### DESCRIPTION:

The FCT20805 is a 2.5 volt clock driver built using advanced CMOS technology. The device consists of two banks of drivers, each with a 1:5 fanout and its own output enable control. The device has a "heartbeat" monitor for diagnostics and PLL driving. The MON output is identical to all other outputs and complies with the output specifications in this document. The FCT20805 offers low capacitance inputs.

The FCT20805 is designed for high speed clock distribution where signal quality and skew are critical. The FCT20805 also allows single point-to-point transmission line driving in applications such as address distribution, where one signal must be distributed to multiple receivers with low skew and high signal quality.

## NOTES:

- See test circuits and waveforms.
- Minimum limits are guaranteed but not tested on Propagation Delays.
- t<sub>PLH</sub> and t<sub>PHL</sub> are production tested. All other parameters guaranteed but not production tested.
- Propagation delay range indicated by Min. and Max. limit is due to V<sub>CC</sub>, operating temperature and process parameters. These propagation delay limits do not imply skew.
- Skew measured between all outputs under identical transitions and load conditions.
- Skew measured is difference between propagation delay times t<sub>PHL</sub> and t<sub>PLH</sub> of same outputs under identical load conditions.
- Part to part skew for all outputs given identical transitions and load conditions at identical V<sub>CC</sub> levels and temperature.
- Airflow of 1m/s is recommended for frequencies above 133MHz.
- This parameter is measured using f = 1MHz.
