

General Description

The 8400110 is a Low Jitter Telecom Rate-Conversion PLL that provides accurate and reliable frequency conversion.

The 8400110 generates a 65.536MHz clock that is either locked to the input reference or locked to the external crystal or oscillator.

In the locked mode, the reference input is continuously monitored for a failure condition. In the event of a failure, the PLL continues to provide a stable free-running clock, ensuring system reliability.

Features

- One 65.536MHz output, synchronized to 8kHz reference
- One 25MHz output, buffered version of the internal osc output
- Provides lock and reference fail indication
- Free run mode when reference clock (REF) fails
- Automatic switch-over to reference when good reference (REF) is available
- 25MHz external master clock source: crystal or oscillator
- Full 3.3V operation
- -40°C to 85°C ambient operating temperature
- Available in a lead-free (RoHS 6) package

Pin Description and Pin Characteristic Tables

Table 1. Pin Descriptions

Number	Name	Type		Description
1, 6, 7, 15, 16, 17, 20, 22, 23, 24, 25, 29, 32	nc	Unused		No connect.
2	LOCK	Output		Lock indicator. When HIGH, the PLL is frequency locked to a valid input reference. LVCMOS/LVTTL interface levels.
3	REF_FAIL	Output		Reference fail indicator. A logic HIGH at this output indicates that the reference (REF) frequency is exhibiting abrupt phase or frequency change. LVCMOS/LVTTL interface levels.
4, 5, 8, 27, 31	GND	Power		Power supply ground.
9	nRST	Input	Pullup	Reset. A logic LOW at this input resets the device. In Reset state, all outputs are forced into high-impedance. LVCMOS/LVTTL interface levels.
10	OSCo	Output		Crystal out.
11	OSCi	Input		Crystal in or single ended clock input.
12, 14, 30	V _{DD}	Power		Core supply pins.
13	FIL_OUT	Output		Filter output pin connected to 4.7μF capacitor.
18, 21	V _{DDA}	Power		Analog supply pins.
19	C65o	Output		Single-ended clock output, 65.536MHz frequency. This output is used for general TDM applications. LVCMOS/LVTTL interface levels.
26	C25o	Output		Single-ended clock output, 25MHz frequency. This is a buffered version of internal crystal oscillator. The phase and frequency accuracy of this output tracks that of the external crystal or oscillator. LVCMOS/LVTTL interface levels.
28	REF	Input	Pulldown	This is the input reference source used for synchronization. LVCMOS/LVTTL interface levels.

NOTE: Pullup and Pulldown refer to internal input resistors. See Table 2, *Pin Characteristics*, for typical values.

Table 2. Pin Characteristics

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C _{IN}	Input Capacitance			4		pF
R _{PULLUP}	Input Pullup Resistor			51		kΩ
R _{PULLDOWN}	Input Pulldown Resistor			51		kΩ
R _{OUT}	Output Impedance	V _{DDO} = 3.6V		17		Ω

Functional Description

The PLL of 8400110 consists of a phase detector, a loop filter and a Voltage Controlled Oscillator (VCO). In the normal mode of operation, the VCO provides an output clock signal that is frequency and phase locked to the input reference clock (REF). In free-run mode, VCO is locked to 25MHz input with an accuracy equal to the accuracy of the OSCi 25MHz clock.

Lock Indicator

The Lock detector monitors if the output clock phase is within 90° of the input reference (REF). If the difference between input reference clock (REF) and output is more than 90°, LOCK output is LOW. The monitor then looks for eight consecutive clocks within 22.5° of the reference, before setting the LOCK to a HIGH.

REF_FAIL

The REF_FAIL signal is HIGH when reference clock (REF) shows greater than 130ppm variation in frequency, there are more than three consecutive edges missing, or there is an abrupt phase shift in the reference clock REF. Under any of these circumstances the PLL input will be switched from primary reference clock (REF) to crystal. When the primary reference clock (REF) is restored and REF_FAIL sets to LOW, the PLL input is switched back to the primary reference clock (REF).

Modes of Operation

The 8400110 device has two modes of operation; normal mode and free-run mode. The device powers up in free-run mode, it automatically transitions to normal mode if a valid reference clock (REF) is available and transitions to free-run mode if the reference fails. RESET signal also will put the device in free-run mode.

Freerun Mode

The freerun mode is typically used when an asynchronous clock source is required or it is used immediately following system power-up before synchronization is achieved. In free-run mode, 8400110 provides an output clock based on oscillator frequency. The output is not synchronized to the reference input clock (REF). In the free-run mode the accuracy of output frequency is equal to the accuracy of the frequency of the oscillator.

Normal Mode

The normal mode is typically used when a synchronous clock is required. In normal mode, 8400110 provides an output clock which is synchronized to the input (REF).

Lock Time

This is the time it takes the PLL to lock to the input reference clock REF. Lock occurs when the input signal and output signal are aligned in phase and frequency with respect to each other. LOCK time is affected by many factors which include:

- Initial input to output phase difference
- Initial input to output frequency difference
- PLL loop bandwidth

Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, V_{DD}	4.6V
Inputs, V_I	-0.5V to $V_{DD} + 0.5V$
Outputs, V_O	-0.5V to $V_{DD} + 0.5V$
Package Thermal Impedance, θ_{JA}	37°C/W
Storage Temperature, T_{STG}	-65°C to 150°C

DC Electrical Characteristics

Table 3A. Power Supply DC Characteristics, $V_{DD} = 3.3V \pm 0.3V$, $T_A = -40^\circ C$ to $85^\circ C$

Input-to-Output Timing for Synchronous Clock

Application Information

Power Supply Filtering Technique

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. The 8400110 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V_{DD} and V_{DDA} should be individually connected to the power supply plane through vias, and $0.01\mu\text{F}$ bypass capacitors should be used for each pin. *Figure 1* illustrates this for a generic V_{DD} pin and also shows that V_{DDA} requires that an additional 10Ω resistor along with a $10\mu\text{F}$ bypass capacitor be connected to the V_{DDA} pin.

Figure 1. Power Supply Filtering

Crystal Input Interface

The 8400110 has been characterized with 18pF parallel resonant crystals. The capacitor values, C1 and C2, shown in *Figure 2* below were determined using a 25MHz, 18pF parallel resonant crystal and

were chosen to minimize the ppm error. The optimum C1 and C2 values can be slightly adjusted for different board layouts.

Figure 2. Crystal Input Interface

LVC MOS to XTAL Interface

The OSCi input can accept a single-ended LVC MOS signal through an AC coupling capacitor. A general interface diagram is shown in *Figure 3*. The OSCo pin can be left floating. The input edge rate can be as slow as 10ns. For LVC MOS signals, it is recommended that the amplitude be reduced from full swing to half swing in order to prevent signal interference with the power rail and to reduce noise. This configuration requires that the output impedance of the driver (R_o) plus the series resistance (R_s) equals the transmission line

impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This can be done in one of two ways. First, R1 and R2 in parallel should equal the transmission line impedance. For most 50Ω applications, R1 and R2 can be 100Ω. This can also be accomplished by removing R1 and making R2 50Ω. By overdriving the crystal oscillator, the device will be functional, but note, the device performance is guaranteed by using a quartz crystal.

Figure 3. General Diagram for LVC MOS Driver to XTAL Input Interface

VFQFN EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 4*. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”) are application specific

and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, please refer to the Application Note on the Surface Mount Assembly of Amkor’s Thermally/Electrically Enhance Leadframe Base Package, Amkor Technology.

Figure 4. P.C. Assembly for Exposed Pad Thermal Release Path – Side View (drawing not to scale)

Power Considerations

This section provides information on power dissipation and junction temperature for the 8400110. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the 8400110 is the sum of the core power plus the analog power plus the power dissipation in the load(s). The following is the power dissipation for $V_{DD} = 3.3V + 0.3V = 3.6V$, which gives worst case results.

- Power (core)_{MAX} = $V_{DD_MAX} * (I_{DD} + I_{DDA}) = 3.6V * (130mA + 15mA) = \mathbf{522mW}$
- Output Impedance R_{OUT} Power Dissipation due to Loading 50Ω to $V_{DD}/2$
Output Current $I_{OUT} = V_{DD_MAX} / [2 * (50\Omega + R_{OUT})] = 3.6V / [2 * (50\Omega + 17\Omega)] = \mathbf{26.9mA}$
- Power Dissipation on the R_{OUT} per LVCMOS output
Power $(R_{OUT}) = R_{OUT} * (I_{OUT})^2 = 17\Omega * (26.9mA)^2 = \mathbf{12.3mW}$ per output
- Total Power Dissipation on the R_{OUT}
Total Power (R_{OUT}) = $12.3mW * 2 = \mathbf{24.6mW}$

Total Power Dissipation

- **Total Power**
= Power (core)_{MAX} + Total Power (R_{OUT})
= $522mW + 24.6mW$
= **546.6mW**

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad, and directly affects the reliability of the device. The maximum recommended junction temperature for devices is $125^\circ C$. Limiting the internal transistor junction temperature, T_j , to $125^\circ C$ ensures that the bond wire and bond pad temperature remains below $125^\circ C$.

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_total + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming no air flow and a multi-layer board, the appropriate value is $37^\circ C/W$ per Table 7 below.

Therefore, T_j for an ambient temperature of $85^\circ C$ with all outputs switching is:

$$85^\circ C + 0.547W * 37^\circ C/W = 105.2^\circ C. \text{ This is below the limit of } 125^\circ C.$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

Table 7. Thermal Resistance θ_{JA} for 32 Lead VFQFN, Forced Convection

Meters per Second	θ_{JA} by Velocity		
	0	1	2.5
Multi-Layer PCB, JEDEC Standard Test Boards	$37.0^\circ C/W$	$32.4^\circ C/W$	$29.0^\circ C/W$

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
