

### General Description

The MIC2145 is a small size boost switching regulator that can provide over 2.5W of output power. The input voltage range is between 2.4V to 16V, making the device suitable for one-cell Li-Ion and 3- to 4-cell alkaline/NiCad/NiMH applications. The output voltage of the MIC2145 can be adjusted up to 16V.

The MIC2145 is well suited for portable, space-sensitive applications. Its typical 450kHz operation allows small surface mount external components to be used. The MIC2145 has a low quiescent current of 200 $\mu$ A, and a typical shutdown current of 0.5 $\mu$ A. The MIC2145 is capable of high efficiencies in a small board area.

The MIC2145 features a low-on resistance internal switch that allows it to provide over 2.5W of output power. The peak switch current can be programmed through an external resistor. This allows the user to set the peak switch current at the level where maximum efficiency occurs. It also allows the user to further optimize for efficiency and inductor size by setting the peak current below the level of inductor saturation.

The MIC2145 is available in an MSOP-8 and 3mm $\times$ 3mm MLF<sup>TM</sup>-10L package with an ambient operating temperature range from -40°C to +85°C.

### Features

- 2.4V to 16V input voltage
- Output adjustable to 16V
- Programmable peak current limit
- Soft start
- Up to 450kHz switching frequency
- 0.5 $\mu$ A shutdown current
- 200 $\mu$ A quiescent current
- Capable of 5V/ 500mA output with 3.3V input
- Achieves over 85% efficiency
- Implements low power BOOST, SEPIC, and FLYBACK topologies
- MSOP-8 and 3mm $\times$ 3mm MLF<sup>TM</sup>-10L

### Applications

- Flash LED driver
- LCD bias supply
- White LED driver
- DSL bias supply
- Local 3V to 5V conversion

### Ordering Information

Part Number		Voltage	Ambient Temp. Range	Package
Standard	Pb-Free			
MIC2145BMM	MIC2145YMM	Adj	-40°C to +85°C	8-lead MSOP
MIC2145BML	MIC2145YML	Adj	-40°C to +85°C	10-lead MLF <sup>TM</sup>

### Typical Application

**Adjustable Output Boost Converter with Programmable Peak Switch Current**

	Logic High (turn-on)	1.5	1.1		V
Enable Input Current	$V_{EN} = 0V$	-1	0.01	1	$\mu A$
	$V_{EN} = 2V$	-1	0.01	1	$\mu A$
Soft Start Current	$V_{EN} = 2V$ , $V_{DD} = 3.0V$	<b>-8</b>	-12	<b>-16</b>	$\mu A$

**Note 1.** Exceeding the absolute maximum rating may damage the device.

**Note 2.** The device is not guaranteed to function outside its operating rating.

**Note 3.** Devices are ESD sensitive. Handling precautions recommended. Human body model, 1.5K $\Omega$  in series with 100pF.

**Note 4.** The current is measured in a DC mode. Actual peak switching current will be higher due to internal propagation delay of the circuit.

**Note 5.**  $V_{EN} \leq V_{DD}$ .

**Note 6.** Specification for packaged product only.

# Typical Characteristics

# Functional Diagram

Figure 1. Block Diagram

## Functional Description

See “Application Information” for component selection and pre-designed circuits.

### Overview

The MIC2145 is a 2.5W boost regulator with programmable peak current limit and a constant off time. Quiescent current for the MIC2145 is typically 200 $\mu$ A when the switch is in the off state. Efficiencies above 80% throughout most operating conditions can be realized.

### Regulation

Regulation is achieved by both of the comparators, which regulate the inductor current and the output voltage by gating the power MOSFET. Initially, power is applied to the SW and VDD pins. When the part is enabled, the power MOSFET turns on and current flows. When the current exceeds the peak current limit threshold, the current limit comparator fires the one-shot to turn off the power MOSFET for 1000ns and resets the SR flip-flop. The current limit comparator continues to cycle the power MOSFET on and off until the output voltage trips the upper threshold of the feedback comparator, which terminates the cycle. The cycle will begin again when the output voltage drops below the lower hysteresis threshold of the feedback comparator. The feedback comparator has a typical hysteresis of 18mV. Due to the gain of the feedback resistor divider, the voltage at  $V_{OUT}$  experiences a typical 167mV of hysteresis for 10V output at 2.4V  $V_{DD}$ . This can be reduced by adding a feed-forward capacitor,  $C_{FF}$  (See “Output Voltage” section).

Figure 2. Typical Regulator Waveforms

### Output

The maximum output voltage is limited by the voltage capability of the output switch. Output voltages of up to 16V can be achieved with the boost circuit. Higher output voltages require a flyback configuration.

### Peak Current Limit

The peak current limit is externally set with a resistor. The peak current range is from 420mA to 2A. There is a minimum resistor value for  $R_{SET}$  at lower  $V_{DD}$  voltages. For resistor value selections, see the “Typical Characteristics: Peak Current Limit vs.  $R_{SET}$ ”.

### Soft Start

The MIC2145 has a built in soft start that controls the rise time of the output voltage and the peak current limit threshold during start up.

Figure 3. Typical Soft Start Waveforms

### Thermal Shutdown

Built-in thermal protection circuitry turns off the power MOSFET when the junction temperature exceeds about 150°C.

## Application Information

Pre-designed circuit information is at the end of this section.

### Output Voltage

The output voltage of the regulator can be set between 2.4V and 16V by connecting a resistor divider at the FB pin. The resistor values are selected by the following equations:

$$R2 = \frac{1.08 \times R1}{V_{OUT} - 1.08}$$

A value of 1M $\Omega$  is recommended for R1 to minimize the quiescent current when the part is off. Then, R2 can be solved using the above equation. A feed-forward capacitor, C<sub>FF</sub>, ranging from 5pF to 100pF can be used in parallel with R1 to reduce the peak-to-peak output voltage ripple, which is shown in Figures 4 and 5.

Figure 4. Without Feed-Forward Capacitor

Figure 5. With Feed-Forward Capacitor (100pF)

**Bootstrap**

A bootstrapped configuration is recommended for applications that require high efficiency at heavy loads (>70mA). This is achieved by connecting the  $V_{DD}$  pin to  $V_{OUT}$  (see

Figure 7). For applications that require high efficiency at light loads (<70mA), the  $V_{DD}$  pin is connected to the input voltage ( $V_{IN}$ ); this is referred to as the basic configuration (see Figure 6).

**Figure 6. Basic Configuration**

**Figure 7. Bootstrap Configuration**

**Inductor**

The MIC2145 has a programmable peak current to allow the usage of small surface mount inductors. A 10 $\mu$ H or 4.7 $\mu$ H inductor is recommended for most portable applications such as powering white LEDs and biasing LCD panels. The

inductor should have a saturation current rating higher than the peak current during circuit operation. A low ESR (Equivalent Series Resistance) inductor is also desirable for high efficiency. Below are tables that list the maximum output current at minimum input voltage with efficiencies greater than 80%.

$V_{IN(min)}$ (V)	$V_{IN(max)}$ (V)	RSET ( $\Omega$ )	$I_{OUT(max)}$ (mA)	$V_{OUT}$ (V)

	4.5		150	12
	4.5		130	15

**Table 4. Typical Application for 4.7 $\mu$ H Inductor in Bootstrap Configuration**

**Diode**

A Schottky diode should be used for the output diode. Most of the application circuits on this data sheet specify the Motorola MBR0530 surface mount Schottky diode. It has a forward current of 0.5A and a low forward voltage drop. For applications that are cost driven, the 1N4148 or equivalent can be used but the efficiency will suffer due to higher forward voltage drop.

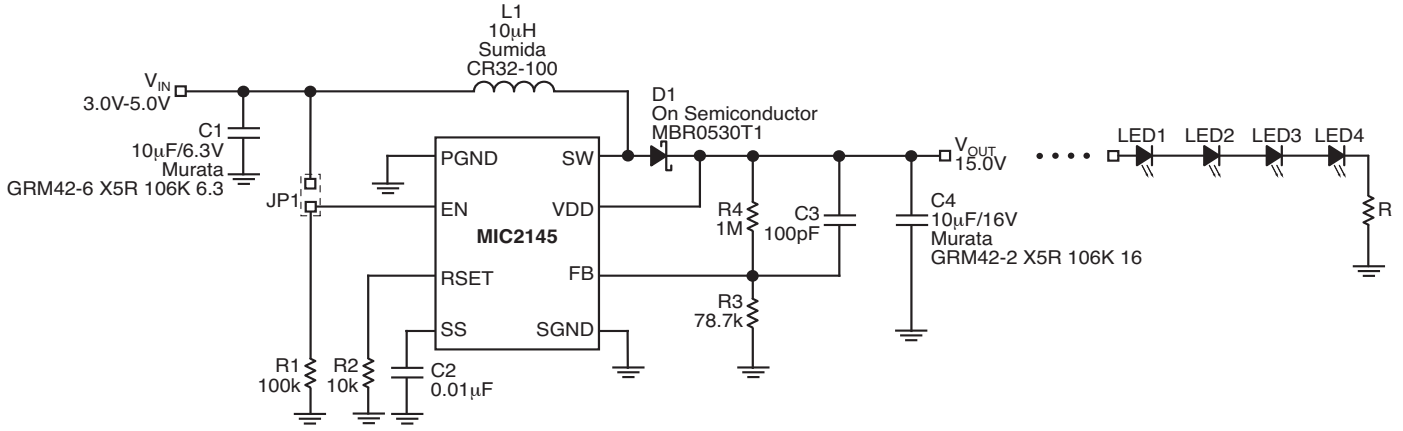

**Output Capacitor**

Low ESR capacitors should be used at the output of the MIC2145 to minimize the switching output ripple voltage. Selection of the capacitor value will depend upon the peak inductor current, inductor size, and the load. MuRata offers the GRM43-2 series with up to 10 $\mu$ F at 25V, with a X5R temperature coefficient in a 1812 surface-mount package. For lower output voltage applications, the GRM42-2 (1210 package/10 $\mu$ F/16V) and GRM42-6 (1206 package/10 $\mu$ F/6.3V) series can be used. Typically, values ranging from 10 $\mu$ F to 47 $\mu$ F can be used for the output capacitor.

**Reducing Peak Current**

If lower than 400mA peak current is required then the soft start pin may be shorted to ground. This changes the reference of the current limit comparator. With the soft start pin shorted to ground, the maximum current will approximately reduce to half. The peak current should always be set at least 50% higher than the maximum load current.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
