16-BIT COLOR LED DRIVER WITH PWM CONTROL

June 2013

GENERAL DESCRIPTION

The IS31FL3726 is comprised of constant-current drivers designed for color LEDs. The output current value can be set using an external resistor. The output current value can be adjusted from 5mA to 60mA through the external resistor.

As a result, all outputs will have virtually the same current levels.

This driver incorporates 16-bit constant t-current outputs, a 16-bit shift register, a 16-bit latch and a 16-bit AND-gate circuit.

These drivers have been designed using the CMOS process.

Figure 3 Timing Diagram

Warning: Latch circuit is leveled-latch circuit. Be careful because it is not triggered-latch circuit.

Note : The latches circuit holds data by pulling the `LATCH` terminal Low. And, when `LATCH` terminal is a High level, latch circuit doesn't hold data, and it passes from the input to the output. When `ENABLE` terminal is a Low level, output terminal `OUT0` to `OUT15` respond to the data, and on and off does. And, when `ENABLE` terminal is a High level, it offs with the output terminal regardless of the data.

Truth Table

CLOCK	LATCH	ENABLE	SERIAL-IN	OUT0 ...OUT7 ... OUT15	SERIAL-OUT
\uparrow	H	L	Dn	Dn ...Dn-7 ...Dn-15	Dn-15
\uparrow	L	L	Dn+1	No change	Dn-14
\uparrow	H	L	Dn+2	Dn+2 ...Dn-5 ...Dn-13	Dn-13
\downarrow	X	L	Dn+3	Dn+2 ...Dn-5 ...Dn-13	Dn-13
\downarrow	X	H	Dn+3	OFF	Dn-13

Note : `OUT0` to `OUT15` =On when Dn = H; `OUT0` to `OUT15` =Off when Dn = L. In order to ensure that the level of the power supply voltage is correct, an external resistor must be connected between R-EXT and GND.

Warning: The following conditions, `ENABLE=0`, `LATCH=1`, `SERIAL-IN=1`, cannot be configured at the same time when power on, or IS31FL3726 will be abnormal.

Conditions: (Refer to test circuit.)

T_{opr} = 25°C, V_{DD}=V_{IH} = 3.3V and 5V, V_{OUT} = 0.7V, V_{IL} = 0V, R_{EXT} = 1000Ω, V_L = 3.0V, R_L = 60Ω, C_L = 10.5pF

Note:

1. If the device is connected in a cascade and tr/tf for the waveform is large, it may not be possible to achieve the timing required for data transfer. Please consider the timings carefully.
2. Delay between outputs. The IS31FL3726 has graduated delay circuits between outputs. The fixed delay time is 5ns (typical), OUT1 has 5ns delay, OUT2 has 10 ns delay, etc. This delay prevents large inrush currents, which reduce power supply bypass capacitor requirements when the outputs turn on. The delay works during switch on and switch off of each output channel. LEDs that have not turned on before ENABLE is low will still turn on and off at the determined delayed time regardless of the state of ENABLE. Therefore, every LED will be illuminated for the amount of time ENABLE is pulled high.

TYPICAL OPERATING CHARACTERISTICS

ADJUSTING OUTPUT CURRENT

The output current of each channel is set by an external resistor R_{ext} , the relationship between I_{out} and R_{ext} is:

$$I_{out} = (V_{R-ext}/R_{ext}) \times 52$$

the V_{R-ext} is 0.36V in the IS31FL3726,so we can count the I_{out} as :

$$I_{out} = 0.36 \times 52 / R_{ext}$$

As show in the figure below:
