

1SP0335x2xx-MBN750H65E2 Preliminary Data Sheet

Compact, high-performance, plug-and-play single-channel IGBT driver based on SCALE-2 technology for individual and parallel-connected modules in 2-level, 3-level and multilevel converter topologies

Abstract

The SCALE-2 plug-and-play driver 1SP0335x2xx-MBN750H65E2 is a compact single-channel intelligent gate driver designed for Hitachi IGBTs MBN750H65E2. The master driver 1SP0335x2Mx-MBN750H65E2 features a fiber-optic interface. It can be used as stand-alone driver or in conjunction with up to three 1SP0335D2Sx-MBN750H65E2 slaves to drive up to four parallel-connected IGBT modules of type MBN750H65E2.

The DC/DC power supply must be purchased as a separate unit (one per master driver).

For drivers adapted to other types of high-power and high-voltage IGBT modules, refer to:

www.IGBT-Driver.com/go/plug-and-play

Features

- ✓ Plug-and-play solution
- ✓ Allows parallel connection of IGBT modules
- ✓ For 2-level, 3-level and multilevel topologies
- ✓ Fiber-optic links (master)
- ✓ Built-in interface to 1SP0335D2Sx (slave)
- ✓ Duty cycle 0...100%
- ✓ Dynamic Advanced Active Clamping DA²C
- ✓ Dynamic IGBT short-circuit protection
- ✓ Monitoring of supply voltage
- Monitoring of gate voltage
- ✓ Extremely reliable; long service life
- ✓ Shortens application development time
- ✓ Suitable for MBN750H65E2

Applications

- ✓ Traction
- ✓ Railroad power supplies
- ✓ Light rail vehicles
- ✓ HVDC
- ✓ Flexible AC transmission systems (FACTS)
- ✓ Medium-voltage converters
- ✓ Industrial drives
- ✓ Wind-power converters
- Medical applications
- ✓ Research
- ✓ And many others

Safety Notice!

The data contained in this data sheet is intended exclusively for technically trained staff. Handling all high-voltage equipment involves risk to life. Strict compliance with the respective safety regulations is mandatory!

Any handling of electronic devices is subject to the general specifications for protecting electrostatic-sensitive devices according to international standard IEC 60747-1, Chapter IX or European standard EN 100015 (i.e. the workplace, tools, etc. must comply with these standards). Otherwise, this product may be damaged.

Important Product Documentation

This data sheet contains only product-specific data. For a detailed description, must-read application notes and common data that apply to the whole series, please refer to the "Description & Application Manual for 1SP0335 SCALE-2 IGBT Drivers" on www.IGBT-Driver.com/go/1SP0335.

When applying SCALE-2 plug-and-play drivers, please note that these drivers are specifically adapted to a particular type of IGBT module. Therefore, the type designation of SCALE-2 plug-and-play drivers also includes the type designation of the corresponding IGBT module. These drivers are not valid for IGBT modules other than those specified. Incorrect use may result in failure.

Mechanical Dimensions

Dimensions: See the relevant "Description and Application Manual"

Mounting principle: Connected to IGBT module with screws

Footnotes to the Key Data

- 1) The transceivers required on the host controller side are not supplied with the gate driver. It is recommended to use the same types as used in the gate driver. For product information refer to www.IGBT-Driver.com/qo/fiberoptics
- 2) The recommended transmitter current at the host controller is 20mA. A higher current may increase iitter or delay at turn-off.
- 3) The typical transmitter current at the gate driver is 18mA. In case of supply undervoltage, the minimum transmitter current at the gate driver is 12mA: this is suitable for adequate plastic optical fibers with a length of more than 10 meters.
- 4) This refers to the manufacturer ordering number, see www.igbt-driver.com/go/ext erni. The customer-side connector as well as cables with different lengths can be supplied by CONCEPT. Refer to the "Description & Application Manual for 1SP0335 SCALE-2 IGBT Drivers" for more information.
- 5) This refers to the manufacturer ordering number, see www.igbt-driver.com/go/ext erni. These connectors are to be used to connect 1SP0335x2Mx (master) or 1SP0335D2Sx (slave) to 1SP0335D2Sx (slave) if parallel connection of IGBT modules is required. Cables with different lengths can be supplied by CONCEPT. Refer to the "Description & Application Manual for 1SP0335 SCALE-2 IGBT Drivers" for more information.
- 6) If the specified value is exceeded, this indicates a driver overload. It should be noted that the driver is not protected against overload.
- 7) The given power can only be fully exploited without slaves 1SP0335D2Sx (no parallel connection of IGBT modules). If the specified value is exceeded, this indicates a driver overload. It should be noted that the driver is not protected against overload. From 70°C to 85°C, the maximum permissible output power can be linearly interpolated from the given data.
- 8) The given power can be fully exploited with slaves 1SP0335D2Sx (parallel connection of IGBT modules). If the specified value is exceeded, this indicates a driver overload. It should be noted that the driver is not protected against overload. From 70°C to 85°C, the maximum permissible output power can be linearly interpolated from the given data.
- 9) The gate current is limited by the gate resistors located on the driver.
- 10) This limit is due to active clamping under switching conditions. Refer to the "Description & Application Manual for 1SP0335 SCALE-2 IGBT Drivers".
- 11) Due to the Dynamic Active Advanced Clamping Function (DA²C) implemented on the driver, the DC-link voltage can be increased in the off-state condition (e.g. after emergency shut-down). This value is only valid when the IGBTs are in the off state (not switching). The time during which the voltage can be applied should be limited to short periods (< 60 seconds). Refer to the "Description & Application Manual for 1SP0335 SCALE-2 IGBT Drivers".

- 12) The maximum dynamic voltage between auxiliary emitters of parallel-connected drivers due to asymmetrical operation at turn-on and turn-off must be limited to the given value.
- 13) Maximum allowed rate of change of auxiliary emitter voltage of parallel connected drivers. This specification guarantees that the drive information will be transferred reliably even with high rate of change of auxiliary emitter voltages (asymmetrical operation).
- 14) Dynamic voltages between auxiliary emitters of parallel connected drivers at turn-on and turn-off lead to equalizing currents over the X2 or X3 bus. The peak and RMS values of the resulting current must be limited to the given value.
- 15) Undervoltage monitoring of the secondary-side supply voltage (Viso to Vee and Vee to COM which correspond with the approximate turn-on and turn-off gate-emitter voltages). If the corresponding voltage drops below this limit on 1SP0335x2Mx (masters), all paralleled IGBTs (master and slaves) are switched off and a fault is transmitted to the status output. If the corresponding voltage drops below this limit on 1SP0335D2Sx (slaves), the corresponding IGBT is switched off. If the IGBT was turned on, a fault will be generated by the gate-monitoring function on the master which will turn off all paralleled IGBT after the corresponding delay.
- 16) The mean value $V_{GE,mean}$ of all gate voltages (master and all slaves) is filtered and compared to the given values at turn-on and turn-off. If the specified values are exceeded ($V_{GE,mean} < V_{GE,on,min}$ at turn-on resp. $V_{GE,mean} > V_{GE,off,max}$ at turn-off) after the given filter delay, the driver turns off all parallel-connected IGBTs and a fault is transmitted to the status output.
- 17) A dynamic Vce protection is implemented on the driver. The maximum allowed Vce voltage at turn-on is dynamically adjusted in order to better fit to the IGBT characteristics at turn-on. At the end of the turn-on process the given static value applies.
- 18) The resulting pulse width of the direct output of the gate drive unit for short-circuit type I (excluding the delay of the gate resistors) is the sum of the response time plus the delay to IGBT turn-off.
- 19) The turn-off event of the IGBT is delayed by the specified time after the response time.
- 20) Including the delay of the external fiber-optic links (cable length: 1m). Measured from the transition of the turn-on or turn-off command at the optical transmitter on the host controller side to the direct output of the gate drive unit (excluding the delay of the gate resistors).
- 21) Output rise and fall times are measured between 10% and 90% of the nominal output swing. The values are given for the driver side of the gate resistors with $2\Omega/1$ uF load. The time constant of the output load in conjunction with the present gate resistors leads to an additional delay at their load side.
- 22) Delay of external fiber-optic links. Measured from the driver secondary side (ASIC output) to the optical receiver on the host controller.
- 23) Measured on the host side. The fault status on the secondary side is automatically reset after the specified time.
- 24) Including the delay of the external fiber-optic links. Measured from the transition of the turn-on or turn-off command at the optical transmitter on the host controller side to the transition of the acknowledge signal at the optical receiver on the host controller side.
- 25) The gate resistors can be leaded or surface mounted. CONCEPT reserves the right to determine which type will be used. Typically, higher quantities will be produced with SMD resistors and small quantities with leaded resistors.
- The driver supply voltage VDC is split into two distinct voltages on the driver. The first one is the turn-on voltage which is regulated at about 15V. The difference between VDC and the turn-on voltage is the turn-off voltage which is not regulated and mainly dependent on the driver input voltage VDC.
- 27) The fault status is set as long as the gate monitoring fault is present. The given value applies if the driver goes from the "off state" to the "on state" and the gate-emitter voltage of one or more parallel connected drivers does not turn on. If the driver goes from the "on state" to the "off state" and the gate-emitter voltage of one or more parallel connected drivers does not turn off, the fault status is applied as long as the gate monitoring fault is present.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«**FORSTAR**» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
