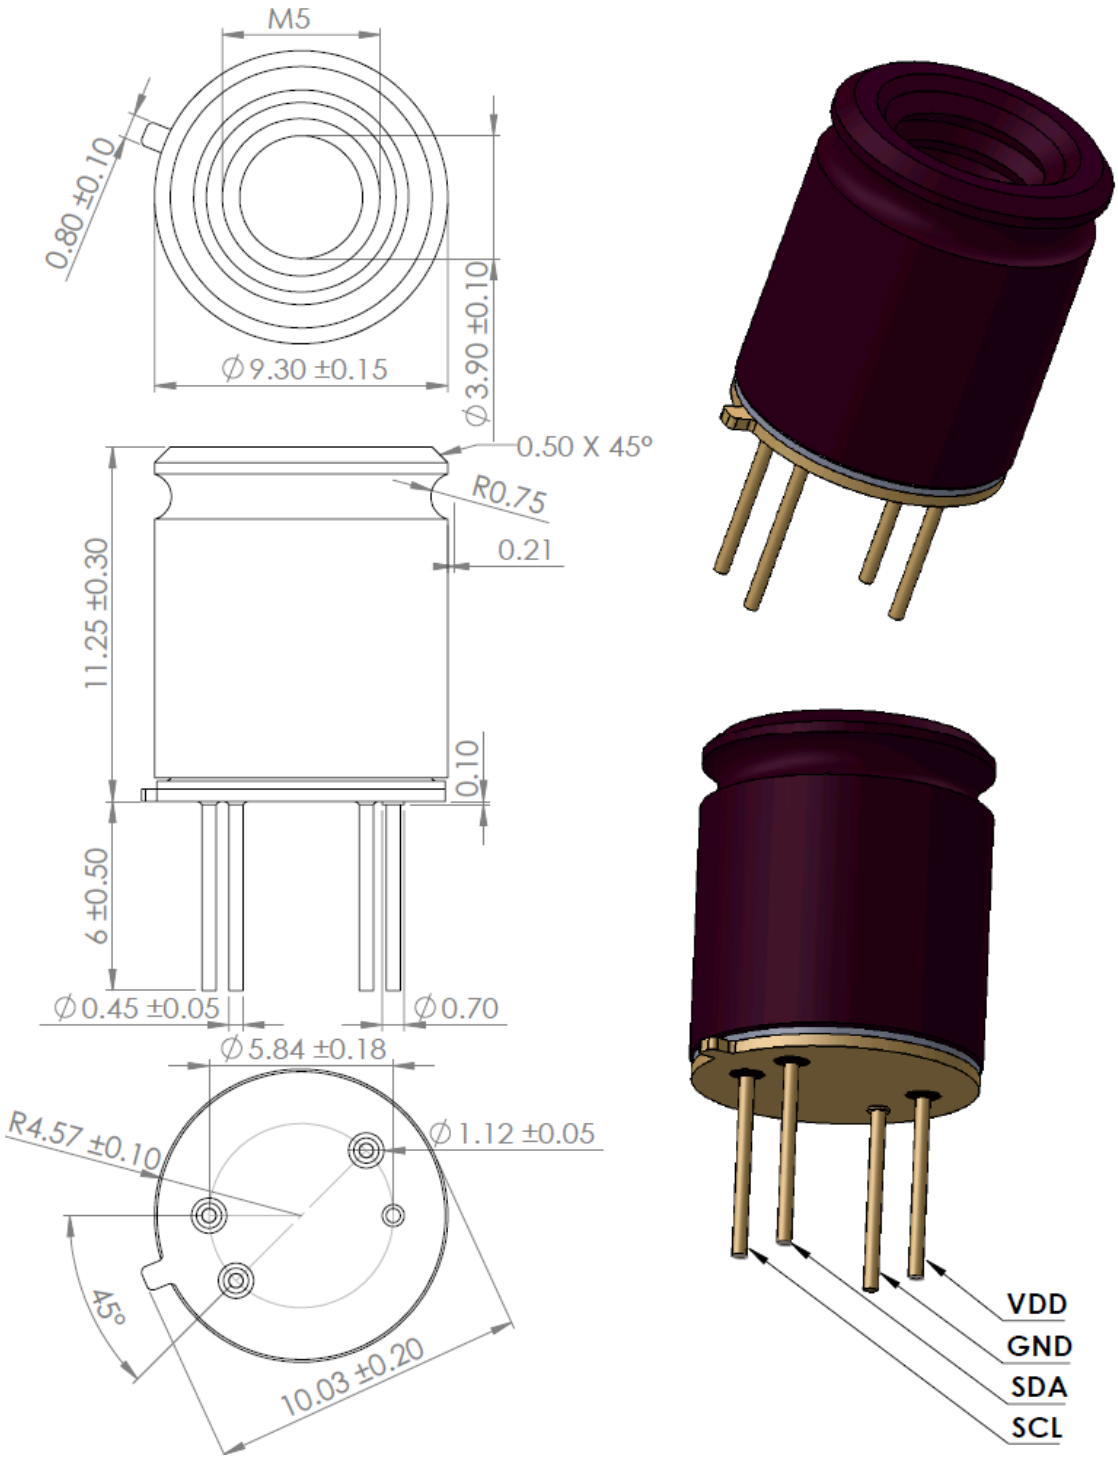

*Figure 29 Mechanical drawing of 55° FOV device*

# 15.2. FOV 110°

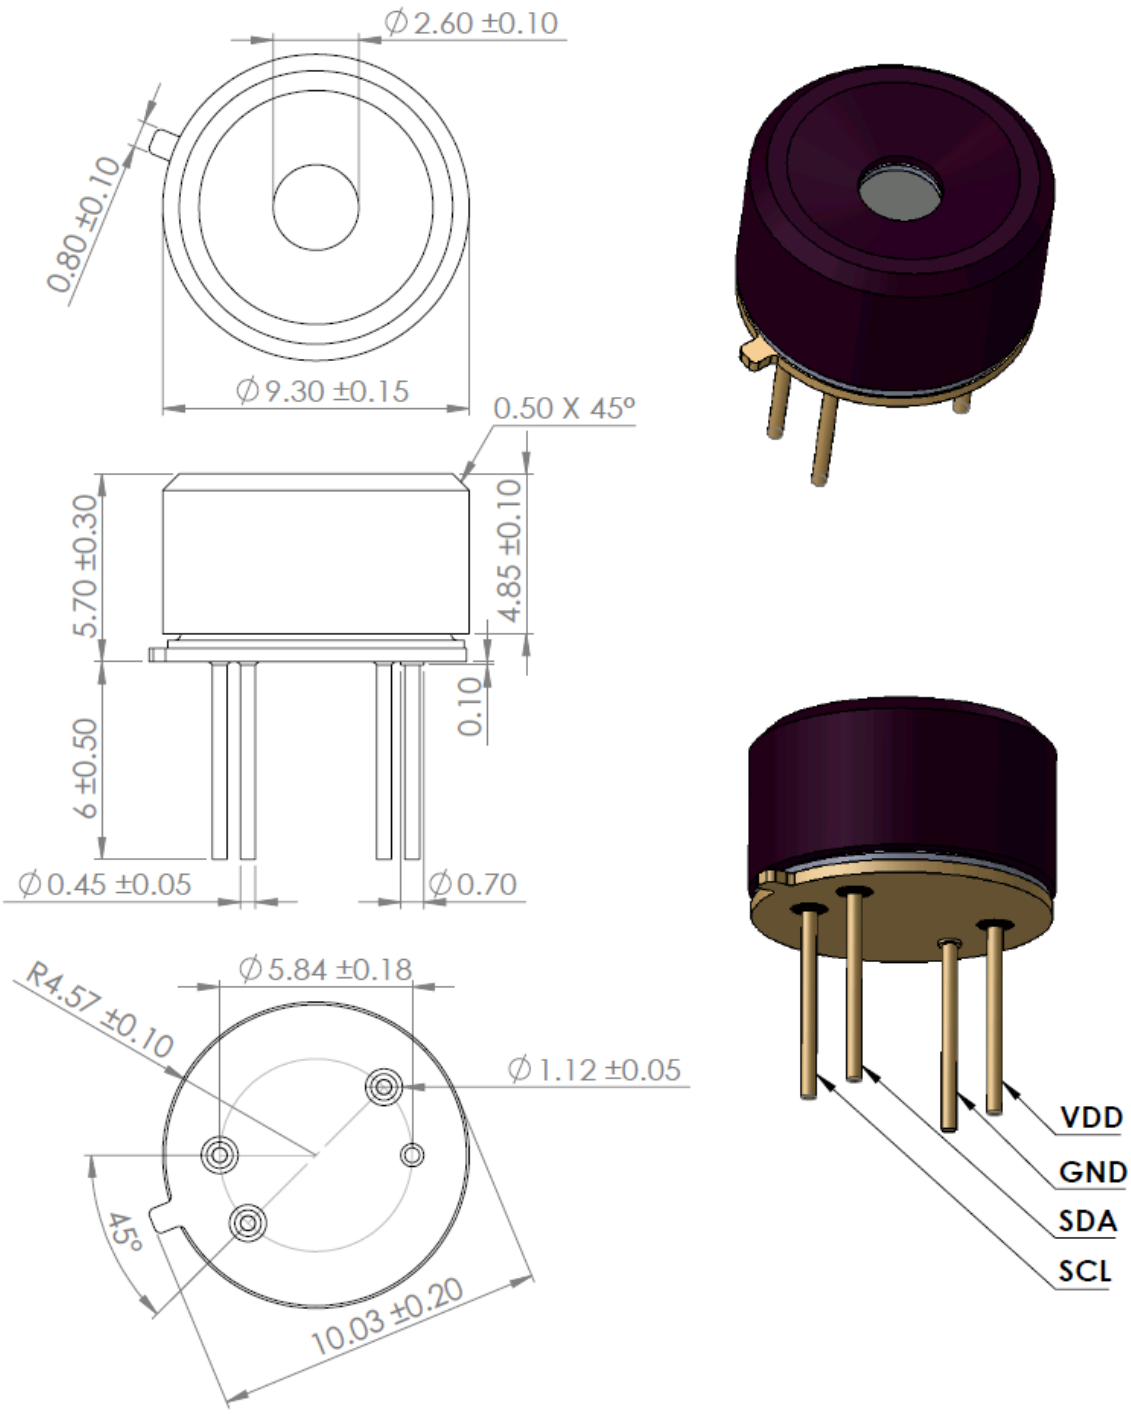

*Figure 30 Mechanical drawing of 110° FOV device*

# 15.3. Device marking

The MLX90641 is laser marked with 10 symbols as follows.

| 1 | A | A | xxxxx | xx | **Laser marking** |
|---|---|---|---|---|---|
| | | | | | 2 digits Split number |
| | | | | 5 digits LOT number | |
| | | A | FOV = 110° | | |
| | | B | FOV = 55° | | |
| | A | Device without thermal gradient compensation (TGC = 0 and may not be changed) | | | |
| | C | Device with thermal gradient compensation (TGC = -4…+3.992) | | | |
| 1 | MLX90641 | | | | |

- Example: “1CA1052801” – Device type MLX90641BCA from lot 10528, sub LOT split 1 and Thermal Gradient Compensation activated.

# 16. Standard Information

Our products are classified and qualified regarding soldering technology, solderability and moisture sensitivity level according to standards in place in Semiconductor industry.

For further details about test method references and for compliance verification of selected soldering method for product integration, Melexis recommends reviewing on our web site the General Guidelines soldering recommendation. For all soldering technologies deviating from the one mentioned in above document (regarding peak temperature, temperature gradient, temperature profile etc), additional classification and qualification tests have to be agreed upon with Melexis.

For package technology embedding trim and form post-delivery capability, Melexis recommends to consult the dedicated trim&form recommendation application note: lead trimming and forming recommendations

Melexis is contributing to global environmental conservation by promoting **lead free** solutions. For more information on qualifications of **RoHS** compliant products (RoHS = European directive on the Restriction Of the use of certain Hazardous Substances) please visit the quality page on our website: http://www.melexis.com/en/quality-environment

# 17. ESD Precautions

Electronic semiconductor products are sensitive to Electro Static Discharge (ESD).
Always observe Electro Static Discharge control procedures whenever handling semiconductor products.

# 18. Revision History Table

| | |
|---|---|
| 25/07/2016 | Initial release |
| 12/08/2016 | Calibration data stored into EEPROM, pixel reading modes explained |
| 13/01/2017 | Added CP data extraction, example updated, accuracy table |
| 01/02/2017 | Kta(i,j) and Kv(i,j) coefficients extraction from EEPROM corrected |
| 15/12/2017 | Overall rework |
| 12/04/2018 | extra temperature ranges calculations, new approach of Emissivity compensation |
| 08/11/2018 | Driver link, Max temp = 300°C, ESD = 4kV, step mode removed, FOV added, |
| 06/02/2019 | Emissivity compensation changed, added absolute accuracy for Ta |
| 06/12/2019 | Rev 3: long term accuracy note, optical consideration, package chamfer info, note regarding max current trough SDA driver, docserver number in the footer |

# OCEAN CHIPS
## Океан Электроники
## Поставка электронных компонентов

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «**JONHON**», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «**FORSTAR**».

AVIC JONHON

**«JONHON»** (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

**«FORSTAR»** (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).

FORSTAR®
