## 2 General

### 2.1 AC electrical characteristics

Unless otherwise specified, propagation delays are measured from the 50% to the 50% point, and rise and fall times are measured at the 20% and 80% points, as shown in the following figure.

**Figure 1. Input signal measurement reference**

All digital I/O switching characteristics, unless otherwise specified, assume that the output pins have the following characteristics.

- $C_L=30$  pF loads
- Slew rate disabled
- Normal drive strength

- All I/O pins are internally clamped to  $V_{SS}$  through a ESD protection diode. There is no diode connection to  $V_{DD}$ . If  $V_{IN}$  greater than  $V_{IO\_MIN}$  ( $= V_{SS}-0.3\text{ V}$ ) is observed, then there is no need to provide current limiting resistors at the pads. If this limit cannot be observed then a current limiting resistor is required. The negative DC injection current limiting resistor is calculated as  $R = (V_{IO\_MIN} - V_{IN})/|I_{ICIO}|$ .
- Open drain outputs must be pulled to  $V_{DD}$ .

## Peripheral operating requirements and behaviors

- $C_x, C_y$  can be provided by using the integrated capacitors when the low frequency oscillator (RANGE = 00) is used. For all other cases external capacitors must be used.
- When low power mode is selected,  $R_f$  is integrated and must not be attached externally.
- The EXTAL and XTAL pins should only be connected to required oscillator components and must not be connected to any other devices.

- Other frequency limits may apply when external clock is being used as a reference for the FLL.
- When transitioning from FEI or FBI to FBE mode, restrict the frequency of the input clock so that, when it is divided by FRDIV, it remains within the limits of the DCO input clock frequency.
- Proper PC board layout procedures must be followed to achieve specifications.
- Crystal startup time is defined as the time between the oscillator being enabled and the OSCINIT bit in the MCG\_S register being set.

### 3.8.3 SPI switching specifications

The Serial Peripheral Interface (SPI) provides a synchronous serial bus with master and slave operations. Many of the transfer attributes are programmable. The following tables provide timing characteristics for classic SPI timing modes. See the SPI chapter of the chip's Reference Manual for information about the modified transfer formats used for communicating with slower peripheral devices.

All timing is shown with respect to 20%  $V_{DD}$  and 80%  $V_{DD}$  thresholds, unless noted, as well as input signal transitions of 3 ns and a 30 pF maximum load on all SPI pins.

## Peripheral operating requirements and behaviors

1. The maximum SCL Clock Frequency in Fast mode with maximum bus loading can be achieved only when using the high drive pins across the full voltage range and when using the normal drive pins and  $VDD \geq 2.7 V$ .
2. The master mode I<sup>2</sup>C deasserts ACK of an address byte simultaneously with the falling edge of SCL. If no slaves acknowledge this address byte, then a negative hold time can result, depending on the edge rates of the SDA and SCL lines.
3. The maximum t<sub>HD</sub>; DAT must be met only if the device does not stretch the LOW period (t<sub>LOW</sub>) of the SCL signal.
4. Input signal Slew = 10 ns and Output Load = 50 pF
5. Set-up time in slave-transmitter mode is 1 IPBus clock period, if the TX FIFO is empty.
6. A Fast mode I<sup>2</sup>C bus device can be used in a Standard mode I<sup>2</sup>C bus system, but the requirement  $t_{SU; DAT} \geq 250$  ns must then be met. This is automatically the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, then it must output the next data bit to the SDA line  $t_{max} + t_{SU; DAT} = 1000 + 250 = 1250$  ns (according to the Standard mode I<sup>2</sup>C bus specification) before the SCL line is released.
7.  $C_b$  = total capacitance of the one bus line in pF.

To achieve 1MHz I<sup>2</sup>C clock rates, consider the following recommendations:

- To counter the effects of clock stretching, the I<sup>2</sup>C baud Rate select bits can be configured for faster than desired baud rate.
- Use high drive pad and DSE bit should be set in PORTx\_PCRn register.
- Minimize loading on the I<sup>2</sup>C SDA and SCL pins to ensure fastest rise times for the SCL line to avoid clock stretching.
- Use smaller pull up resistors on SDA and SCL to reduce the RC time constant.

**Table 41. I<sup>2</sup>C 1Mbit/s timing**

SCL Clock Frequency	f <sub>SCL</sub>	0	1 <sup>1</sup>	MHz
Hold time (repeated) START condition. After this period, the first clock pulse is generated.	t <sub>HD</sub> ; STA	0.26	—	μs

Set-up time for a repeated START condition	t <sub>SU</sub> ; STA	0.26	—	μs
Data hold time for I <sup>2</sup> C bus devices	t <sub>HD</sub> ; DAT	0	—	μs
Data set-up time	t <sub>SU</sub> ; DAT	50	—	ns
Rise time of SDA and SCL signals	t <sub>r</sub>	20 + 0.1C <sub>b</sub>	120	ns
Fall time of SDA and SCL signals	t <sub>f</sub>	20 + 0.1C <sub>b</sub> <sup>2</sup>	120	ns

Bus free time between STOP and START condition	t <sub>BUF</sub>	0.5	—	μs

1. The maximum SCL clock frequency of 1 Mbit/s can support maximum bus loading when using the high drive pins across the full voltage range.
2.  $C_b$  = total capacitance of the one bus line in pF.

See [General switching specifications](#).

### 3.8.6 I2S/SAI switching specifications

This section provides the AC timing for the I2S/SAI module in master mode (clocks are driven) and slave mode (clocks are input). All timing is given for noninverted serial clock polarity (TCR2[BCP] is 0, RCR2[BCP] is 0) and a noninverted frame sync (TCR4[FSP] is 0, RCR4[FSP] is 0). If the polarity of the clock and/or the frame sync have been inverted, all the timing remains valid by inverting the bit clock signal (BCLK) and/or the frame sync (FS) signal shown in the following figures.

- The actual value used could vary with tolerance.
- For highest glass capacitance values, LCD\_GCR[LADJ] should be configured as specified in the LCD Controller chapter within the device's reference manual.
- $V_{IREG}$  maximum should never be externally driven to any level other than  $V_{DD} - 0.15$  V
- VLL1, VLL2 and VLL3 are a function of  $V_{IREG}$  only when the regulator is enabled (GCR[RVEN]=1) and the charge pump is enabled (GCR[CPSEL]=1).
- VLL1, VLL2 and VLL3 are a function of  $V_{DDA}$  only under either of the following conditions:
  - The charge pump is enabled (GCR[CPSEL]=1), the regulator is disabled (GCR[RVEN]=0), and VLL3 =  $V_{DDA}$  through the internal power switch (GCR[VSUPPLY]=0).
  - The resistor bias string is enabled (GCR[CPSEL]=0), the regulator is disabled (GCR[RVEN]=0), and VLL3 is connected to  $V_{DDA}$  externally (GCR[VSUPPLY]=1).

## 8 Terminology and guidelines

### 8.1 Definitions

Key terms are defined in the following table:

Term	Definition
Rating	<p>A minimum or maximum value of a technical characteristic that, if exceeded, may cause permanent chip failure:</p> <ul style="list-style-type: none"> <li>• <i>Operating ratings</i> apply during operation of the chip.</li> <li>• <i>Handling ratings</i> apply when the chip is not powered.</li> </ul> <p><b>NOTE:</b> The likelihood of permanent chip failure increases rapidly as soon as a characteristic begins to exceed one of its operating ratings.</p>
Operating requirement	<p>A specified value or range of values for a technical characteristic that you must guarantee during operation to avoid incorrect operation and possibly decreasing the useful life of the chip</p>
Operating behavior	<p>A specified value or range of values for a technical characteristic that are guaranteed during operation if you meet the operating requirements and any other specified conditions</p>
Typical value	<p>A specified value for a technical characteristic that:</p> <ul style="list-style-type: none"> <li>• Lies within the range of values specified by the operating behavior</li> <li>• Is representative of that characteristic during operation when you meet the <a href="#">typical-value conditions</a> or other specified conditions</li> </ul> <p><b>NOTE:</b> Typical values are provided as design guidelines and are neither tested nor guaranteed.</p>

## 8.2 Examples

*Operating rating:*

Symbol	Description	Min.	Max.	Unit
V <sub>DD</sub>	1.0 V core supply voltage	-0.3	1.2	V

*Operating requirement:*

Symbol	Description	Min.	Max.	Unit
V <sub>DD</sub>	1.0 V core supply voltage	0.9	1.1	V

*Operating behavior that includes a typical value:*

Symbol	Description	Min.	Typ.	Max.	Unit
I <sub>WP</sub>	Digital I/O weak pullup/pulldown current	10	70	130	μA

## 8.3 Typical-value conditions

Typical values assume you meet the following conditions (or other conditions as specified):

Symbol	Description	Value	Unit
T <sub>A</sub>	Ambient temperature	25	°C
V <sub>DD</sub>	3.3 V supply voltage	3.3	V

## 8.4 Relationship between ratings and operating requirements

## 8.5 Guidelines for ratings and operating requirements

Follow these guidelines for ratings and operating requirements:

- Never exceed any of the chip’s ratings.
- During normal operation, don’t exceed any of the chip’s operating requirements.
- If you must exceed an operating requirement at times other than during normal operation (for example, during power sequencing), limit the duration as much as possible.
