

## Micropower quad CMOS voltage comparators

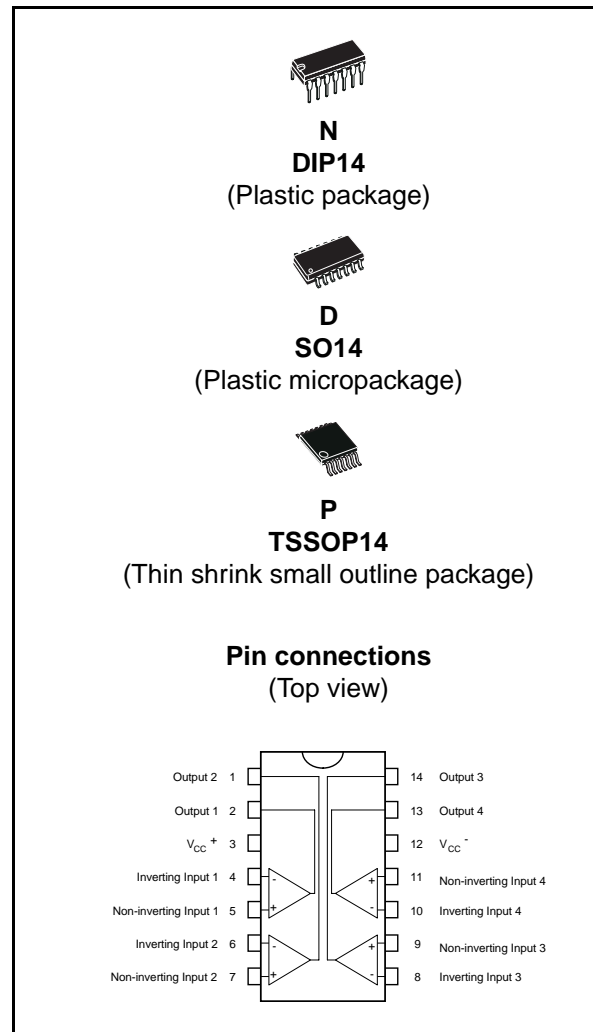

### Features

- Push-pull CMOS output (no external pull-up resistor required)
- Extremely low supply current: 9µA typ per comparator
- Wide single supply range 2.7V to 16V or dual supplies (±1.35V to ±8V)
- Extremely low input bias current: 1pA typ
- Extremely low input offset current: 1pA typ
- Input common-mode voltage range includes GND
- High input impedance:  $10^{12}\Omega$  typ
- Last response time: 2µs typ. for 5mV overdrive
- Pin-to-pin and functionally compatible with bipolar LM339

### Description

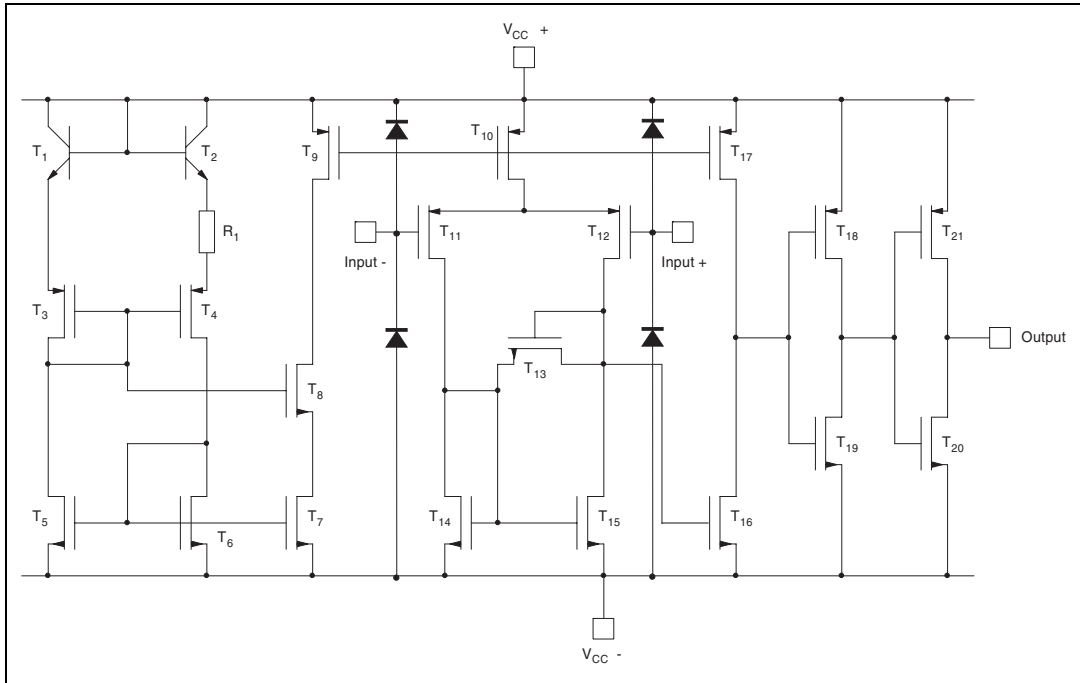

The TS3704 is a micropower CMOS quad voltage comparator with extremely low consumption of 9µA typ / comparator (20 times less than bipolar LM339). The push-pull CMOS output stage allows power and space saving by eliminating the external pull-up resistor required by usual open-collector output comparators.

Thus response times remain similar to the LM339.

	MM: machine model <sup>(7)</sup>	50	V
	CDM: charged device model <sup>(8)</sup>	1.5	kV

- All voltage values, except differential voltage, are with respect to network ground terminal.
- Differential voltages are the non-inverting input terminal with respect to the inverting input terminal.
- The magnitude of the input and the output voltages must never exceed the magnitude of the positive and negative supply voltages.
- Guaranteed by design.
- $P_d$  is calculated with  $T_{amb} = +25^\circ\text{C}$ ,  $T_j = +150^\circ\text{C}$  and  
 $R_{thja} = 80^\circ\text{C/W}$  for DIP14 package  
 $R_{thja} = 150^\circ\text{C/W}$  for SO14 package  
 $R_{thja} = 175^\circ\text{C/W}$  for TSSOP14 package
- Human body model: A 100pF capacitor is charged to the specified voltage, then discharged through a 1.5k $\Omega$  resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
- Machine model: A 200pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 $\Omega$ ). This is done for all couples of connected pin combinations while the other pins are floating.
- Charged device model: all pins and the package are charged together to the specified voltage and then discharged directly to the ground through only one pin. This is done for all pins.
