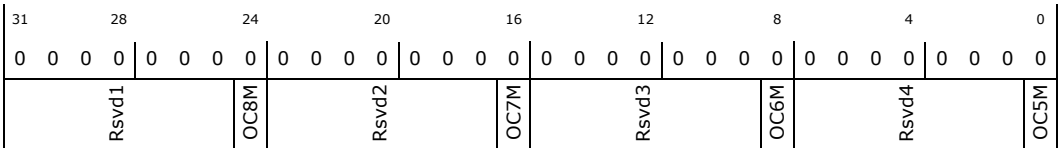
## 18.6.40 XHCI USB3 Overcurrent Pin Mapping 2 (U3OCM2)—Offset CCh



The RW/L property of this register is controlled by OCCFDONE bit. Note: U3OCM2 allows the OC pins 8:5 to be mapped to the same 6 SS ports that U3OCM1 allows. This a llows flexibility in pairing SS ports with HS ports at the connector. Care must be taken to make s ure OC pin assignment is consistent across USB3 and USB2 ports (depending upon the pairing).

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:20, F:0] + CCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |

## 18.6.41 USB2 Port Routing (USB2PR)—Offset D0h

### Access Method

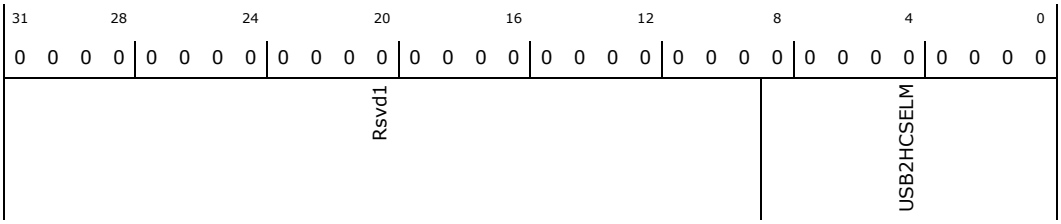
**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:20, F:0] + D0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:9 | 000000h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 8:0 | 000h<br>RW | **USB2 HC Selector (USB2HCSEL):** This field maps the USB2 port between the XHCI and EHCI controller (it has no effect on USB3). When set to 1, Routes USB2 pins to the XHCI controller. Routes OC pin to XHCI (based on the mapping in the OC register). Masks the USB2 port from the EHCI. Masks OC pin from ECHI. When set to 0, Routes all the USB2 pins to the legacy EHCI. Routes OC pin to EHCI (based on the mapping in the OC register). Masks the USB2 port from the XHCI. Masks OC pin from XHCI. Port to bit mapping is in one-hot encoding, i.e. bit 0 controls port 1 and so on.<br><br>**Power Well:** SUS |

## 18.6.42 USB2 Port Routing Mask (USB2PRM)—Offset D4h



The RW/L property of this register is controlled by the ACCTRL bit.

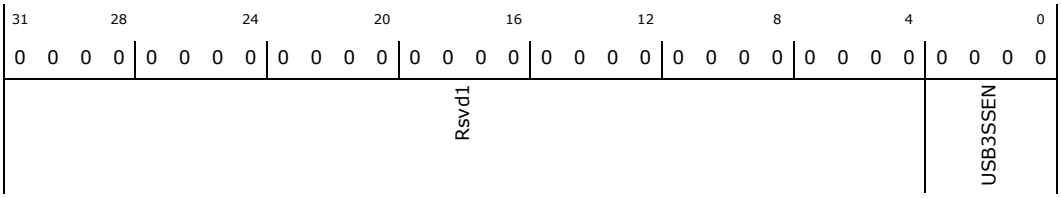
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:20, F:0] + D4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:9 | 000000h RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 8:0 | 000h RW/L | **USB2 HC Selector Mask (USB2HCSELM):** This field allows the BIOS to communicate to the OS which USB 2.0 ports can be switched from the EHCI controller to the xHCI controller. When set to 1, The OS may switch the USB 2.0 port between the EHCI and xHCI host controllers by modifying the corresponding USB2HCSEL bit. When set to 0, The OS shall not modify the corresponding USB2HCSEL bit. BIOS shall set this bit to a '1' if the corresponding USB2HCSEL bit is RW, unless it knows an internal USB 2.0 device attached to that port will not work under xHCI. Port to bit mapping is in one-hot encoding, i.e. bit 0 controls port 1 and so on.<br><br>**Power Well:** Core |



## 18.6.43 USB3 Port Routing (USB3PR)—Offset D8h

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:20, F:0] + D8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|

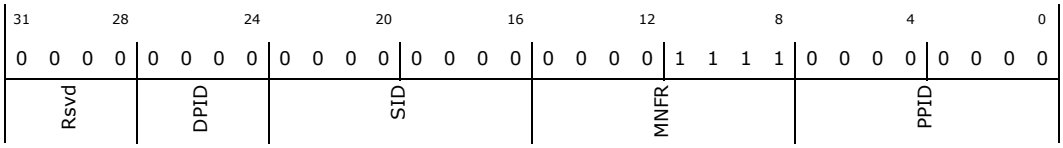
| 15:12 | 0h<br>RW | **UTMI+ DFT Port Select (UTMIDFTPS):** One CRC is shared for all the UTMI+ ports. These bits select the UTMI+ port for which CRC data will be updated and loopback status reflected in UTMILPBKSTS. 0h: (default) No UTMI+ Port is selected 1h: UTMI+ Port 0 2h: UTMI+ Port 1 3h: UTMI+ Port 2 4h: UTMI+ Port 3 5h: UTMI+ Port 4 6h: UTMI+ Port 5 7h: UTMI+ Port 6 8h: UTMI+ Port 7 9h: UTMI+ Port 8 Ah: UTMI+ Port 9 Bh: UTMI+ Port 10 Ch: UTMI+ Port 11 Dh: UTMI+ Port 12 Eh: UTMI+ Port 13 Others: Reserved<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 11:8 | 0h<br>RW | **Loop Number (UTMILPBKLOOPN_3_0):** Number of repeatable fixed pattern within a packet Note: Connect register bit 3 to counter bit 7, register bit 2 to counter bit 5, register bit 1 to counter bit 3, register bit 0 to counter bit 1. Counter bits 6, 4, 2 and 0 will be tied off to 0. Hence, the programmable loop number shall be: 0000b: 0 loop 0001b: 2 loops 0010b: 8 loops 0011b: 10 loops 1100b: 160 loops 1101b: 162 loops 1110b: 168 loops 1111b: 170 loops (max)<br><br>**Power Well:** Core |
| 7:6 | 0h<br>RW | **Operational Mode (UTMIOPMODE_1_0):** Operational Mode in test mode. These signals select between various operational modes: 00b: Normal Operation 01b: Non-Driving 10b: Disable Bit Stuffing and NRZI encoding 11b: Reserved<br><br>**Power Well:** Core |
| 5 | 0h<br>RW | **Termination Select (UTMITERMSEL):** Termination Select in test mode. This signal selects between the FS and HS terminations: 0b: HS termination enabled 1b: FS termination enabled<br><br>**Power Well:** Core |
| 4:3 | 0h<br>RW | **Transceiver Select (UTMIXCVRSELECT_1_0):** Transceiver Select in test mode. This signal selects between the LS, FS and HS transceivers: 00b: HS transceiver enabled 01b: FS transceiver enabled 10b: LS transceiver enabled 11b: Reserved<br><br>**Power Well:** Core |
| 2:1 | 0h<br>RO | **UTMI+ Loopback Status (UTMILPBKSTS):** Loopback Status for port selected by UTMIDFTPS 00b: Reset condition 01b: Comparator has started receiving data and the received data matches with the TX pattern. 10b: Comparator has started receiving data the received data does not match with the TX pattern but there was no assertion of RC error from UTMI. 11b: Comparator has started receiving data and RX ERROR was asserted for at least one clock by UTMI. Note that this does not reflect the status of pattern comparison since RX error from UTMI is unexpected for loopback.<br><br>**Power Well:** Core |
| 0 | 0h<br>RW | **Loopback Enable (UTMILPBKEN):** Enable loopback test mode. If asserted, loopback test mode is enabled<br><br>**Power Well:** Core |

## 18.6.51 Manufacturing Process ID (MANID)—Offset F8h



Not for EDS

### Access Method

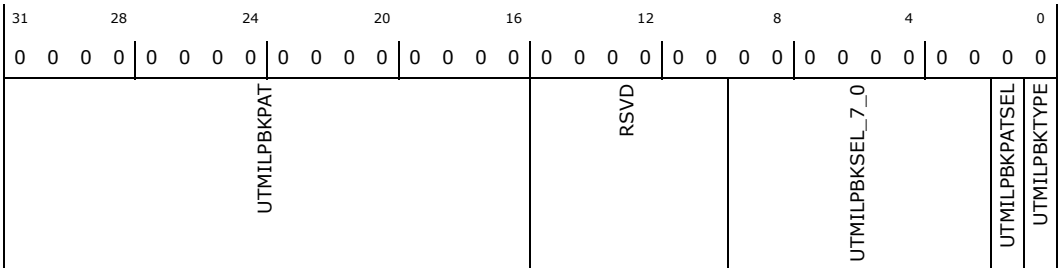
**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:20, F:0] + F8h

### Default: 00000F00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0h<br>RO | **Reserved (Rsvd):** Reserved.<br><br>**Power Well:** Core |
| 27:24 | 0h<br>RO/V | **Dot Portion Process ID (DPID):** See Chap 6 for value<br><br>**Power Well:** Core |
| 23:16 | 00h<br>RO/V | **Stepping ID (SID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate stepping when the Revision ID may not change. See Chap 6 for value<br><br>**Power Well:** Core |
| 15:8 | 0Fh<br>RO | **Manufacturer (MNFR):** 0Fh = Intel.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RO/V | **Process Portion Process ID (PPID):** See Chap 6 for value<br><br>**Power Well:** Core |

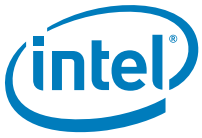
## 18.6.52 DFT 3 (DFT3)—Offset FCh



Not for EDS

### Access Method

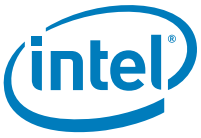
**Type:** PCI Configuration Register (Size: 32 bits)



**Offset:** [B:0, D:20, F:0] + FCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **Loopback Pattern (UTMILPBKPAT):** 2-byte pattern for loopback Note: This 2-byte pattern will be replicated to the upper 2-byte to form the DW pattern<br><br>**Power Well:** Core |
| 15:10 | 00h<br>RO | **Reserved (RSVD):** Reserved<br><br>**Power Well:** Core |
| 9:2 | 00h<br>RW | **Loopback Lane Select (UTMILPBKSEL_7_0):** Port is selected if the corresponding bit is selected Note: MSB is for UTMI+ Port13, LSB is for UTMI+ Port0<br><br>**Power Well:** Core |



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0b<br>RW | **Loopback Pattern (UTMILPBKPATSEL):** Near end loopback pattern generation type: 0b: Fixed pattern 1b: USB2 test packet<br><br>**Power Well:** Core |
| 0 | 0b<br>RW | **Loopback Type (UTMILPBKTYPE):** Loopback Type in test mode. This signal selects between DNELB and ANELB, and will only take effect if DTUTMILPBKEN is set. 0b: Digital Near-End Loopback (DNELB) 1b: Analog Near-End Loopback (ANELB) Note: Analog Far-End Loopback (AFELB) is not supported<br><br>**Power Well:** Core |

## 18.7 USB xHCI Memory Mapped I/O Registers

### Table 213. Summary of USB xHCI Memory Mapped I/O Registers—MBAR

| Offset | Size (Bytes) | Register Name (Register Symbol) | Default Value |
|---|---|---|---|
| 0–0h | 1 | "Capability Registers Length (CAPLENGTH)—Offset 0h" on page 2176 | 80h |
| 2–3h | 2 | "Host Controller Interface Version Number (HCIVERSION)—Offset 2h" on page 2176 | 0100h |
| 4–7h | 4 | "Structural Parameters 1 (HCSPARAMS1)—Offset 4h" on page 2177 | 07000820h |
| 8–Bh | 4 | "Structural Parameters 2 (HCSPARAMS2)—Offset 8h" on page 2178 | 84000054h |

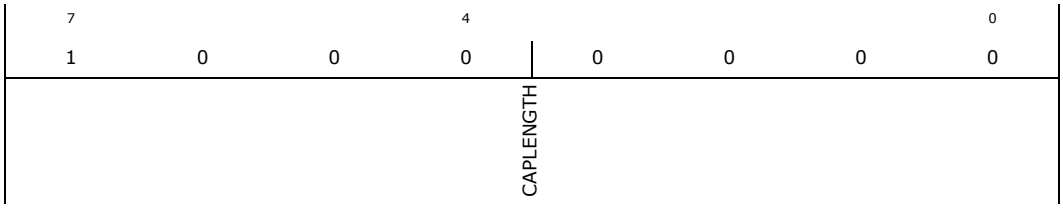
## 18.7.1 Capability Registers Length (CAPLENGTH)—Offset 0h

This register is used as an offset to add to register base, to find the beginning of the Operational Register Space. This register is modified and maintained by BIOS.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Offset:** [MBAR] + 0h

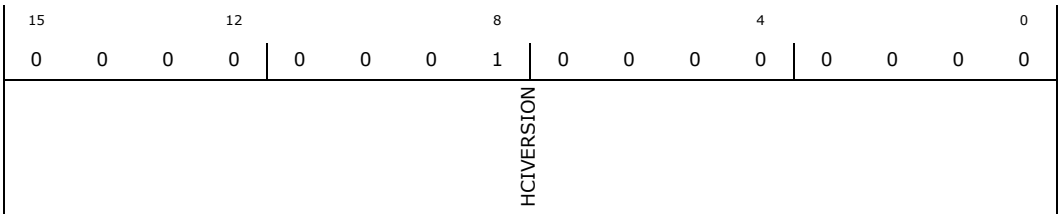
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 80h<br>RW/L | **Capability Registers Length (CAPLENGTH):** This field is used as an offset to add to register base, to find the beginning of the Operational Register Space.<br><br>**Power Well:** Core |

## 18.7.2 Host Controller Interface Version Number (HCIVERSION)—Offset 2h

This is a two-byte register containing a BCD encoding of the xHCI specification revision number supported by this host controller. The most significant byte of this register represents a major revision, and the least significant bit is the minor revision, e.g. 0100h corresponds to xHCI version 1.0. This register is modified and maintained by BIOS.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Offset:** [MBAR] + 2h

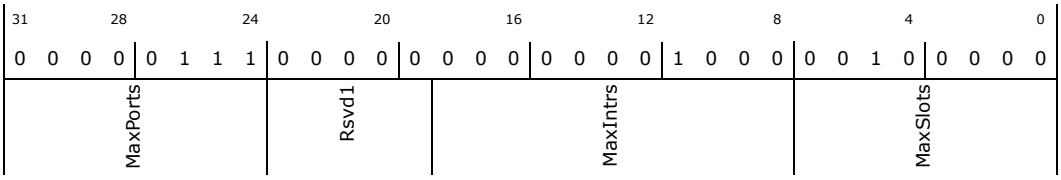
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0100h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0100h<br>RO | **Host Controller Interface Version Number (HCIVERSION):** This is a two-byte field containing a BCD encoding of the xHCI specification revision number supported by this host controller. The most significant byte of this field represents a major revision, and the least significant bit is the minor revision, e.g. 0100h corresponds to xHCI version 1.0.<br><br>**Power Well:** Core |

## 18.7.3 Structural Parameters 1 (HCSPARAMS1)—Offset 4h

This register defines basic structural parameters supported by this xHC implementation: Number of Device Slots support, Interrupters, Root Hub ports, etc. This register is modified and maintained by BIOS.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 4h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

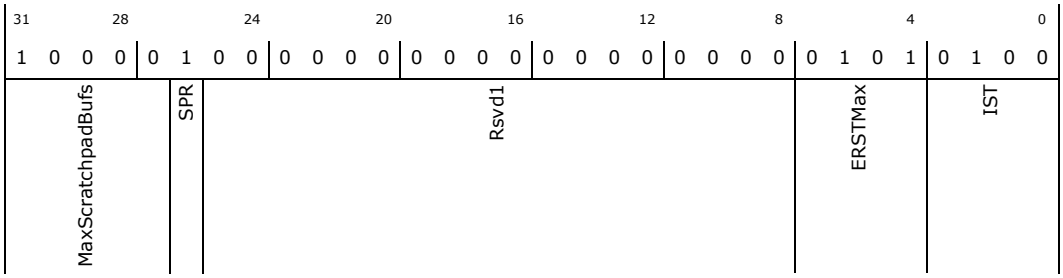
**Default:** 07000820h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 07h<br>RO | **Number of Ports (MaxPorts):** This field specifies the maximum Port Number value, i.e the highest number of Port Register Sets that are addressable in the Operational Register Space (refer to the xHCI for USB specification). Valid values are in the range of 1h to FFh.<br>The value in this field shall reflect the maximum Port Number value assigned by an *xHCI Supported Protocol Capability*, described in the xHCI for USB specification. Software shall refer to these capabilities to identify whether a specific Port Number is valid, and the protocol supported by the associated Port Register Set.<br><br>**Power Well:** Core |
| 23:19 | 00h<br>RW/L | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 18:8 | 008h<br>RW/L | **Number of Interrupters (MaxIntrs):** This field specifies the number of Interrupters implemented on this host controller. Each Interrupter is allocated to a vector of MSI-X, and controls its generation and moderation.<br>The value of this field determines how many Interrupter Register Sets are addressable in the Runtime Register Space (refer to the xHCI for USB specification). Valid values are in the range of 1h to 400h. A '0' in this field is undefined.<br><br>**Power Well:** Core |
| 7:0 | 20h<br>RW/L | **Number of Device Slots (MaxSlots):** This field specifies the maximum number of Device Context Structures and Doorbell Array entries this host controller can support. Valid values are in the range of 1h to 400h. A '0' in this field is undefined.<br><br>**Power Well:** Core |

## 18.7.4 Structural Parameters 2 (HCSPARAMS2)—Offset 8h

This register defines additional xHC structural parameters. This register is modified and maintained by BIOS.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 8h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

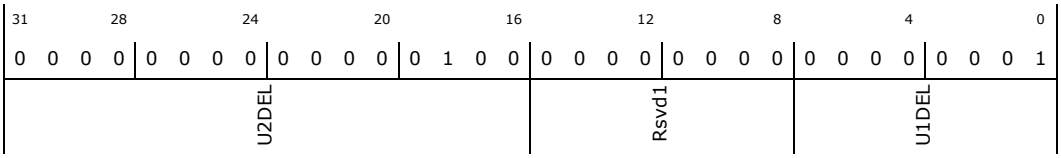
**Default:** 84000054h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 10h<br>RW/L | **Max Scratchpad Buffers (MaxScratchpadBufs):** Valid values are 0-31. This field indicates the number of Scratchpad Buffers system software shall reserve for the xHC. Refer to xHCI for USB specification for more information.<br><br>**Power Well:** Core |
| 26 | 1b<br>RW/L | **Scratchpad Restore (SPR):** If *Max Scratchpad Buffers* is greater than '0' then this flag indicates whether the xHC uses the Scratchpad Buffers for saving state when executing Save and Restore State operations. If *Max Scratchpad Buffers* is = '0', then this flag shall be '0'. Refer to the xHCI for USB specification for more information.<br>A value of '1' indicates that the xHC requires the integrity of the Scratchpad Buffer space to be maintained across power events.<br>A value of '0' indicates that the Scratchpad Buffer space may be freed and reallocated between power events.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 25:8 | 00000h<br>RW/L | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:4 | 5h<br>RW/L | **Event Ring Segment Table Max (ERSTMax):** Valid values are 0-15. This field determines the maximum value supported by the *Event Ring Segment Table Base Size* registers (5.5.2.3.1), where<br>The maximum number of Event Ring Segment Table entries = 2^(ERST Max)<br><br>e.g. if the ERST Max = 7, then the xHC *Event Ring Segment Table(s)* supports up to 128 entries, if ERST Max = 15, then 32K entries, etc.<br><br>**Power Well:** Core |
| 3:0 | 4h<br>RW/L | **Isochronous Scheduling Threshold (IST):** The value in this field indicates to system software the minimum distance (in time) that it is required to stay ahead of the host controller while adding TRBs, in order to have the host controller process them at the correct time. The value shall be specified in terms of number of frames/microframes.<br>If bit [3] of IST is cleared to '0', software can add a TRB no later than IST[2.0] microframes before that TRB is scheduled to be executed.<br>If bit [3] of IST is set to '1', software can add a TRB no later than IST[2:0] frames before that TRB is scheduled to be executed.<br>Refer to the xHCI for USB specification for details on how software uses this information for scheduling isochronous transfers.<br><br>**Power Well:** Core |

## 18.7.5 Structural Parameters 3 (HCSPARAMS3)—Offset Ch

This register defines link exit latency related structural parameters. This register is modified and maintained by BIOS.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

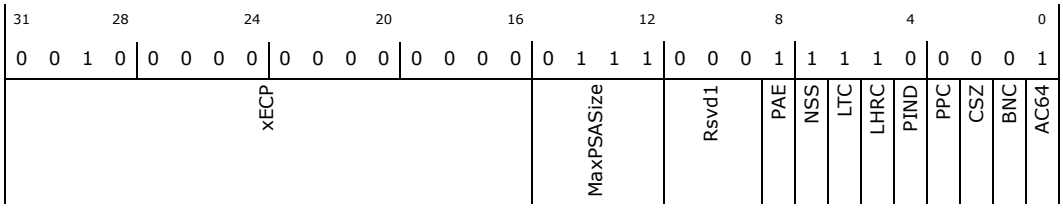
**Default:** 00040001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0004h<br>RW/L | **U2 Device Exit Latency (U2DEL):** Worst case latency to transition from U2 to U0. Applies to all root hub ports. The following are permissible values:<br>• 0000h = Zero<br>• 0001h = Less than 1 s<br>• 0002h = Less than 2 s<br>•<br>• 07FFh = Less than 2047 s.<br>• 0800-FFFFh = Reserved<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 00h<br>RW/L | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 01h<br>RW/L | **U1 Device Exit Latency (U1DEL):** Worst case latency to transition a root hub Port Link State (PLS) from U1 to U0. Applies to all root hub ports. The following are permissible values:<br>• 01h = Less than 1 s<br>• 02h = Less than 2 s<br>• ...<br>• 0Ah = Less than 10 s<br>• 0B-FFh = Reserved<br><br>**Power Well:** Core |

## 18.7.6 Capability Parameters (HCCPARAMS)—Offset 10h

The default values for all fields in this register are implementation dependent. This register defines optional capabilities supported by the xHCI. This register is modified and maintained by BIOS.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 10h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 200071E1h

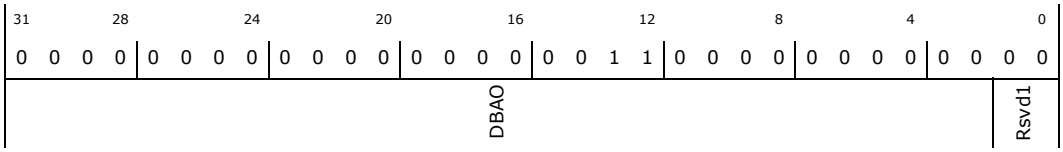
| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 2000h<br>RW/L | **xHCI Extended Capabilities Pointer (xECP):** This field indicates the existence of a capabilities list. The value of this field indicates a relative offset, in 32-bit words, from Base to the beginning of the first extended capability.<br>For example, using the offset of Base is 1000h and the xECP value of 0068h, we can calculate the following effective address of the first extended capability: 1000h + (0068h (( 2) -) 1000h + 01A0h -) 11A0h<br>a. This is not tightly coupled with the USBBASE address register mapping control.<br><br>**Power Well:** Core |
| 15:12 | 7h<br>RW/L | **Maximum Primary Stream Array Size (MaxPSASize):** This field identifies the maximum size Primary Stream Array that the xHC supports. The Primary Stream Array size = 2^(MaxPSASize+1).<br>Valid MaxPSASize values are 0 to 15, where 0 indicates that Streams are not supported.<br><br>**Power Well:** Core |
| 11:9 | 0h<br>RW/L | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 8 | 1b<br>RW/L | **Parse All Event Data (PAE):** This flag indicates whether the host controller implementation parses all Event Data TRBs while advancing to the next TD after a Short Packet, or skips all but the first Event Data TRB. A 1 in this bit indicates that all Event Data TRBs are parsed. A 0 in this bit indicates that only the first Event Data TRB is parsed. Refer to the xHCI for USB specification.<br><br>**Power Well:** Core |
| 7 | 1b<br>RW/L | **No Secondary SID Support (NSS):** This flag indicates whether the host controller implementation supports Secondary Stream IDs. A 1 in this bit indicates that Secondary Stream ID decoding is not supported. A 0 in this bit indicates that Secondary Stream ID decoding is supported. Refer to the xHCI for USB specification.<br><br>**Power Well:** Core |
| 6 | 1b<br>RW/L | **Latency Tolerance Messaging Capability (LTC):** This flag indicates whether the host controller implementation supports Latency Tolerance Messaging (LTM). A 1 in this bit indicates that LTM is supported. A 0 in this bit indicates that LTM is not supported. Refer to the xHCI for USB specification.<br><br>**Power Well:** Core |
| 5 | 1b<br>RW/L | **Light HC Reset Capability (LHRC):** This flag indicates whether the host controller implementation supports a Light Host Controller Reset. A 1 in this bit indicates that Light Host Controller Reset is supported. A 0 in this bit indicates that Light Host Controller Reset is not supported. The value of this flag affects the functionality of the *Light Host Controller Reset* (LHCRST) flag in the USBCMD register. Refer to the xHCI for USB specification.<br><br>**Power Well:** Core |
| 4 | 0b<br>RW/L | **Port Indicators (PIND):** This bit indicates whether the xHC root hub ports support port indicator control. When this bit is a 1, the port status and control registers include a read/ writeable field for controlling the state of the port indicator. Refer to the xHCI for USB specification for the definition of the *Port Indicator Control* field.<br><br>**Power Well:** Core |
| 3 | 0b<br>RO | **Port Power Control (PPC):** This flag indicates whether the host controller implementation includes port power control. A 1 in this bit indicates the ports have port power switches. A 0 in this bit indicates the port does not have port power switches. The value of this flag affects the functionality of the PP flag in each port status and control register. See the xHCI for USB specification.<br><br>**Power Well:** Core |
| 2 | 0b<br>RW/L | **Context Size (CSZ):** If this bit is set to 1, then the xHC uses 64 byte Context data structures. If this bit is cleared to 0, then the xHC uses 32 byte Context data structures. Note: This flag does *not* apply to Stream Contexts.<br><br>**Power Well:** Core |
| 1 | 0b<br>RW/L | **BW Negotiation Capability (BNC):** This flag identifies whether the xHC has implemented the Bandwidth Negotiation. Values for this flag have the following interpretation:<br>• 0 = BW Negotiation not implemented<br>• 1 = BW Negotiation implemented<br>Refer to the xHCI for USB specification for more information on Bandwidth Negotiation.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 0 | 1b<br>RW/L | **64-bit Addressing Capability (AC64):** This flag documents the addressing range capability of this implementation. The value of this flag determines whether the xHC has implemented the high order 32 bits of 64 bit register and data structure pointer fields. Values for this flag have the following interpretation:<br>• 0 = 32-bit address memory pointers implemented<br>• 1 = 64-bit address memory pointers implemented<br>If 32-bit address memory pointers are implemented, the xHC shall ignore the high order 32 bits of 64 bit data structure pointer fields, and system software shall ignore the high order 32 bits of 64 bit xHC registers.<br><br>**Power Well:** Core |

## 18.7.7 Doorbell Offset (DBOFF)—Offset 14h

This register defines the offset of the Doorbell Array base address from the Base.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 14h

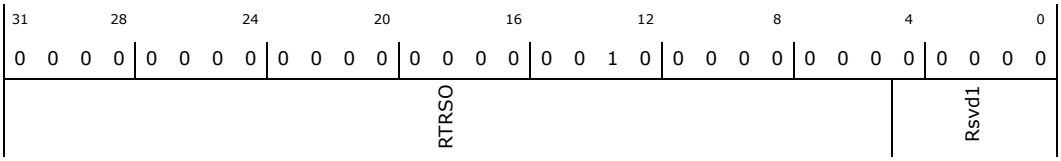
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00003000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 00000C00h<br>RO | **Doorbell Array Offset (DBAO):** This field defines the offset in Dwords of the Doorbell Array base address from the Base i.e. the base address of the xHCI Capability register address space.<br><br>**Power Well:** Core |
| 1:0 | 0h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 18.7.8 Runtime Register Space Offset (RTSOFF)—Offset 18h

This register defines the offset of the HCI Runtime Registers from the Base.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 18h

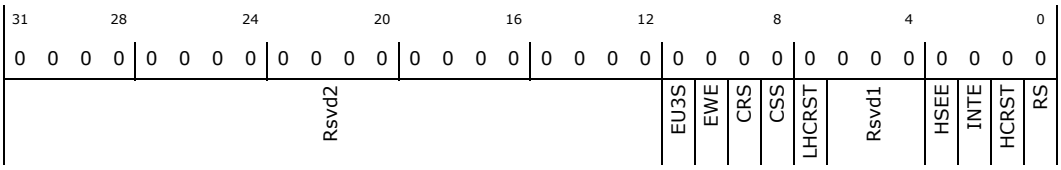
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00002000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:5 | 0000100h<br>RO | **Runtime Register Space Offset (RTRSO):** This field defines the 32-byte offset of the xHCI Runtime Registers from the Base, i.e. Runtime Register Base Address = Base + Runtime Register Set Offset.<br><br>**Power Well:** Core |
| 4:0 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 18.7.9 USB Command (USBCMD)—Offset 80h

The Command Register indicates the command to be executed by the serial bus host controller. Writing to the register causes a command to be executed.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 80h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

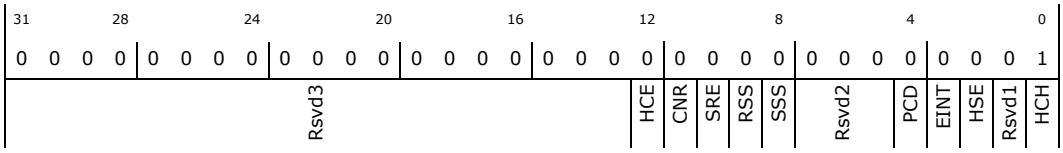
| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 00000h<br>RO | **Rsvd2:** Reserved.<br><br>**Power Well:** Core |
| 11 | 0b<br>RW | **Enable U3 MFINDEX Stop (EU3S):** When set to 1, the xHC may stop the MFINDEX counting action if all Root Hub ports are in the U3, Disconnected, Disabled, or Powered-off state. When cleared to 0 the xHC may stop the MFINDEX counting action if all Root Hub ports are in the Disconnected, Disabled, Training, or Powered-off state. Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |
| 10 | 0b<br>RW | **Enable Wrap Event (EWE):** When set to 1, the xHC shall generate an MFINDEX Wrap Event every time the MFINDEX register transitions from 03FFFh to 0. When cleared to 0 no MFINDEX Wrap Events are generated. Refer to the xHCI for USB specification for more information.<br>When this register is exposed by a Virtual Function (VF), the generation of MFINDEX Wrap Events to VFs shall be emulated by the VMM.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 9 | 0b<br>RW | **Controller Restore State (CRS):** When set to 1, and HCHalted (HCH) = 1, then the xHC shall perform a Restore State operation and restore its internal state. When set to 1 and *Run/Stop* (R/S) = 1 or *HCHalted* (HCH) = 0, or when cleared to 0, no Restore State operation shall be performed. This flag always returns 0 when read. Refer to the *Restore State Status* (RSS) flag in the USBSTS register for information on Restore State completion. Refer to the xHCI for USB specification, for more information. Note that undefined behavior may occur if a Restore State operation is initiated while *Save State Status* (SSS) = 1.<br>When this register is exposed by a Virtual Function (VF), this bit only controls restoring the state of the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |
| 8 | 0b<br>RW | **Controller Save State (CSS):** When written by software with 1 and HCHalted (HCH) = 1, then the xHC shall save any internal state that may be restored by asubsequent Restore State operation. When written by software with 1 and HCHalted (HCH) =0, or written with 0, no Save State operation shall be performed. This flag always returns 0 when read. Refer to the Save State Status (SSS) flag in the USBSTS register for information on Save State completion. Refer to the xHCI for USB specification for more information on xHC Save/Restore operation. Note that undefined behavior may occur if a Save State operation is initiated while Restore State Status (RSS) = 1.<br>When this register is exposed by a Virtual Function (VF), this bit only controls saving the state of the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |
| 7 | 0b<br>RW | **Light Host Controller Reset (LHCRST):** Optional normative. If the *Light HC Reset Capability* (LHRC) bit in the HCCPARAMS register is 1, then this flag allows the driver to reset the xHC without affecting the state of the ports.<br>A system software read of this bit as 0 indicates the *Light Host Controller Reset* has completed and it is safe for software to re-initialize the xHC. A software read of this bit as a 1 indicates the *Light Host Controller Reset* has not yet completed.<br>If not implemented, a read of this flag shall always return a 0.<br>All registers in the Aux Power well shall maintain the values that had been asserted prior to the Light Host Controller Reset. (Refer to the xHCI for USB specification for more information.)<br>When this register is exposed by a Virtual Function (VF), this bit only generates a Light Reset to the xHC instance presented by the selected VF, e.g. disabling the VF's device slots and setting the associated VF Run bit to Stopped. Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |
| 6:4 | 0h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 3 | 0b<br>RW | **Host System Error Enable (HSEE):** When this bit is a 1, and the HSE bit in the USBSTS register is a 1, the xHC shall assert out-of-band error signaling to the host. The signaling is acknowledged by software clearing the HSE bit. Refer to the xHCI for USB specification for more information.<br>When this register is exposed by a Virtual Function (VF), the effect of the assertion of this bit on the Physical Function (PF0) is determined by the VMM. Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2 | 0b<br>RW | **Interrupter Enable (INTE):** This bit provides system software with a means of enabling or disabling the host system interrupts generated by Interrupters. When this bit is a 1, then Interrupter host system interrupt generation is allowed, i.e. the xHC shall issue an interrupt at the next interrupt threshold if the host system interrupt mechanism (e.g. MSI, MSIX, etc.) is enabled. The interrupt is acknowledged by a host system interrupt specific mechanism.<br>When this register is exposed by a Virtual Function (VF), this bit only enables the set of Interrupters assigned to the selected VF.<br><br>**Power Well:** Core |
| 1 | 0b<br>RW | **Host Controller Reset (HCRST):** This control bit is used by software to reset the host controller. The effects of this bit on the xHC and the Root Hub registers are similar to a Chip Hardware Reset.<br>When software writes a 1 to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on the USB is immediately terminated. A USB reset shall not be driven on USB2 downstream ports, however a Hot or Warm Reseta shall be initiated on USB3 Root Hub downstream ports. PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Software shall reinitialize the host controller, as described in the xHCI for USB specification, in order to return the host controller to an operational state.<br>This bit is cleared to 0 by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a 0 to this bit and shall not write any xHC Operational or Runtime registers until while HCRST is 1. Note, the completion of the xHC reset process is not gated by the Root Hub port reset process. Software shall not set this bit to 1 when the HCHalted (HCH) bit in the USBSTS register is a 0. Attempting to reset an actively running host controller may result in undefined behavior. When this register is exposed by a Virtual Function (VF), this bit only resets the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |
| 0 | 0b<br>RW | **Run/Stop (RS):**<br>• 1 = Run<br>• 0 = Stop<br>When set to a 1, the xHC proceeds with execution of the schedule. The xHC continues execution as long as this bit is set to a 1. When this bit is cleared to 0, the xHC completes any current or queued commands or TDs, and any USB transactions associated with them, then halts. Refer to section 5.4.1.1 for more information on how R/S shall be managed. The xHC shall halt within 16 ms. after software clears the Run/Stop bit if the above conditions have been met. The HCHalted (HCH) bit in the USBSTS register indicates when the xHC has finished its pending pipelined transactions and has entered the stopped state. Software shall not write a 1 to this flag unless the xHC is in the Halted state (i.e. HCH in the USBSTS register is 1). Doing so may yield undefined results. Writing a 0 to this flag when the xHC is in the Running state (i.e. HCH = 0) and any Event Rings are in the Event Ring Full state (refer to section 4.9.4) may yield undefined resultsresult in lost events. When this register is exposed by a Virtual Function (VF), this bit only controls the run state of the xHC instance presented by the selected VF.<br><br>**Power Well:** Core |

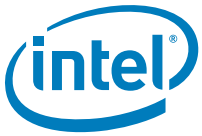
## 18.7.10 USB Status (USBSTS)—Offset 84h

This register indicates pending interrupts and various states of the Host Controller. The status resulting from a transaction on the serial bus is not indicated in this register. Software sets a bit to '0' in this register by writing a '1' to it (RW1C). Refer to specification *eXtensible Host Controller Interface for Universal Serial Bus (xHCI)* for additional information concerning USB interrupt conditions.



**Access Method**

**Type:** Memory Mapped I/O Register (Size: 32 bits)



**Offset:** [MBAR] + 84h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

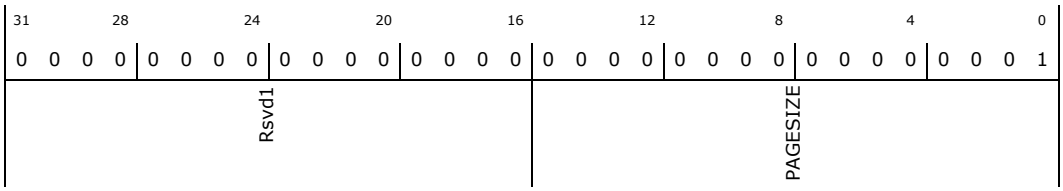
**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:13 | 00000h<br>RO | **Rsvd3:** Reserved.<br><br>**Power Well:** Core |
| 12 | 0b<br>RO | **Host Controller Error (HCE):** This bit is not preset in HC, this is deviation from XHCI 1.0 spec.<br><br>**Power Well:** Core |
| 11 | 0b<br>RO | **Controller Not Ready (CNR):** This is deviation from XHCI 1.0 spec.<br><br>**Power Well:** Core |
| 10 | 0b<br>RW/C | **Save/Restore Error (SRE):** If an error occurs during a Save or Restore operation, this bit shall be set to 1. This bit shall be cleared to 0 when a Save or Restore operation is initiated or when written with 1. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the Save/Restore completion status for the selected VF. Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |
| 9 | 0b<br>RO | **Restore State Status (RSS):** When the Controller Restore State (CRS) flag in the USBCMD register is written with 1 this bit shall be set to 1 and remain 1 while the xHC restores its internal state. When the Restore State operation is complete, this bit shall be cleared to 0. Refer to the xHCI for USB specification for more information.<br>When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the restoring the state for the selected VF. Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |
| 8 | 0b<br>RO | **Save State Status (SSS):** When the *Controller Save State* (CSS) flag in the USBCMD register is written with 1, this bit shall be set to 1 and remain 1 while the xHC saves its internal state. When the Save State operation is complete, this bit shall be cleared to 0. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the saving the state for the selected VF. Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |
| 7:5 | 0h<br>RO | **Rsvd2:** Reserved.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 4 | 0b<br>RW/C | **Port Change Detect (PCD):** The xHC sets this bit to a 1 when any port has a change bit transition from a 0 to a 1. This bit is allowed to be maintained in the Aux Power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the xHC, this bit is loaded with the OR of all of the PORTSC change bits. Refer to the xHCI for USB specification for more information. This bit provides system software an efficient means of determining if there has been Root Hub port activity. Refer to the xHCI for USB specification for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the Root Hub Ports associated with the Device Slots assigned to the selected VF. Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |
| 3 | 0b<br>RW/C | **Event Interrupt (EINT):** The xHC sets this bit to 1 when the *Interrupt Pending* (IP) bit of any Interrupter transitions from 0 to 1. Refer to the xHCI for USB specification for usage information.<br>Software that uses *EINT* shall clear it prior to clearing any IP flags. A race condition may occur if software clears the *IP* flags, then clears the *EINT* flag, and between the operations another *IP* 0 to '1' transition occurs. In this case, the new IP transition shall be lost.<br>When this register is exposed by a Virtual Function (VF), this bit is the logical 'OR' of the IP bits for the Interrupters assigned to the selected VF. And it shall be cleared to 0 when all associated interrupter IP bits are cleared, i.e. all the VFs Interrupter Event Ring(s) are empty. Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |
| 2 | 0b<br>RW/C | **Host System Error (HSE):** The xHC sets this bit to 1 when a serious error is detected, either internal to the xHC or during a host system access involving the xHC module. (In a PCI system, conditions that set this bit to 1 include PCI Parity error, PCI Master Abort, and PCI Target Abort.) When this error occurs, the xHC clears the Run/Stop (R/S) bit in the USBCMD register to prevent further execution of the scheduled TDs. If the HSEE bit in the USBCMD register is a 1, the xHC shall also assert out-of-band error signaling to the host. Refer to the xHCI for USB specification for more information.<br>When this register is exposed by a Virtual Function (VF), the assertion of this bit affects all VFs and reflects the Host System Error state of the Physical Function (PF0). Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |
| 1 | 0b<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 0 | 1b<br>RO | **HCHalted (HCH):** This bit is a 0 whenever the *Run/Stop* (R/S) bit is a 1. The xHC sets this bit to 1 after it has stopped executing as a result of the *Run/Stop* (R/S) bit being cleared to 0, either by software or by the xHC hardware (e.g. internal error). If this bit is '1', then SOFs, microSOFs, or Isochronous Timestamp Packets (ITP) shall not be generated by the xHC, and any received Transaction Packet shall be dropped. When this register is exposed by a Virtual Function (VF), this bit only reflects the Halted state of the xHC instance presented by the selected VF. Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |

## 18.7.11 Page Size (PAGESIZE)—Offset 88h

The default value for this register is implementation dependent.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 88h

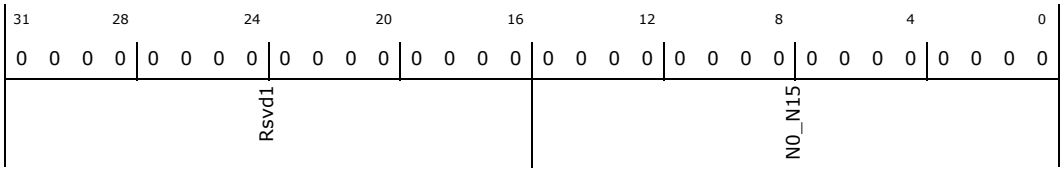
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0001h<br>RO | **Page Size (PAGESIZE):** This field defines the page size supported by the xHC implementation. This xHC supports a page size of 2^(n+12) if bit n is Set. For example, if bit 0 is Set, the xHC supports 4k byte page sizes.<br>For a Virtual Function, this register reflects the page size selected in the *System Page Size* field of the SR-IOV Extended Capability structure. For the Physical Function 0, this register reflects the implementation dependent default xHC page size.<br>Various xHC resources reference PAGESIZE to describe their minimum alignment requirements. The maximum possible page size is 128M.<br><br>**Power Well:** Core |

## 18.7.12 Device Notification Control (DNCTRL)—Offset 94h

This register is used by software to enable or disable the reporting of the reception of specific USB Device Notification Transaction Packets. A *Notification Enable* (Nx, where x = 0 to 15) flag is defined for each of the 16 possible device notification types. If a flag is set for a specific notification type, a Device Notification Event shall be generated when the respective notification packet is received. After reset, all notifications are disabled. Refer to specification *eXtensible Host Controller Interface for Universal Serial Bus (xHCI)*. This register shall be written as a Dword. Byte writes produce undefined results.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 94h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

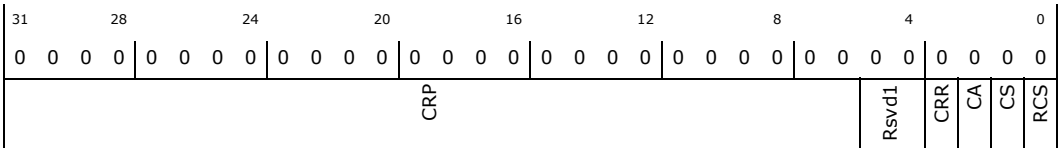
**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0000h<br>RW | **Notification Enable (N0_N15):** When a Notification Enable bit is set, a Device Notification Event shall be generated when a Device Notification Transaction Packet is received with the matching value in the Notification Type field. For example, setting N1 to '1' enables Device Notification Event generation if a Device Notification TP is received with a Notification Type field set to '1' (FUNCTIONAL_WAKE), etc.<br><br>**Power Well:** Core |

## 18.7.13 Command Ring Low (CRCR_LO)—Offset 98h

The Command Ring Control Register provides Command Ring control and status capabilities, and identifies the address and Cycle bit state of the Command Ring Dequeue Pointer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 98h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

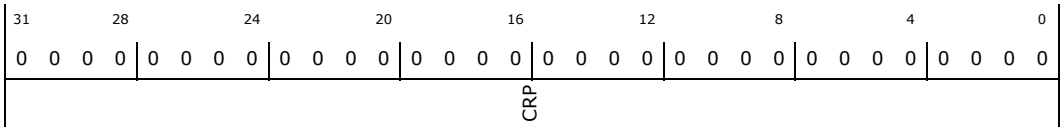
**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0000000h<br>RW | **Command Ring Pointer (CRP):** This field defines low order bits of the initial value of the 64-bit Command Ring Dequeue Pointer.<br>Writes to this field are ignored when *Command Ring Running* (CCR) = '1'.<br>If the CRCR is written while the Command Ring is stopped (CCR = '0'), the value of this field shall be used to fetch the first Command TRB the next time the *Host Controller Doorbell* register is written with the DB Reason field set to Host Controller Command.<br>If the CRCR is *not* written while the Command Ring is stopped (CRR = '0') then the Command Ring shall begin fetching Command TRBs at the current value of the internal xHC Command Ring Dequeue Pointer.<br>Reading this field always returns '0'.<br><br>**Power Well:** Core |
| 5:4 | 0h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 3 | 0b<br>RO | **Command Ring Running (CRR):** This flag is set to '1' if the *Run/Stop* (R/S) bit is '1' and the *Host Controller Doorbell* register is written with the *DB Reason* field set to *Host Controller Command*. It is cleared to '0' when the Command Ring is 'stopped' after writing a '1' to the *Command Stop* (CS) or *Command Abort* )CA) flags, or if the *R/S* bit is cleared to '0'<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2 | 0b<br>RW/S | **Command Abort (CA):** Writing a '1' to this bit shall immediately terminate the currently executing command, stop the Command Ring, and generate a Command Completion Event with the Completion Code set to Command Ring Stopped. Refer to the xHCI for USB specification for more information on aborting a command.<br>The next write to the *Host Controller Doorbell* with *DB Reason* field set to *Host Controller Command* shall restart the Command Ring operation.<br>Writes to this flag are ignored by the xHC if *Command Ring Running* (CCR) = '0'.<br>Reading this bit always returns '0'.<br><br>**Power Well:** Core |
| 1 | 0b<br>RW/S | **Command Stop (CS):** Writing a '1' to this bit shall stop the operation of the Command Ring after the completion of the currently executing command, and generate a *Command Completion Event* with the *Completion Code* set to *Command Ring Stopped* and the Command TRB Pointer set to the current value of the Command Ring Dequeue Pointer. Refer to the xHCI for USB specification for more information on stopping a command.<br>The next write to the *Host Controller Doorbell* with *DB Reason* field set to *Host Controller Command* shall restart the Command Ring operation.<br>Writes to this flag are ignored by the xHC if *Command Ring Running* (CCR) = '0'.<br>Reading this bit shall always return '0'.<br><br>**Power Well:** Core |
| 0 | 0b<br>RW | **Ring Cycle State (RCS):** This bit identifies the value of the xHC *Consumer Cycle State* (CCS) flag for the TRB referenced by the *Command Ring Pointer*. Refer to the xHCI for USB specification for more information.<br>Writes to this flag are ignored if *Command Ring Running* is '1'.<br>If the CRCR is written while the Command Ring is stopped (CCR = '0'), then the value of this flag shall be used to fetch the first Command TRB the next time the *Host Controller Doorbell* register is written with the *DB Reason* field set to *Host Controller Command*.<br>If the CRCR is *not* written while the Command Ring is stopped (CRR = '0'), then the Command Ring shall begin fetching Command TRBs using the current value of the Internal Command Ring CCS flag.<br>Reading this flag always returns '0'.<br><br>**Power Well:** Core |

## 18.7.14 Command Ring High (CRCR_HI)—Offset 9Ch

The Command Ring Control Register provides Command Ring control and status capabilities, and identifies the address and Cycle bit state of the Command Ring Dequeue Pointer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 9Ch

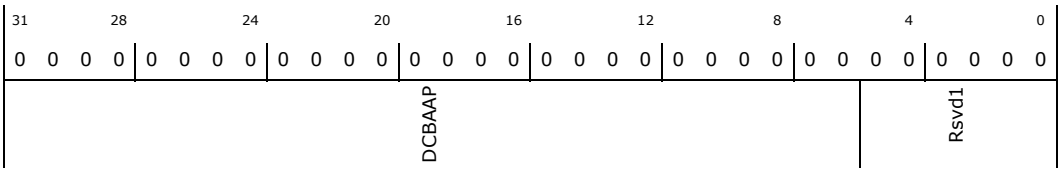
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h<br>RW | **Command Ring Pointer (CRP):** This field defines high order bits of the initial value of the 64-bit Command Ring Dequeue Pointer.<br>Writes to this field are ignored when *Command Ring Running* (CCR) = '1'.<br>If the CRCR is written while the Command Ring is stopped (CCR = '0'), the value of this field shall be used to fetch the first Command TRB the next time the *Host Controller Doorbell* register is written with the DB Reason field set to Host Controller Command.<br>If the CRCR is *not* written while the Command Ring is stopped (CRR = '0') then the Command Ring shall begin fetching Command TRBs at the current value of the internal xHC Command Ring Dequeue Pointer.<br>Reading this field always returns '0'.<br><br>**Power Well:** Core |

## 18.7.15 Device Context Base Address Array Pointer Low (DCBAAP_LO)—Offset B0h

The Device Context Base Address Array Pointer Register identifies the base address of the Device Context Base Address Array. The memory structure referenced by this physical memory pointer is assumed to be physically contiguous and 64-byte aligned.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + B0h

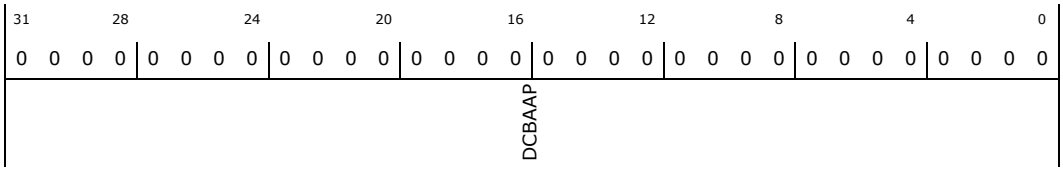
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0000000h<br>RW | **Device Context Base Address Array Pointer (DCBAAP):** This field defines low order bits of the 64-bit base address of the Device Context Pointer Array, which is a table of address pointers that reference Device Context structures for the devices attached to the host.<br><br>**Power Well:** Core |
| 5:0 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 18.7.16 Device Context Base Address Array Pointer High (DCBAAP_HI)—Offset B4h

The Device Context Base Address Array Pointer Register identifies the base address of the Device Context Base Address Array. The memory structure referenced by this physical memory pointer is assumed to be physically contiguous and 64-byte aligned.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + B4h

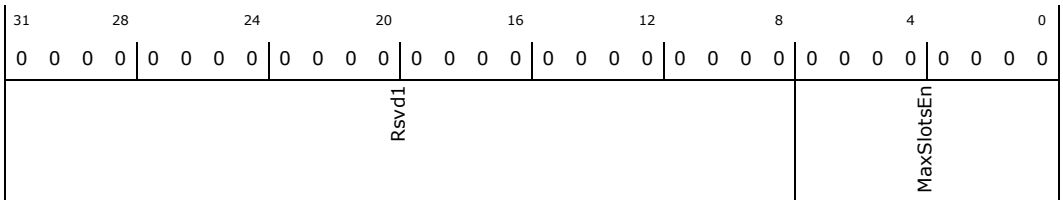
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h<br>RW | **Device Context Base Address Array Pointer (DCBAAP):** This field defines high order bits of the 64-bit base address of the Device Context Pointer Array, which is a table of address pointers that reference Device Context structures for the devices attached to the host.<br><br>**Power Well:** Core |

## 18.7.17 Configure (CONFIG)—Offset B8h

This register defines runtime xHC configuration parameters.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

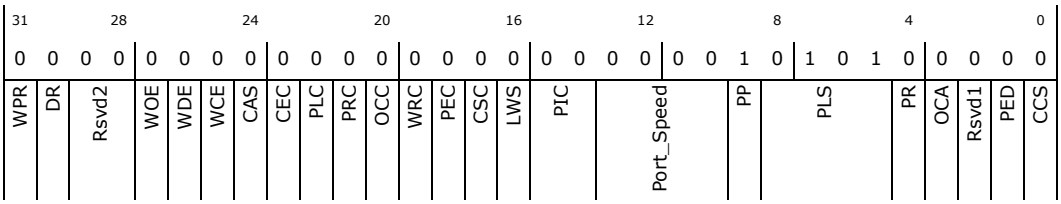
**Offset:** [MBAR] + B8h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 000000h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **Max Device Slots Enabled (MaxSlotsEn):** This field specifies the maximum number of enabled Device Slots. Valid values are in the range of 0 to MaxSlots. Enabled Devices Slots are allocated contiguously, e.g. a value of 16 specifies that Device Slots 1 to 16 are active. A value of '0' disables all Device Slots. A disabled Device Slot shall not respond to Doorbell Register references.<br>This field shall not be modified by software if the xHC is running (Run/Stop (R/S) = '1').<br><br>**Power Well:** Core |

## 18.7.18 Port 1 Status and Control USB3 (PORTSC1USB2)—Offset 480h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 480h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

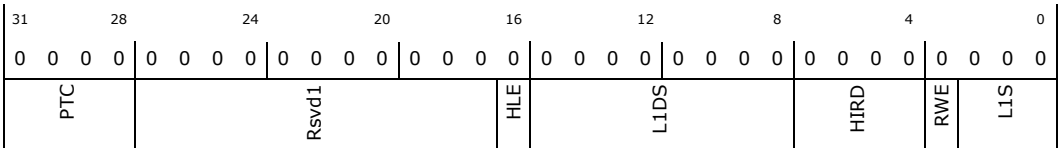
### 18.7.19 Port 1 Power Management Status and Control USB2 (PORTPMSC1USB2)—Offset 484h

This register is in the Aux Power well. It is only reset by platform hardware during a cold reset or in response to a *Host Controller Reset* (HCRST). The USB2 Port Power Management Status and Control register provides the USB2 LPM parameters necessary for the xHC to generate a LPM Token to the downstream device.



**Access Method**

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 484h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

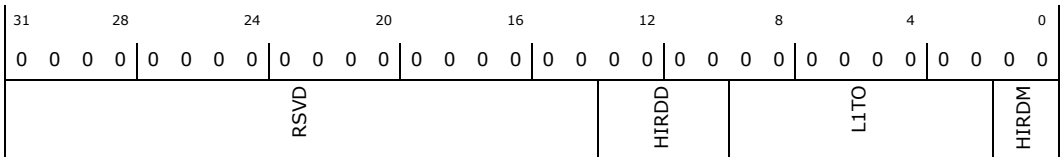
**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0h<br>RW | **Port Test Control (PTC):** Note: This register is sticky.<br><br>**Power Well:** SUS |
| 27:17 | 000h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 16 | 0b<br>RO | **Hardware LPM Enable (HLE):** Reserved.<br><br>**Power Well:** SUS |
| 15:8 | 00h<br>RW | **L1 Device Slot (L1DS):** Note: This register is sticky. System software sets this field to indicate the ID of the Device Slot associated with the device directly attached to the Root Hub port. A value of 0 indicates no device is present. The xHC uses this field to lookup information necessary to generate the LPM Token packet.<br><br>**Power Well:** SUS |
| 7:4 | 0h<br>RW | **Best Effort Service Latency (HIRD):** Note: This register is sticky.<br>System software sets this field to indicate to the recipient device how long the xHC will drive resume if it (the xHC) initiates an exit from L1. For more information about *BESL* value encoding, refer to the xHCI for USB specification.<br>Note that the *BESL* field is used by both software and hardware controlled LPM. Refer to the xHCI for USB specification for more information on *BESL* use and how *DBESL* may be used to establish an initial value for BESL.<br><br>**Power Well:** SUS |
| 3 | 0b<br>RW | **Remote Wake Enable (RWE):** Note: This register is sticky. System software sets this flag to enable or disable the device for remote wake from L1. The value of this flag shall temporarily (while in L1) override the current setting of the Remote Wake feature set by the standard Set/ClearFeature() commands defined in Universal Serial Bus Specification, revision 2.0, Chapter 9.<br><br>**Power Well:** SUS |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2:0 | 0h<br>RW | **L1 Status (L1S):** Note: This register is sticky. This field is used by software to determine whether an L1- based suspend request (LPM transaction) was successful, specifically:<br>• 0 = Invalid - This field shall be ignored by software.<br>• 1 = Success - Port successfully transitioned to L1 (ACK)<br>• 2 = Not Yet - Device is unable to enter L1 at this time (NYET)<br>• 3 = Not Supported - Device does not support L1 transitions (STALL)<br>• 4 = Timeout/Error - Device failed to respond to the LPM Transaction or an error occurred<br>• 5-7 = Reserved<br>The value of this field is only valid when the port resides in the L0 or L1 state (*PLS* = 0 or 2). Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** SUS |

## 18.7.20 Port X Hardware LPM Control Register (PORTHLPM1)—Offset 48Ch

There are 9 PORTHLPM registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh and 50Ch. This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The field definitions depend on the protocol supported. For USB3, this register is reserved and shall be treated by software as RsvdP. For USB2, the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 48Ch

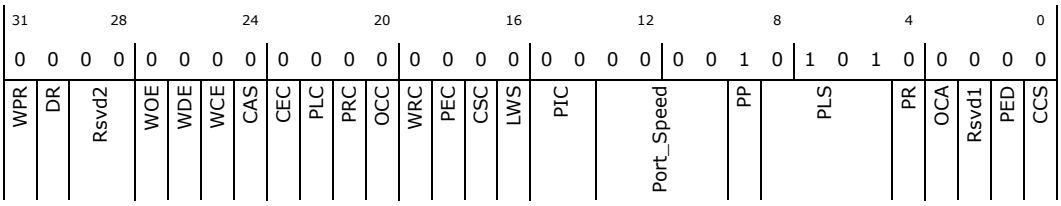
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 00000h<br>RO | **RESERVED (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 13:10 | 0h<br>RW | **Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume upon exit from L1. The HIRDD value is is encoded as follows:<br>• 0h = 50 us (default)<br>• 1h = 125 us<br>• 2h = 200 us<br>• ...<br>• Fh = 1.175ms<br>The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.<br><br>**Power Well:** SUS |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 9:2 | 00h<br>RW | **L1 Timeout (L1TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us. ... FFh: 65,280us Note: This register is sticky.<br><br>**Power Well:** SUS |
| 1:0 | 0h<br>RW | **Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. The following are permissible values:<br>• 0 = Initiate L1 using HIRD only time out (default)<br>• 1 = Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD<br>• 2,3 = Reserved<br>Note: This register is sticky.<br><br>**Power Well:** SUS |

## 18.7.21 Port 2 Status and Control USB3 (PORTSC2USB2)—Offset 490h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 490h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 000002A0h

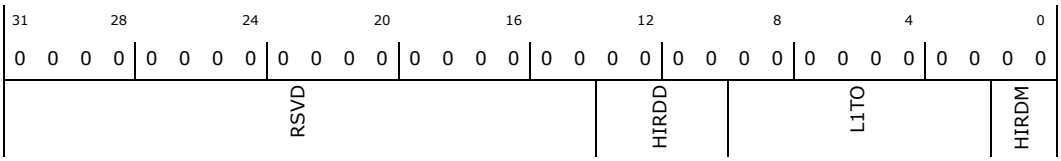
## 18.7.26 Port X Hardware LPM Control Register (PORTHLPM3)—Offset 4ACh

There are 9 PORTHLPM registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh and 50Ch. This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The field definitions depend on the protocol supported. For USB3, this register is reserved and shall be treated by software as RsvdP. For USB2, the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

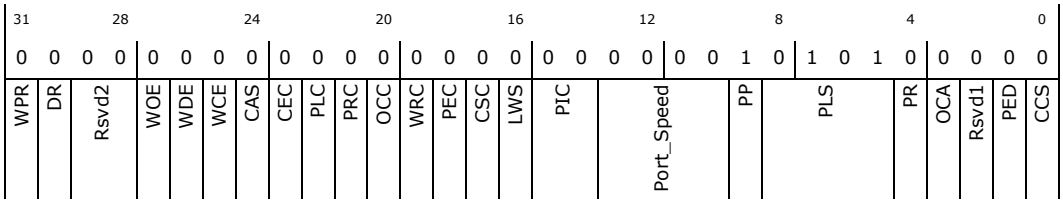
**Offset:** [MBAR] + 4ACh

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

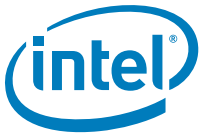
| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 00000h<br>RO | **RESERVED (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 13:10 | 0h<br>RW | **Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume upon exit from L1. The HIRDD value is is encoded as follows:<br>• 0h = 50 us (default)<br>• 1h = 125 us<br>• 2h = 200 us<br>• ...<br>• Fh = 1.175ms<br>The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.<br><br>**Power Well:** SUS |
| 9:2 | 00h<br>RW | **L1 Timeout (L1TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us. ... FFh: 65,280us Note: This register is sticky.<br><br>**Power Well:** SUS |
| 1:0 | 0h<br>RW | **Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. The following are permissible values:<br>• 0 = Initiate L1 using HIRD only time out (default)<br>• 1 = Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD<br>• 2,3 = Reserved<br>Note: This register is sticky.<br><br>**Power Well:** SUS |

## 18.7.27 Port 4 Status and Control USB3 (PORTSC4USB2)—Offset 4B0h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)



**Offset:** [MBAR] + 4B0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

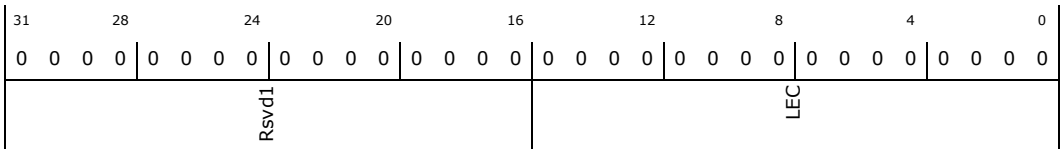
## 18.7.38 Port 1 Link Info (PORTLI1)—Offset 4E8h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 4E8h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

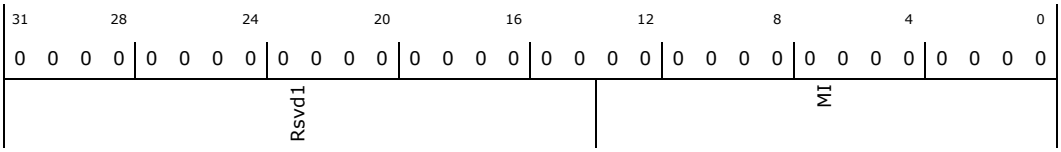
**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0000h<br>RO | **Link Error Count (LEC):** Reserved.<br><br>**Power Well:** Core |

## 18.7.39 Microframe Index (MFINDEX)—Offset 2000h

This register is used by the system software to determine the current periodic frame. The register value is incremented every 125 microseconds (once each microframe). This register is only incremented while *Run/Stop* = '1'. The value of this register affects the SOF value generated by USB2 Bus Instances.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2000h

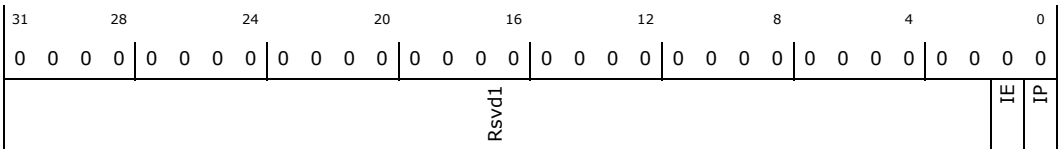
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 00000h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 13:0 | 0000h<br>RO | **Microframe Index (MI):** Reserved.<br><br>**Power Well:** Core |

## 18.7.40 Interrupter 1 Management (IMAN1)—Offset 2020h

The Interrupter Management registers allow system software to enable, disable, detect and force xHC interrupts. There are 8 IMAN registers. x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2020h

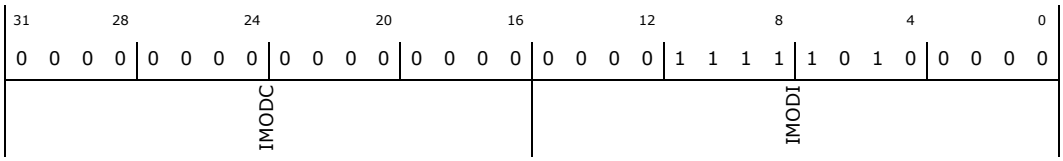
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 00000000h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 1 | 0b<br>RW | **Interrupt Enable (IE):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0b<br>RW/C | **Interrupt Pending (IP):** Reserved.<br><br>**Power Well:** Core |

## 18.7.41 Interrupter 1 Moderation (IMOD1)—Offset 2024h

The Interrupter Moderation Register controls the 'interrupt moderation' feature of an interrupter, allowing system software to throttle the interrupt rate generated by the xHC. There are 8 IMOD registers. x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2024h

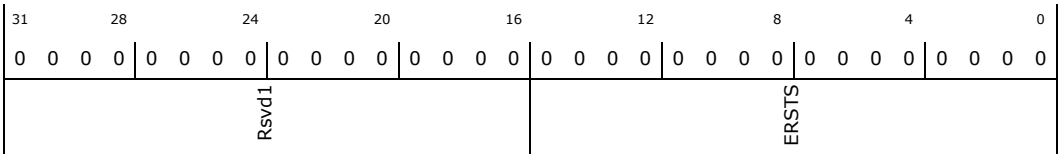
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000FA0h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **Interrupt Moderation Counter (IMODC):** Down counter. Loaded with the IMODI value whenever *IP* is cleared to '0', counts down to '0' and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags both equal '1', and EHB = '0'.<br>This counter may be written directly by software at any time to alter the interrupt rate.<br><br>**Power Well:** Core |
| 15:0 | 0FA0h<br>RW | **Interrupt Moderation Interval (IMODI):** Default = '4000' (~1 ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic, and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty.<br><br>**Power Well:** Core |

## 18.7.42 Event Ring Segment Table Size 1 (ERSTSZ1)—Offset 2028h

The *Event Ring Segment Table Size Register* defines the number of segments supported by the Event Ring Segment Table. There are 8 ERSTSZ registers. x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2028h

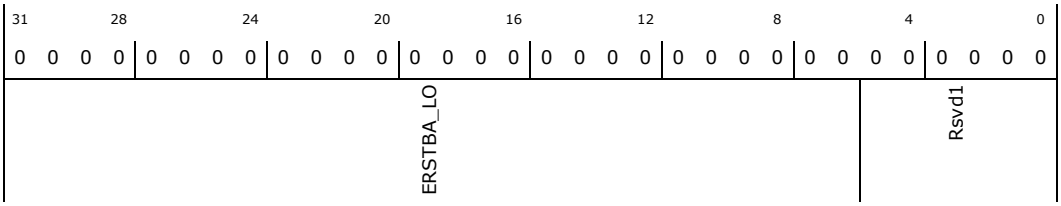
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0000h RW | **Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (see specification xHCI for USB).<br>For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring.<br>For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled.<br><br>**Power Well:** Core |

## 18.7.43 Event Ring Segment Table Base Address Low 1 (ERSTBA_LO1)—Offset 2030h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_LOx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2030h

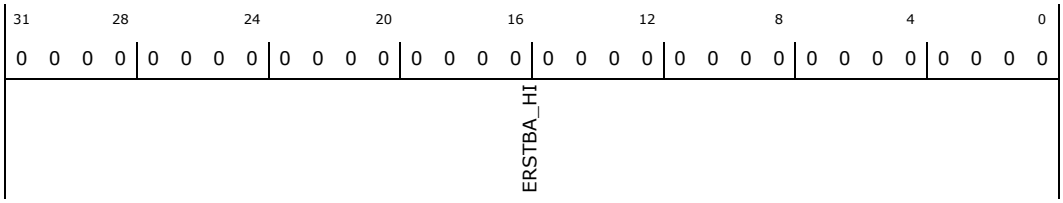
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0000000h<br>RW | **Event Ring Segment Table Base Address Register (ERSTBA_LO):** This field defines the low order bits of the start address of the Event Ring Segment Table.<br>Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state.<br>Refer to the xHCI for USB specification for more information.<br>This field shall not be modified if HCHalted (HCH) = 0.<br><br>**Power Well:** Core |
| 5:0 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 18.7.44 Event Ring Segment Table Base Address High 1 (ERSTBA_HI1)—Offset 2034h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_HIx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2034h

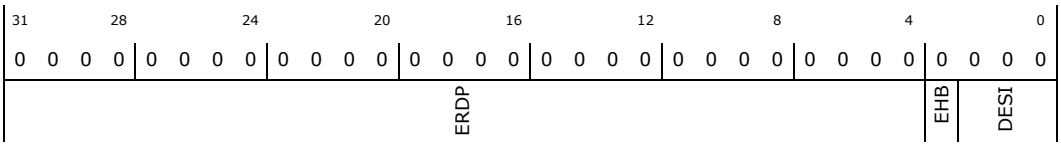
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h<br>RW | **Event Ring Segment Table Base Address (ERSTBA_HI):** This field defines the high order bits of the start address of the Event Ring Segment Table.<br>Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state.<br>Refer to the xHCI for USB specification for more information.<br>This field shall not be modified if HCHalted (HCH) = 0.<br><br>**Power Well:** Core |

## 18.7.45 Event Ring Dequeue Pointer Low 1 (ERDP_LO1)—Offset 2038h

There are 8 ERDP_LOx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2038h

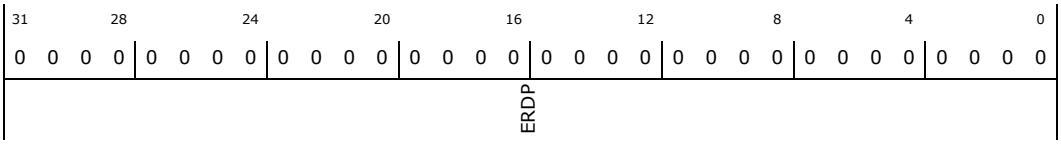
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0000000h<br>RW | **Event Ring Dequeue Pointer (ERDP):** This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer.<br><br>**Power Well:** Core |
| 3 | 0b<br>RW/C | **Event Handler Busy (EHB):** This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |
| 2:0 | 0h<br>RW | **Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.<br><br>**Power Well:** Core |

## 18.7.46 Event Ring Dequeue Pointer High 1 (ERDP_HI1)—Offset 203Ch

There are 8 ERDP_HIx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 203Ch

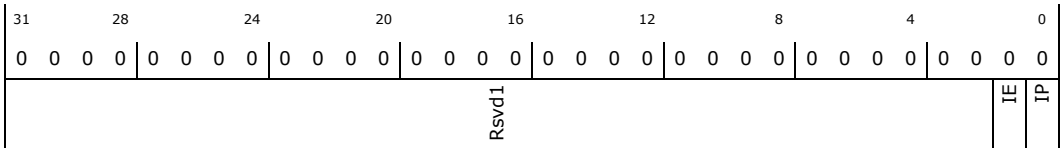
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h<br>RW | **Event Ring Dequeue Pointer (ERDP):** This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer.<br><br>**Power Well:** Core |

## 18.7.47 Interrupter 2 Management (IMAN2)—Offset 2040h

The Interrupter Management registers allow system software to enable, disable, detect and force xHC interrupts. There are 8 IMAN registers. x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2040h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0000h<br>RW | **Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (see specification xHCI for USB).<br>For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring.<br>For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled.<br><br>**Power Well:** Core |

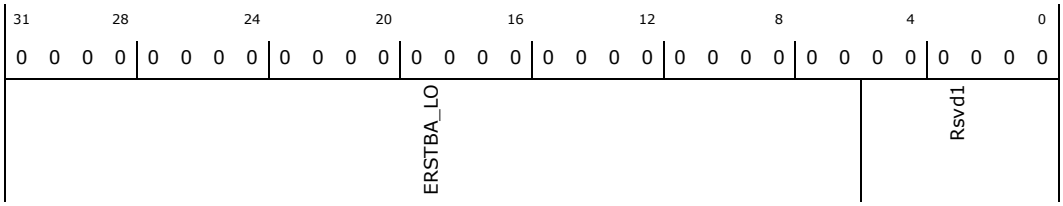
## 18.7.57 Event Ring Segment Table Base Address Low 3 (ERSTBA_LO3)—Offset 2070h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_LOx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2070h

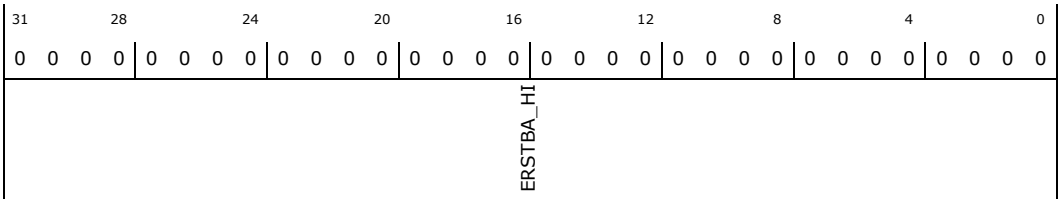
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0000000h<br>RW | **Event Ring Segment Table Base Address Register (ERSTBA_LO):** This field defines the low order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state.<br>Refer to the xHCI for USB specification for more information.<br>This field shall not be modified if HCHalted (HCH) = 0.<br><br>**Power Well:** Core |
| 5:0 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 18.7.58 Event Ring Segment Table Base Address High 3 (ERSTBA_HI3)—Offset 2074h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_HIx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2074h

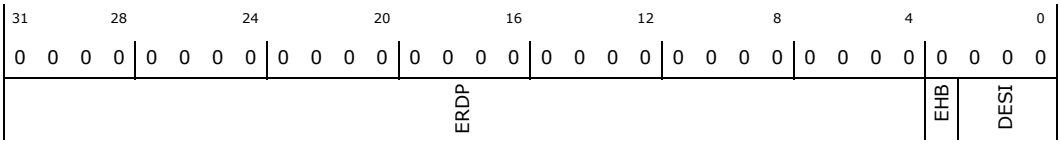
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h RW | **Event Ring Segment Table Base Address (ERSTBA_HI):** This field defines the high order bits of the start address of the Event Ring Segment Table. Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state. Refer to the xHCI for USB specification for more information. This field shall not be modified if HCHalted (HCH) = 0.<br><br>**Power Well:** Core |

## 18.7.59 Event Ring Dequeue Pointer Low 3 (ERDP_LO3)—Offset 2078h

There are 8 ERDP_LOx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2078h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

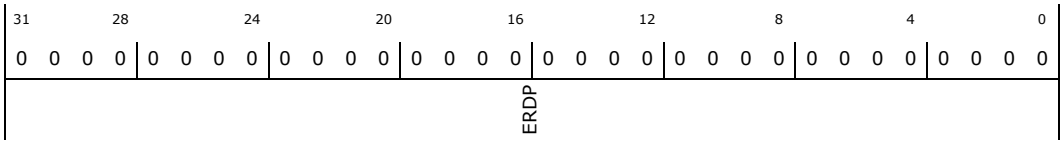
**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0000000h RW | **Event Ring Dequeue Pointer (ERDP):** This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer.<br><br>**Power Well:** Core |
| 3 | 0b RW/C | **Event Handler Busy (EHB):** This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2:0 | 0h<br>RW | **Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.<br><br>**Power Well:** Core |

## 18.7.60 Event Ring Dequeue Pointer High 3 (ERDP_HI3)—Offset 207Ch

There are 8 ERDP_HIx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 207Ch

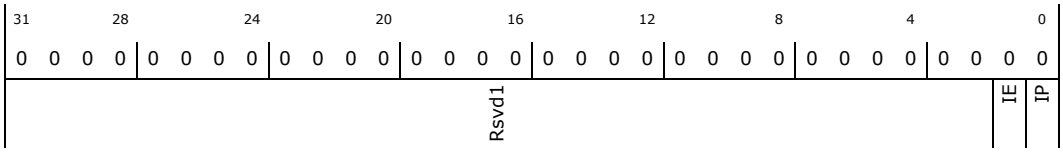
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h<br>RW | **Event Ring Dequeue Pointer (ERDP):** This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer.<br><br>**Power Well:** Core |

## 18.7.61 Interrupter 4 Management (IMAN4)—Offset 2080h

The Interrupter Management registers allow system software to enable, disable, detect and force xHC interrupts. There are 8 IMAN registers. x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2080h

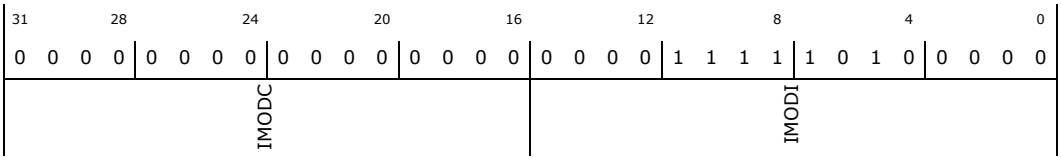
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 00000000h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 1 | 0b<br>RW | **Interrupt Enable (IE):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0b<br>RW/C | **Interrupt Pending (IP):** Reserved.<br><br>**Power Well:** Core |

## 18.7.62 Interrupter 4 Moderation (IMOD4)—Offset 2084h

The Interrupter Moderation Register controls the 'interrupt moderation' feature of an interrupter, allowing system software to throttle the interrupt rate generated by the xHC. There are 8 IMOD registers. x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2084h

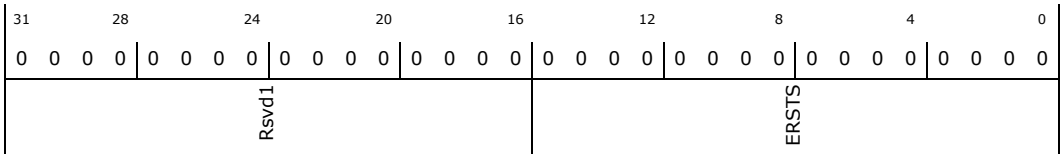
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000FA0h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **Interrupt Moderation Counter (IMODC):** Down counter. Loaded with the IMODI value whenever *IP* is cleared to '0', counts down to '0' and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags = '1', and EHB = '0'.<br>This counter may be written directly by software at any time to alter the interrupt rate.<br><br>**Power Well:** Core |
| 15:0 | 0FA0h<br>RW | **Interrupt Moderation Interval (IMODI):** Default = '4000' (~1 ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic, and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty.<br><br>**Power Well:** Core |

## 18.7.63 Event Ring Segment Table Size 4 (ERSTSZ4)—Offset 2088h

The *Event Ring Segment Table Size Register* defines the number of segments supported by the Event Ring Segment Table. There are 8 ERSTSZ registers. x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2088h

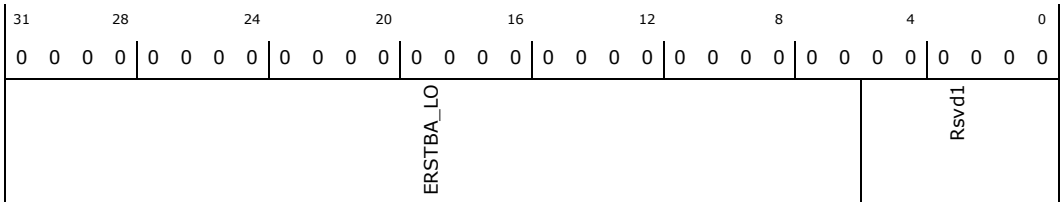
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0000h<br>RW | **Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (see specification xHCI for USB).<br>For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring.<br>For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled.<br><br>**Power Well:** Core |

## 18.7.64 Event Ring Segment Table Base Address Low 4 (ERSTBA_LO4)—Offset 2090h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_LOx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2090h

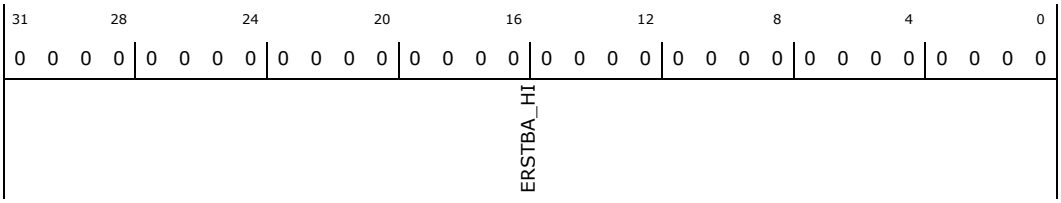
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0000000h<br>RW | **Event Ring Segment Table Base Address Register (ERSTBA_LO):** This field defines the low order bits of the start address of the Event Ring Segment Table.<br>Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state.<br>Refer to the xHCI for USB specification for more information.<br>This field shall not be modified if HCHalted (HCH) = 0.<br><br>**Power Well:** Core |
| 5:0 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 18.7.65 Event Ring Segment Table Base Address High 4 (ERSTBA_HI4)—Offset 2094h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_HIx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2094h

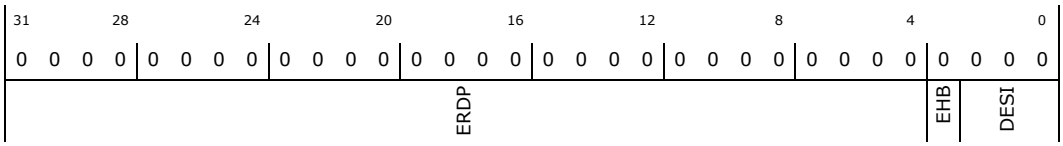
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h<br>RW | **Event Ring Segment Table Base Address (ERSTBA_HI):** This field defines the high order bits of the start address of the Event Ring Segment Table.<br>Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state.<br>Refer to the xHCI for USB specification for more information.<br>This field shall not be modified if HCHalted (HCH) = 0.<br><br>**Power Well:** Core |

## 18.7.66 Event Ring Dequeue Pointer Low 4 (ERDP_LO4)—Offset 2098h

There are 8 ERDP_LOx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 2098h

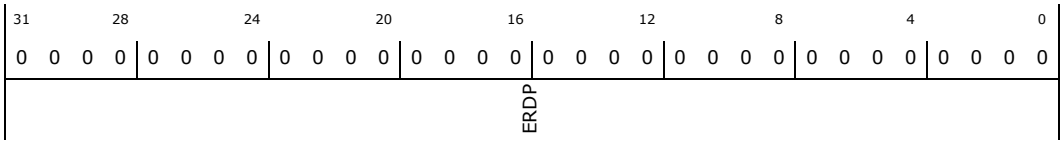
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0000000h<br>RW | **Event Ring Dequeue Pointer (ERDP):** This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer.<br><br>**Power Well:** Core |
| 3 | 0b<br>RW/C | **Event Handler Busy (EHB):** This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |
| 2:0 | 0h<br>RW | **Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.<br><br>**Power Well:** Core |

## 18.7.67 Event Ring Dequeue Pointer High 4 (ERDP_HI4)—Offset 209Ch

There are 8 ERDP_HIx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 209Ch

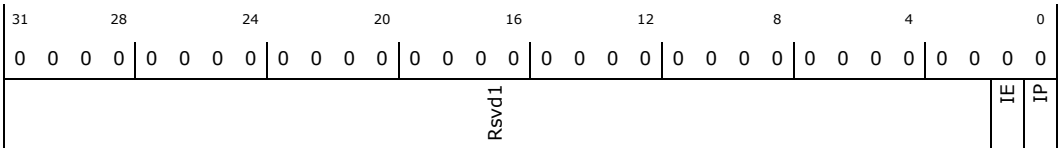
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h<br>RW | **Event Ring Dequeue Pointer (ERDP):** This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer.<br><br>**Power Well:** Core |

## 18.7.68 Interrupter 5 Management (IMAN5)—Offset 20A0h

The Interrupter Management registers allow system software to enable, disable, detect and force xHC interrupts. There are 8 IMAN registers. x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 20A0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

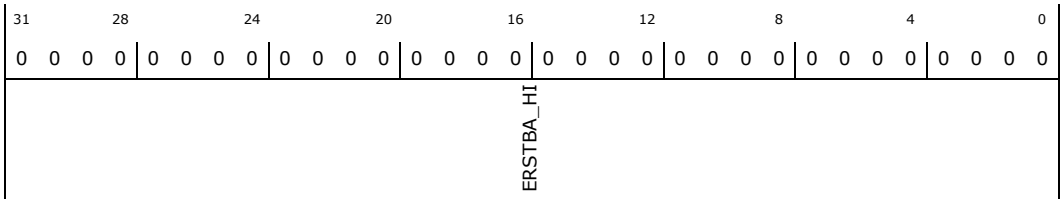
## 18.7.79 Event Ring Segment Table Base Address High 6 (ERSTBA_HI6)—Offset 20D4h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_HIx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 20D4h

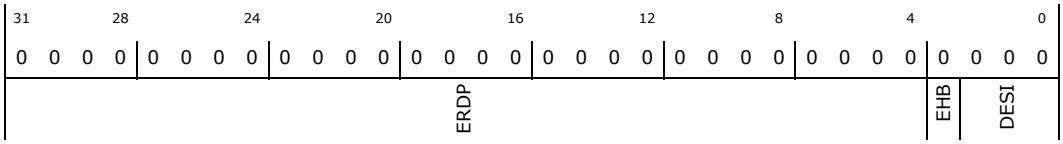
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h<br>RW | **Event Ring Segment Table Base Address (ERSTBA_HI):** This field defines the high order bits of the start address of the Event Ring Segment Table.<br>Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state.<br>Refer to the xHCI for USB specification for more information.<br>This field shall not be modified if HCHalted (HCH) = 0.<br><br>**Power Well:** Core |

## 18.7.80 Event Ring Dequeue Pointer Low 6 (ERDP_LO6)—Offset 20D8h

There are 8 ERDP_LOx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 20D8h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

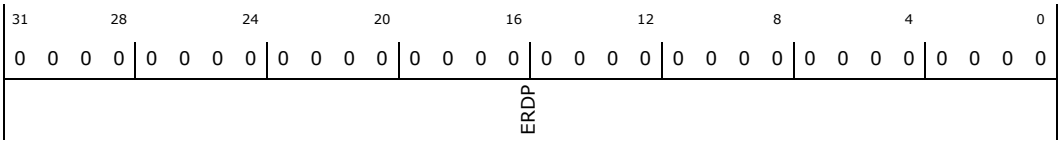
**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0000000h<br>RW | **Event Ring Dequeue Pointer (ERDP):** This field defines the low order bits of the 64-bit address of the current Event Ring Dequeue Pointer.<br><br>**Power Well:** Core |
| 3 | 0b<br>RW/C | **Event Handler Busy (EHB):** This flag shall be set to 1 when the IP bit is set to 1 and cleared to 0 by software when the Dequeue Pointer register is written. Refer to the xHCI for USB specification for more information.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2:0 | 0h<br>RW | **Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.<br><br>**Power Well:** Core |

## 18.7.81 Event Ring Dequeue Pointer High 6 (ERDP_HI6)—Offset 20DCh

There are 8 ERDP_HIx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 20DCh

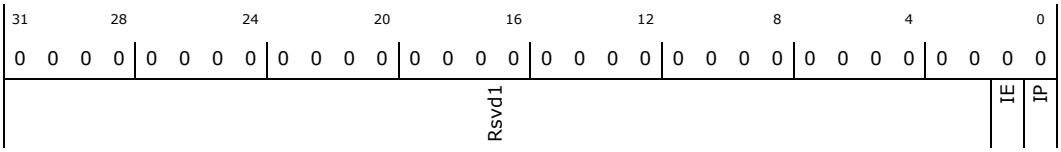
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h<br>RW | **Event Ring Dequeue Pointer (ERDP):** This field defines the high order bits of the 64-bit address of the current Event Ring Dequeue Pointer.<br><br>**Power Well:** Core |

## 18.7.82 Interrupter 7 Management (IMAN7)—Offset 20E0h

The Interrupter Management registers allow system software to enable, disable, detect and force xHC interrupts. There are 8 IMAN registers. x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 20E0h

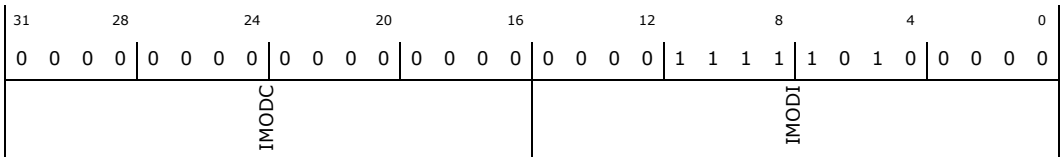
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 00000000h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 1 | 0b<br>RW | **Interrupt Enable (IE):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0b<br>RW/C | **Interrupt Pending (IP):** Reserved.<br><br>**Power Well:** Core |

## 18.7.83 Interrupter 7 Moderation (IMOD7)—Offset 20E4h

The Interrupter Moderation Register controls the 'interrupt moderation' feature of an interrupter, allowing system software to throttle the interrupt rate generated by the xHC. There are 8 IMOD registers. x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 20E4h

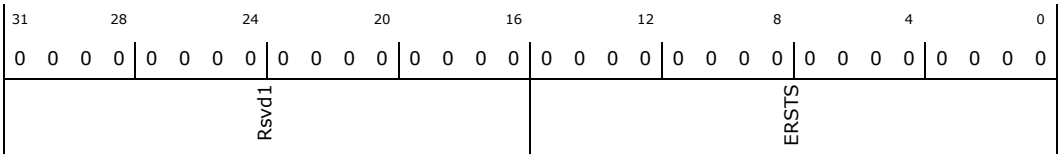
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000FA0h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **Interrupt Moderation Counter (IMODC):** Down counter. Loaded with the IMODI value whenever *IP* is cleared to '0', counts down to '0' and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags = '1', and EHB = '0'.<br>This counter may be written directly by software at any time to alter the interrupt rate.<br><br>**Power Well:** Core |
| 15:0 | 0FA0h<br>RW | **Interrupt Moderation Interval (IMODI):** Default = '4000' (~1 ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic, and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty.<br><br>**Power Well:** Core |

## 18.7.84 Event Ring Segment Table Size 7 (ERSTSZ7)—Offset 20E8h

The *Event Ring Segment Table Size Register* defines the number of segments supported by the Event Ring Segment Table. There are 8 ERSTSZ registers. x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 20E8h

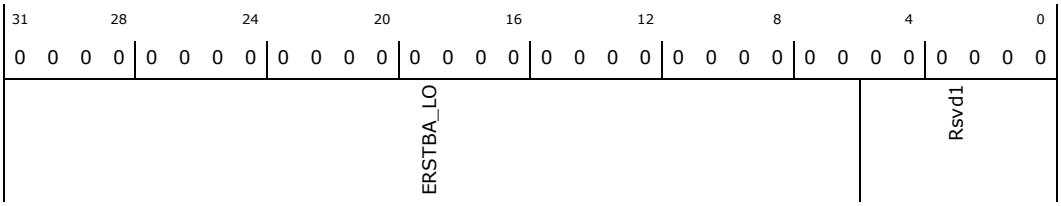
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0000h<br>RW | **Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (see xHCI for USB specification).<br>For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring.<br>For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled.<br><br>**Power Well:** Core |

## 18.7.85 Event Ring Segment Table Base Address Low 7 (ERSTBA_LO7)—Offset 20F0h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_LOx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 20F0h

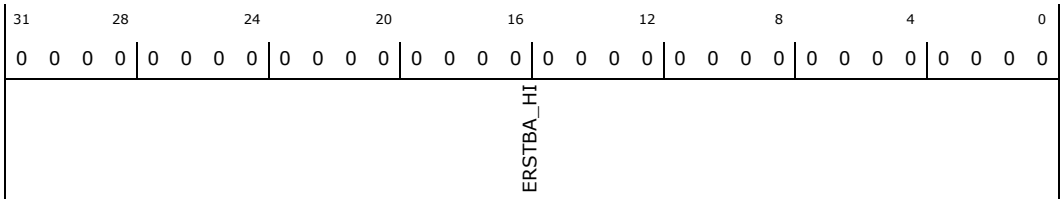
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0000000h<br>RW | **Event Ring Segment Table Base Address Register (ERSTBA_LO):** This field defines the low order bits of the start address of the Event Ring Segment Table.<br>Writing this register sets the Event Ring State Machine:EREP Advancement to the Start state.<br>Refer to the xHCI for USB specification for more information.<br>This field shall not be modified if HCHalted (HCH) = 0.<br><br>**Power Well:** Core |
| 5:0 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 18.7.86 Event Ring Segment Table Base Address High 7 (ERSTBA_HI7)—Offset 20F4h

The *Event Ring Segment Table Base Address Register* identifies the start address of the Event Ring Segment Table. There are 8 ERSTBA_HIx registers, with x = 1, 2, ... 8.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 20F4h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |

| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

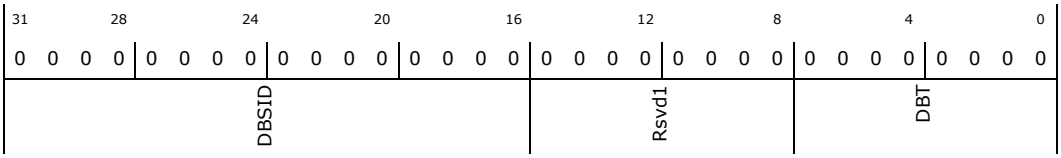
## 18.7.100 Door Bell 5 (DOORBELL5)—Offset 3010h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3010h

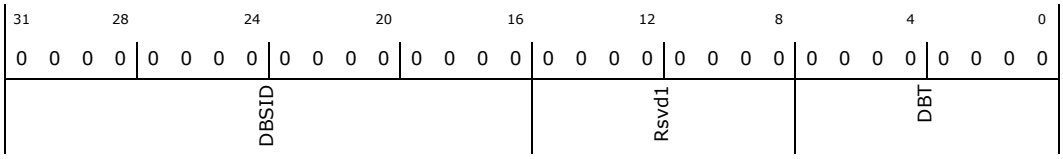
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.101 Door Bell 6 (DOORBELL6)—Offset 3014h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3014h

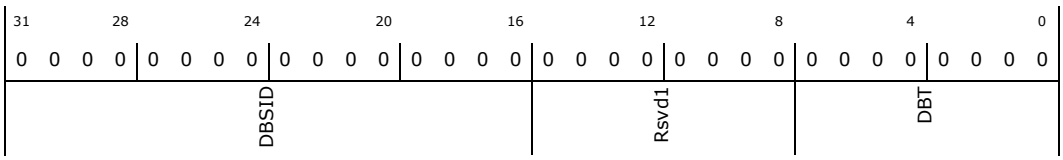
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.102 Door Bell 7 (DOORBELL7)—Offset 3018h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3018h

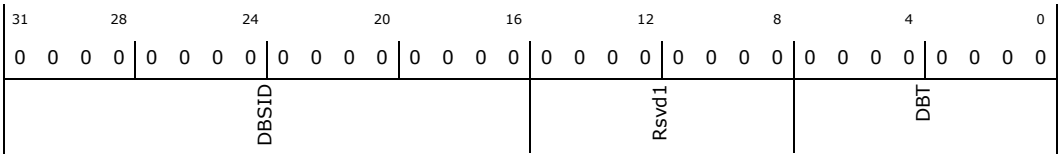
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.103 Door Bell 8 (DOORBELL8)—Offset 301Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 301Ch

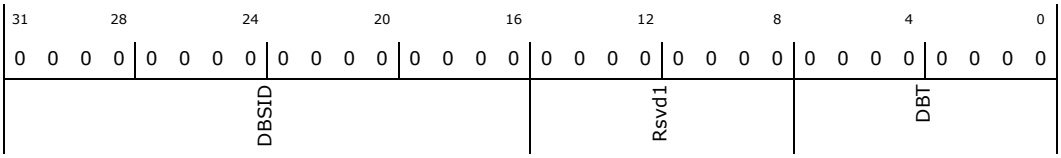
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.104 Door Bell 9 (DOORBELL9)—Offset 3020h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3020h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

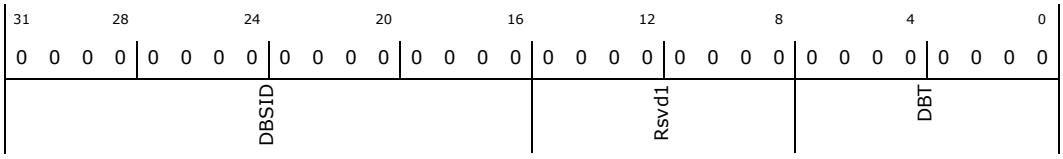
**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.105 Door Bell 10 (DOORBELL10)—Offset 3024h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3024h

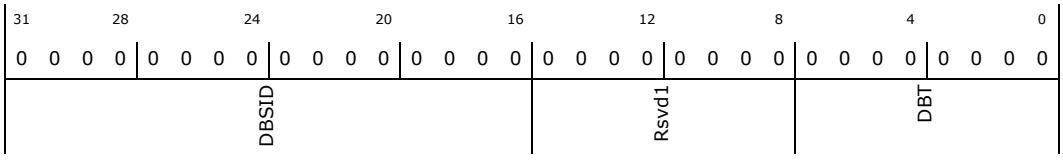
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.106 Door Bell 11 (DOORBELL11)—Offset 3028h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3028h

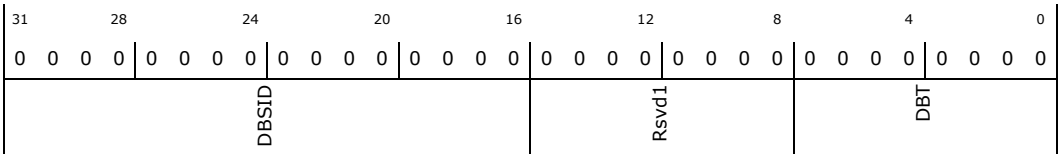
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.107 Door Bell 12 (DOORBELL12)—Offset 302Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 302Ch

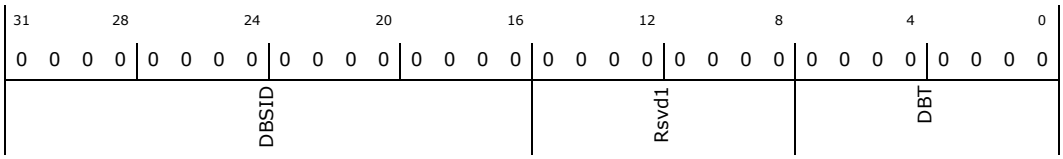
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.108 Door Bell 13 (DOORBELL13)—Offset 3030h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3030h

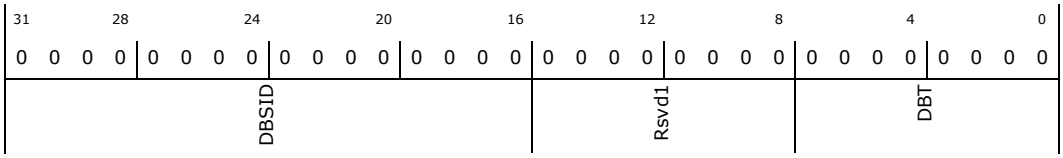
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.109 Door Bell 14 (DOORBELL14)—Offset 3034h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3034h

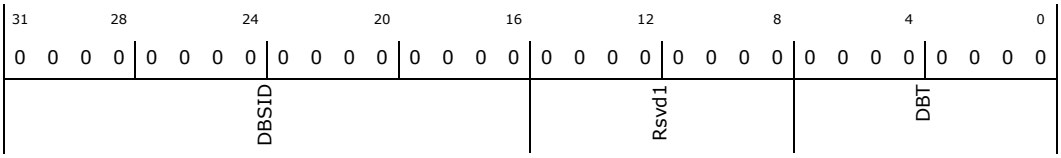
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.110 Door Bell 15 (DOORBELL15)—Offset 3038h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3038h

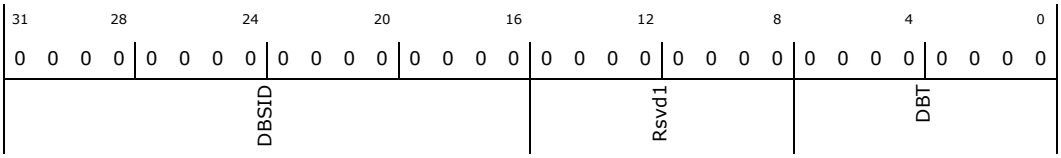
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.111 Door Bell 16 (DOORBELL16)—Offset 303Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 303Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

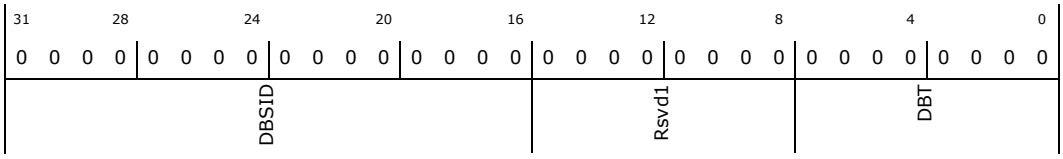
**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.112 Door Bell 17 (DOORBELL17)—Offset 3040h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3040h

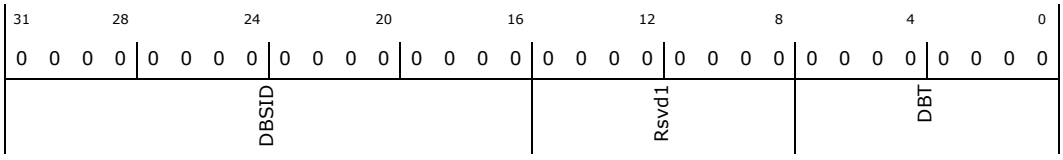
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.113 Door Bell 18 (DOORBELL18)—Offset 3044h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3044h

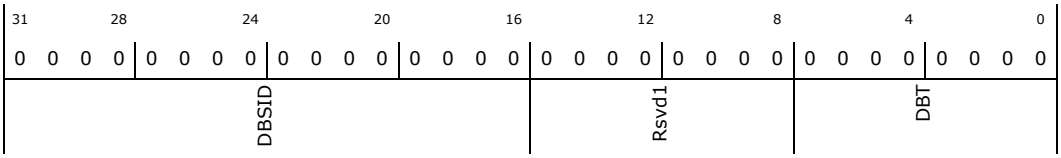
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.114 Door Bell 19 (DOORBELL19)—Offset 3048h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3048h

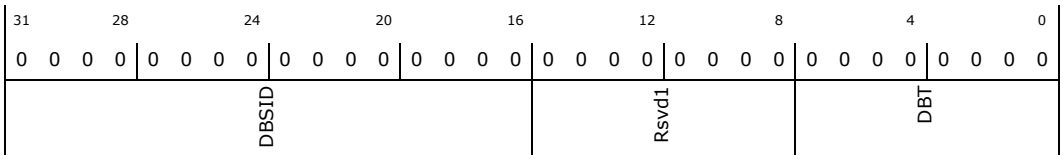
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.115 Door Bell 20 (DOORBELL20)—Offset 304Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 304Ch

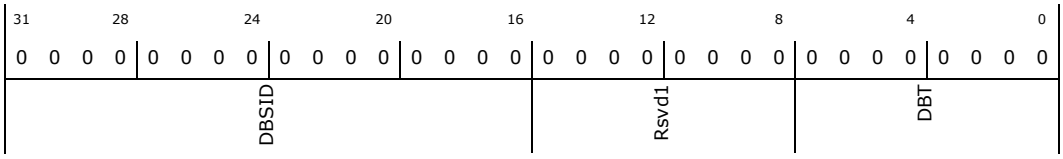
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.116 Door Bell 21 (DOORBELL21)—Offset 3050h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3050h

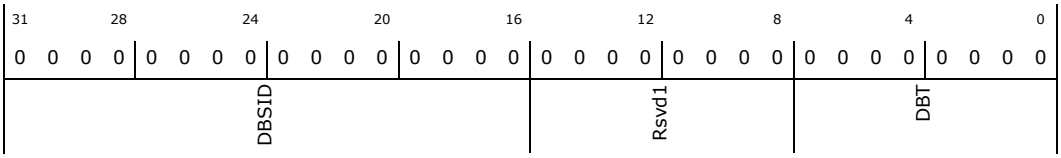
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.117 Door Bell 22 (DOORBELL22)—Offset 3054h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3054h

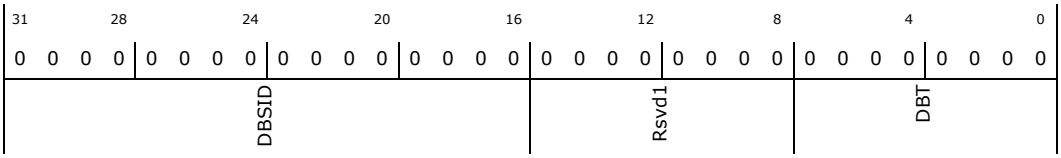
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.118 Door Bell 23 (DOORBELL23)—Offset 3058h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3058h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

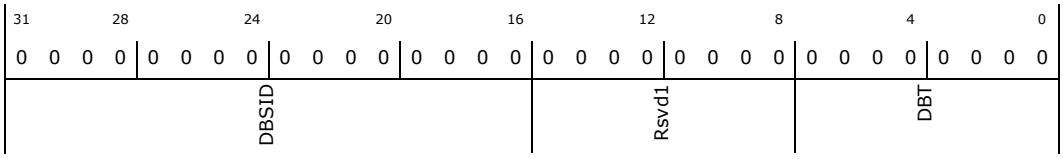
**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.119 Door Bell 24 (DOORBELL24)—Offset 305Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 305Ch

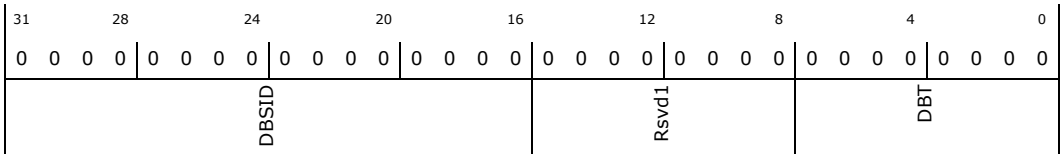
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.120 Door Bell 25 (DOORBELL25)—Offset 3060h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3060h

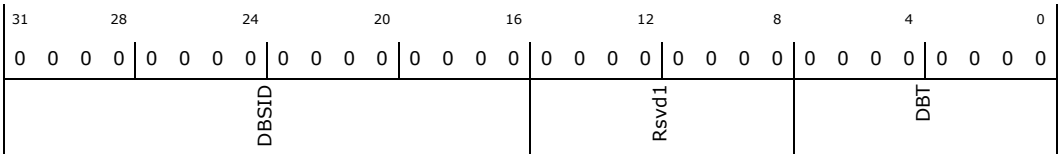
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.121 Door Bell 26 (DOORBELL26)—Offset 3064h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3064h

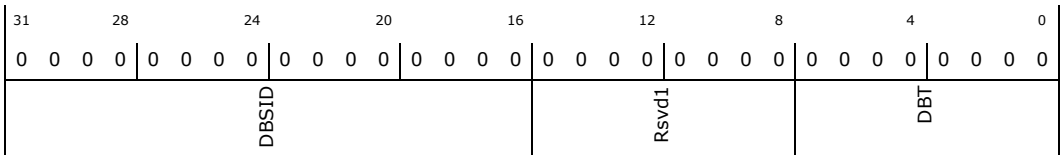
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.122 Door Bell 27 (DOORBELL27)—Offset 3068h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3068h

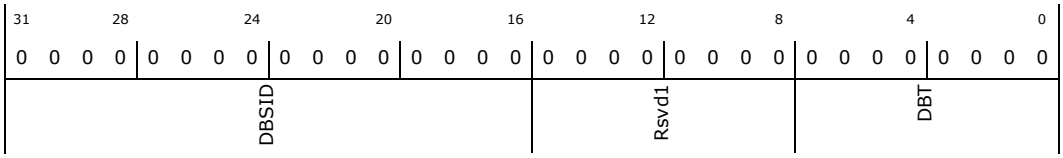
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.123 Door Bell 28 (DOORBELL28)—Offset 306Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 306Ch

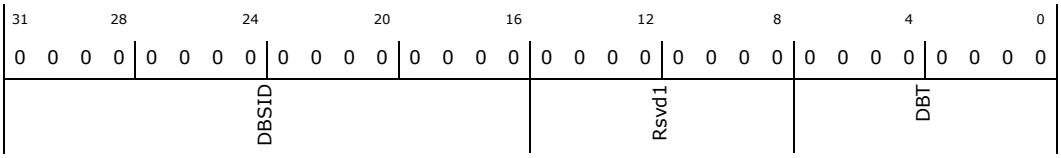
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.124 Door Bell 29 (DOORBELL29)—Offset 3070h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3070h

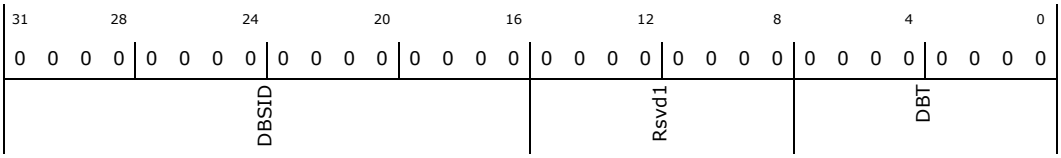
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.125 Door Bell 30 (DOORBELL30)—Offset 3074h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3074h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

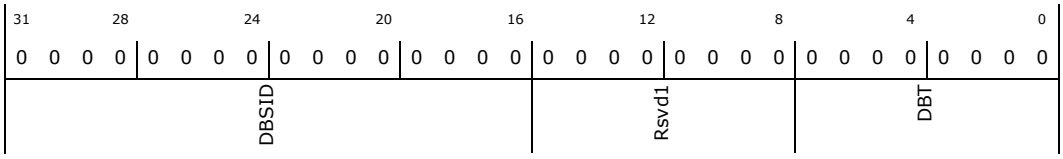
**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 00h<br>RW | **DB Target (DBT):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

## 18.7.126 Door Bell 31 (DOORBELL31)—Offset 3078h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved. Refer to the xHCI for USB specification for more information.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 3078h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **DB Stream ID (DBSID):** Refer to field descriptions for the DOORBELL1 register.<br><br>**Power Well:** Core |

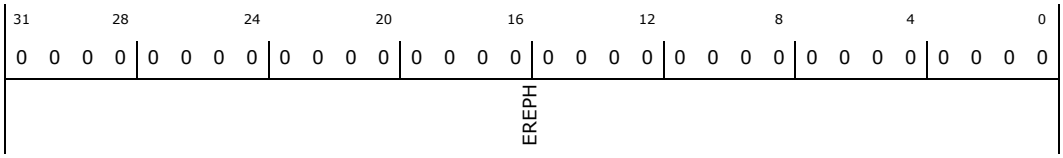
## 18.7.143 XECP_CMDM_STS5—Offset 8054h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 8054h

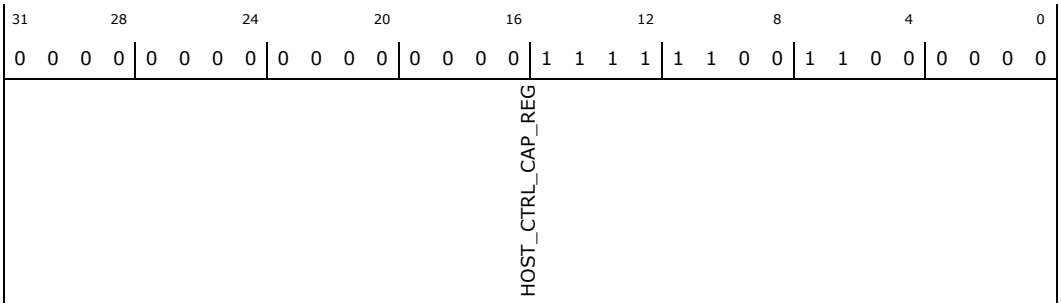
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h RO | **Event Ring Enqueue Pointer High (EREPH):** Reserved.<br><br>**Power Well:** Core |

## 18.7.144 Host Controller Capability (HOST_CTRL_CAP_REG)—Offset 8070h

This register is modified and maintained by BIOS



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

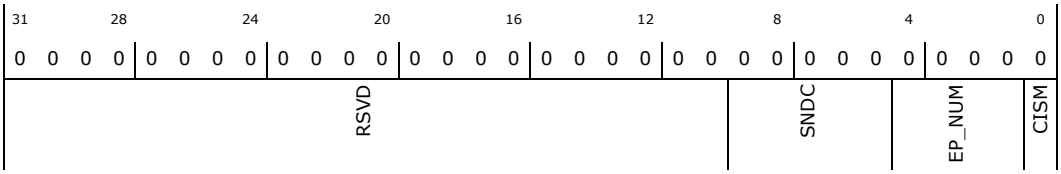
**Offset:** [MBAR] + 8070h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0000FCC0h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0000FCC0h<br>RW/L | **Host Controller Capability (HOST_CTRL_CAP_REG):** This is a register that describe the host controller the extended cap location. It includes the XECP_HOST_NEXT_CAP_OFFSET and VEND_DEF_HOST_CAP_ID_192<br><br>**Power Well:** Core |

## 18.7.145 Override EP Flow Control (HOST_CLR_MASK_REG)—Offset 8078h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

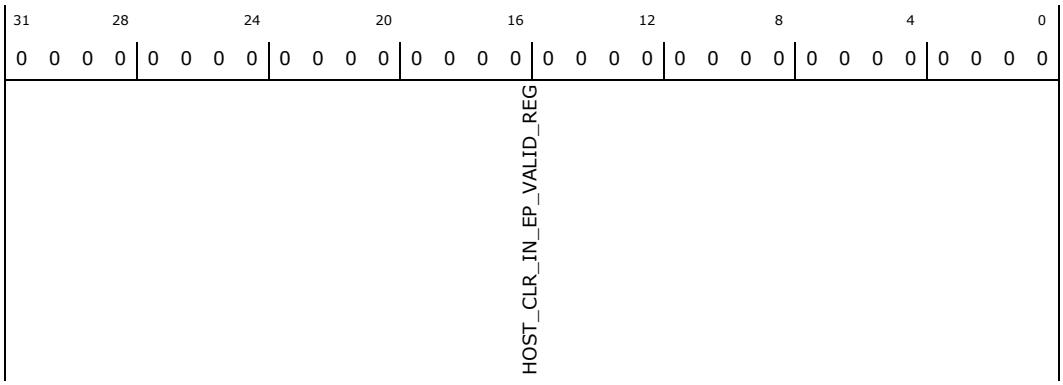
**Offset:** [MBAR] + 8078h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 000000h<br>RO | **RESERVED (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 9:5 | 00h<br>RW | **Slot Number Default Config (SNDC):** 5bits of slot number as a default configuration. It can scale to max of 128 slots.<br><br>**Power Well:** Core |
| 4:1 | 0h<br>RW | **EP Number (EP_NUM):** 4bits of EP number<br><br>**Power Well:** Core |
| 0 | 0b<br>RW | **Clear Internal Scheduler's Mask (CISM):** This is a register that is used to clear the internal scheduler's mask that is used to stop scheduling a particular EP. Bit0 indicates the direction of the EP<br><br>**Power Well:** Core |

## 18.7.146 Clear Active IN EP ID Control (HOST_CLR_IN_EP_VALID_REG)—Offset 807Ch



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

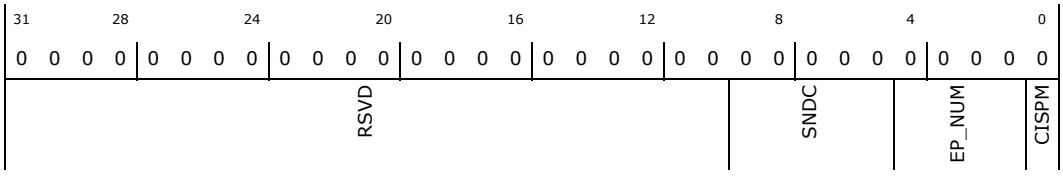
**Offset:** [MBAR] + 807Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 00000000h RW | **Clear Active IN EP ID Control (HOST_CLR_IN_EP_VALID_REG):** This register is used to clear the internal valid IN EP array that TRM stored in order to guarantee one IN EP per port. This register allows software to clear the valid bit of each port IN EP. This field indicates the port number. For a 2port configuration, only bit1:0 are valid. It can scale for the max number of ports that we support.<br><br>**Power Well:** Core |

## 18.7.147 Clear Poll Mask Control (HOST_CLR_PMASK_REG)—Offset 8080h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 8080h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 000000h<br>RO | **RESERVED (RSVD):** Reserved.<br><br>**Power Well:** Core |

|---|---|---|
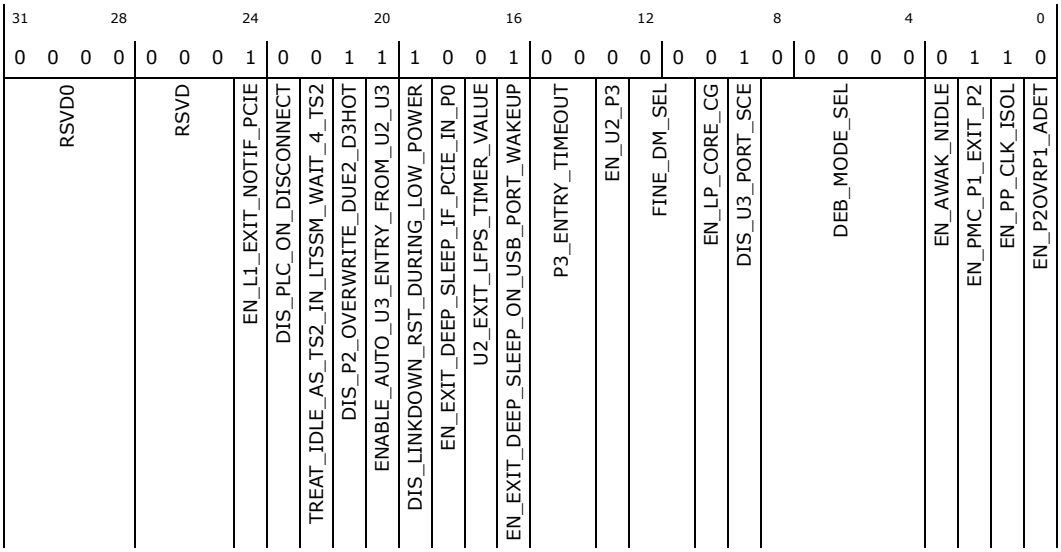
| 4:0 | 00h<br>RW | **Slot Select (SLOT_SEL):** Reads will return: BELT Value (BELTV) [4:0]: Value of selected BELT is return in this field Writes will control : Slot Select (): Used to select the BELT for a given Slot # when the BELT Select is programmed to select the Slot-ID (this field is zero based)<br><br>**Power Well:** Core |

## 18.7.175 AUX Power Management Control (AUX_CTRL_REG2)—Offset 8154h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 8154h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 01390206h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0h<br>RW | **RESERVED0 (RSVD0):** Reserved.<br><br>**Power Well:** SUS |
| 27:25 | 0h<br>RW | **RESERVED (RSVD):** Reserved.<br><br>**Power Well:** SUS |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 24 | 1b<br>RW | **Enable L1 exit notification to SNPS PCIe core (EN_L1_EXIT_NOTIF_PCIE):** This bit enables a L1 exit notification to SNPS PCIe core. There is a case where USB ports have waked up and AUX PM module has started the wakeup process. The AUX PM control state got into a wait for P0 state because it needs to wait until PCIe core to signal powerdown state change. Due to the fact that the core is in D3Hot, there is no run_stop bit set such that no internal interrupt will be fired. This causes the LTSSM of PCIe stayed in L1 even though AUX PM has known that it needs an L1 exit. This bit works together with bit21 of this register.<br>• 1 = enables this feature<br>• 0 = disables this feature.<br><br>**Power Well:** SUS |
| 23 | 0b<br>RW | **DISABLE PLC ON DISCONNECT (DIS_PLC_ON_DISCONNECT):**<br>• 1 = do not assert PLC for disconnection<br>• 0 = assert PLC for disconnection<br><br>**Power Well:** SUS |
| 22 | 0b<br>RW | **TREAT_IDLE_AS_TS2_IN_LTSSM_WAIT_4_TS2:** This bit enables a feature in PCIe core LTSSM to treat IDLE received as TS2 when LTSSM is in wait for TS2 receive state. This is a function requested from PHY where it is possible to not able to receive TS2 without error.<br>• 1 = treat Logic IDLE as TS2 received when in some PCIe LTSSM state.<br>• 0 = disable this feature.<br><br>**Power Well:** SUS |
| 21 | 1b<br>RW | **Disable p2 overwrite due to the D3HOT where PCIe core enters the L1 (DIS_P2_OVERWRITE_DUE2_D3HOT):** We added a feature where if PCIe core LTSSM enters L1 due to the D3hot, the aux PM control will not start a P2 overwrite function in anticipating for the next L23 enter.<br>• 1 = disables p2 overwrite due to the D3HOT where PCIe core enters the L1.<br>• 0 = enables P2 overwrite even if we are in D3Hot.<br><br>**Power Well:** SUS |
| 20 | 1b<br>RW | **Enable the port to enter U3 automatically when in U1/U2 (ENABLE_AUTO_U3_ENTRY_FROM_U2_U3):**<br>• 1 = enables the port to enter U3 automatically when in U1/U2<br>• 0 = disables the port to enter U3 automatically when in U1/U2<br><br>**Power Well:** SUS |
| 19 | 1b<br>RW | **No linkdown reset is issued during low power state (DIS_LINKDOWN_RST_DURING_LOW_POWER):** No linkdown reset is issued during low power state.<br><br>**Power Well:** SUS |
| 18 | 0b<br>RW | **EN_EXIT_DEEP_SLEEP_IF_PCIE_IN_P0:** This bit enables a feature in AUX PM module where if PCIe core LTSSM is in P0 for a duration of time, we will exit the deep sleep state. This is for failure control in case.<br>• 1 = enable this feature<br>• 0 = disable this feature<br><br>**Power Well:** SUS |
| 17 | 0b<br>RW | **U2_EXIT_LFPS_TIMER_VALUE:** This bit selects U2 exit LFPS timer value.<br>• 0 = 320ns 400ns in 25MHz domain<br>• 1 = 240ns 320ns in 25MHz domain<br><br>**Power Well:** SUS |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 16 | 1b<br>RW | **EN_EXIT_DEEP_SLEEP_ON_USB_PORT_WAKEUP:** This bit enables a function that AUX PM module exits from the deep sleep state due to the USB ports wakeup level signal. We have added this feature where USB ports will generated a wakeup level signal to wakeup the AUX PM module if it is in deep sleep state and this level signal will be cleared if the change bits are updated by software.<br>• 1 = enables this function<br>• 0 = disables this function which means that a wakeup pulse generated from each USB PortSC event will wake up the AUX PM module from deep sleep if the D3 state is programmed.<br><br>**Power Well:** SUS |
| 15:14 | 0h<br>RW | **P3_ENTRY_TIMEOUT:** This field defines the timeout value to enter P3 mode in U2.<br>• 00 = 7us 8us<br>• 01 = 511us 512us<br>• 10 = disables the timer (0us)<br>• 11 = disables the timer (0us)<br><br>**Power Well:** SUS |

Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.<br><br>**Power Well:** SUS |
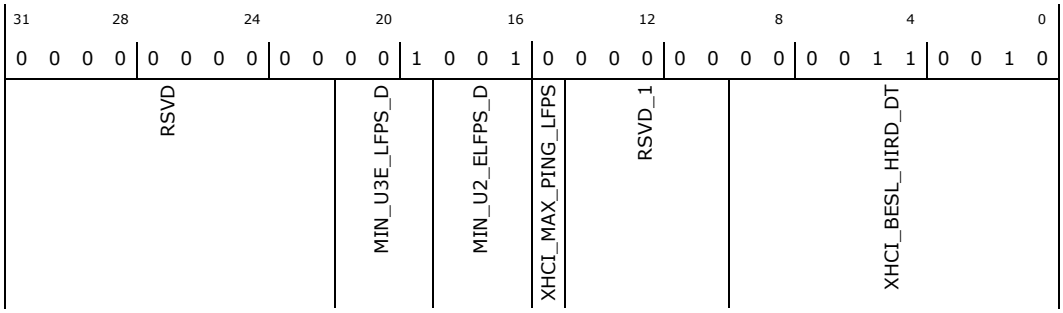
| 3 | 0b<br>RW | **USB3 Aux Clock Trunk Gating Enable (USB3_AC_TGE):** When set, allows Aux Clock Trunk feeding to USB3.0 ports to be gated when port Aux clock is gated at all USB3.0 ports and all USB3.0 modPHY instances. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.<br><br>**Power Well:** SUS |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2 | 0b<br>RW | **USB3 Port Aux/Port clock gating enable (USB3_AP_CGE):** When set, allows the aux_pclk clock into the USB3 port to be gated when conditions are met. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.<br><br>**Power Well:** SUS |
| 1 | 0b<br>RW | **ModPHY port Aux clock gating enable in U2 (MPP_AC_GEU2):** When set, allows the aux clock into the ModPhy to be gated when Link is in U2 and pipe has been in PS3 for at least the time defined by U2 Residency Before ModPHY Clock Gating field. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.<br><br>**Power Well:** SUS |
| 0 | 0b<br>RW | **ModPHY port Aux clock gating enable in Disconnected, U3 or Disabled (MPP_AC_GE_DDU3):** When set, allows the aux clock into the ModPHY to be gated when Link is in Disconnected, U3 or Disabled state. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.<br><br>**Power Well:** SUS |

## 18.7.179 USB LPM Parameters (USB_LPM_PARAM)—Offset 8170h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 8170h

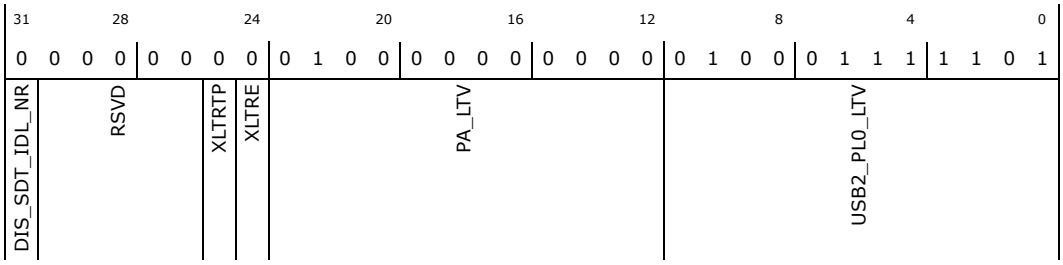
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00090032h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:22 | 000h<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 21:19 | 001b<br>RW | **Min U3 Exit LFPS Duration (MIN_U3E_LFPS_D):** This field defines the minimum duration of LFPS driven by Host Controller upon U3 exit LFPS handshake. Note that there is an uncertainty of +-16us in actual duration driven by the Host Controller.<br>•<br>• 0b000 = 96us<br>• 0b001 = 160us<br>• 0b010 = 224us<br>• 0b011 = 288us<br>• 0b100 = 352us<br>• 0b101 = 416us<br>• 0b110 = 480us<br>• 0b111 = 544us<br><br>**Power Well:** SUS |
| 18:16 | 001b<br>RW | **Min U2 Exit LFPS Duration (MIN_U2_ELFPS_D):** This field defines the minimum duration of LFPS driven by Host Controller upon U2 exit LFPS handshake. Note that there is an uncertainty of +-16us in actual duration driven by the Host Controller.<br>• 0b000 = 96us<br>• 0b001 = 160us<br>• 0b010 = 224us<br>• 0b011 = 288us<br>• 0b100 = 352us<br>• 0b101 = 416us<br>• 0b110 = 480us<br>• 0b111 = 544us<br><br>**Power Well:** SUS |
| 15 | 0b<br>RW | **Max PING LFPS Rx Detection (XHCI_MAX_PING_LFPS):** This field defines the maximum timing for PING LFPS. If an incoming LFPS will be considered a PING if it has a timing such that it is less than or equal to the selected value. Otherwise it will be considered for the other types of LFPS.<br>• 0b Max PING LFPS timing set to 256 ns<br>• (32 link clocks)<br>• 1b Max PING LFPS timing set to 320 ns (40 link clocks)<br><br>**Power Well:** SUSe |
| 14:10 | 00h<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 9:0 | 032h<br>RW | **xHCI BESL to HIRD Distance (XHCI_BESL_HIRD_DT):** This field defines the gap between BESL and duration of Resume signalling from Host upon Host Initiated Resume from USB2.0 LPM. The default value of this register corresponds to xHCI spec defined 50us value.<br>• Value BESL to HIRD Distance<br>• 000h = 0us<br>• 001h = 1us<br>• 002h = 2us<br>• 3FFh = 1023us<br><br>**Power Well:** SUS |

## 18.7.180 xHC Latency Tolerance Parameters - LTV Control (XLTP_LTV1)—Offset 8174h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 8174h

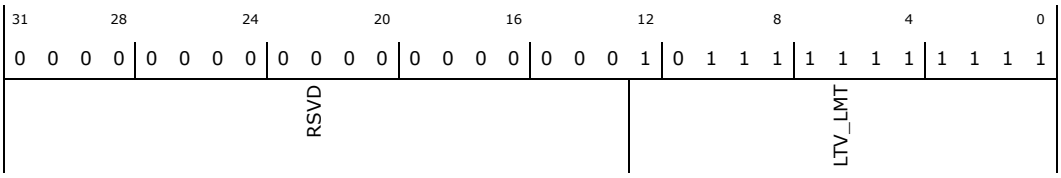
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0040047Dh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RW | **Disable scheduler direct transition from IDLE to NO requirement (DIS_SDT_IDL_NR):**<br>• 0 = (default) allow scheduler direct transition from IDLE to NO requirement<br>• 1 = Disable scheduler direct transition from IDLE to NO requirement<br><br>**Power Well:** Core |
| 30:26 | 00h<br>RW | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 25 | 0b<br>RW | **XHCI LTR Transition Policy (XLTRTP):** When '0', LTR messaging state machine transitions from High, Medium, or Low LTR states to Active state upon the Alarm Timer timout and stays in Active until the next service boundary. When '1', the LTR messaging state machine transitions through High ? Med ? Low ? Active states assuming enough latency is available for each transition.<br><br>**Power Well:** Core |
| 24 | 0b<br>RW | **XHCI LTR Enable (XLTRE):** This bit must be set to enable LTV messaging from XHCI to the PMC.<br><br>**Power Well:** Core |
| 23:12 | 400h<br>RW | **Periodic Active LTV (PA_LTV):**<br>• **23:22 Latency Scale**<br>• 00b = Reserved<br>• 01b = Latency Value to be multiplied by 1024<br>• 10b = Latency Value to be multiplied by 32,768<br>• 11b = Latency Value to be multiplied by 1,048,576<br>•<br>• **21:12 Latency Value (ns) Defaults to 0 microseconds**<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 11:0 | 47Dh<br>RW | **USB2 Port L0 LTV (USB2_PL0_LTV):**<br>• **11:10 Latency Scale**<br>• 00b = Reserved<br>• 01b = Latency Value to be multiplied by 1024<br>• 10b = Latency Value to be multiplied by 32,768<br>• 11b = Latency Value to be multiplied by 1,048,576<br>•<br>• **9:0 Latency Value Defaults to 128 Microseconds(ns)**<br><br>**Power Well:** Core |

## 18.7.181 xHC Latency Tolerance Parameters LTV Control 2 (XLTP_LTV2)—Offset 8178h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

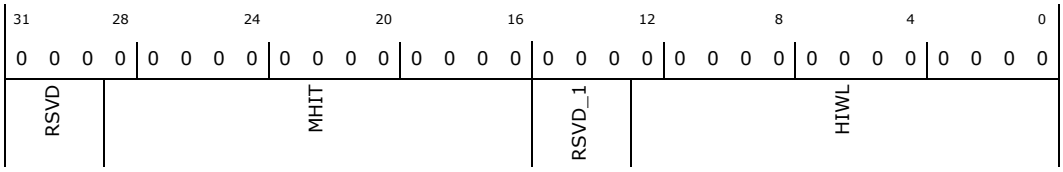
**Offset:** [MBAR] + 8178h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 000017FFh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:13 | 00000h<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 12:0 | 17FFh<br>RW | **LTV Limit (LTV_LMT):** This register defines a maximum LTR value that is allowed to be advertised to the PMC. This is meant to be used as a workaround or mitigation if issues are discovered with the LTR values generated by the XHC using the defined algorithms. If the LTR value of the XHC is larger than the value in this register field, the value in this field is sent to the PMC instead. Default value is the highest possible - 101b<br>• 12:10: Latency Multiplier Field<br>• 000b - Value times 1 ns<br>• 001b - Value times 32 ns<br>• 010b - Value times 1,024 ns<br>• 011b - Value times 32,768 ns<br>• 100b - Value times 1,048,576 ns<br>• 101b - Value times 33,554,432 ns<br>• 110b-111b - Not Permitted<br>• 9:0: Latency Value Default = 3FFh<br><br>**Power Well:** Core |

## 18.7.182 xHC Latency Tolerance Parameters - High Idle Time Control (XLTP_HITC)—Offset 817Ch



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

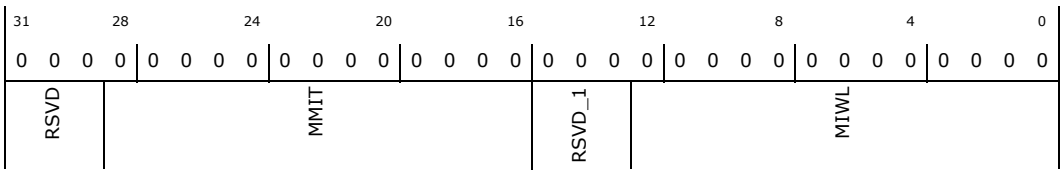
**Offset:** [MBAR] + 817Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0h<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 28:16 | 0000h<br>RW | **Minimum High Idle Time (MHIT):** LTR value can be indicated. This value must be larger than HIWL.<br>• 12:7 - Time value in # of 125 Microsecond Bus Intervals (0 - 8ms)<br>• 6:0 - Fractional BI Time value in Microseconds ( 0 - 124 Microseconds)<br><br>**Power Well:** Core |
| 15:13 | 0h<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 12:0 | 0000h<br>RW | **High Idle Wake Latency (HIWL):** This is the latency to access memory from the High Idle Latency state This value must be larger than MIWL and LIWL.<br>• 12:7 - Time value in # of 125 Microseconds Bus Intervals (0 - 8ms)<br>• 6:0 - Fractional BI Time value in Microseconds ( 0 - 124 Microseconds)<br><br>**Power Well:** Core |

## 18.7.183 xHC Latency Tolerance Parameters - Medium Idle Time Control (XLTP_MITC)—Offset 8180h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

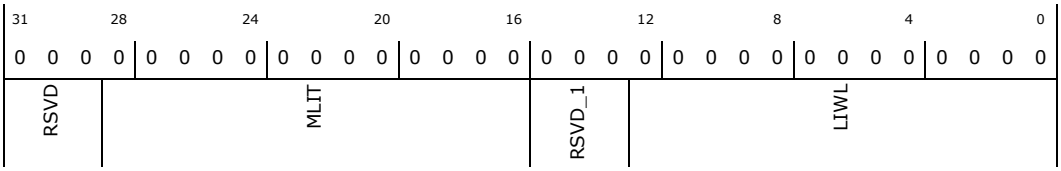
**Offset:** [MBAR] + 8180h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0h<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 28:16 | 0000h<br>RW | **Minimum Medium Idle Time (MMIT):** LTR value can be indicated. This value must be larger than MIWL.<br>• 12:7 - Time value in # of 125 Microseconds Bus Intervals (0 - 8ms)<br>• 6:0 - Fractional BI Time value in Microseconds ( 0 - 124 Microseconds)<br><br>**Power Well:** Core |
| 15:13 | 0h<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 12:0 | 0000h<br>RW | **Medium Idle Wake Latency (MIWL):** This is the latency to access memory from the Medium Idle Latency state. This value must be larger than LIWL.<br>• 12:7 - Time value in # of 125 Microseconds Bus Intervals (0 - 8ms)<br>• 6:0 - Fractional BI Time value in Microseconds ( 0 - 124 Microseconds)<br><br>**Power Well:** Core |

## 18.7.184 xHC Latency Tolerance Parameters Low Idle Time Control (XLTP_LITC)—Offset 8184h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 8184h

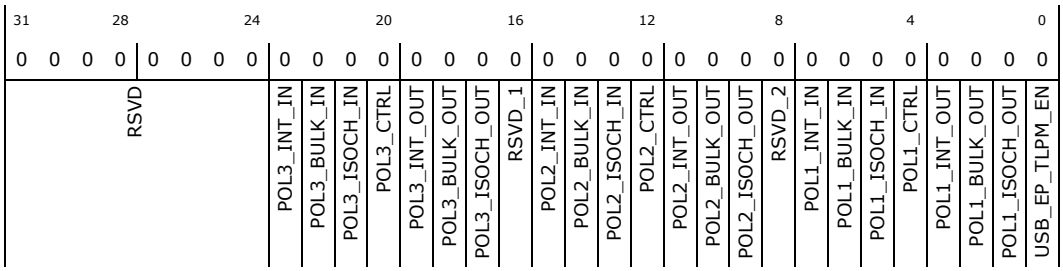
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0h<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 28:16 | 0000h<br>RW | **Minimum Low Idle Time (MLIT):** LTR value can be indicated. This value must be larger than LIWL<br>• 12:7 - Time value in # of 125 Microseconds Bus Intervals (0 - 8ms)<br>• 6:0 - Fractional BI Time value in Microseconds ( 0 - 124 Microseconds)<br><br>**Power Well:** Core |
| 15:13 | 0h<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 12:0 | 0000h<br>RW | **Low Idle Wake Latency (LIWL):** This is the latency to access memory from the Medium Idle Latency state.<br>• 12:7 - Time value in # of 125 Microsecond Bus Intervals (0 - 8ms)<br>• 6:0 - Fractional BI Time value in Microseconds ( 0 - 124 Microseconds)<br><br>**Power Well:** Core |

## 18.7.185 USB EP Type Lock Policy (USB_EP_TLP)—Offset 8344h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 8344h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |

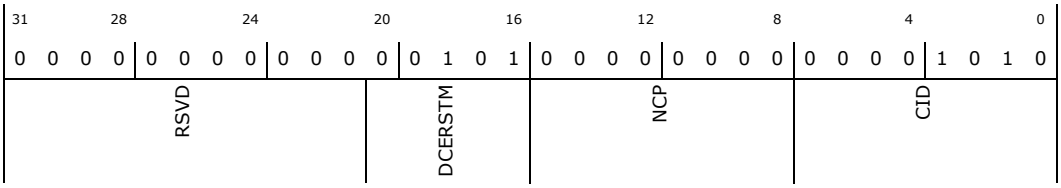
## 18.7.190 Debug Capability ID Register (DCID)—Offset 8480h

The Debug Capability *ID Register* links the USB Debug Capability into the xHCI list of Extended Capabilities and defines its basic capabilities. This register is modified and maintained by BIOS.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 8480h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0005000Ah

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:21 | 000h<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 20:16 | 05h<br>RW | **Debug Capability Event Ring Segment Table Max (DCERSTM):** Valid values are 0 15. This field determines the maximum value supported by the Debug Capability Event Ring Segment Table Base Size registers (see xHCI USB specification), where:<br><br>The maximum number of Event Ring Segment Table entries = 2^(DCERST Max)<br>e.g. if DCERST Max = 7, then the *Debug Capability Event Ring Segment Table(s)* supports up to 128 entries, 15 then 32K entries, etc.<br>Note: This register is sticky.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RW | **Next Capability Pointer (NCP):** This field indicates the location of the next capability with respect to the effective address of this capability. Refer to the xHCI USB specification for more information on this field. Note: This register is sticky.<br><br>**Power Well:** Core |
| 7:0 | 0Ah<br>RW | **Capability ID (CID):** Refer to the xHCI USB specification for descriptions of the capabilities listed below. ## 18.7.192 Debug Capability Event Ring Segment Table Size Register (DCERSTSZ)—Offset 8488h

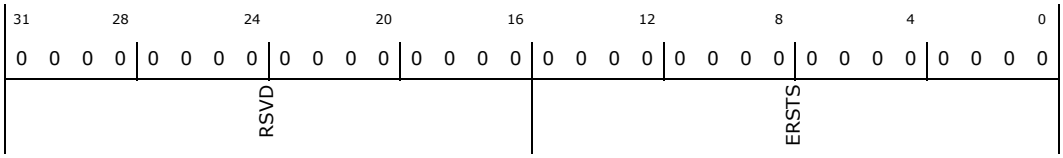
The Debug Capability *Event Ring Segment Table Size Register* defines the number of segments supported by the Debug Capability Event Ring Segment Table.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 8488h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0000h<br>RW | **Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the *Debug Capability Event Ring Segment Table Base Address* register. The maximum value supported by an xHC implementation for this register is defined by the *DCERST Max* field in the DCID register. See the xHCI USB specification for more information. Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'.<br><br>**Power Well:** Core |

## 18.7.193 Debug Capability Event Ring Segment Table Base Address Register (DCERSTBA)—Offset 8490h

The *Debug Capability Event Ring Segment Table Base Address Register* identifies the start address of the Debug Capability Event Ring Segment Table.

### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**Offset:** [MBAR] + 8490h

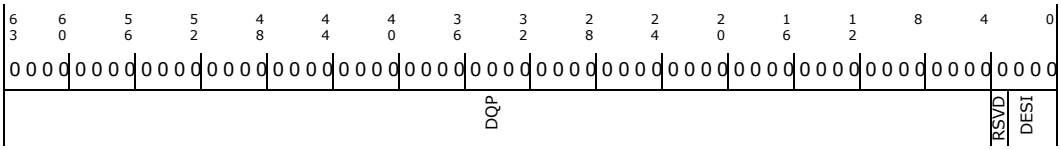
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:4 | 0000000000000000h<br>RW | **Event Ring Segment Table Base Address Register (ERSTBAR):** This field defines the high order bits of the start address of the Debug Capability Event Ring Segment Table.<br>Software shall initialize this register before setting the *Debug Capability Enable* field in the DCCTRL register to 1.<br><br>**Power Well:** Core |
| 3:0 | 0h<br>RW | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |

## 18.7.194 Debug Capability Event Ring Dequeue Pointer Register (DCERDP)—Offset 8498h

The *Debug Capability Event Ring Dequeue Pointer Register* is written by software to define the Debug Capability Event Ring Dequeue Pointer location to the xHC. Software updates this pointer when it has finished the evaluation of an Event(s) on the Debug Capability Event Ring.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**Offset:** [MBAR] + 8498h

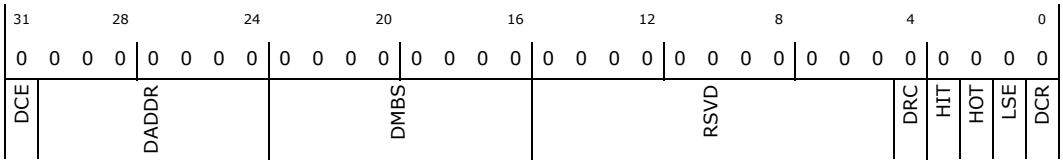
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:4 | 000000000000000h RW | **Dequeue Pointer (DQP):** This field defines the high order bits of the 64-bit address of the current Debug Capability Event Ring Dequeue Pointer. Software shall initialize this register before setting the *Debug Capability Enable* field in the DCCTRL register to '1'.<br><br>**Power Well:** Core |
| 3 | 0b RW | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 2:0 | 0h RW | **Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.<br><br>**Power Well:** Core |

## 18.7.195 Debug Capability Control Register (DCCTRL)—Offset 84A0h

The *Debug Capability Control Register* is used to manage the Debug Capability.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 84A0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

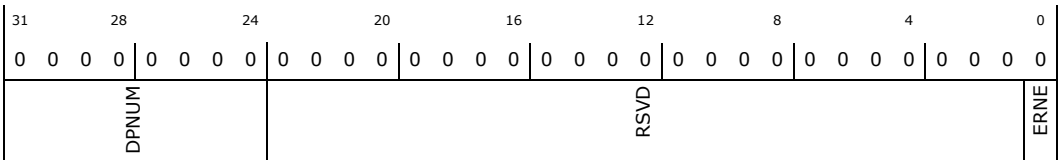
**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b RW | **Debug Capability Enable (DCE):** Setting this bit to a 1 enables xHCI USB Debug Capability operation. This bit is a 0 if the USB Debug Capability is disabled. Clearing this bit releases the Root Hub port assigned to the Debug Capability, and terminates any Debug Capability Transfer or Event Ring activity.<br><br>**Power Well:** Core |
| 30:24 | 00h RO | **Device Address (DADDR):** This field reports the USB device address assigned to the Debug Device during the enumeration process. This field is valid when the *DbC Run* bit is 1.<br><br>**Power Well:** Core |
| 23:16 | 00h RO | **Debug Max Burst Size (DMBS):** This field identifies the maximum burst size supported by the bulk endpoints of this DbC implementation. LPT-LP USB Debug Device does not support bursting.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:5 | 000h<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 4 | 0b<br>RW/C | **DbC Run Change (DRC):** This bit shall be set to '1' when DCR bit is cleared to '0', i.e. by any DbC Port State transition that exits the DbC-Configured state. While this bit is 1 the *Debug Capability Doorbell Register* (DCDB) is disabled. Software shall clear this bit to re-enable the DCDB.<br><br>**Power Well:** Core |
| 3 | 0b<br>RW/S | **Halt IN TR (HIT):** While this bit is 1 the Debug Capability shall generate STALL TPs for all OUT DPs received for the IN TR. The Debug Capability shall clear this bit when a ClearFeature(ENDPOINT_HALT) request is received for the endpoint. This field is valid only when the Debug Capability is in Run Mode (DCR = 1). When not in Run Mode, this field shall return 0 when read, and writes will have no effect. Refer to the xHCI USB specification for more information.<br><br>**Power Well:** Core |
| 2 | 0b<br>RW/S | **Halt OUT TR (HOT):** While this bit is 1 the Debug Capability shall generate STALL TPs for all IN TPs received for the OUT TR. The Debug Capability shall clear this bit when a ClearFeature(ENDPOINT_HALT) request is received for the endpoint. This field is valid only when the Debug Capability is in Run Mode (DCR = 1). When not in Run Mode, this field shall return 0 when read, and writes will have no effect. Refer to the xHCI USB specification for more information.<br><br>**Power Well:** Core |
| 1 | 0b<br>RW | **Link Status Event Enable (LSE):** Setting this bit to a 1 enables the Debug Capability to generate Port Status Change Events due to the *Port Link Status Change* bit transitioning from a 0 to a 1. Refer to the xHCI USB specification for more information.<br><br>**Power Well:** Core |
| 0 | 0b<br>RO | **DbC Run (DCR):** When 0, Debug Device is not in the Configured state. When 1, Debug Device is in the Configured state and bulk Data pipe transactions are accepted by Debug Capability and routed to the IN and OUT Transfer Rings. A 0 to 1 transition of the *Port Reset* (DCPORTSC:PR) bit will clear this bit to 0.<br><br>**Power Well:** Core |

## 18.7.196 Debug Capability Status Register (DCST)—Offset 84A4h

The *Debug Capability Status Register* reports capability related status information to software.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 84A4h

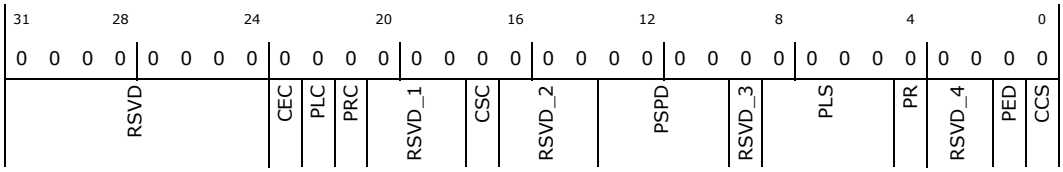
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 00h<br>RO | **Debug Port Number (DPNUM):** This field provides the ID of the Root Hub port that the Debug Capability has been automatically attached to. The value is '0' when the Debug Capability is not attached to a Root Hub port.<br><br>**Power Well:** Core |
| 23:1 | 000000h<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0b<br>RO | **Event Ring Not Empty (ERNE):** When '1', this field indicates that the Debug Capability Event Ring has a Transfer Event on it. It is automatically cleared to '0' by the xHC when the Debug Capability Event Ring is empty, i.e. the Debug Capability Enqueue Pointer is equal to the *Debug Capability Event Ring Dequeue Pointer* register.<br><br>**Power Well:** Core |

## 18.7.197 Debug Capability Port Status and Control Register (DCPORTSC)—Offset 84A8h

The fields of the *Debug Capability PORTSC Register* are defined below and provide information about the state of the Root Hub port that is assigned to the Debug Capability. Note that the fields in this register function differently than those in a normal *Port Status and Control Register* (described in section 5.4.8) because the Root Hub port assigned to the Debug Capability is acting as an Upstream Facing Port, not a Downstream Facing Port.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 84A8h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

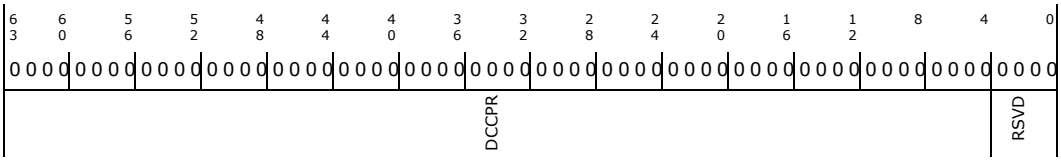
**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 00h<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 23 | 0b<br>RW/C | **Port Config Error Change (CEC):** This flag indicates that the port failed to configure its link partner.<br>• 0 = No change<br>• 1 = Port Config Error detected<br>Software shall clear this bit by writing a '1' to it.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 22 | 0b<br>RW/C | **Port Link Status Change (PLC):** This flag is set to '1' due to the following PLS transitions:<br>• U0 -) U3 = Suspend signaling detected from Debug Host<br>• U3 -) U0 = Resume complete<br>• Polling -) Disabled = Training Error<br>• Ux or Recovery -) Inactive = Error<br>Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.<br><br>**Power Well:** Core |
| 21 | 0b<br>RW/C | **Port Reset Change (PRC):** This bit is set when reset processing on this port is complete (i.e. a '1' to '0' transition of PR).<br>• '0' = No change<br>• '1' = Reset complete<br>Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.<br><br>**Power Well:** Core |
| 20:18 | 0h<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 17 | 0b<br>RW/C | **Connect Status Change (CSC):** an already-set bit (i.e., the bit will remain '1'). Software shall clear this bit by writing a '1' to it.<br>This field is '0' if DCE is '0'.<br><br>**Power Well:** Core |
| 16:14 | 0h<br>RO | **Reserved (RSVD_2):** Reserved.<br><br>**Power Well:** Core |
| 13:10 | 0h<br>RO | **Port Speed (PSPD):** This field identifies the speed of the port. This field is only relevant when a Debug Host is attached (CCS = '1') in all other cases, this field shall indicate Undefined Speed.<br>• 0 Undefined Speed<br>• 1-15 Protocol Speed ID (PSI)<br>Refer to the xHCI for USB specification for the definition of PSIs. Note: The Debug Capability does not support LS, FS, or HS operation.<br><br>**Power Well:** Core |
| 9 | 0b<br>RO | **Reserved (RSVD_3):** Reserved.<br><br>**Power Well:** Core |
| 8:5 | 0h<br>RO | **Port Link State (PLS):** This field reflects its current link state. This field is only relevant when a Debug Host is attached (Debug Port Number ) '0').<br>• 0 = Link is in the U0 State<br>• 1 = Link is in the U1 State<br>• 2 = Link is in the U2 State<br>• 3 = Link is in the U3 State (Device Suspended)<br>• 4 = Link is in the Disabled State<br>• 5 = Link is in the RxDetect State<br>• 6 = Link is in the Inactive State<br>• 7 = Link is in the Polling State<br>• 8 = Link is in the Recovery State<br>• 9 = Link is in the Hot Reset State<br>• 15:10 = Reserved<br>Note: Transitions between different states are not reflected until the transition is complete.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 4 | 0b<br>RO | **Port Reset (PR):**<br>• '1' = Port is in Reset<br>• '0' = Port is not in Reset<br>This bit is set to '1' when the bus reset sequence as defined in the USB Specification is detected on the Root Hub port assigned to the Debug capability. It is cleared when the bus reset sequence is completed by the Debug Host, and the DbC shall transition to the USB Default state. A '0' to '1' transition of this bit shall clear DCPORTSC PED ('0'). This field is '0' if DCE or CCS are '0'.<br><br>**Power Well:** Core |
| 3:2 | 0h<br>RO | **Reserved (RSVD_4):** Reserved.<br><br>**Power Well:** Core |
| 1 | 0b<br>RW | **Port Enabled/Disabled (PED):**<br>• '1' = Enabled.<br>• '0' = Disabled.<br>This flag shall be set to '1' by a '0' to '1' transition of CCS or a '1' to '0' transition of the PR. When PED transitions from '1' to '0' due to the assertion of PR, the port's link shall transition to the Rx.Detect state. This flag may be used by software to enable or disable the operation of the Root Hub port assigned to the Debug Capability. The Debug Capability Root Hub port operation may be disabled by a fault condition (disconnect event or other fault condition, e.g. a LTSSM Polling substate timeout, tPortConfiguration timeout error, etc.), the assertion of DCPORTSC PR, or by software.<br>• 0 = Debug Capability Root Hub port is disabled.<br>• 1 = Debug Capability Root Hub port is enabled.<br>When the port is disabled (PED = '0') the port's link shall enter the SS.Disabled state and remain there until PED is reasserted ('1') or DCE is negated ('0'). Note that the Root Hub port is remains mapped to Debug Capability while PED = '0'. While PED = '0' the Debug Capability will appear to be disconnected to the Debug Host. Note: This bit is not affected by PORTSC PR bit transitions. This field is '0' if DCE or CCS are '0'.<br><br>**Power Well:** Core |
| 0 | 0b<br>RO | **Current Connect Status (CCS):**<br>• '1' = A Root Hub port is connected to a Debug Host and assigned to the Debug Capability.<br>• '0' = No Debug Host is present.<br>This value reflects the current state of the port, and may not correspond to the value reported by the *Connect Status Change* (CSC) field in the *Port Status Change Event* that was generated by a '0' to '1' transition of this bit. This flag is '0' if Debug Capability Enable (DCE) is '0'.<br><br>**Power Well:** Core |

## 18.7.198 Debug Capability Context Pointer Register (DCCP)—Offset 84B0h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**Offset:** [MBAR] + 84B0h

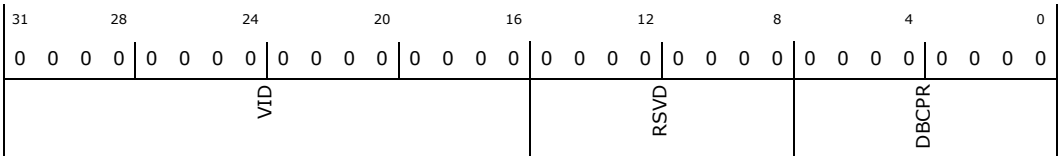
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:4 | 0000000000000000h RW | **Debug Capability Context Pointer Register (DCCPR):** This field defines the high order bits of the start address of the Debug Capability Context data structure associated with the Debug Capability. Software shall initialize this register before setting the Debug Capability Enable bit in the Debug Capability Control Register to '1'.<br><br>**Power Well:** Core |
| 3:0 | 0h RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |

## 18.7.199 Debug Capability Device Descriptor Info Register 1 (DCDDI1)—Offset 84B8h

The *Debug Capability Device Descriptor Register 1* identifies the Device Protocol and Vendor ID values that shall be reported by DbC in its Device Descriptor when it is enumerated by a Debug Host. Refer to section 9.6.1, Table 9-8 in the USB3 spec. This register shall be initialized before enabling the DbC (DCE = '1').



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 84B8h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|

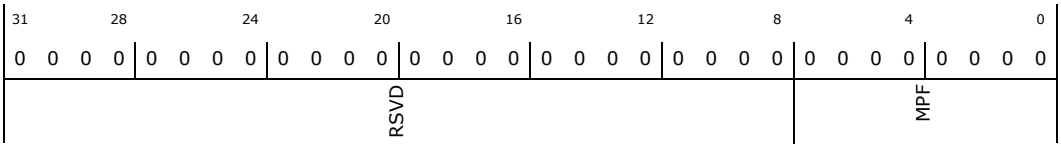
## 18.7.201 Debug Capability Descriptor Parameters (DCDP)—Offset 8530h

The *Debug Capability Device Descriptor Register 2* identifies the Device Revision and Product ID values that shall be reported by DbC in its Device Descriptor when it is enumerated by a Debug Host. Refer to section 9.6.1, Table 9-8 in the Universal Serial Bus 3.0 Specification.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 8530h

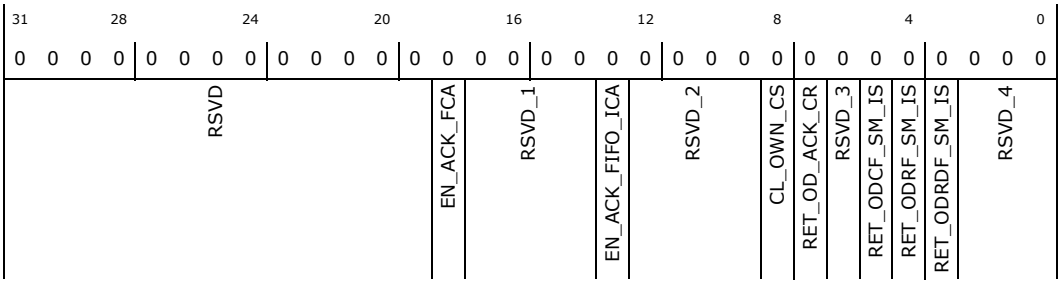
**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 000000h<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **Max Power Field (MPF):** This field will be used by USB Debug Device to report maximum power consumption when the device is fully operational. This value is returned by bMaxPower field in response to Configuration Descriptor read from the debug device. Note: bU1DevExitLat and bU2DevExitLat fields returned in BOS Descriptor read will be taken from the corresponding fields from the Host Controller space.<br><br>**Power Well:** Core |

## 18.7.202 Debug Device Control ODMA (DBGDEV_CTRL_ODMA_REG)—Offset 8538h

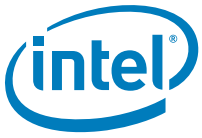
This register contains a number of fields that provide a specific level of configurability for the OUT DMA that is part of Debug Device logic. This configurability is above and beyond that defined in the xHCI specification.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 8538h



**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:20, F:0] + 10h

**Default:** 00000000h

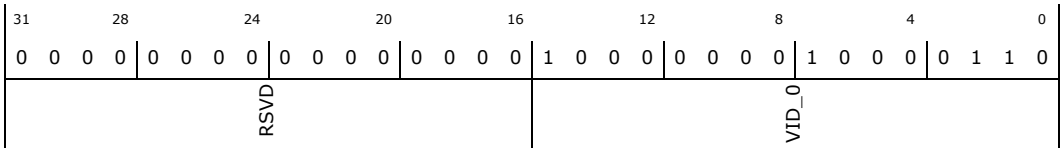
| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0000h<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 18 | 0b<br>RW | **Enable ACK FIFO credit accounting (EN_ACK_FCA):** Setting this field will enable ACK FIFO credit accounting. ODMA will ensure that ample room exists in the ACK FIFO for expected device responses prior to initiating a given DP<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 17:14 | 0h<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 13 | 0b<br>RW | **Enable ACK FIFO ICA mechanisms (EN_ACK_FIFO_ICA):** Setting this field will enable ACK FIFO individual credit accounting mechanisms for Async vs. Periodic Endpoints. ODMA will ensure that ample room exists in the ACK FIFO for expected device responses prior to initiating a given DP<br><br>**Power Well:** Core |
| 12:9 | 0h<br>RO | **Reserved (RSVD_2):** Reserved.<br><br>**Power Well:** Core |
| 8 | 0b<br>RW | **Clear ownership of context semaphore (CL_OWN_CS):** Setting this field generates a pulse that clears the ownership of the context semaphore that is shared between the Out DMA Response and Completion Finite State Machines<br><br>**Power Well:** Core |
| 7 | 0b<br>RW | **Return OD ACK credits (RET_OD_ACK_CR):** Setting this field generates a pulse that implicitly returns all of the Out DMA ACK credits on all ports<br><br>**Power Well:** Core |
| 6 | 0b<br>RO | **Reserved (RSVD_3):** Reserved.<br><br>**Power Well:** Core |
| 5 | 0b<br>RW | **Return ODCF SM to idle state (RET_ODCF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Completion Finite State Machine into the IDLE state<br><br>**Power Well:** Core |
| 4 | 0b<br>RW | **Return ODRF SM to idle state (RET_ODRF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Response Finite State Machine into the IDLE state<br><br>**Power Well:** Core |
| 3 | 0b<br>RW | **Return ODRDF SM to idle state (RET_ODRDF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Read Finite State Machine into the IDLE state<br><br>**Power Well:** Core |
| 2:0 | 0h<br>RO | **Reserved (RSVD_4):** Reserved.<br><br>**Power Well:** Core |

## 18.8 USB EHCI PCI Configuration Registers

### Table 214. Summary of USB EHCI PCI Configuration Registers—0/29/0

| Offset | Size (Bytes) | Register Name (Register Symbol) | Default Value |
|---|---|---|---|
| 0–0h | 1 | "Vendor ID and Device ID (VID_DID)—Offset 0h" on page 2352 | 00008086h |
| 4–4h | 1 | "Command and Device Status (CMD_STS)—Offset 4h" on page 2352 | 02900000h |
| 8–Bh | 4 | "Revision ID and Programming Interface and Sub/Base Class Code (RID_PI_CC)—Offset 8h" on page 2355 | 0C032000h |
| C–Fh | 4 | "Reserved and Master Latency Timer and Header Type (RSVD_MLT_HT)—Offset Ch" on page 2356 | 00000000h |
| 10–13h | 4 | "Memory Base Address (MBAR)—Offset 10h" on page 2357 | 00000000h |
| 2C–2Fh | 4 | "USB2 Subsystem Vendor ID and USB2 Subsystem ID (SSVID_SSID)—Offset 2Ch" on page 2358 | 00000000h |
| 34–37h | 4 | "Capabilities Pointer and Reserved (CAP_PTR_RSVD)—Offset 34h" on page 2358 | 00000050h |
| 3C–3Fh | 4 | "Interrupt Line and Interrupt Pin and Reserved (ILINE_IPIN_RSVD)—Offset 3Ch" on page 2359 | 00000000h |
| 50–53h | 4 | "PCI Power Management Capability ID and Next Item Pointer #1 and PM Capabilities (PM_CID_NEXT_CAP)—Offset 50h" on page 2359 | C9C35801h |
| 54–57h | 4 | "Power Management Control/Status (PM_CS)—Offset 54h" on page 2361 | 00000008h |
| 58–5Bh | 4 | "Debug Port Capability ID and Next Item Pointer #2 and Debug Port Base Offset (DP_CID_NEXT_BASE)—Offset 58h" on page 2362 | 20A0980Ah |
| 60–63h | 4 | "Serial Bus Release Number and Frame Length Adjustment and Port Wake Capability (SBRN_FLA_PWC)—Offset 60h" on page 2363 | 07FF2020h |
| 64–67h | 4 | "Port Disable Override and RMH Device Removable (PDO_RMHDR)—Offset 64h" on page 2364 | 00000000h |
| 68–6Bh | 4 | "USB2 Legacy Support Extended Capability (ULSEC)—Offset 68h" on page 2365 | 00000001h |
| 6C–6Fh | 4 | "USB2 Legacy Support Control/Status (ULSCS)—Offset 6Ch" on page 2366 | 00000000h |
| 70–73h | 4 | "Intel-Specific USB2 SMI (ISU2SMI)—Offset 70h" on page 2369 | 00000000h |
| 74–77h | 4 | "OverCurrent Mapping (OCMAP)—Offset 74h" on page 2371 | C0300C03h |
| 7C–7Fh | 4 | "EHC Suspend Well Configuration and RMH Wake Control (EHCSUSCFGRMHWC)—Offset 7Ch" on page 2371 | 0000408Ch |
| F8–FBh | 4 | "Manufacturer's ID (MANID)—Offset F8h" on page 2374 | 00000F86h |



## 18.8.1 Vendor ID and Device ID (VID_DID)—Offset 0h

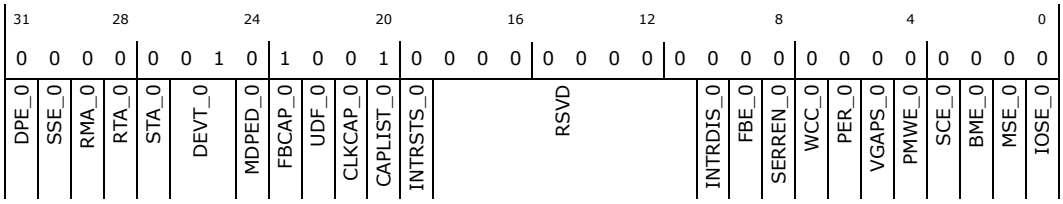
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 0h

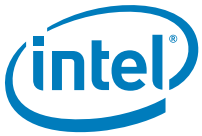
**Default:** 00008086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RO | **Reserved (RSVD):** Reserved. |
| 15:0 | 8086h<br>RO | **Vendor ID (VID_0):** 16-bit field which indicates company vendor as Intel.<br><br>**Power Well:** Core |



## 18.8.2 Command and Device Status (CMD_STS)—Offset 4h

### Access Method



**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 4h

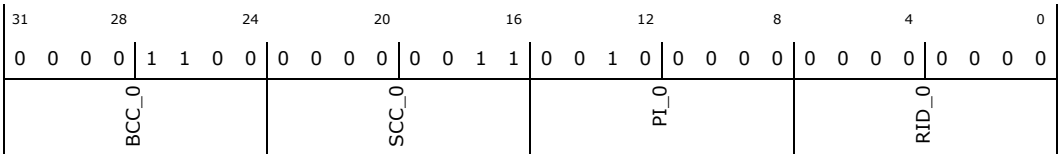
**Default:** 02900000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RWC | **Detected Parity Error (DPE_0):** This bit is set whenever a parity error is seen on the internal interface to the USB2 host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a '1' to this bit location.<br><br>**Power Well:** Core |
| 30 | 0b<br>RWC | **Signaled System Error (SSE_0):** This bit is set whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. The following conditions can cause the generation of SERR#: a parity error is seen on address, command, or data (if the data was targeting the EHC) on the internal interface to the USB2 host controller due to a parity error on the system interface and bit 6 of the Command register is set to 1. An EHC-initiated memory read results in a completion packet with a status other than successful on the system interface (if SERR on Aborts Enable is also set) Software clears this bit by writing a '1' to this bit location.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 29 | 0b<br>RWC | **Received Master-Abort Status (RMA_0):** This bit is set when USB2, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. This event can optionally generate an SERR# by setting the SERR# Enable bit and the SERR on Aborts Enable (bit 3, offset 84h). Software clears this bit by writing a '1' to this bit location.<br><br>**Power Well:** Core |
| 28 | 0b<br>RWC | **Received Target Abort Status (RTA_0):** This bit is set when USB2, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. This event can optionally generate an SERR# by setting the SERR# Enable bit and the SERR on Aborts Enable (bit 3, offset 84h). Software clears this bit by writing a '1' to this bit location.<br><br>**Power Well:** Core |
| 27 | 0b<br>RO | **Signaled Target-Abort Status (STA_0):** This bit is used to indicate when the USB2 function responds to a cycle with a target abort. There is no reason for this to happen, so this bit will be hard-wired to '0'. Read-Only<br><br>**Power Well:** Core |
| 26:25 | 01b<br>RO | **DEVSEL# Timing Status (DEVT_0):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.<br><br>**Power Well:** Core |
| 24 | 0b<br>RWC | **Master Data Parity Error Detected (MDPED_0):** This bit is set whenever a data parity error is detected on a USB2 read completion packet on the internal interface to the USB2 host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a '1' to this bit location.<br><br>**Power Well:** Core |
| 23 | 1b<br>RO | **Fast Back-to-Back Capable (FBCAP_0):** Reserved as '1'.<br><br>**Power Well:** Core |
| 22 | 0b<br>RO | **User Definable Features (UDF_0):** Reserved as '0'<br><br>**Power Well:** Core |
| 21 | 0b<br>RO | **66 Mhz Capable (CLKCAP_0):** Reserved as '0'<br><br>**Power Well:** Core |
| 20 | 1b<br>RO | **Capabilities List (CAPLIST_0):** Hardwired to '1' indicating that offset 34h contains a valid capabilities pointer.<br><br>**Power Well:** Core |
| 19 | 0b<br>RO | **Interrupt Status (INTRSTS_0):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit.<br><br>**Power Well:** Core |
| 18:11 | 00000000b<br><br>RO | **Reserved (RSVD):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 10 | 0b<br>RW | **Interrupt Disable (INTRDIS_0):** When cleared to '0', the function is capable of generating interrupts. When '1', the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable. This bit defaults to '0'. This bit is added as part of the PCI 2.3 Specification.<br><br>**Power Well:** Core |
| 9 | 0b<br>RO | **Fast Back to Back Enable (FBE_0):** Reserved as '0'.<br><br>**Power Well:** Core |
| 8 | 0b<br>RW | **SERR# Enable (SERREN_0):** on a memory read completion (if SERR on Aborts Enable is also set) Detection of an address or command parity error and the Parity Error Response bit is setDetection of a data parity error (when the data is going to the EHC) and the Parity Error Response bit is set<br><br>**Power Well:** Core |
| 7 | 0b<br>RO | **Wait Cycle Control (WCC_0):** Reserved as '0'.<br><br>**Power Well:** Core |
| 6 | 0b<br>RW | **Parity Error Response (PER_0):** When set to 1, the USB2 Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the EHCI specification. If it detects bad parity on the address or command phases when this bit is set to 1, the host controller does not take the cycle, halts the host controller (if currently not halted) and sets the host system error bit in the USBSTS register. Note that this applies to both requests and completions from the system interface. See section 9.19.2.4 for information regarding parity errors detected by the Prefetch DMA Engine. This bit must be set in order for the parity errors to generate SERR#.<br><br>**Power Well:** Core |
| 5 | 0b<br>RO | **VGA Palette Snoop (VGAPS_0):** Reserved as '0'<br><br>**Power Well:** Core |
| 4 | 0b<br>RO | **Postable Memory Write Enable (PMWE_0):** Reserved as '0'<br><br>**Power Well:** Core |
| 3 | 0b<br>RO | **Special Cycle Enable (SCE_0):** Reserved as '0'<br><br>**Power Well:** Core |
| 2 | 0b<br>RW | **Bus Master Enable (BME_0):** When set, bus mastering from EHCI is allowed, and will generate memory reads and writes for USB transfers. Notes on the EHC implementation: - Writes to change this bit occur immediately. Specifically, a write followed by a read will return the updated value. - When the BME bit is changed from 1 to 0, the EHC will cease accessing main memory within 2 microframes (250 usec). During this time, any number of reads and/or writes to memory may occur. - Clearing the BME bit shuts down the EHC DMA engines in the same manner that clearing the Run/Stop does. However, the schedule status bits and the HCHalted bit do not change based on the BME value.<br><br>**Power Well:** Core |
| 1 | 0b<br>RW | **Memory Space Enable (MSE_0):** This bit controls access to the USB2 Memory Space registers. If this bit is set, accesses to the USB2 registers are enabled. The Base Address register for USB2 should be programmed before this bit is set.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 0 | 0b<br>RO | **I/O Space Enable (IOSE_0):** Reserved as '0'.<br><br>**Power Well:** Core |



## 18.8.3 Revision ID and Programming Interface and Sub/Base Class Code (RID_PI_CC)—Offset 8h

### Access Method

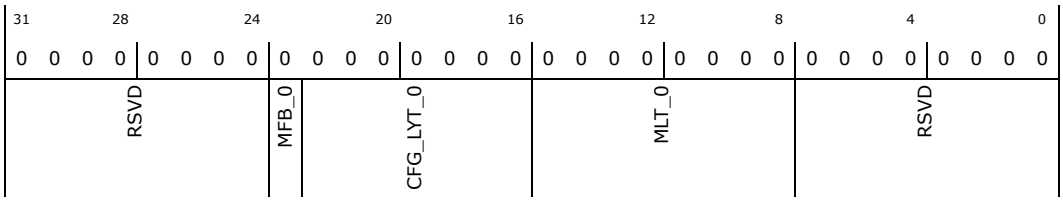
**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 8h

### Default: 0C032000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0Ch<br>RO | **Base Class Code (BCC_0):** A value of 0Ch indicates that this is a Serial Bus controller.<br><br>**Power Well:** Core |
| 23:16 | 03h<br>RO | **Sub Class Code (SCC_0):** A value of 03h indicates that this is a Universal Serial Bus Host Controller.<br><br>**Power Well:** Core |
| 15:8 | 20h<br>RO | **Programming Interface (PI_0):** A value of 20h indicates that this USB2 Host Controller conforms to the EHCI specification.<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RO | **Revision ID (RID_0):** The value reported in this register indicates stepping of the host controller hardware.<br><br>**Power Well:** Core |

## 18.8.4 Reserved and Master Latency Timer and Header Type (RSVD_MLT_HT)—Offset Ch



Reserved, for padding Master Latency Timer Header Type Reserved

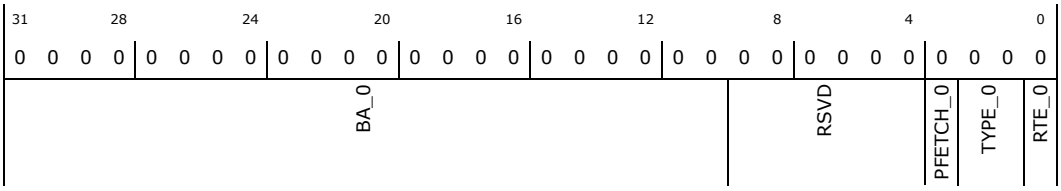
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 00h<br>RO | **Reserved (RSVD):** Reserved. |
| 23 | 0b<br>RO | **Multi Function Bit (MFB_0):** When set to 1 this indicates that this is a multifunction device. Default to 0 since EHCI is at function 0, no other function beyond.<br><br>**Power Well:** Core |
| 22:16 | 0000000b<br>RO | **Configuration Layout (CFG_LYT_0):** Hardwired to 0 to indicate a standard PCI configuration layout.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RO | **Master Latency Timer (MLT_0):** Because the USB2 controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RO | **Reserved (RSVD):** Reserved. |



## 18.8.5 Memory Base Address (MBAR)—Offset 10h

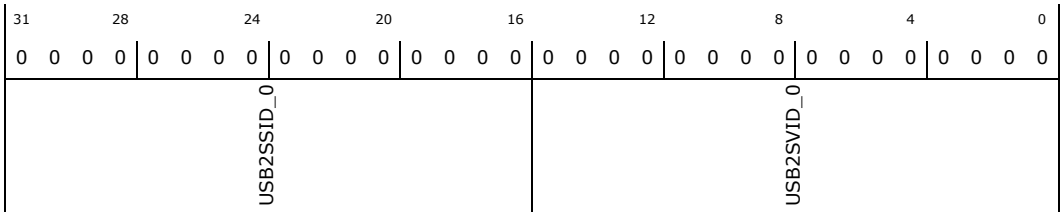
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 000000h<br>RW | **Base Address (BA_0):** Bits (31:10) correspond to memory address signals (31:10), respectively. This gives 1 KB of relocatable memory space aligned to 1 KB boundaries.<br><br>**Power Well:** Core |
| 9:4 | 000000b<br>RO | **Reserved (RSVD):** Reserved. |
| 3 | 0b<br>RO | **Prefetchable (PFETCH_0):** Read Only. This bit is hardwired to 0 indicating that this range should not be prefetched.<br><br>**Power Well:** Core |
| 2:1 | 00b<br>RO | **Type (TYPE_0):** indicating that this range can be mapped anywhere within 32-bit address space.<br><br>**Power Well:** Core |
| 0 | 0b<br>RO | **Resource Type Indicator (RTE_0):** Read Only. This bit is hardwired to 0 indicating that the base address field in this register maps to memory space<br><br>**Power Well:** Core |



## 18.8.6 USB2 Subsystem Vendor ID and USB2 Subsystem ID (SSVID_SSID)—Offset 2Ch

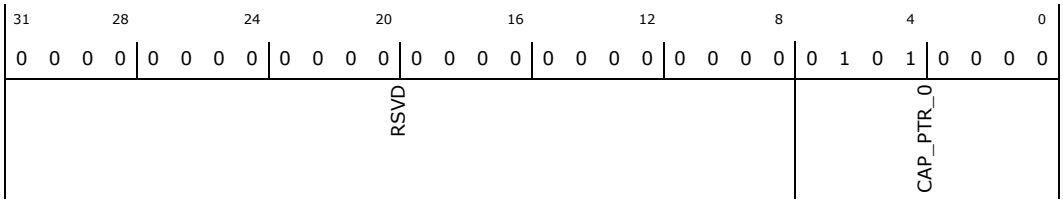
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RW/L | **USB2 Subsystem ID (USB2SSID_0):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s). Writes to this register are enabled when the WRT_RDONLY bit (offset 80h, bit 0) is set to 1. Writes should be done as a single 16-bit cycle. Reset: none<br><br>**Power Well:** Core |
| 15:0 | 0000h<br>RW/L | **USB2 Subsystem Vendor ID (USB2SVID_0):** This register, in combination with the USB2 Subsystem ID register, enables the operating system to distinguish each subsystem from the others. Writes to this register are enabled when the WRT_RDONLY bit (offset 80h, bit 0) is set to 1. Reset: none<br><br>**Power Well:** Core |



## 18.8.7 Capabilities Pointer and Reserved (CAP_PTR_RSVD)—Offset 34h

### Access Method

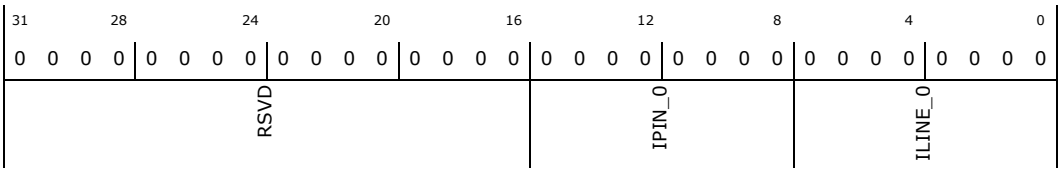
**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 34h

**Default:** 00000050h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 000000h<br><br>RO | **Reserved (RSVD):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 50h<br>RO | **Capabilities Pointer (CAP_PTR_0):** This register points to the starting offset of the USB2 capabilities ranges.<br><br>**Power Well:** Core |



## 18.8.8 Interrupt Line and Interrupt Pin and Reserved (ILINE_IPIN_RSVD)—Offset 3Ch

### Access Method

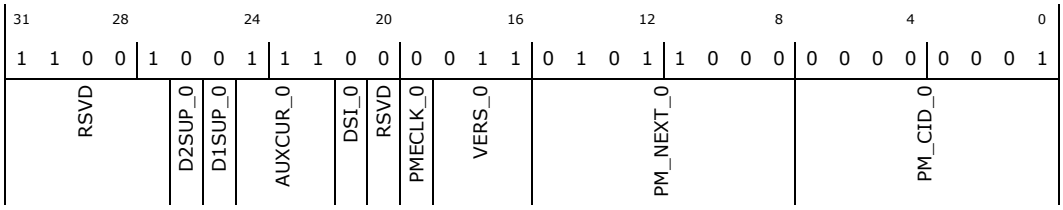
**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 3Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br><br>RO | **Reserved (RSVD):** Reserved. |
| 15:8 | 00h<br>RO | **Interrupt Pin (IPIN_0):** Bits 3:0 reflect the value programmed in the interrupt pin registers in chipset configuration space. Bits 7:4 are hardwired to 0000b. NOTE: As a single function device, only INTA# may be used while the other three interrupt lines have no meaning. (refer to PCI 3.0 spec section 2.2.6 Interrupt Pins)<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **Interrupt line (ILINE_0):** This data is not used by the SOC. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to. Reset: core well and D3-to-D0.<br><br>**Power Well:** Core |

## 18.8.9 PCI Power Management Capability ID and Next Item Pointer #1 and PM Capabilities (PM_CID_NEXT_CAP)—Offset 50h



PCI Power Management Capabilities ID Next Item Pointer #1 Power Management Capabilities

### Access Method

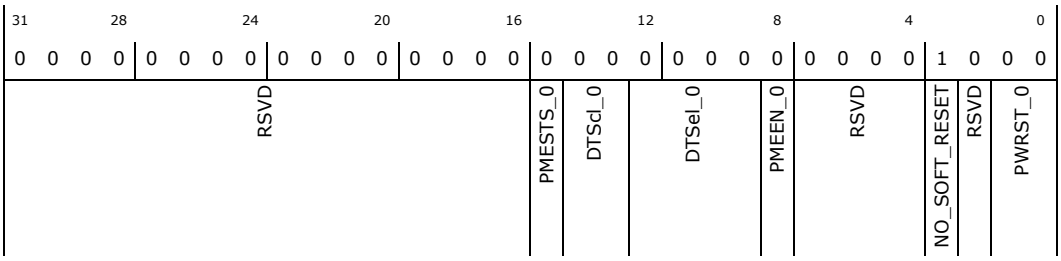
**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 50h

**Default:** C9C35801h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 11001b<br>RO | **Reserved (RSVD):** Reserved. |
| 26 | 0b<br>RO | **D2_Support (D2SUP_0):** The D2 state is not supported. Reset: core well, but not D3-to-D0.<br><br>**Power Well:** Core |
| 25 | 0b<br>RO | **D1_Support (D1SUP_0):** The D1 state is not supported. Reset: core well, but not D3-to-D0.<br><br>**Power Well:** Core |
| 24:22 | 111b<br>RW/L | **Aux_Current (AUXCUR_0):** The USB2 SIP EHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known.<br><br>**Power Well:** Core |
| 21 | 0b<br>RO | **DSI (DSI_0):** The Intel EHC reports 0, indicating that no device-specific initialization is required. Reset: core well, but not D3-to-D0.<br><br>**Power Well:** Core |
| 20 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 19 | 0b<br>RO | **PME Clock (PMECLK_0):** The Intel EHC reports 0, indicating that no PCI clock is required to generate PME#. Reset: core well, but not D3-to-D0.<br><br>**Power Well:** Core |
| 18:16 | 011b<br>RW/L | **Version (VERS_0):** Version: The Intel EHC reports 011, indicating that it complies with Revision 1.21 of the PCI Power Management Specification. Note: As contigency plan, the bit can be reverted by BIOS to 010b to support PCI PM Revision 1.1, by manipulating the offset80h Access Control register's WRT_RDONLY bit.<br><br>**Power Well:** Core |
| 15:8 | 58h<br>RW/L | **Next Item Pointer #1 (PM_NEXT_0):** This register defaults to 58h, which indicates that the next capability registers begin at configuration offset 58h. This register is writable when the WRT_RDONLY bit is set. This allows BIOS to effectively hide the Debug Port capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of 58h implies Debug Port and FLR capabilities visible 98h implies Debug Port invisible, next capability is FLR 00h implies that both Debug port and FLR capability are hidden Note that this value is never expected to be programmed. Reset: core well, but not D3-to-D0<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 01h<br>RO | **PCI Power Management Capability ID (PM_CID_0):** A value of 01h indicates that this is a PCI Power Management capabilities field.<br><br>**Power Well:** Core |



## 18.8.10 Power Management Control/Status (PM_CS)—Offset 54h

### Access Method

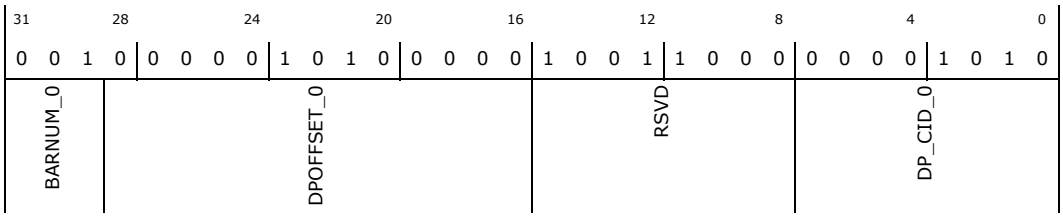
**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 54h

### Default: 00000008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br>RO | **Reserved (RSVD):** Reserved. |
| 15 | 0b<br>RWC | **PME_Status (PMESTS_0):** This bit is set when the EHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.<br><br>**Power Well:** Resume |
| 14:13 | 00b<br>RO | **Data_Scale (DTScl_0):** because it does not support the associated Data register.<br><br>**Power Well:** Resume |
| 12:9 | 0h<br>RO | **Data_Select (DTSel_0):** because it does not support the associated Data register.<br><br>**Power Well:** Resume |
| 8 | 0b<br>RW | **PME_En (PMEEN_0):** A '1' enables the EHC to generate an internal PME signal when PME_Status is '1'. This bit must be explicitly cleared by the operating system each time it is initially loaded.<br><br>**Power Well:** Resume |
| 7:4 | 0000b<br>RO | **Reserved (RSVD):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 1b<br>RO | **No Soft Reset (NO_SOFT_RESET):** A '0' indicates device does perform an internal reset upon D3hot to D0 transition via software control of the PowerState bits. Configuration Context is lost. Full re-initialization sequence is needed to return the device to D0 Initialized.(Default to '1') Note: As contigency plan, the bit can be reverted by BIOS to 0, by manipulating the offset80h Access Control register?s WRT_RDONLY bit.<br><br>**Power Well:** Resume |
| 2 | 0b<br><br>RO | **Reserved (RSVD):** Reserved. |
| 1:0 | 00b<br>RW | **PowerState (PWRST_0):** This 2-bit field is used both to determine the current power state of EHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3hot state, the accesses to the EHC memory range must not be accepted; but the configuration space must still be accessible. When not in the D0 state, the generation of the interrupt output is blocked. Specifically, the PIRQ[H] is not asserted when not in the D0 state. When software changes this value from the D3hot state to the D0 state, an internal warm (soft) reset is generated, and software must re-initialize the function.<br><br>**Power Well:** Resume |



## 18.8.11 Debug Port Capability ID and Next Item Pointer #2 and Debug Port Base Offset (DP_CID_NEXT_BASE)—Offset 58h

### Access Method

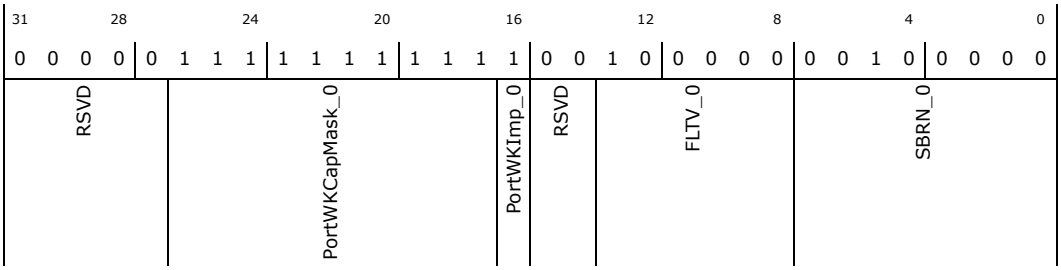
**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 58h

**Default:** 20A0980Ah

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 001b<br>RO | **BAR Number (BARNUM_0):** Read-Only. This field is hardwired to 001b to indicate the memory BAR at offset 10h in the EHCI configuration space. Reset: Not applicable.<br><br>**Power Well:** Core |
| 28:16 | 00A0h<br>RO | **Debug Port Offset (DPOFFSET_0):** This field is hardwired to 0A0h to indicate that the debug port registers begin at offset A0h in the EHCI memory range. Reset: Not applicable.<br><br>**Power Well:** Core |
| 15:8 | 98h<br><br>RO | **Reserved (RSVD):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0Ah<br>RO | **Debug Port Capability ID (DP_CID_0):** This register is hardwired to 0Ah which indicates that this is the start of a Debug Port Capability structure. Reset: Not applicable.<br><br>**Power Well:** Core |



## 18.8.12 Serial Bus Release Number and Frame Length Adjustment and Port Wake Capability (SBRN_FLA_PWC)—Offset 60h

### Access Method

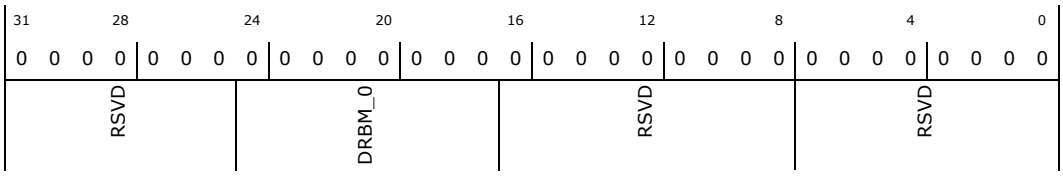
**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 60h

### Default: 07FF2020h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 00000b<br>RO | **Reserved (RSVD):** Reserved. |
| 26:17 | 3FFh<br>RW | **Port Wake Up Capability Mask (PortWKCapMask_0):** Bit positions 1 through 8 correspond to a physical port implemented on this host controller. For example, bit position 1 corresponds to port 1, position 2 port 2, etc. Are only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition<br><br>**Power Well:** Resume |
| 16 | 1b<br>RW | **Port Wake Implemented (PortWKImp_0):** A '1' in bit 0 indicates that this register is implemented to software. Are only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition<br><br>**Power Well:** Resume |
| 15:14 | 00b<br>RO | **Reserved (RSVD):** Reserved. |
| 13:8 | 100000b<br>RW | **Frame Length Timing Value (FLTV_0):** Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (# High Speed bit times) FLADJ Value (decimal) (decimal) 59488 0 (00h) 59504 1 (01h) 59520 2 (02h) ... 59984 31 (1Fh) 60000 32 (20h) ... 60480 62 (3Eh) 60496 63 (3Fh) Are only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition<br><br>**Power Well:** Resume |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 20h<br>RO | **Serial Bus Release Number (SBRN_0):** value of 20h indicates that this controller follows USB release 2.0<br><br>**Power Well:** Resume |



## 18.8.13 Port Disable Override and RMH Device Removable (PDO_RMHDR)—Offset 64h

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 64h

### Default: 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0000000b<br>RO | **Reserved (RSVD):** Reserved. |
| 24:17 | 00h<br>RW | **Device Removable Bit Map (DRBM_0):** A 1 in a given bit position in this field indicates that the corresponding downstream port of the RMH is connected to a non-removable device. A 0 indicates that the port is exposed to the user. Bits 8:1 are mapped to Ports 8:1. This bits control the value returned by the RMH in the Deviceremovable field of the Hub Descriptor. A 1 in a given bit position in this register will result in the corresponding bit in the DeviceRemovable field of the hub descriptor being set to 1 as well (indicating that the port is connected to a non-removable device). System BIOS is expected to set these values upon Boot and resume from Sx states.<br><br>**Power Well:** Core |

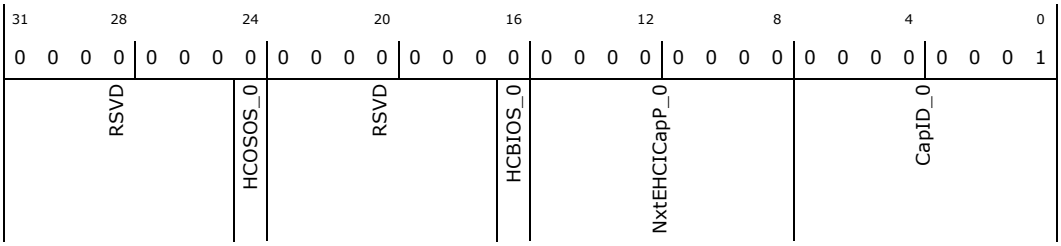
| 7:0 | 00h<br>RO | **Reserved (RSVD):** Reserved. |



## 18.8.14 USB2 Legacy Support Extended Capability (ULSEC)—Offset 68h

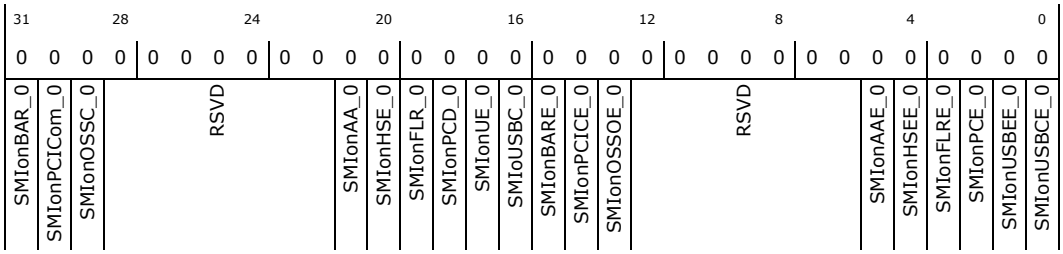
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 68h

### Default: 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0000000b<br>RO | **Reserved (RSVD):** Reserved. |
| 24 | 0b<br>RW | **HC OS Owned Semaphore (HCOSOS_0):** System software sets this bit to request ownership of the EHCI controller. Ownership is obtained when this bit reads as 1 and the HC BIOS Owned Semaphore bit reads as clear. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.<br><br>**Power Well:** Resume |
| 23:17 | 0000000b<br>RO | **Reserved (RSVD):** Reserved. |
| 16 | 0b<br>RW | **HC BIOS Owned Semaphore (HCBIOS_0):** The BIOS sets this bit to establish ownership of the EHCI controller. System BIOS will clear this bit in response to a request for ownership of the EHCI controller by system software. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.<br><br>**Power Well:** Resume |
| 15:8 | 00h<br>RO | **Next EHCI Capability Pointer (NxtEHCICapP_0):** A value of 00h indicates that there are no EHCI Extended Capability structures in this device. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.<br><br>**Power Well:** Resume |
| 7:0 | 01h<br>RO | **Capability ID (CapID_0):** A value of 01h indicates that this EHCI Extended Capability is the Legacy Support Capability. This register is implemented in the Suspend Well. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.<br><br>**Power Well:** Resume |



## 18.8.15 USB2 Legacy Support Control/Status (ULSCS)—Offset 6Ch

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 6Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RWC | **SMI on BAR (SMIonBAR_0):** This bit is set to '1' whenever the Base Address Register (BAR) is written. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.<br><br>**Power Well:** Resume |
| 30 | 0b<br>RWC | **SMI on PCI Command (SMIonPCICom_0):** This bit is set to '1' whenever the PCI Command Register is written. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.<br><br>**Power Well:** Resume |
| 29 | 0b<br>RWC | **SMI on OS Ownership Change (SMIonOSSC_0):** This bit is set to '1' whenever the HC OS Owned Semaphore bit in the USB2 Legacy Support Extended Capability register transitions from 1 to a 0 or 0 to a 1. This register is only reset by the resume power well going low. It is not reset by the core power well going low or by a D3-to-D0 state transition.<br><br>**Power Well:** Resume |

It is not reset by the core power well going low or by a D3-to-D0 state transition<br><br>**Power Well:** Resume |

## 18.8.17 OverCurrent Mapping (OCMAP)—Offset 74h

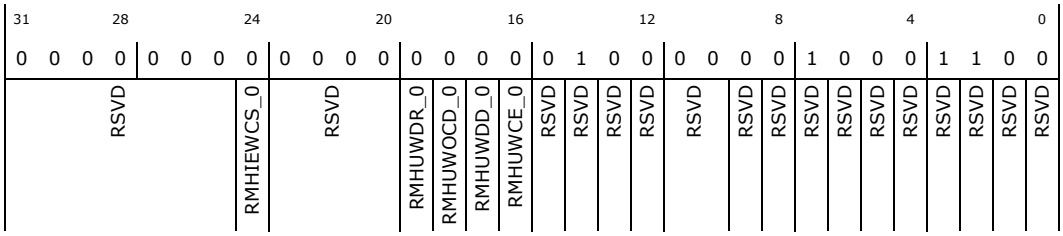
### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 74h

**Default:** C0300C03h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | C0h<br>RW | **OC Mapping D (OCMAPD_0):** Each bit position maps OC4, for EHCI1 to a set of ports as follows: The OC4 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin.<br><br>**Power Well:** Resume |
| 23:16 | 30h<br>RW | **OC Mapping C (OCMAPC_0):** OC Mapping C. Each bit position maps OC3, for EHCI1 to a set of ports as follows: The OC3 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin.<br><br>**Power Well:** Resume |
| 15:8 | 0Ch<br>RW | **OC Mapping B (OCMAPB_0):** OC Mapping B. Each bit position maps OC2, for EHCI1 to a set of ports as follows: The OC2 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin.<br><br>**Power Well:** Resume |
| 7:0 | 03h<br>RW | **OC Mapping A (OCMAPA_0):** OC Mapping A: Each bit position maps OC1, for EHCI1 to a set of ports as follows: The OC1 pin is ganged to the overcurrent signal of each port that has its corresponding bit set. It is SW's responsibility to ensure that a given port's bit map is set only for one OC pin.<br><br>**Power Well:** Core |



## 18.8.18 EHC Suspend Well Configuration and RMH Wake Control (EHCSUSCFGRMHWC)—Offset 7Ch

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:29, F:0] + 7Ch

**Default:** 0000408Ch

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0000000b<br>RO | **Reserved (RSVD):** Reserved. |
| 24 | 0b<br>RW | **RMH Inherit EHCI Wake Control Settings (RMHIEWCS_0):** When this bit is set, the RMH behaves as if bits 2:0 of this register reflect the appropriate bits of EHCI PORTSC0 bits 22:20.<br><br>**Power Well:** Resume |
| 23:20 | 0000b<br>RO | **Reserved (RSVD):** Reserved. |
| 19 | 0b<br>RW | **RMH Upstream Wake on Device Resume (RMHUWDR_0):** This bit governs the hub behavior when globally suspended. When this bit is 0 it enables the port to be sensitive to device initiated resume events as system wake-up events. i.e, the hub will initiate a resume on its upstream port and cause a wake when a device resume occurs on an enabled DS port When this bit is set to 1 and a device resume event is seen on a downstream port, the hub does not initiate a wake upstream and does not cause a wake.<br><br>**Power Well:** Resume |
| 18 | 0b<br>RW | **RMH Upstream Wake on OC Disable (RMHUWOCD_0):** This bit governs the hub behavior when globally suspended. When this bit is 0 it enables the port to be sensitive to overcurrent conditions as system wake-up events. i.e,, the hub will initiate a resume on its upstream port and cause a wake when an OC condition occurs on an enabled DS port When this bit is set to 1 and an over current event is seen, the hub does not initiate a wake upstream and does not cause a wake.<br><br>**Power Well:** Resume |
| 17 | 0b<br>RW | **RMH Upstream Wake on Disconnect Disable (RMHUWDD_0):** This bit governs the hub behavior when globally suspended. When this bit is set to 0, the globally suspended hub treats disconnect events on downstream port as resume events to be propagated upstream. In this case, it is allowed to initiate a wake on its upstream por and cause a system wake in response to a disconnect event on a downstream port When this bit is set to 1, and the hub is globally suspended, the hub does not initiate a resume on its upstream port or cause a resume when a disconnect event occurs on a downstream port.<br><br>**Power Well:** Resume |
| 16 | 0b<br>RW | **RMH Upstream Wake on Connect Enable (RMHUWCE_0):** This bit governs the hub behavior when globally suspended. When this bit is set to 0, and the hub is globally suspended, the hub treats connect events on a downstream port as resume events to be propagated upstream. As well as waking up the system. When this bit is set to 1,and the hub is globally suspended, the hub does not wake the system nor does it initiate a resume on its upstream port when a connect event occurs on a downstream port.<br><br>**Power Well:** Resume |

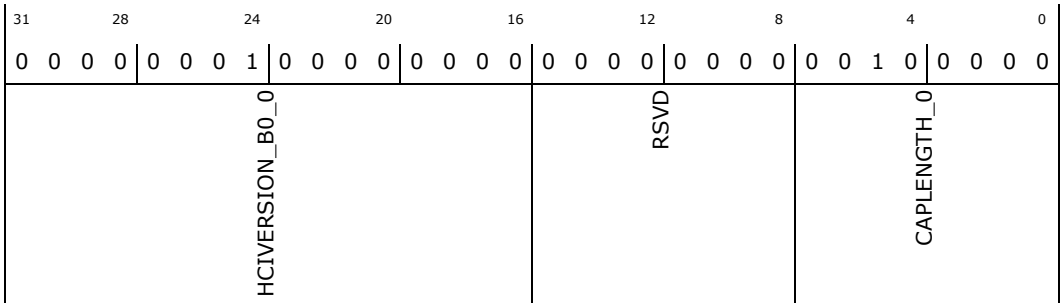
| 4126- 4426h | 4 | "USB Per Port (USB2_PER_PORT_2_LANE0/1/2/3) - Offset 4126h/4226h/4326h/4426h" on page 2433 | 00001249h |

## 18.9.1 Capability Registers Length and HC Interface Version Number (CAP_HCIV)—Offset 0h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 0h

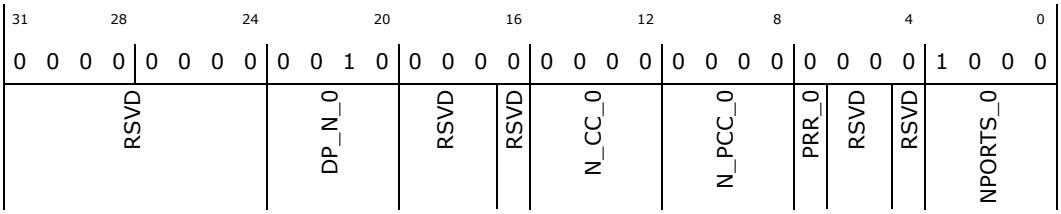
**MBAR Type:** PCI Configuration Register (Size: 32 bits)
**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 01000020h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0100h<br>RO | **Host Controller Interface Version Number (HCIVERSION_B0_0):** This is a two-byte register containing a BCD encoding of the version number of interface that this host controller interface conforms.<br><br>**Power Well:** Core |
| 15:8 | 00h<br><br>RO | **Reserved (RSVD):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 20h<br>RO | **Capability Registers Length (CAPLENGTH_0):** This register is used as an offset to add to the Memory Base Register to find the beginning of the Operational Register Space. This is fixed at 20h, indicating that the Operation Registers begin at offset 20h.<br><br>**Power Well:** Resume |

## 18.9.2 Host Controller Structural Parameters (HCSPARAMS)—Offset 4h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 4h

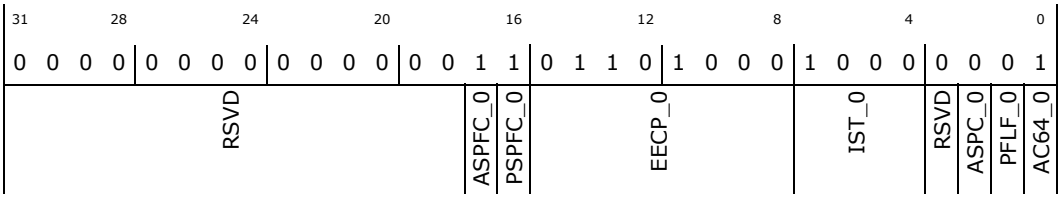
**MBAR Type:** PCI Configuration Register (Size: 32 bits)
**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 00200008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 00h<br>RO | **Reserved (RSVD):** Reserved. |
| 23:20 | 2h<br>RO | **Debug Port Number (DP_N_0):** Hardwired to 2h, indicating that the Debug Port is on the 2nd port on the EHC. This register is only reset by the resume power well going low. It is not reset by a D3-to-D0 state transition or HCRESET (Host Controller Reset)<br><br>**Power Well:** Resume |
| 19:17 | 000b<br>RO | **Reserved (RSVD):** Reserved. |
| 16 | 0b<br>RO | **Reserved (RSVD):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:12 | 0h<br>RO | **Number of Companion Controllers (N_CC_0):** This field indicates the number of companion controllers associated with this USB 2.0 host controller. A zero in this field indicates there are no companion host controllers. Port-ownership hand-off is not supported. Only high-speed devices are supported on the host controller root ports. A value larger than one in this field indicates there are companion USB 1.1 host controller(s). Port-ownership hand-offs are supported. High, Full- and Low-speed devices are supported on the host controller root ports. There are no companion controllers. This field is set to '0' as Read-Only bit.<br><br>**Power Well:** Core |
| 11:8 | 0h<br>RO | **Number of Ports per Companion Controller (N_PCC_0):** This field indicates the number of ports supported per companion host controller. It is used to indicate the port routing configuration to system software. Read-Only. This register is only reset by the resume power well going low. It is not reset by a D3-to-D0 state transition or HCRESET (Host Controller Reset)<br><br>**Power Well:** Core |
| 7 | 0b<br>RO | **Port Routing Rules (PRR_0):** This field indicates the method used by this implementation for how all ports are mapped to companion controllers. This is hardwired to 0, indicating that the first N_PCC (=2) ports are routed to the lowest numbered function companion host controller, the next N_PCC ports are routed to the next lowest function companion controller, and so on<br><br>**Power Well:** Resume |
| 6:5 | 00b<br><br>RO | **Reserved (RSVD):** Reserved. |
| 4 | 0b<br><br>RO | **Reserved (RSVD):** Reserved. |
| 3:0 | 8h<br>RW | **N_PORTS (NPORTS_0):** This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the Operational Register Space. Valid values are in the range of 1H to FH. The default value for the EHCI controller indicates 8 ports. BIOS may overwrite the default value to properly describe the board or chip SKU . (please refer to RMH Configuration Details in section 1.23.2). A zero in this field is undefined. Integrated RMH - If USBr is disabled, this should be updated by BIOS to 2 such that the EHC reports 2ports to be default, port 0 assigned to the RMH and port 1 assigned to the debug device. If USB-R is enabled, the number reported should be updated to 3 by BIOS (port 2 will be assigned to USB-R in this case) Legacy Mode - The default value for the EHCI controller indicates 8 ports. If USB-R support is enabled, BIOS should account for the additional ports in calculating the value to write to this field.<br><br>**Power Well:** Resume |

## 18.9.3 Host Controller Capability Parameters (HCCPARAMS)—Offset 8h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 8h

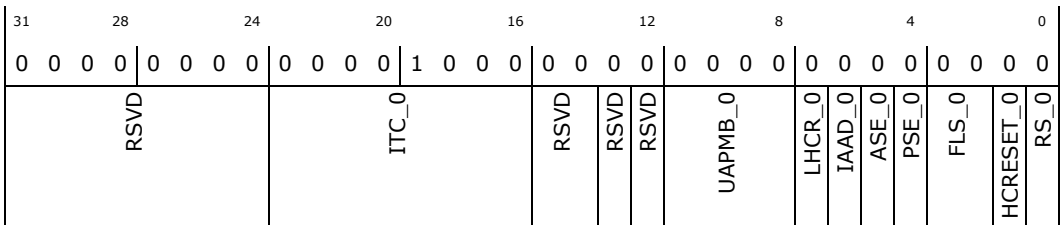
**MBAR Type:** PCI Configuration Register (Size: 32 bits)
**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 00036881h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 00000000000000b<br>RO | **Reserved (RSVD):** Reserved. |
| 17 | 1b<br>RW | **Asynchronous Schedule Prefetch Capability (ASPFC_0):** This bit indicates that tthe hardware support the Asynch schedule prefetch enable bit in the USB command register.<br><br>**Power Well:** Resume |
| 16 | 1b<br>RW | **Periodic Schedule Prefetch Capability (PSPFC_0):** This bit indicates that the EHC hardware supports the Periodic Schedule prefetch bit in the USB2 Command Register.<br><br>**Power Well:** Core |
| 15:8 | 68h<br>RO | **EHCI Extended Capabilities Pointer (EECP_0):** This field is hardwired to 68h, indicating that the EHCI capabilities list exists and begins at offset 68h in the PCI configuration space.<br><br>**Power Well:** Resume |
| 7:4 | 8h<br>RO | **Isochronous Scheduling Threshold (IST_0):** This field indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule. When bit [7] is zero, the value of the least significant 3 bits indicates the number of micro-frames a host controller hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is a one, then host software assumes the host controller may cache an isochronous data structure for an entire frame. Refer to the EHCI specification for details on how software uses this information for scheduling isochronous transfers. The Intel USB2 hardwires this field to 8h.<br><br>**Power Well:** Resume |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 2 | 0b<br>RO | **Asynchronous Schedule Park Capability (ASPC_0):** This bit is hardwired to 0 indicating that the Host Controller does not support this optional feature.<br><br>**Power Well:** Resume |
| 1 | 0b<br>RO | **Programmable Frame List Flag (PFLF_0):** If this bit is set to a zero, then system software must use a frame list length of 1024 elements with this host controller. The USBCMD register Frame List Size field is a read-only register and must be set to zero. If set to a one, then system software can specify and use a smaller frame list and configure the host controller via the USBCMD register Frame List Size field. The frame list must always be aligned on a 4K page boundary. This requirement ensures that the frame list is always physically contiguous. The Intel EHC does not support different frame list lengths. This bit is read-only '0'.<br><br>**Power Well:** Core |
| 0 | 1b<br>RO | **64-bit Addressing Capability (AC64_0):** This field documents the addressing range capability of this implementation. The value of this field determines whether software should use the 32-bit or 64-bit data structures. Values for this field have the following interpretation:0b data structures using 32-bit address memory pointers; 1b data structures using 64-bit address memory pointers The USB2 SIP supports 64-bit addressing only. This bit is read-only '1'.<br><br>**Power Well:** Resume |

## 18.9.4 USB2 Command Register (USB2CMD)—Offset 20h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 20h

**MBAR Type:** PCI Configuration Register (Size: 32 bits)
**MBAR Reference:** [B:0, D:29, F:0] + 10h

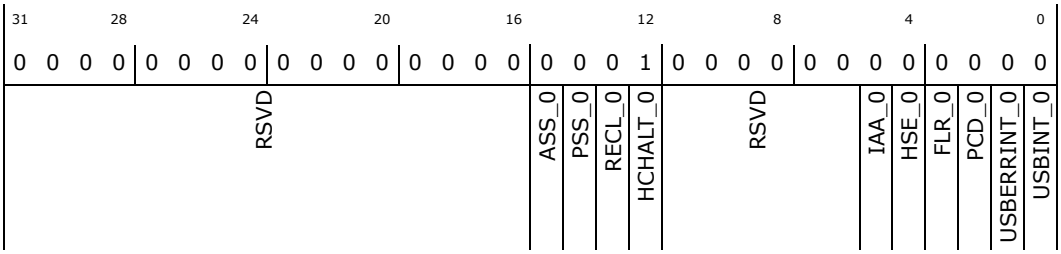
**Default:** 00080000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 00h<br>RO | **Reserved (RSVD):** Reserved. |
| 23:16 | 08h<br>RW | **Interrupt Threshold Control (ITC_0):** This field is used by system software to select the maximum rate at which the host controller will issue interrupts. The only valid values are defined below. If software writes an invalid value to this register, the results are undefined. Value Maximum Interrupt Interval 00h Reserved 01h 1 micro-frame 02h 2 micro-frames 04h 4 micro-frames 08h 8 micro-frames (default, equates to 1 ms) 10h 16 micro-frames (2 ms) 20h 32 micro-frames (4 ms) 40h 64 micro-frames (8 ms) Refer to Section 4 in the EHCI specification for interrupts affected by this field.<br><br>**Power Well:** Core |
| 15:14 | 00b<br>RO | **Reserved (RSVD):** Reserved. |
| 13 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 12 | 0h<br>RO | **Reserved (RSVD):** Reserved. |
| 11:8 | 0h<br>RO | **Unimplemented Asynchronous Park Mode Bits (UAPMB_0):** This field is hardwired to 000b because the host controller does not support this optional feature.<br><br>**Power Well:** Core |
| 7 | 0b<br>RO | **Light Host Controller Reset (LHCR_0):** Read Only 0b. The Intel EHC does not implement this optional reset and hardwires this bit to 0.<br><br>**Power Well:** Core |
| 6 | 0b<br>RW | **Interrupt on Async Advance Doorbell (IAAD_0):** This bit is used as a doorbell by software to tell the host controller to issue an interrupt the next time it advances asynchronous schedule. Software must write a 1 to this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule state , it sets the Interrupt on Async Advance status bit in the USBSTS register. If the Interrupt on Async Advance Enable bit in the USBINTR register is a one then the host controller will assert an interrupt at the next interrupt threshold. See the EHCI specification for operational details. The host controller sets this bit to a zero after it has set the Interrupt on Async Advance status bit in the USBSTS register to a one. Software should not write a one to this bit when the asynchronous schedule is disabled. Doing so will yield undefined results.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 5 | 0b<br>RW | **Asynchronous Schedule Enable (ASE_0):** This bit controls whether the host controller skips processing the Asynchronous Schedule. Values mean: 0b Do not process the Asynchronous Schedule 1b Use the ASYNCLISTADDR register to access the Asynchronous Schedule.<br><br>**Power Well:** Core |
| 4 | 0b<br>RW | **Periodic Schedule Enable (PSE_0):** This bit controls whether the host controller skips processing the Periodic Schedule. Values mean: 0b Do not process the Periodic Schedule 1b Use the PERIODICLISTBASE register to access the Periodic Schedule.<br><br>**Power Well:** Core |
| 3:2 | 00b<br>RO | **Frame List Size (FLS_0):** This field is R/W only if Programmable Frame List Flag in the HCCPARAMS registers is set to a one. . This field specifies the size of the frame list. The size the frame list controls which bits in the Frame Index Register should be used for the Frame List Current index. Values mean:00b 1024 elements (4096 bytes) Default value; 01b 512 elements (2048 bytes); 10b 256 elements (1024 bytes) - for resource-constrained environments<br><br>**Power Well:** Core |
| 1 | 0b<br>RW | **Host Controller Reset (HCRESET_0):** This control bit used by software to reset the host controller. The effects of this on Root Hub registers are similar to a Chip Hardware Reset. When software writes a one to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports. Note: PCI Configuration registers and Host Controller Capability Registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Port ownership will be disowned by the host controller(s), with the side effects described in the EHCI spec. Software must reinitialize the host controller in order to return the host controller to an operational state. This bit is set to zero by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a zero to this register. Software should not set this bit to a one when the HCHalted bit in the USBSTS register is a zero. Attempting to reset an actively running host controller will result in undefined behavior. This reset must be used to leave EHCI port test modes.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 0 | 0b<br>RW | **Run/Stop (RS_0):** 1=Run. 0=Stop. When set to a 1, the Host Controller proceeds with execution of the schedule. The Host Controller continues execution as long as this bit is set to a 1. When this bit is set to 0, the Host Controller completes the current and any actively pipelined transactions on the USB and then halts. The Host Controller must halt within 16 microframes after software clears the Run bit. The HC Halted bit in the status register indicates when the Host Controller has finished its pending pipelined transactions and has entered the stopped state. Software should not write a 1 to this field unless the host controller is in the Halted state (i.e. HCHalted in the USBSTS register is a one). The following table explains how the different combinations of Run and Halted must be interpreted: Run/Stop Halted Interpretation 0 0 Valid- in the process of halting 0 1 Valid- halted 1 0 Valid- running 1 1 Invalid- the HCHalted bit clears immediately Memory read cycles initiated by the EHC that receive any status other than Successful will result in this bit being cleared (and also affect the Host Error bit).<br><br>**Power Well:** Core |

## 18.9.5 USB2 Status (USB2STS)—Offset 24h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 24h

**MBAR Type:** PCI Configuration Register (Size: 32 bits)
**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 00001000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0000h<br><br>RO | **Reserved (RSVD):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0b<br>RO | **Asynchronous Schedule Status (ASS_0):** This bit reports the current real status of the Asynchronous Schedule. If this bit is a zero then the status of the Asynchronous Schedule is disabled. If this bit is a one then the status of the Asynchronous Schedule is enabled. The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the USBCMD register. When this bit and the Asynchronous Schedule Enable bit are the same value, the Asynchronous Schedule is either enabled (1) or disabled (0).<br><br>**Power Well:** Core |
| 14 | 0b<br>RO | **Periodic Schedule Status (PSS_0):** This bit reports the current real status of the Periodic Schedule. If this bit is a zero then the status of the Periodic Schedule is disabled. If this bit is a one then the status of the Periodic Schedule is enabled. The Host Controller is not required to immediately disable or enable the Periodic Schedule when software transitions the Periodic Schedule Enable bit in the USBCMD register. When this bit and the Periodic Schedule Enable bit are the same value, the Periodic Schedule is either enabled (1) or disabled (0). The Prefetch-Based Pause feature prevents this bit from transitioning to 0 if it currently has a request pending, in addition to the regular Periodic DMA engine.<br><br>**Power Well:** Core |
| 13 | 0b<br>RO | **Reclamation (RECL_0):** This is a read-only status bit, which is used to detect an empty asynchronous schedule. The operational model and valid transitions for this bit are described in Section 4 of the EHCI Specification.<br><br>**Power Well:** Core |
| 12 | 1b<br>RO | **HCHalted (HCHALT_0):** This bit is a zero whenever the Run/Stop bit is a one. The Host Controller sets this bit to 1 after it has stopped executing as a result of the Run/Stop bit being set to 0, either by software or by the Host Controller hardware (e.g. internal error). The Prefetch-Based Pause feature prevents this bit from transitioning to 0 if it is currently has a request pending, in addition to the regular DMA engines.<br><br>**Power Well:** Core |
| 11:6 | 000000b<br><br>RO | **Reserved (RSVD):** Reserved. |
| 5 | 0b<br>RWC | **Interrupt on Async Advance (IAA_0):** System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing a one to the Interrupt on Async Advance Doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 4 | 0b<br>RWC | **Host System Error (HSE_0):** The Host Controller sets this bit to 1 when a serious error occurs during a host system access involving the Host Controller module. Memory read cycles initiated by the EHC that receive any status other than Successful will result in this bit being set. When this error occurs, the Host Controller clears the Run/Stop bit in the Command register to prevent further execution of the scheduled TDs. A hardware interrupt is generated to the system (if enabled in the Interrupt Enable Register).<br><br>**Power Well:** Core |
| 3 | 0b<br>RWC | **Frame List Rollover (FLR_0):** The Host Controller sets this bit to a one when the Frame List Index (see Section 9.3.2.4) rolls over from its maximum value to zero. Since the USB2 SIP only supports the 1024-entry Frame List Size, the Frame List Index rolls over every time FRNUM[13] toggles.<br><br>**Power Well:** Core |
| 2 | 0b<br>RWC | **Port Change Detect (PCD_0):** The Host Controller sets this bit to a one when any port for which the Port Owner bit is set to zero has a change bit transition from a zero to a one or a Force Port Resume bit transition from a zero to a one as a result of a J-K transition detected on a suspended port. This bit will also be set as a result of the Connect Status Change being set to a one after system software has relinquished ownership of a connected port by writing a zero to a port's Port Owner bit. This bit is allowed to be maintained in the Auxiliary power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the EHCI HC device, this bit is loaded with the OR of all of the PORTSC change bits (including: Force port resume, over-current change, enable/disable change and connect status change). Regardless of the implementation, whenever this bit is readable (i.e., in the D0 state), it must provide a valid view of the Port Status registers.<br><br>**Power Well:** Core |
| 1 | 0b<br>RWC | **USB Error Interrupt (USBERRINT_0):** The Host Controller sets this bit to 1 when completion of a USB transaction results in an error condition (e.g., error counter underflow). If the TD on which the error interrupt occurred also had its IOC bit set, both this bit and Bit 0 are set. See the EHCI specification for a list of the USB errors that will result in this interrupt being asserted.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
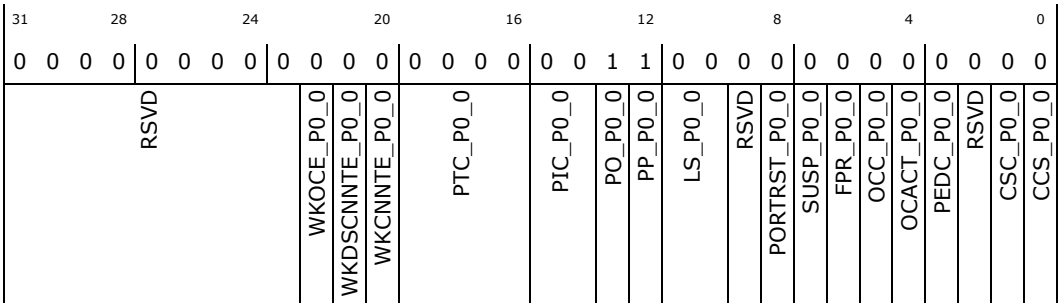
| 0 | 0b<br>RW | **Configure Flag (CF_0):** Host software sets this bit as the last action in its process of configuring the Host Controller. This bit controls the default port-routing control logic. Bit values and side-effects are listed below. See section 4 of the EHCI spec for operation details. 0b Port routing control logic default-routes each port to the classic host controllers. 1b Port routing control logic default-routes all ports to this host controller. This register is in the suspend power well. It is only reset by hardware when the suspend power is initially applied or in response to a host controller reset.<br><br>**Power Well:** Resume |

## 18.9.12 Port Status and Control (PORTSC1)—Offset 64h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 64h

**MBAR Type:** PCI Configuration Register (Size: 32 bits)
**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 00003000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:23 | 000h<br>RO | **Reserved (RSVD):** Reserved. |
| 22 | 0b<br>RW | **Wake on Over-current Enable (WKOCE_P0_0):** Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Over-current Active bit (bit 4 of this register) is set.<br><br>**Power Well:** Resume |
| 21 | 0b<br>RW | **Wake on Disconnect Enable (WKDSCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. When enabled to do so, the EHC setsthe PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from connected to disconnected (i.e., bit 0 of this register changes from 1 to 0).<br><br>**Power Well:** Resume |
| 20 | 0b<br>RW | **Wake on Connect Enable (WKCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from disconnected to connected (i.e., bit 0 of this register changes from 0 to 1).<br><br>**Power Well:** Resume |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 19:16 | 0h<br>RW | **Port Test Control (PTC_P0_0):** When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one.<br><br>**Power Well:** Resume |
| 15:14 | 00b<br>RW | **Port Indicator Control (PIC_P0_0):** Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior.<br><br>**Power Well:** Resume |
| 13 | 1b<br>RW | **Port Owner (PO_P0_0):** This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details.<br><br>**Power Well:** Resume |
| 12 | 1b<br>RO | **Port Power (PP_P0_0):** Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power.<br><br>**Power Well:** Resume |
| 11:10 | 00b<br>RO | **Line Status (LS_P0_0):** These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset<br><br>**Power Well:** Resume |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 9 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 8 | 0b<br>RW | **Port Reset (PORTRST_P0_0):** 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detets that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared.<br><br>**Power Well:** Resume |
| 7 | 0b<br>RW | **Suspend (SUSP_P0_0):** 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined.<br><br>**Power Well:** Resume |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 6 | 0b<br>RW | **Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.<br><br>**Power Well:** Resume |
| 5 | 0b<br>RWC | **Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner.<br><br>**Power Well:** Resume |
| 4 | 0b<br>RO | **Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'.<br><br>**Power Well:** Resume |
| 3 | 0b<br>RWC | **Port Enable/Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it.<br><br>**Power Well:** Resume |
| 2 | 0b<br><br>RO | **Reserved (RSVD):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0b<br>RWC | **Connect Status Change (CSC_P0_0):** 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it.<br><br>**Power Well:** Resume |
| 0 | 0b<br>RO | **Current Connect Status (CCS_P0_0):** 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set.<br><br>**Power Well:** Resume |

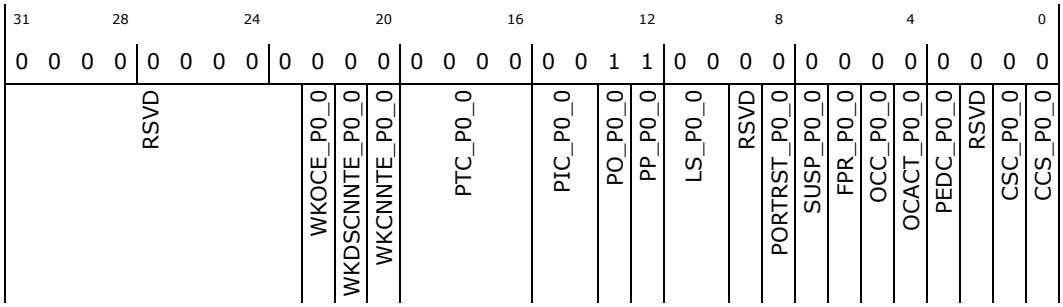
| 8 | 0b<br>RW | **Port Reset (PORTRST_P0_0):** 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detets that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared.<br><br>**Power Well:** Resume |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0b<br>RW | **Suspend (SUSP_P0_0):** 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined.<br><br>**Power Well:** Resume |
| 6 | 0b<br>RW | **Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.<br><br>**Power Well:** Resume |
| 5 | 0b<br>RWC | **Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner.<br><br>**Power Well:** Resume |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 4 | 0b<br>RO | **Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'.<br><br>**Power Well:** Resume |
| 3 | 0b<br>RWC | **Port Enable/Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it.<br><br>**Power Well:** Resume |
| 2 | 0b<br><br>RO | **Reserved (RSVD):** Reserved. |
| 1 | 0b<br>RWC | **Connect Status Change (CSC_P0_0):** 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it.<br><br>**Power Well:** Resume |
| 0 | 0b<br>RO | **Current Connect Status (CCS_P0_0):** 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set.<br><br>**Power Well:** Resume |

## 18.9.14 Port Status and Control (PORTSC3)—Offset 6Ch



### Access Method

**Offset:** [MBAR] + 6Ch

**MBAR Type:** PCI Configuration Register (Size: 32 bits)
**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 00003000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:23 | 000h<br>RO | **Reserved (RSVD):** Reserved. |
| 22 | 0b<br>RW | **Wake on Over-current Enable (WKOCE_P0_0):** Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Over-current Active bit (bit 4 of this register) is set.<br><br>**Power Well:** Resume |
| 21 | 0b<br>RW | **Wake on Disconnect Enable (WKDSCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. When enabled to do so, the EHC setsthe PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from connected to disconnected (i.e., bit 0 of this register changes from 1 to 0).<br><br>**Power Well:** Resume |
| 20 | 0b<br>RW | **Wake on Connect Enable (WKCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from disconnected to connected (i.e., bit 0 of this register changes from 0 to 1).<br><br>**Power Well:** Resume |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 19:16 | 0h<br>RW | **Port Test Control (PTC_P0_0):** When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one.<br><br>**Power Well:** Resume |
| 15:14 | 00b<br>RW | **Port Indicator Control (PIC_P0_0):** Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior.<br><br>**Power Well:** Resume |
| 13 | 1b<br>RW | **Port Owner (PO_P0_0):** This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details.<br><br>**Power Well:** Resume |
| 12 | 1b<br>RO | **Port Power (PP_P0_0):** Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power.<br><br>**Power Well:** Resume |
| 11:10 | 00b<br>RO | **Line Status (LS_P0_0):** These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset<br><br>**Power Well:** Resume |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 9 | 0b<br><br>RO | **Reserved (RSVD):** Reserved. |
| 8 | 0b<br>RW | **Port Reset (PORTRST_P0_0):** 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detets that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared.<br><br>**Power Well:** Resume |
| 7 | 0b<br>RW | **Suspend (SUSP_P0_0):** 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined.<br><br>**Power Well:** Resume |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 6 | 0b<br>RW | **Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.<br><br>**Power Well:** Resume |
| 5 | 0b<br>RWC | **Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner.<br><br>**Power Well:** Resume |
| 4 | 0b<br>RO | **Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'.<br><br>**Power Well:** Resume |
| 3 | 0b<br>RWC | **Port Enable/Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it.<br><br>**Power Well:** Resume |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0b<br>RW | **Suspend (SUSP_P0_0):** 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined.<br><br>**Power Well:** Resume |
| 6 | 0b<br>RW | **Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.<br><br>**Power Well:** Resume |

Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior.<br><br>**Power Well:** Resume |
| 13 | 1b<br>RW | **Port Owner (PO_P0_0):** This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details.<br><br>**Power Well:** Resume |
| 12 | 1b<br>RO | **Port Power (PP_P0_0):** Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power.<br><br>**Power Well:** Resume |
| 11:10 | 00b<br>RO | **Line Status (LS_P0_0):** These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset<br><br>**Power Well:** Resume |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 9 | 0b<br><br>RO | **Reserved (RSVD):** Reserved. |
| 8 | 0b<br>RW | **Port Reset (PORTRST_P0_0):** 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detets that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared.<br><br>**Power Well:** Resume |
| 7 | 0b<br>RW | **Suspend (SUSP_P0_0):** 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined.<br><br>**Power Well:** Resume |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 6 | 0b<br>RW | **Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.<br><br>**Power Well:** Resume |
| 5 | 0b<br>RWC | **Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner.<br><br>**Power Well:** Resume |
| 4 | 0b<br>RO | **Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'.<br><br>**Power Well:** Resume |
| 3 | 0b<br>RWC | **Port Enable/Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it.<br><br>**Power Well:** Resume |
| 2 | 0b<br><br>RO | **Reserved (RSVD):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0b<br>RWC | **Connect Status Change (CSC_P0_0):** 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it.<br><br>**Power Well:** Resume |
| 0 | 0b<br>RO | **Current Connect Status (CCS_P0_0):** 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set.<br><br>**Power Well:** Resume |

The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.<br><br>**Power Well:** Resume |
| 5 | 0b<br>RWC | **Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner.<br><br>**Power Well:** Resume |
| 4 | 0b<br>RO | **Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'.<br><br>**Power Well:** Resume |
| 3 | 0b<br>RWC | **Port Enable/Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it.<br><br>**Power Well:** Resume |
| 2 | 0b<br><br>RO | **Reserved (RSVD):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
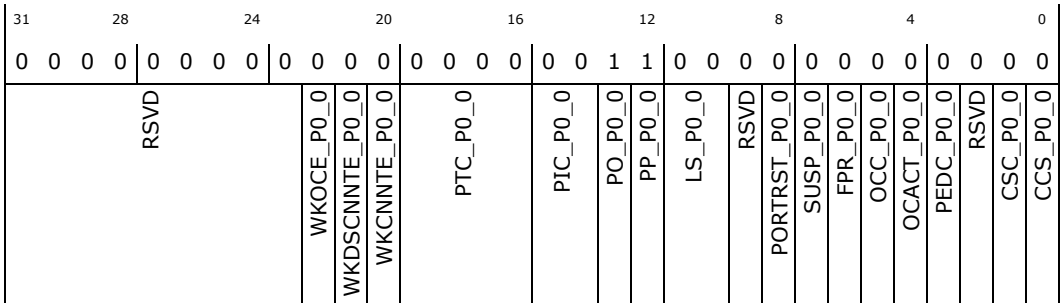
| 1 | 0b<br>RWC | **Connect Status Change (CSC_P0_0):** 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it.<br><br>**Power Well:** Resume |
| 0 | 0b<br>RO | **Current Connect Status (CCS_P0_0):** 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set.<br><br>**Power Well:** Resume |

## 18.9.19 Port Status and Control (PORTSC8)—Offset 80h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + 80h

**MBAR Type:** PCI Configuration Register (Size: 32 bits)
**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 00003000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:23 | 000h<br><br>RO | **Reserved (RSVD):** Reserved. |
| 22 | 0b<br>RW | **Wake on Over-current Enable (WKOCE_P0_0):** Writing this bit to a one enables the port to be sensitive to over-current conditions as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Over-current Active bit (bit 4 of this register) is set.<br><br>**Power Well:** Resume |

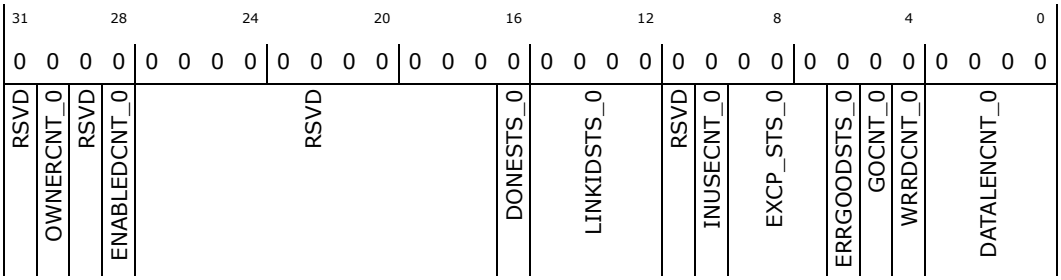
| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 21 | 0b<br>RW | **Wake on Disconnect Enable (WKDSCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device disconnects as wake-up events. When enabled to do so, the EHC setsthe PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from connected to disconnected (i.e., bit 0 of this register changes from 1 to 0).<br><br>**Power Well:** Resume |
| 20 | 0b<br>RW | **Wake on Connect Enable (WKCNNTE_P0_0):** Writing this bit to a one enables the port to be sensitive to device connects as wake-up events. When enabled to do so, the EHC sets the PME Status bit in the Power Management Control/Status Register (offset 54, bit 15) when the Current Connect Status changes from disconnected to connected (i.e., bit 0 of this register changes from 0 to 1).<br><br>**Power Well:** Resume |
| 19:16 | 0h<br>RW | **Port Test Control (PTC_P0_0):** When this field is zero, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value. The encoding of the test mode bits are (0110b - 1111b are reserved): Bits Test Mode 0000b Test mode not enabled 0001b Test J_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0010b Test K_STATE- During this test mode the hardware forces pre-emphasis disabled to the AFE if bit 29 of the USB2 Safe Mode Register is set (config offset FCh.bit 29) 0011b Test SE0_NAK 0100b Test Packet 0101b Test FORCE_ENABLE Refer to USB Specification Revision 2.0, Chapter 7 and the EHCI specification, Chapter 4 for details on each test mode. The EHC does not support the option to run the port tests while the Run/Stop bit is a one.<br><br>**Power Well:** Resume |
| 15:14 | 00b<br>RW | **Port Indicator Control (PIC_P0_0):** Writing to these bits directly controls the corresponding LED output pins. Bit 15 is inverted to generate USBLEDG#(n) where n is the port number. Bit 14 is inverted to generate USBLEDA#(n). Software is responsible for controlling these as specified in the USB Specification Revision 2.0. Bit Value Meaning 00b Port indicators are off 01b Amber 10b Green 11b Undefined The Intel EHC only supports bit value of 00b. Other values will result in unspecified behavior.<br><br>**Power Well:** Resume |
| 13 | 1b<br>RW | **Port Owner (PO_P0_0):** This bit unconditionally goes to a 0b when the Configure Flag makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configure Flag bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port. See Section 4 of the EHCI Specification for operational details.<br><br>**Power Well:** Resume |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 12 | 1b<br>RO | **Port Power (PP_P0_0):** Hard-wired with a value of '1' on the Intel EHC. This indicates that the port does have power.<br><br>**Power Well:** Resume |
| 11:10 | 00b<br>RO | **Line Status (LS_P0_0):** These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits(11:10) USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset<br><br>**Power Well:** Resume |
| 9 | 0b<br><br>RO | **Reserved (RSVD):** Reserved. |
| 8 | 0b<br>RW | **Port Reset (PORTRST_P0_0):** 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to guarantee the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detets that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USB2STS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHALTED bit is a one. The Run/Stop bit in the Command Register must be set in order for the Port Reset bit to be cleared.<br><br>**Power Well:** Resume |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0b<br>RW | **Suspend (SUSP_P0_0):** 1=Port in suspend state. 0=Port not in suspend state. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State 0X Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to a 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when:Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined.<br><br>**Power Well:** Resume |
| 6 | 0b<br>RW | **Force Port Resume (FPR_P0_0):** 1= Resume detected/driven on port. 0=No resume (K-state) detected/driven on port. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero.<br><br>**Power Well:** Resume |
| 5 | 0b<br>RWC | **Over-current Change (OCC_P0_0):** This bit gets set to a one when there is a change to the Over-current Active bit. Software clears this bit by writing a one to this bit position. The functionality of this bit is not dependent upon the port owner.<br><br>**Power Well:** Resume |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 4 | 0b<br>RO | **Over-current Active (OCACT_P0_0):** 1=This port currently has an over-current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed. The functionality of this bit is not dependent upon the port owner. The Intel EHC automatically disables the port when the over-current active bit is '1'.<br><br>**Power Well:** Resume |
| 3 | 0b<br>RWC | **Port Enable/Disable Change (PEDC_P0_0):** 1=Port enabled/disabled status has changed. 0=No change. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a port error). This bit is not set due to the Disabled-to-Enabled transition, nor due to a disconnect. Software clears this bit by writing a 1 to it.<br><br>**Power Well:** Resume |
| 2 | 0b<br><br>RO | **Reserved (RSVD):** Reserved. |
| 1 | 0b<br>RWC | **Connect Status Change (CSC_P0_0):** 1=Change in Current Connect Status. 0=No change. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be 'setting' an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it.<br><br>**Power Well:** Resume |
| 0 | 0b<br>RO | **Current Connect Status (CCS_P0_0):** 1=Device is present on port. 0=No device is present. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set.<br><br>**Power Well:** Resume |

## 18.9.20 Debug Port Control/Status Register (DP_CTRLSTS)—Offset A0h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + A0h

**MBAR Type:** PCI Configuration Register (Size: 32 bits)
**MBAR Reference:** [B:0, D:29, F:0] + 10h

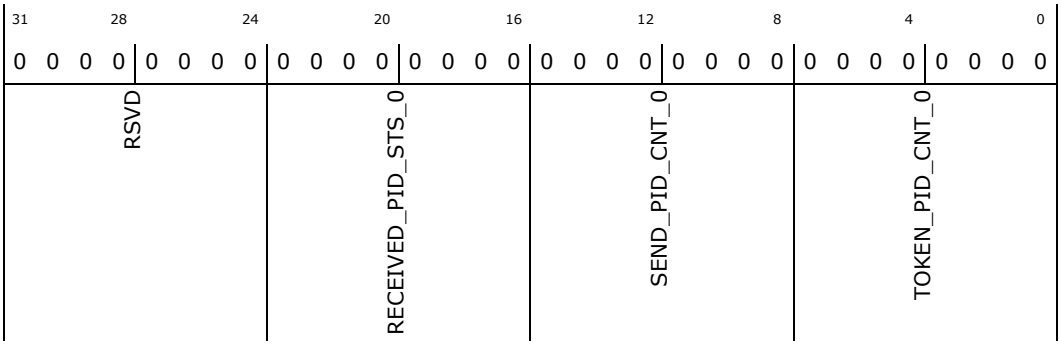
**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 30 | 0b<br>RW | **OWNER_CNT (OWNERCNT_0):** When software writes a 1 to this bit, the ownership of the debug port is forced to the EHCI controller (i.e. immediately taken away from the companion Classic USB Host Controller) If the port was already owned by the EHCI controller, then setting this bit has no effect. This bit overrides all of the ownership-related bits in the standard EHCI registers. Note that the value in this bit does not affect the value reported in the PORTSC Port Owner bit.<br><br>**Power Well:** Core |
| 29 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 28 | 0b<br>RW | **ENABLED_CNT (ENABLEDCNT_0):** This bit = 1 if the debug port is enabled for operation. Software can clear this by writing a zero to it. The hardware clears the bit for the same conditions where hardware clears the Port Enable/Disable bit (in the PORTSC register). (Note this bit is not cleared when software clears the Port Enabled/Disabled bit in the PORTSC.) Software can directly set this bit if the port is already enabled in the associated Port Status and Control register (this is enforced by the hardware). Reset default = 0.<br><br>**Power Well:** Core |
| 27:17 | 00000000000b<br>RO | **Reserved (RSVD):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 16 | 0b<br>RWC | **DONE_STS (DONESTS_0):** Read/Write-Clear. This bit is set by hardware to indicate that the request is complete. Writing a 1 to this bit will clear it if it is set. Writing a 0 to this bit has no effect. Reset default = 0<br><br>**Power Well:** Core |
| 15:12 | 0000b<br>RO | **LINK_ID_STS (LINKIDSTS_0):** Read-Only. This field identifies the link interface. It is hardwired to 0h to indicate that it is a USB Debug Port.<br><br>**Power Well:** Core |
| 11 | 0b<br><br>RO | **Reserved (RSVD):** Reserved. |
| 10 | 0b<br>RO | **IN_USE_CNT (INUSECNT_0):** Set by software to indicate that the port is in use. Cleared by software to indicate that the port is free and may be used by other software. This bit is cleared after reset. (This bit has no affect on hardware.)<br><br>**Power Well:** Core |
| 9:7 | 000b<br>RO | **EXCEPTION_STS (EXCP_STS_0):** Read-Only. This field indicates the exception when the ERROR_GOOD#_STS bit is set. This field should be ignored if the ERROR_GOOD#_STS bit is 0. 000 No Error. Note: this should not be seen, since this field should only be checked if there is an erro. 001 Transaction error: indicates the USB2 transaction had an error (CRC, bad PID, timeout, etc.) 010 HW error. Request was attempted (or in progress) when port was suspended or reset. All Others are reserved Reset default = 000b<br><br>**Power Well:** Core |
| 6 | 0b<br>RO | **ERROR_GOOD_STS (ERRGOODSTS_0):** Read-Only. The hardware clears this bit to 0 upon the proper completion of a read or write. The hardware sets this bit to indicate that an error has occurred. Details on the nature of the error are provided in the Exception field. Reset default = 0.<br><br>**Power Well:** Core |
| 5 | 0b<br>RW | **GO_CNT (GOCNT_0):** Software sets this bit to cause the hardware to perform a read or write request. Writing a 0 to this bit has no effect. Writing a 1 to this bit when it is already set may result in undefined behavior. When set, the hardware clears this bit when the hardware sets the DONE_STS bit. Reset default = 0.<br><br>**Power Well:** Core |
| 4 | 0b<br>RW | **WRITE_READ_CNT (WRRDCNT_0):** Software sets this bit to indicate that the current request is a write. Software clears this bit to indicate that the current request is a read. Reset default = 0.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3:0 | 0000b<br>RW | **DATA_LEN_CNT (DATALENCNT_0):** This field is used to indicate the size of the data to be transferred. Reset default = 0h. For write operations, this field is set by software to indicate to the hardware how many bytes of data in Data Buffer are to be transferred to the console. A value of 0h indicates that a zero-length packet should be sent. A value of 1-8 indicates 1-8 bytes are to be transferred. Values 9-Fh are illegal and how hardware behaves if used is undefined. For read operations, this field is set by hardware to indicate to software how many bytes in Data Buffer are valid in response to a read operation. A value of 0h indicates that a zero length packet was returned and the state of Data Buffer is not defined. A value of 1-8 indicates 1-8 bytes were received. Hardware is not allowed to return values 9-Fh. The transferring of data always starts with byte 0 in the data area and moves toward byte 7 until the transfer size is reached.<br><br>**Power Well:** Core |

## 18.9.21 USB PIDs Register (DP_USB_PIDs)—Offset A4h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + A4h

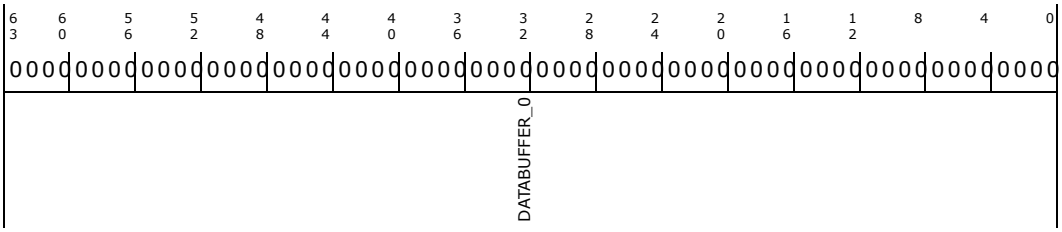
**MBAR Type:** PCI Configuration Register (Size: 32 bits)
**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 00h<br><br>RO | **Reserved (RSVD):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 23:16 | 00h<br>RO | **RECEIVED_PID_STS (RECEIVED_PID_STS_0):** The hardware updates this field with the received PID for transactions in either direction. When the controller is writing data, this field is updated with the handshake PID that is received from the device. When the host controller is reading data, this field is updated with the data packet PID (if the device sent data), or the handshake PID (if the device NAKs the request). This field is valid when the hardware clears the GO_DONE#_CNT bit. Reset Default = 0.<br><br>**Power Well:** Core |
| 15:8 | 00h<br>RW | **SEND_PID_CNT (SEND_PID_CNT_0):** The hardware sends this PID to begin the data packet when sending data to USB (ie. WRITE_READ#_CNT is asserted). Software will typically set this field to either DATA0 or DATA1 PID values. Reset Default = 0<br><br>**Power Well:** Core |
| 7:0 | 00h<br>RW | **TOKEN_PID_CNT (TOKEN_PID_CNT_0):** The hardware sends this PID as the Token PID for each USB transaction. Software will typically set this field to either IN, OUT or SETUP PID values. Reset Default = 0.<br><br>**Power Well:** Core |

## 18.9.22 Debug Port Data Buffer Bytes 7:0 (DP_DATA_BUF_B)—Offset A8h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

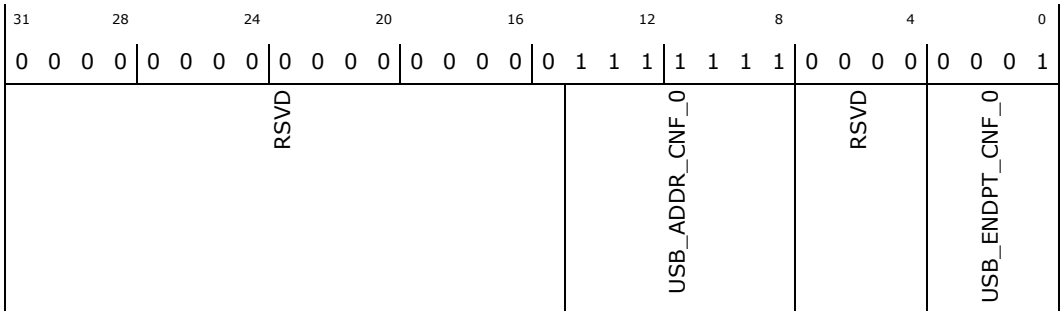
**Offset:** [MBAR] + A8h

**MBAR Type:** PCI Configuration Register (Size: 32 bits)
**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:0 | 0000000000000000h RW | **DATABUFFER (DATABUFFER_0):** These are the 8 bytes of the data buffer. Bits 7:0 correspond to least significant byte (byte 0). Bits 63:56 correspond to the most significant byte (byte 7). The bytes in the Data Buffer must be written with data before software initiates a write request. For a read request, the Data Buffer contains valid data when DONE_STS is set by the hardware, ERROR_GOOD#_STS is cleared by the hardware, and the DATA_LENGTH_CNT field indicates the number of bytes that are valid. Reset Default = 0.<br><br>**Power Well:** Core |

## 18.9.23 Debug Port Config Register (DP_CFG)—Offset B0h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Offset:** [MBAR] + B0h

**MBAR Type:** PCI Configuration Register (Size: 32 bits)
**MBAR Reference:** [B:0, D:29, F:0] + 10h

**Default:** 00007F01h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:15 | 000000000 00000000b<br>RO | **Reserved (RSVD):** Reserved. |
| 14:8 | 7fh<br>RW | **USB_ADDRESS_CNF (USB_ADDR_CNF_0):** 7-bit field that identifies the USB device address used by the controller for all Token PID generation. This is a R/W field that is set to 7Fh after reset<br><br>**Power Well:** Core |
| 7:4 | 0000b<br>RO | **Reserved (RSVD):** Reserved. |
| 3:0 | 01h<br>RW | **USB_ENDPOINT_CNF (USB_ENDPT_CNF_0):** This 4-bit field identifies the endpoint used by the controller for all Token PID generation. This is a R/W field that is set to 01h after reset.<br><br>**Power Well:** Core |

## 18.9.24 USB Test Per Port Register 1 (USB2_TEST_PERPORT_REG1_LANE0/1/2/3) - Offset 4113h/4213h/4313h/4413h

### Access Method

**Type:** Message Bus Register (Size: 32 bits)

**Offset:** [Port: 0x43] + 4113h/4213h/4313h/4413h

**Op Codes:** 6h - Read, 7h – Write

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |

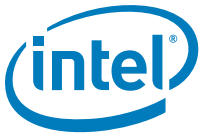
# 19 USB Device Controller Interfaces (3.0, ULPI)

The SoC implements a single USB 3.0 device controller, where the platform acts as a peripheral to another device or another PC.

The USB Device controller supports connections at Super Speed (3.0) on the USB3DEV interface, and High and Full speeds (2.0/1.x) on the ULPI interface. To support High and Full Speed devices on ULPI, an external PHY is required.

***Note:*** The ULPI interface must be implemented even if only SuperSpeed support is required. The USB3DEV interface will not operate if the ULPI interface is disabled.



## 19.0.1 Signal Descriptions

See Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

### Table 217. USB 3.0 Device Signals

| Signal Name | Direction Plat. Power | Description |
|---|---|---|
| **USB3DEV_RXP/N[0]** | I<br>V1P0S | **Data In:**<br>High speed serialized data inputs |
| **USB3DEV_TXP/N[0]** | O<br>V1P0S | **Data Out:**<br>High speed serialized data outputs. |
| **USB3DEV_REXT[0]** | | **Resistor Compensation:**<br>An external resistor must be connected between this pin and package ground. Contact your Intel representative for details. |

### Table 218. USB ULPI Device Signals

| Signal Name | Direction Plat. Power | Description |
|---|---|---|
| **USB_ULPI_CLK** | I<br>V1P8A | **Interface Clock**<br>By default, control and data signals are synchronous to clock. |
| **USB_ULPI_DATA[7:0]** | I/O<br>V1P8A | **Bi-directional data bus**<br>Driven low by the Link during idle. The Link starts a transfer by sending a non-zero pattern. The PHY must assert USB_ULPI_DIR before using the data bus. A turnaround cycle is required every time that USB_ULPI_DIR toggles. |
| **USB_ULPI_DIR** | I<br>V1P8A | **Direction of the data bus**<br>By default, USB_ULPI_DIR is low and the PHY listens for non-zero data from the Link. The PHY asserts USB_ULPI_DIR to get control of the data bus. |
| **USB_ULPI_NXT** | I<br>V1P8A | **Next Data**<br>The PHY drives USB_ULPI_NXT high to throttle the data bus |
| **USB_ULPI_STP** | O<br>V1P8A | **Stop data**<br>The Link drives USB_ULPI_STP high to signal the end of its data stream. The Link can also drive USB_ULPI_STP high to request data bus access from the PHY |
| **USB_ULPI_REFCLK** | O<br>V1P8A | **Reference clock**<br>ULPI reference clock for external PHY |
| **USB_ULPI_RST#** | O<br>V1P8A | **Reset**<br>Used to reset the external PHY. Not part of ULPI specification. Optionally used by driver. |

# 19.1 USB Device Controller

The USB device controller can control one USB 3.0 Device port. Either a combo SS + ULPI Device port, or UPLI only port. It supports hosts conforming to USB 3.0 at bit rates up to 5 Gbps on USB3DEV interface as well as USB 2.0 hosts at up to 480 Mbps via a PHY on ULPI.

## 19.1.1 Features

Features supported by the Device Controller include:

- Enumerable by both ACPI and PCI. The USB3 device subsystem is designed to appear to the OS as a true PCI device. It will also support ACPI-enumerated methods.
- Device controller registers and data structures are implemented as extensions to the EHCI programmers interface.
- Support for LPM (Link Power Management)

Some of the key features of the ULPI device controller are:

- Supports up to 8 endpoints when acting as device
- 8-bit data interface transmitted at 60 MHz ULPI clock

***Note:*** Recommended not to disconnect the connection when a debug session is in progress.

## 19.1.2 Power Management Features

The USB 3.0 device subsystem supports the following device power states:

- D0: Functional and highest power state.
- RTD3 (D3): Software managed deepest low power state in which state is saved/ restored if needed prior to entry/exit

### 19.1.2.1 D0

This is the Functional and highest power state. The USB 3.0 device subsystem is in this state when the USB link is in U0 (U0 is the normal operational state where packets can be transmitted and received).

### 19.1.2.2 D3

D3 is a low power state that is used when the link is suspended; for example, U3 (U3 is a link state where a device is put into a suspend state. Significant link and device powers are saved).

This is a software directed state in which the controller is either power gated or the power is disabled.

### 19.1.3 Interrupts

A Functional Interrupt is generated by the logic in the USB device controller core to indicate the occurrence of an event needing application intervention. The design of the USB device core is such that events such as "link change" that would traditionally trigger an interrupt through an interrupt status register, are instead delivered to an 'Event buffer' in host memory, together with an interrupt indicating this.

## 19.2 References

Universal Serial Bus (USB) 3.0 Revision Specification

Universal Serial Bus (USB) 2.0 Revision Specification

ULPI Working Group: http://www.ulpi.org/

## 19.3 Register Map

See Chapters Section 3, "Register Access Methods" on page 69 and Section 4, "Mapping Address Spaces" on page 75 for additional information. Also note that the device controller also contains both device and host registers. The host functionality of this controller is not fully functional and should not be used. See the USB Host chapter for host controllers.

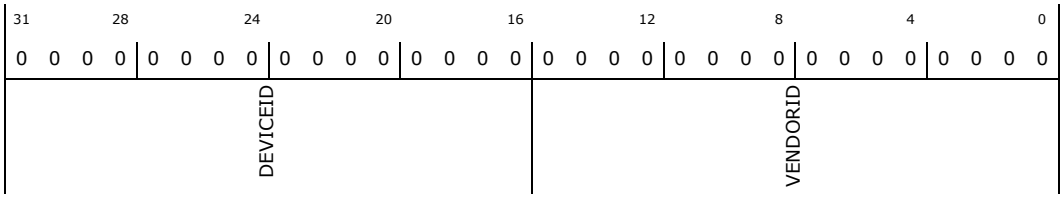
§

## 19.4 USB 3.0 Device PCI Configuration Registers

### Table 219. Summary of USB 3.0 Device PCI Configuration Registers—0/22/0

| Offset | Size | Register ID—Description | Default Value |
|---|---|---|---|
| 0h | 4 | "reg_DEVVENDID_type (DEVVENDID)—Offset 0h" on page 2456 | 00000000h |
| 4h | 4 | "reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h" on page 2456 | 00100000h |
| 8h | 4 | "reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h" on page 2458 | 00000000h |
| Ch | 4 | "reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch" on page 2458 | 00000000h |
| 10h | 4 | "reg_BAR_type (BAR)—Offset 10h" on page 2459 | 00000000h |
| 14h | 4 | "reg_BAR1_type (BAR1)—Offset 14h" on page 2459 | 00000000h |
| 2Ch | 4 | "reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch" on page 2460 | 00000000h |
| 30h | 4 | "reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h" on page 2461 | 00000000h |
| 34h | 4 | "reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h" on page 2461 | 00000080h |
| 3Ch | 4 | "reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch" on page 2462 | 00000100h |
| 80h | 4 | "reg_POWERCAPID_type (POWERCAPID)—Offset 80h" on page 2462 | 48030001h |
| 84h | 4 | "reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h" on page 2463 | 00000008h |
| F8h | 4 | "reg_MANID_type (MANID)—Offset F8h" on page 2463 | 00000000h |

### 19.4.1 reg_DEVVENDID_type (DEVVENDID)—Offset 0h



DEVICEVENDORID - Device ID and Vendor ID Register

**Access Method**

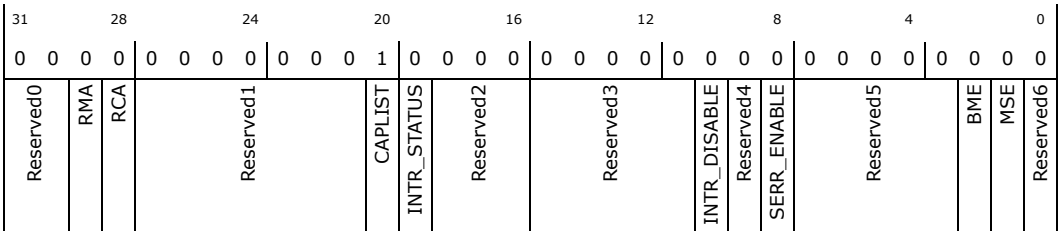
**Type:** PCI Configuration Register (Size: 32 bits)

**DEVVENDID:** [B:0, D:22, F:0] + 0h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h RO | **DEVICEID:** Reserved. |
| 15:0 | 0000h RO | **VENDORID:** Reserved. |

### 19.4.2 reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h



STATUSCOMMAND- Status and Command

**Access Method**

**Type:** PCI Configuration Register (Size: 32 bits)

**STATUSCOMMAND:** [B:0, D:22, F:0] + 4h

**Default:** 00100000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RO | **Reserved0:** Reserved. |
| 29 | 0h<br>RW/1C | **RMA:** Reserved. |
| 28 | 0h<br>RW/1C | **RCA:** Reserved. |
| 27:21 | 00h<br>RO | **Reserved1:** Reserved. |
| 20 | 1h<br>RO | **CAPLIST:** Reserved. |
| 19 | 0h<br>RO | **INTR_STATUS:** Reserved. |
| 18:16 | 0h<br>RO | **Reserved2:** Reserved. |
| 15:11 | 00h<br>RO | **Reserved3:** Reserved. |
| 10 | 0h<br>RW | **INTR_DISABLE:** Reserved. |
| 9 | 0h<br>RO | **Reserved4:** Reserved. |
| 8 | 0h<br>RW | **SERR_ENABLE:** Reserved. |

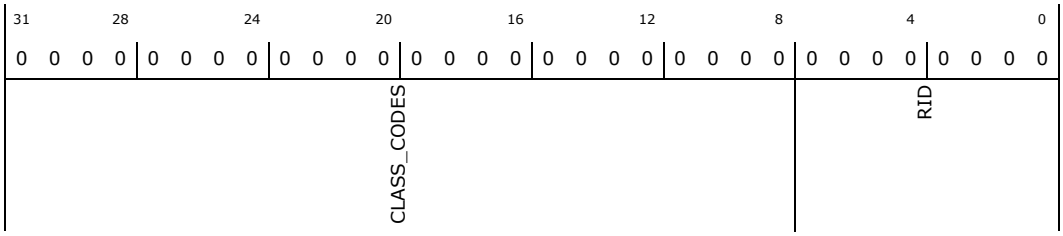
| 2 | 0h<br>RW | **BME:** Reserved. |
| 1 | 0h<br>RW | **MSE:** Reserved. |
| 0 | 0h<br>RO | **Reserved6:** Reserved. |

## 19.4.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h



REVCLASSCODE - Revision ID and Class Code

### Access Method

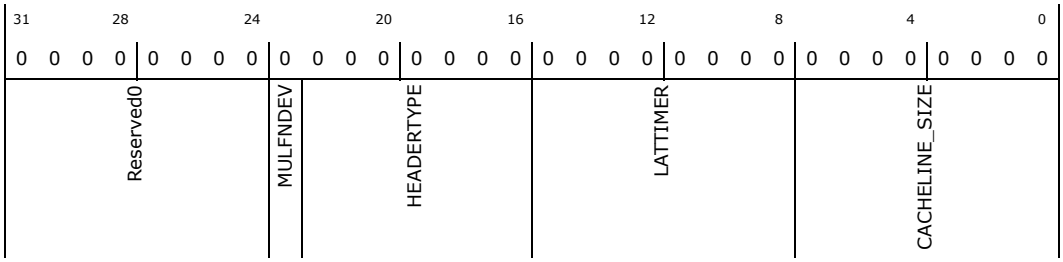
**Type:** PCI Configuration Register (Size: 32 bits)

**REVCLASSCODE:** [B:0, D:22, F:0] + 8h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 000000h RO | **CLASS_CODES:** Reserved. |
| 7:0 | 00h RO | **RID:** Reserved. |

## 19.4.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch



CLLATHEADERBIST - Cache Line Latency Header and BIST

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

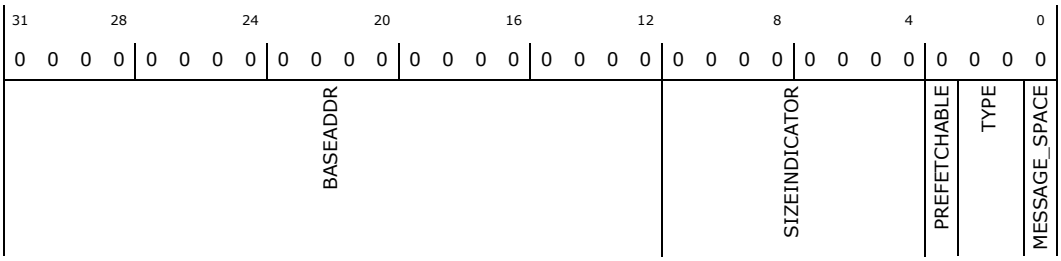
**CLLATHEADERBIST:** [B:0, D:22, F:0] + Ch

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 00h RO | **Reserved0:** Reserved. |
| 23 | 0h RO | **MULFNDEV:** Reserved. |
| 22:16 | 00h RO | **HEADERTYPE:** Reserved. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 00h<br>RO | **LATTIMER:** Reserved. |
| 7:0 | 00h<br>RW | **CACHELINE_SIZE:** Reserved. |

## 19.4.5 reg_BAR_type (BAR)—Offset 10h



BAR -Base Address Register

### Access Method

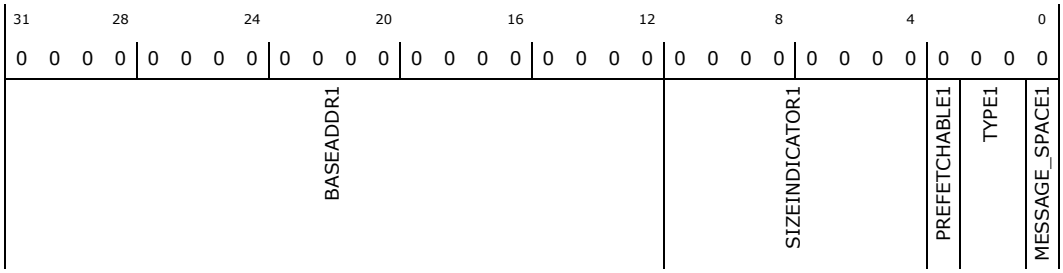
**Type:** PCI Configuration Register (Size: 32 bits)

**BAR:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:12 | 00000h<br>RW | **BASEADDR:** Reserved. |
| 11:4 | 00h<br>RO | **SIZEINDICATOR:** Reserved. |
| 3 | 0h<br>RO | **PREFETCHABLE:** Reserved. |
| 2:1 | 0h<br>RO | **TYPE:** Reserved. |
| 0 | 0h<br>RO | **MESSAGE_SPACE:** Reserved. |

## 19.4.6 reg_BAR1_type (BAR1)—Offset 14h



BAR1 -Base Address Register1

### Access Method

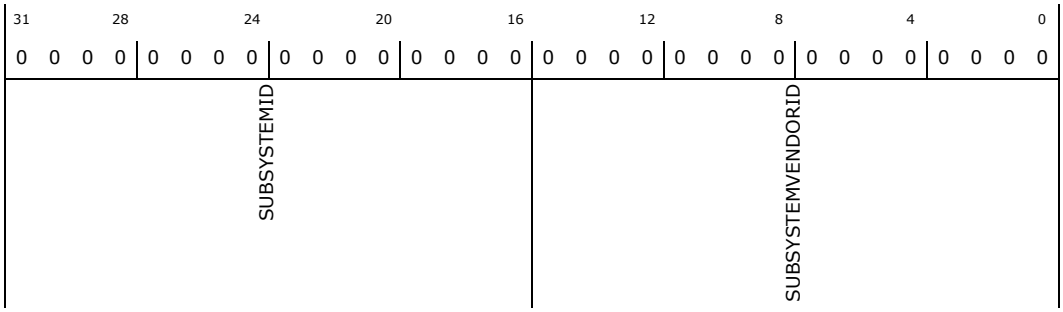
**Type:** PCI Configuration Register (Size: 32 bits)

**BAR1:** [B:0, D:22, F:0] + 14h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:12 | 00000h RW | **BASEADDR1:** Reserved. |
| 11:4 | 00h RO | **SIZEINDICATOR1:** Reserved. |
| 3 | 0h RO | **PREFETCHABLE1:** Reserved. |
| 2:1 | 0h RO | **TYPE1:** Reserved. |
| 0 | 0h RO | **MESSAGE_SPACE1:** Reserved. |

## 19.4.7 reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch



SUBSYSTEMID -Subsystem Vendor and Subsystem ID

### Access Method

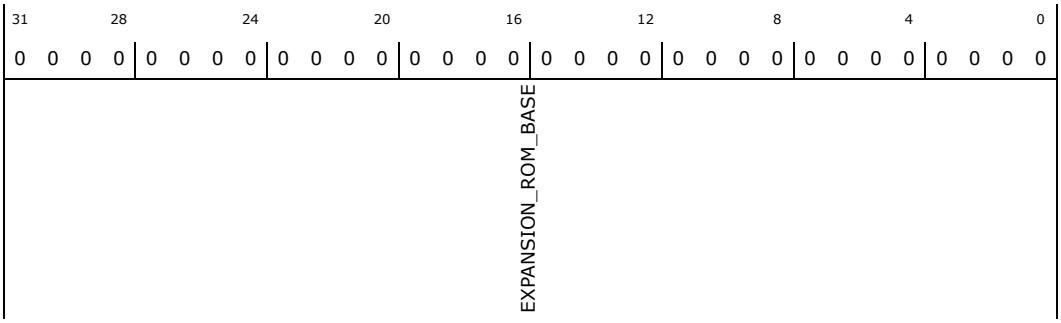
**Type:** PCI Configuration Register (Size: 32 bits)

**SUBSYSTEMID:** [B:0, D:22, F:0] + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h RW/O | **SUBSYSTEMID:** Reserved. |
| 15:0 | 0000h RW/O | **SUBSYSTEMVENDORID:** Reserved. |

## 19.4.8 reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h



EXPANSION ROM base address

### Access Method

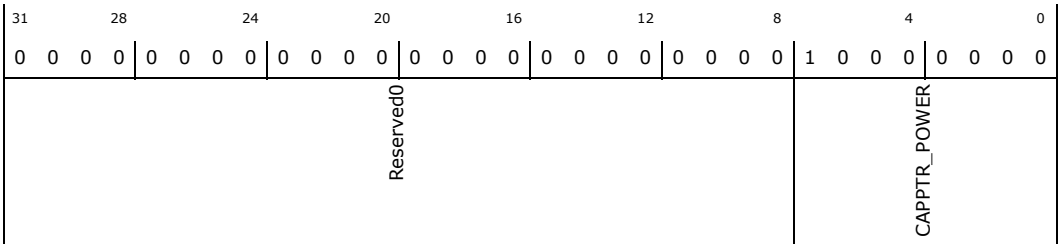
**Type:** PCI Configuration Register (Size: 32 bits)

**EXPANSION_ROM_BASEADDR:** [B:0, D:22, F:0] + 30h

### Default: 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 00000000h RO | **EXPANSION_ROM_BASE:** Reserved. |

## 19.4.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h



CAPABILITYPTR - Capabilities Pointer

### Access Method

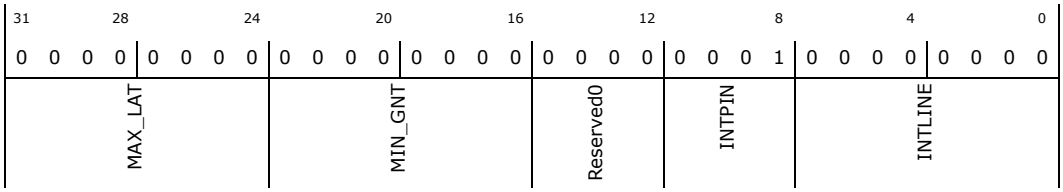
**Type:** PCI Configuration Register (Size: 32 bits)

**CAPABILITYPTR:** [B:0, D:22, F:0] + 34h

### Default: 00000080h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 000000h RO | **Reserved0:** Reserved. |
| 7:0 | 80h RO | **CAPPTR_POWER:** Reserved. |

## 19.4.10 reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch



INTERRUPTREG - Interrupt Register

### Access Method

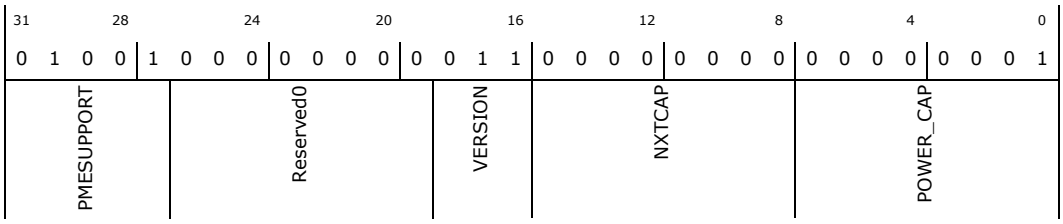
**Type:** PCI Configuration Register (Size: 32 bits)

**INTERRUPTREG:** [B:0, D:22, F:0] + 3Ch

**Default:** 00000100h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 00h RO | **MAX_LAT:** Reserved. |
| 23:16 | 00h RO | **MIN_GNT:** Reserved. |
| 15:12 | 0h RO | **Reserved0:** Reserved. |
| 11:8 | 1h RO | **INTPIN:** Reserved. |
| 7:0 | 00h RW | **INTLINE:** Reserved. |

## 19.4.11 reg_POWERCAPID_type (POWERCAPID)—Offset 80h



POWERCAPID - PowerManagement Capability ID

### Access Method

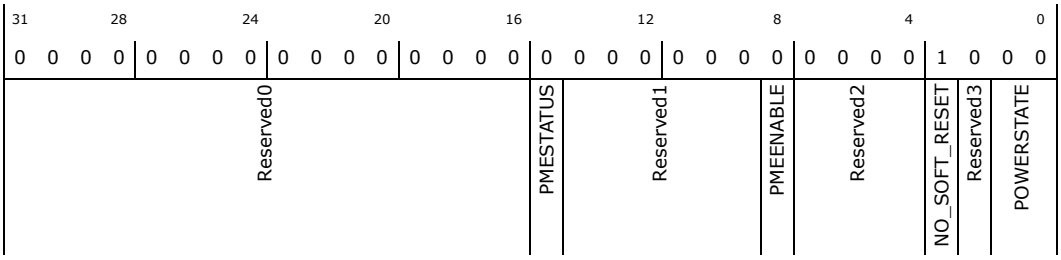
**Type:** PCI Configuration Register (Size: 32 bits)

**POWERCAPID:** [B:0, D:22, F:0] + 80h

**Default:** 48030001h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:27 | 09h RO | **PMESUPPORT:** Reserved. |
| 26:19 | 00h RO | **Reserved0:** Reserved. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 18:16 | 3h<br>RO | **VERSION:** Reserved. |
| 15:8 | 00h<br>RO | **NXTCAP:** Reserved. |
| 7:0 | 01h<br>RO | **POWER_CAP:** Reserved. |



## 19.4.12 reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h

### Access Method

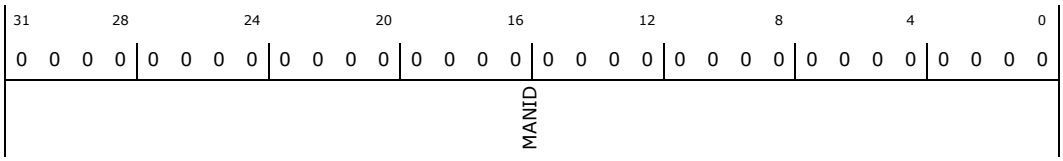
**Type:** PCI Configuration Register (Size: 32 bits)

**PMECTRLSTATUS:** [B:0, D:22, F:0] + 84h

**Default:** 00000008h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h<br>RO | **Reserved0:** Reserved. |
| 15 | 0h<br>RW/1C | **PMESTATUS:** Reserved. |
| 14:9 | 00h<br>RO | **Reserved1:** Reserved. |
| 8 | 0h<br>RW | **PMEENABLE:** Reserved. |
| 7:4 | 0h<br>RO | **Reserved2:** Reserved. |
| 3 | 1h<br>RO | **NO_SOFT_RESET:** Reserved. |
| 2 | 0h<br>RO | **Reserved3:** Reserved. |
| 1:0 | 0h<br>RW | **POWERSTATE:** Reserved. |

## 19.4.13 reg_MANID_type (MANID)—Offset F8h



Manufacturers ID

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**MANID:** [B:0, D:22, F:0] + F8h

**Default:** 00000000h

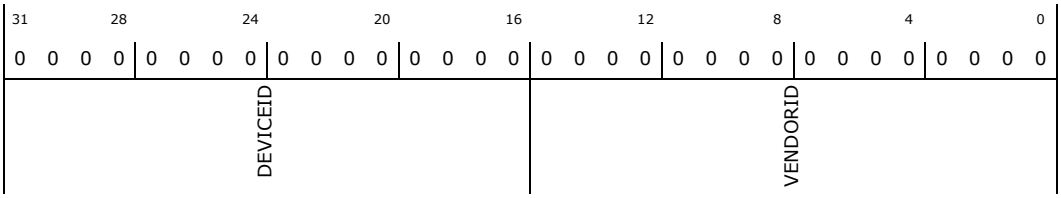
| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 00000000h<br>RO | **MANID:** Reserved. |

## 19.5 USB 3.0 Device PCI Configuration Registers

### Table 220. Summary of USB 3.0 Device PCI Configuration Registers—0/22/0

| Offset | Size | Register ID—Description | Default Value |
|---|---|---|---|
| 0h | 4 | "reg_DEVVENDID_type (DEVVENDID)—Offset 0h" on page 2465 | 00000000h |
| 4h | 4 | "reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h" on page 2465 | 00100000h |
| 8h | 4 | "reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h" on page 2467 | 00000000h |
| Ch | 4 | "reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch" on page 2467 | 00000000h |
| 10h | 4 | "reg_BAR_type (BAR)—Offset 10h" on page 2468 | 00000000h |
| 14h | 4 | "reg_BAR1_type (BAR1)—Offset 14h" on page 2468 | 00000000h |
| 2Ch | 4 | "reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch" on page 2469 | 00000000h |
| 30h | 4 | "reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h" on page 2470 | 00000000h |
| 34h | 4 | "reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h" on page 2470 | 00000080h |
| 3Ch | 4 | "reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch" on page 2471 | 00000100h |
| 80h | 4 | "reg_POWERCAPID_type (POWERCAPID)—Offset 80h" on page 2471 | 48030001h |
| 84h | 4 | "reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h" on page 2472 | 00000008h |
| F8h | 4 | "reg_MANID_type (MANID)—Offset F8h" on page 2472 | 00000000h |

### 19.5.1 reg_DEVVENDID_type (DEVVENDID)—Offset 0h



DEVICEVENDORID - Device ID and Vendor ID Register

**Access Method**

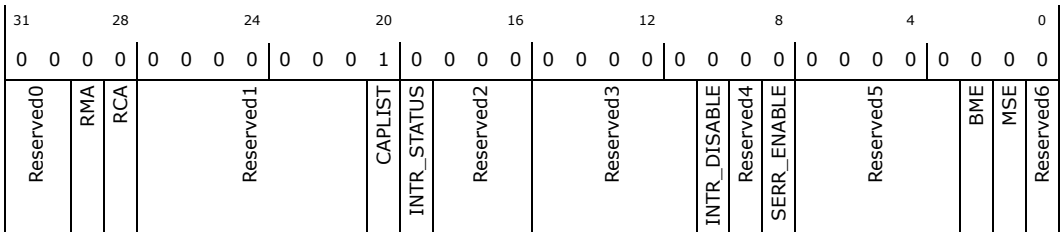
**Type:** PCI Configuration Register (Size: 32 bits)

**DEVVENDID:** [B:0, D:22, F:0] + 0h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h RO | **DEVICEID:** Reserved. |
| 15:0 | 0000h RO | **VENDORID:** Reserved. |

### 19.5.2 reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h



STATUSCOMMAND- Status and Command

**Access Method**

**Type:** PCI Configuration Register (Size: 32 bits)

**STATUSCOMMAND:** [B:0, D:22, F:0] + 4h

**Default:** 00100000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RO | **Reserved0:** Reserved. |
| 29 | 0h<br>RW/1C | **RMA:** Reserved. |
| 28 | 0h<br>RW/1C | **RCA:** Reserved. |
| 27:21 | 00h<br>RO | **Reserved1:** Reserved. |
| 20 | 1h<br>RO | **CAPLIST:** Reserved. |
| 19 | 0h<br>RO | **INTR_STATUS:** Reserved. |
| 18:16 | 0h<br>RO | **Reserved2:** Reserved. |
| 15:11 | 00h<br>RO | **Reserved3:** Reserved. |
| 10 | 0h<br>RW | **INTR_DISABLE:** Reserved. |
| 9 | 0h<br>RO | **Reserved4:** Reserved. |
| 8 | 0h<br>RW | **SERR_ENABLE:** Reserved. |
| 7:3 | 00h<br>RO | **Reserved5:** Reserved. |

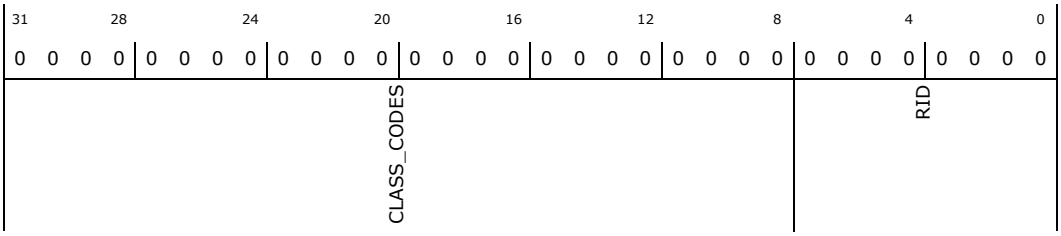
| 1 | 0h<br>RW | **MSE:** Reserved. |
| 0 | 0h<br>RO | **Reserved6:** Reserved. |

## 19.5.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h



REVCLASSCODE - Revision ID and Class Code

### Access Method

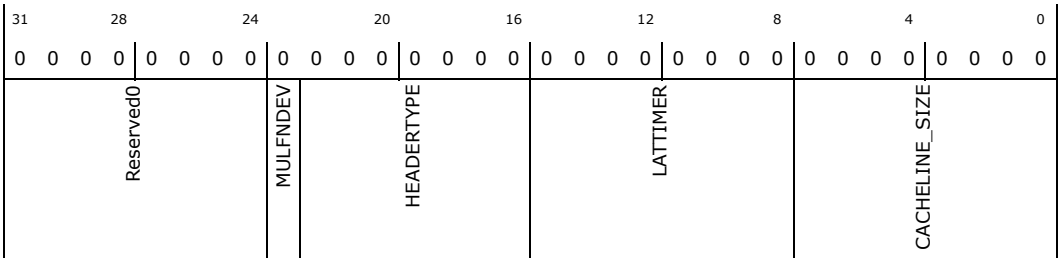
**Type:** PCI Configuration Register (Size: 32 bits)

**REVCLASSCODE:** [B:0, D:22, F:0] + 8h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 000000h RO | **CLASS_CODES:** Reserved. |
| 7:0 | 00h RO | **RID:** Reserved. |

## 19.5.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch



CLLATHEADERBIST - Cache Line Latency Header and BIST

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

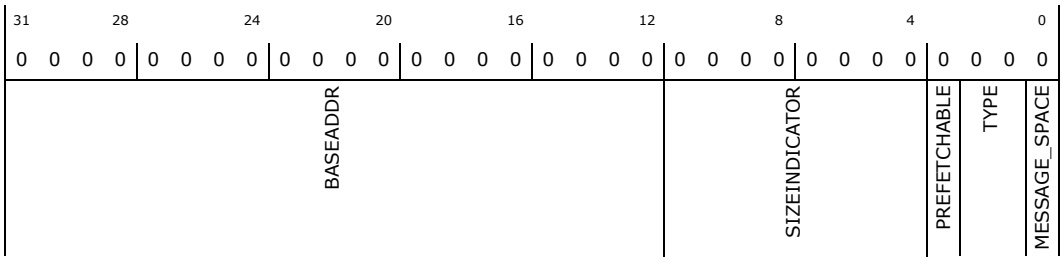
**CLLATHEADERBIST:** [B:0, D:22, F:0] + Ch

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 00h RO | **Reserved0:** Reserved. |
| 23 | 0h RO | **MULFNDEV:** Reserved. |
| 22:16 | 00h RO | **HEADERTYPE:** Reserved. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 00h RO | **LATTIMER:** Reserved. |
| 7:0 | 00h RW | **CACHELINE_SIZE:** Reserved. |

## 19.5.5 reg_BAR_type (BAR)—Offset 10h



BAR -Base Address Register

### Access Method

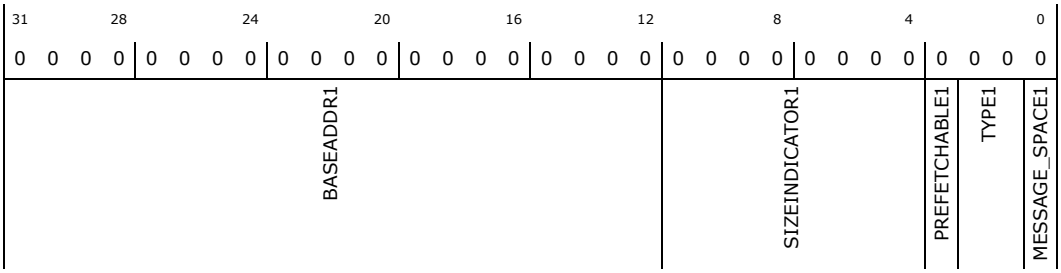
**Type:** PCI Configuration Register (Size: 32 bits)

**BAR:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:12 | 00000h RW | **BASEADDR:** Reserved. |
| 11:4 | 00h RO | **SIZEINDICATOR:** Reserved. |
| 3 | 0h RO | **PREFETCHABLE:** Reserved. |
| 2:1 | 0h RO | **TYPE:** Reserved. |
| 0 | 0h RO | **MESSAGE_SPACE:** Reserved. |

## 19.5.6 reg_BAR1_type (BAR1)—Offset 14h



BAR1 -Base Address Register1

### Access Method

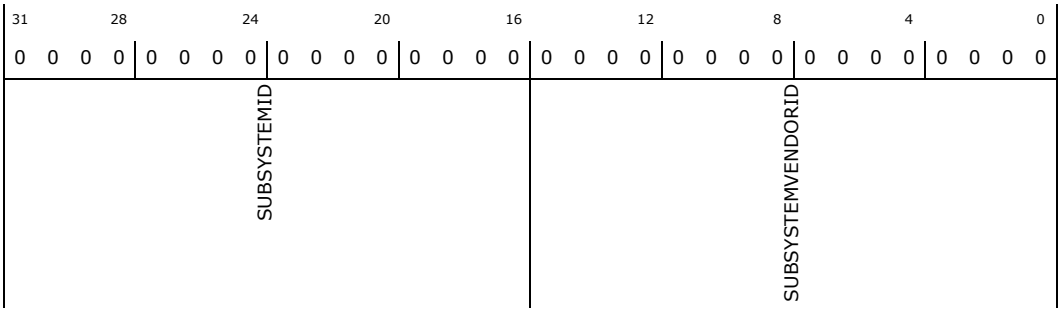
**Type:** PCI Configuration Register (Size: 32 bits)

**BAR1:** [B:0, D:22, F:0] + 14h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:12 | 00000h RW | **BASEADDR1:** Reserved. |
| 11:4 | 00h RO | **SIZEINDICATOR1:** Reserved. |
| 3 | 0h RO | **PREFETCHABLE1:** Reserved. |
| 2:1 | 0h RO | **TYPE1:** Reserved. |
| 0 | 0h RO | **MESSAGE_SPACE1:** Reserved. |

## 19.5.7 reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch



SUBSYSTEMID -Subsystem Vendor and Subsystem ID

### Access Method

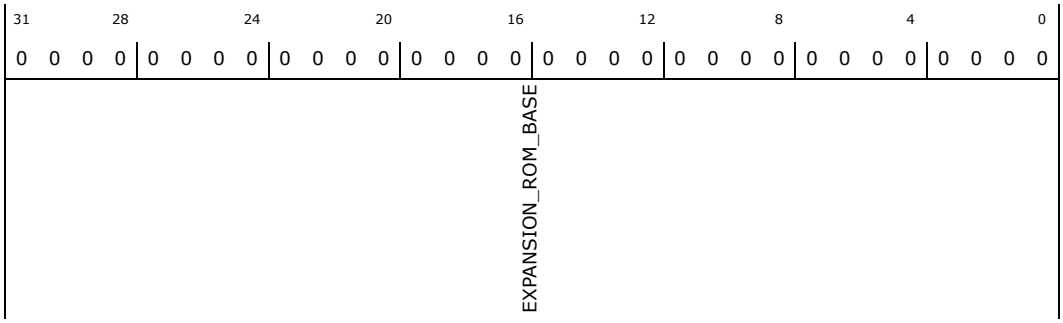
**Type:** PCI Configuration Register (Size: 32 bits)

**SUBSYSTEMID:** [B:0, D:22, F:0] + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h RW/O | **SUBSYSTEMID:** Reserved. |
| 15:0 | 0000h RW/O | **SUBSYSTEMVENDORID:** Reserved. |

## 19.5.8 reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h



EXPANSION ROM base address

### Access Method

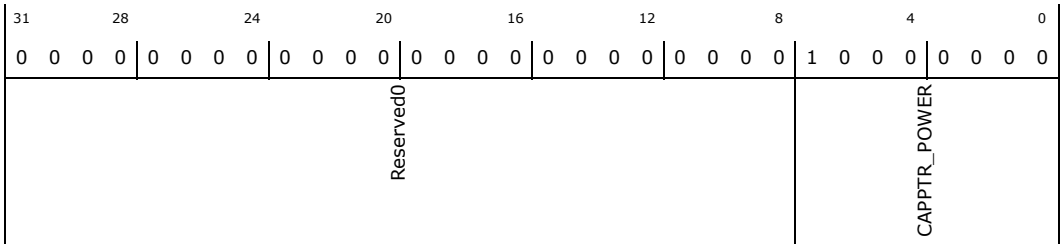
**Type:** PCI Configuration Register (Size: 32 bits)

**EXPANSION_ROM_BASEADDR:** [B:0, D:22, F:0] + 30h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 00000000h<br>RO | **EXPANSION_ROM_BASE:** Reserved. |

## 19.5.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h



CAPABILITYPTR - Capabilities Pointer

### Access Method

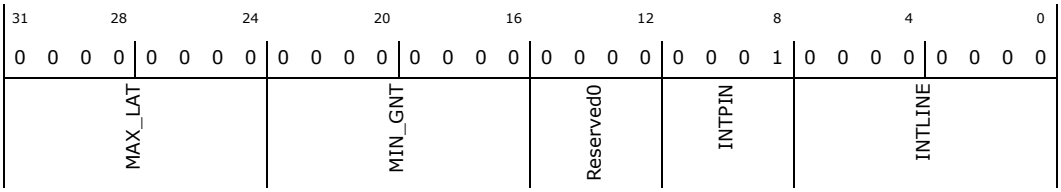
**Type:** PCI Configuration Register (Size: 32 bits)

**CAPABILITYPTR:** [B:0, D:22, F:0] + 34h

**Default:** 00000080h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 000000h<br>RO | **Reserved0:** Reserved. |
| 7:0 | 80h<br>RO | **CAPPTR_POWER:** Reserved. |

## 19.5.10 reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch



INTERRUPTREG - Interrupt Register

### Access Method

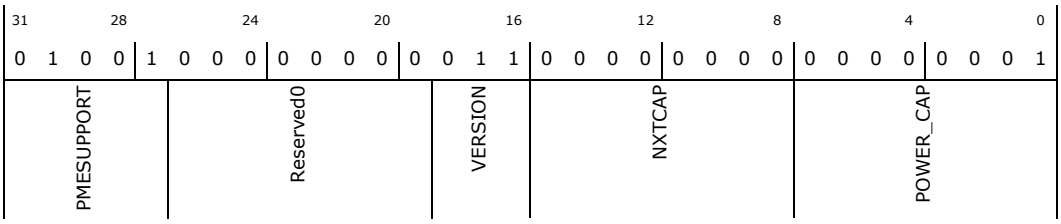
**Type:** PCI Configuration Register (Size: 32 bits)

**INTERRUPTREG:** [B:0, D:22, F:0] + 3Ch

**Default:** 00000100h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 00h RO | **MAX_LAT:** Reserved. |
| 23:16 | 00h RO | **MIN_GNT:** Reserved. |
| 15:12 | 0h RO | **Reserved0:** Reserved. |
| 11:8 | 1h RO | **INTPIN:** Reserved. |
| 7:0 | 00h RW | **INTLINE:** Reserved. |

## 19.5.11 reg_POWERCAPID_type (POWERCAPID)—Offset 80h



POWERCAPID - PowerManagement Capability ID

### Access Method

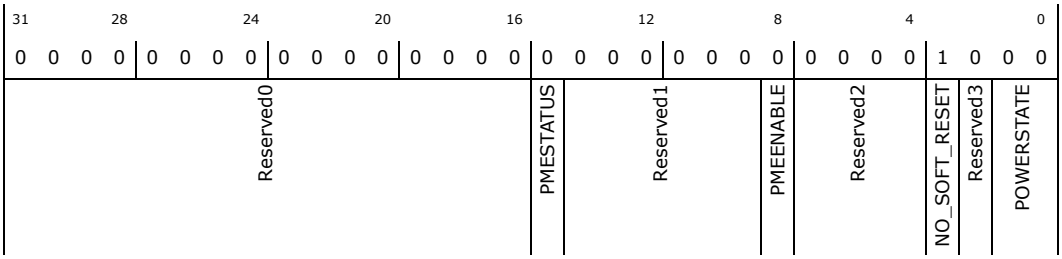
**Type:** PCI Configuration Register (Size: 32 bits)

**POWERCAPID:** [B:0, D:22, F:0] + 80h

**Default:** 48030001h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:27 | 09h RO | **PMESUPPORT:** Reserved. |
| 26:19 | 00h RO | **Reserved0:** Reserved. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 18:16 | 3h<br>RO | **VERSION:** Reserved. |
| 15:8 | 00h<br>RO | **NXTCAP:** Reserved. |
| 7:0 | 01h<br>RO | **POWER_CAP:** Reserved. |



## 19.5.12 reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h

### Access Method

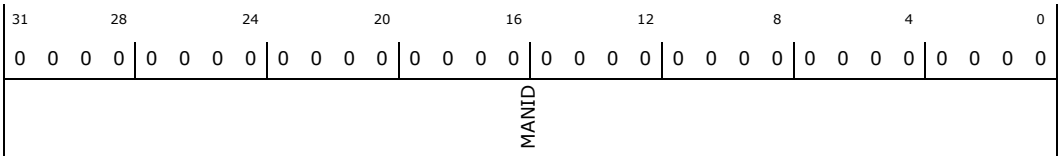
**Type:** PCI Configuration Register (Size: 32 bits)

**PMECTRLSTATUS:** [B:0, D:22, F:0] + 84h

**Default:** 00000008h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h<br>RO | **Reserved0:** Reserved. |
| 15 | 0h<br>RW/1C | **PMESTATUS:** Reserved. |
| 14:9 | 00h<br>RO | **Reserved1:** Reserved. |
| 8 | 0h<br>RW | **PMEENABLE:** Reserved. |
| 7:4 | 0h<br>RO | **Reserved2:** Reserved. |
| 3 | 1h<br>RO | **NO_SOFT_RESET:** Reserved. |
| 2 | 0h<br>RO | **Reserved3:** Reserved. |
| 1:0 | 0h<br>RW | **POWERSTATE:** Reserved. |

## 19.5.13 reg_MANID_type (MANID)—Offset F8h



Manufacturers ID

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**MANID:** [B:0, D:22, F:0] + F8h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 00000000h<br>RO | **MANID:** Reserved. |

## 19.6 USB 3.0 Device Memory Mapped I/O Registers

### Table 221. Summary of USB 3.0 Device Memory Mapped I/O Registers—BAR

| Offset | Size | Register ID—Description | Default Value |
|---|---|---|---|
| 0h | 4 | "CAPLENGTH—Offset 0h" on page 2480 | 00960020h |
| 4h | 4 | "HCSPARAMS1—Offset 4h" on page 2481 | 0200017Fh |

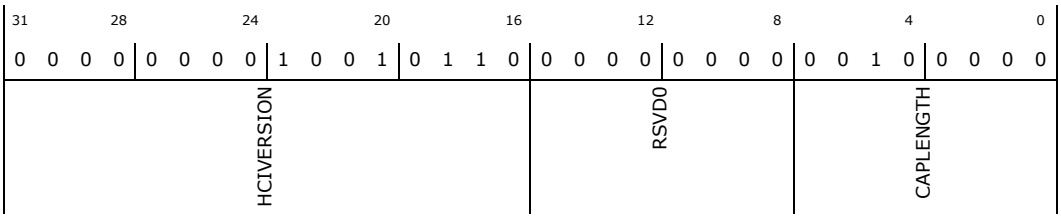
## 19.6.1 CAPLENGTH—Offset 0h

This register is used as an offset to add to register base to find the beginning of the Operational Register Space.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CAPLENGTH:** [BAR] + 0h

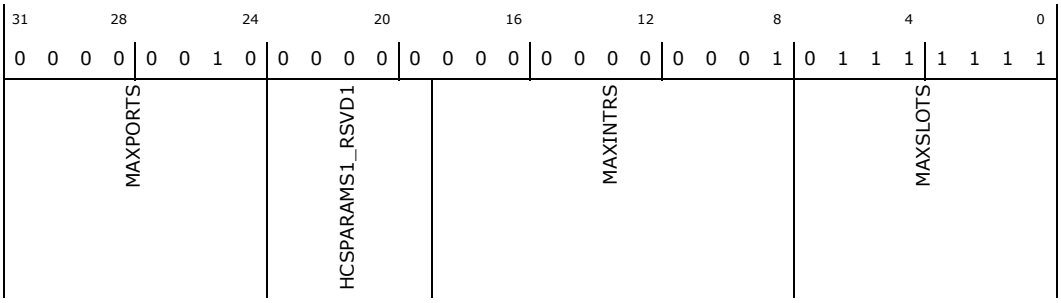
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00960020h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 096h<br>RO | **HCIVERSION:** This is a two-byte register containing a BCD encoding of the xHCI specification revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision. e.g. 0100h corresponds to xHCI version 1.0.xs |
| 15:8 | 0h<br>RO | **RSVD0:** Reserved. |
| 7:0 | 20h<br>RO | **CAPLENGTH:** This register is used as an offset to add to register base to find the beginning of the Operational Register Space. |

## 19.6.2 HCSPARAMS1—Offset 4h

number of ports implemented is 2 because there is 1 DWC_USB2_HOST_NUM_U2_ROOT_PORTS and 1 DWC_USB3_HOST_NUM_U3_ROOT_PORT



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**HCSPARAMS1:** [BAR] + 4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

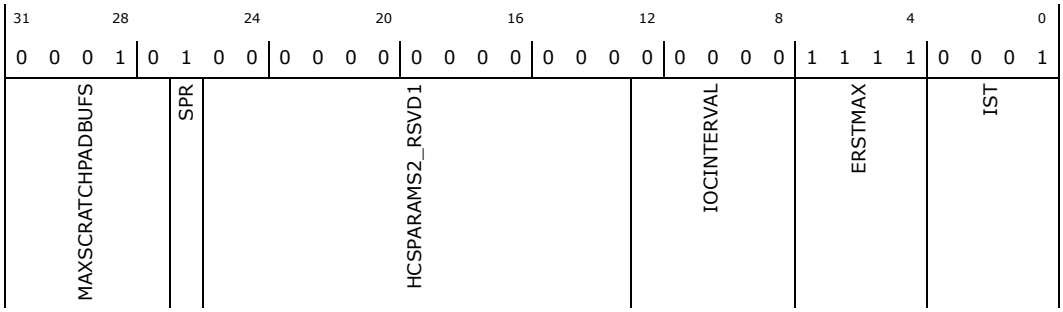
**Default:** 0200017Fh

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 02h<br>RO | **MAXPORTS:** Number of Ports (MaxPorts). This field specifies the maximum Port Number value, i.e. the highest numbered Port Register Set that are addressable in the Operational Register Space (refer to Table 29). Valid values are in the range of 1h to FFh. The value in this field shall reflect the maximum Port Number value assigned by an xHCI Supported Protocol Capability, described in section 7.2. Software shall refer to these capabilities to identify whether a specific Port Number is valid, and the protocol supported by the associated Port Register Set. |
| 23:19 | 0h<br>RO | **HCSPARAMS1_RSVD1:** reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 18:8 | 1h<br>RO | **MAXINTRS:** Number of Interrupters (MaxIntrs). This field specifies the number of Interrupters implemented on this host controller. Each Interrupter may be allocated to a MSI or MSI-X vector and controls its generation and moderation. The value of this field determines how many Interrupter Register Sets are addressable in the Runtime Register Space (refer to section 5.5). Valid values are in the range of 1h to 400h. A 0 in this field is undefined. |
| 7:0 | 7fh<br>RO | **MAXSLOTS:** Number of Device Slots (MaxSlots). This field specifies the maximum number of Device Context Structures and Doorbell Array entries this host controller can support. Valid values are in the range of 1 to 255. The value of 0 is reserved. |

## 19.6.3 HCSPARAMS2—Offset 8h

Host Controller Structural Parameters 2



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**HCSPARAMS2:** [BAR] + 8h

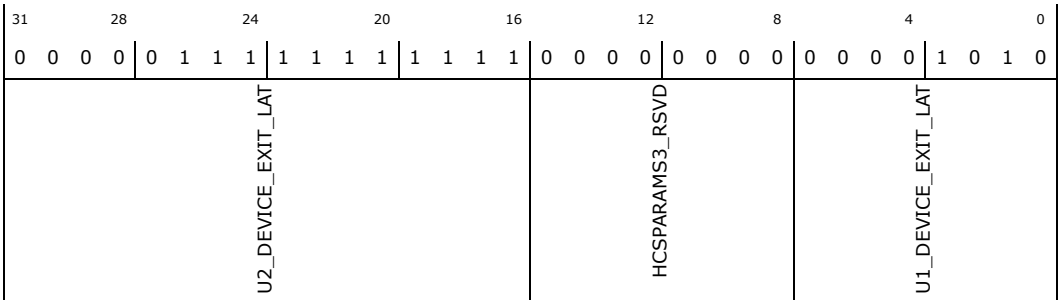
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 140000F1h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:27 | 02h<br>RO | **MAXSCRATCHPADBUFS:** For xHCI 0.96,this field is Max Scratchpad Bufs / For xHCI 1.0, this field is Max Scratchpad Bufs Lo |
| 26 | 1h<br>RO | **SPR:** Scratchpad Restore (SPR) |
| 25:13 | 0h<br>RO | **HCSPARAMS2_RSVD1:** reserved |
| 12:8 | 0h<br>RO | **IOCINTERVAL:** This field is valid only for xHCI 0.96. For xHCI 1.0, this field is Reserved. |
| 7:4 | fh<br>RO | **ERSTMAX:** Event Ring Segment Table Max (ERST Max) |
| 3:0 | 1h<br>RO | **IST:** Isochronous Scheduling Threshold (IST) |

## 19.6.4 HCSPARAMS3—Offset Ch

Structural Parameters 3 Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**HCSPARAMS3:** [BAR] + Ch

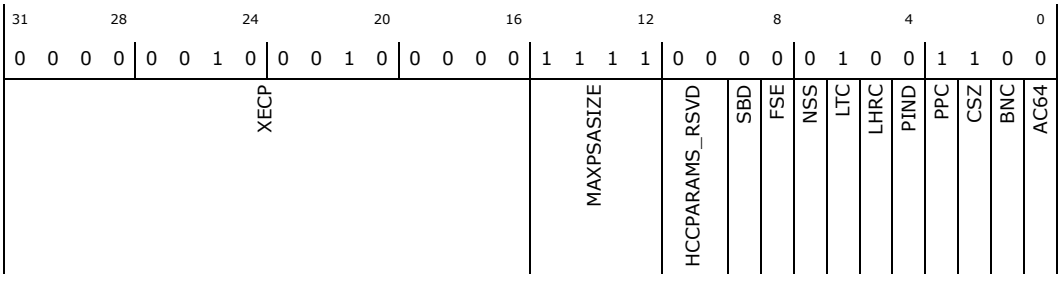
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 07FF000Ah

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 07ffh RO | **U2_DEVICE_EXIT_LAT:** Reserved. |
| 15:8 | 0h RO | **HCSPARAMS3_RSVD:** Reserved. |
| 7:0 | 0ah RO | **U1_DEVICE_EXIT_LAT:** Reserved. |

## 19.6.5 HCCPARAMS—Offset 10h

Capability Parameters Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**HCCPARAMS:** [BAR] + 10h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

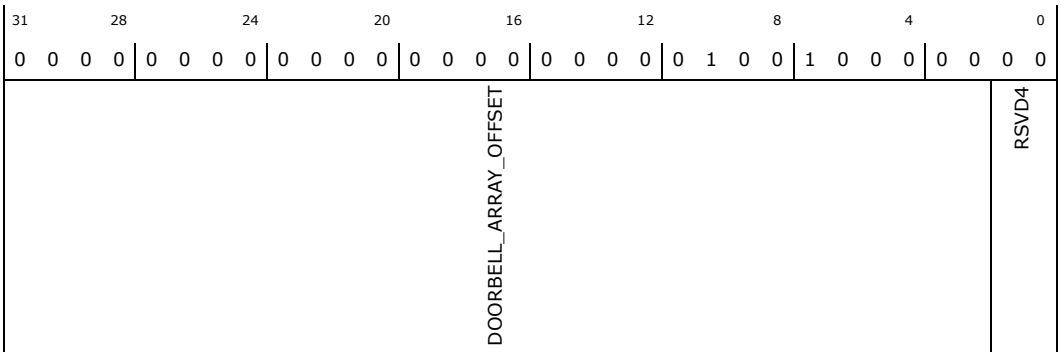
**Default:** 0220F04Ch

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 220h RO | **XECP:** Based on configuration, core automatically updates it |

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:12 | fh<br>RO | **MAXPSASIZE:** Maximum Primary Stream Array Size |
| 11:10 | 0h<br>RO | **HCCPARAMS_RSVD:** Reserved |
| 9 | 0h<br>RO | **SBD:** Secondary Bandwidth Domain Reporting (SBD) |
| 8 | 0h<br>RO | **FSE:** For xHCI 0.96, this field is Force Stopped Event (FSE) / For xHCI 1.0, this field is Parse All Event Data (PAE) |
| 7 | 0h<br>RO | **NSS:** No Secondary SID Support (NSS). This flag indicates whether the host controller implementation supports Secondary Stream IDs. A 1 in this bit indicates that Secondary Stream ID decoding is not supported. A 0 in this bit indicates that Secondary Stream ID decoding is supported. (refer to Sections 4.12.2 and 6.2.3). |
| 6 | 1h<br>RO | **LTC:** Latency Tolerance Messaging Capability (LTC). This flag indicates whether the host controller implementation supports Latency Tolerance Messaging (LTM). A 1 in this bit indicates that LTM is supported. A 0 in this bit indicates that LTM is not supported. Refer to section 4.13.1 for more information on LTM. |
| 5 | 0h<br>RO | **LHRC:** Light HC Reset Capability (LHRC). This flag indicates whether the host controller implementation supports a Light Host Controller Reset. A 1 in this bit indicates that Light Host Controller Reset is supported. A 0 in this bit indicates that Light Host Controller Reset is not supported. The value of this flag affects the functionality of the Light Host Controller Reset (LHCRST) flag in the USBCMD register (refer to Section 5.4.1). |
| 4 | 0h<br>RO | **PIND:** Port Indicators (PIND). This bit indicates whether the xHC root hub ports support port indicator control. When this bit is a 1, the port status and control registers include a read/writeable field for controlling the state of the port indicator. Refer to Section 5.4.8 for definition of the Port Indicator Control field. |
| 3 | 1h<br>RO | **PPC:** Port Power Control (PPC). This flag indicates whether the host controller implementation includes port power control. A 1 in this bit indicates the ports have port power switches. A 0 in this bit indicates the port do not have port power switches. The value of this flag affects the functionality of the PP flag in each port status and control register (refer to Section 5.4.8). |
| 2 | 1h<br>RO | **CSZ:** Context Size (CSZ). If this bit is set to 1, then the xHC uses 64 byte Context data structures. If this bit is cleared to 0, then the xHC uses 32 byte Context data structures. Note: This flag does not apply to Stream Contexts. |
| 1 | 0h<br>RO | **BNC:** BW Negotiation Capability (BNC). This flag identifies whether the xHC has implemented the Bandwidth Negotiation. Values for this flag have the following interpretation: for Value 0 Description BW Negotiation not implemented. for Value 1 DescriptionBW Negotiation implemented. Refer to section 4.16 of XHCI specification for more information on Bandwidth Negotiation. |
| 0 | 0h<br>RO | **AC64:** 64-bit Addressing Capability (AC64). This flag documents the addressing range capability of this implementation. The value of this flag determines whether the xHC has implemented the high order 32 bits of 64 bit register and data structure pointer fields. Values for this flag have the following interpretation: for Value 0 Description 32-bit address memory pointers implemented. for Value 1 description 64-bit address memory pointers implemented. If 32-bit address memory pointers are implemented, the xHC shall ignore the high order 32 bits of 64 bit data structure pointer fields, and system software shall ignore the high order 32 bits of 64 bit xHC registers. |

## 19.6.6 DBOFF—Offset 14h

Doorbell Offset Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DBOFF:** [BAR] + 14h

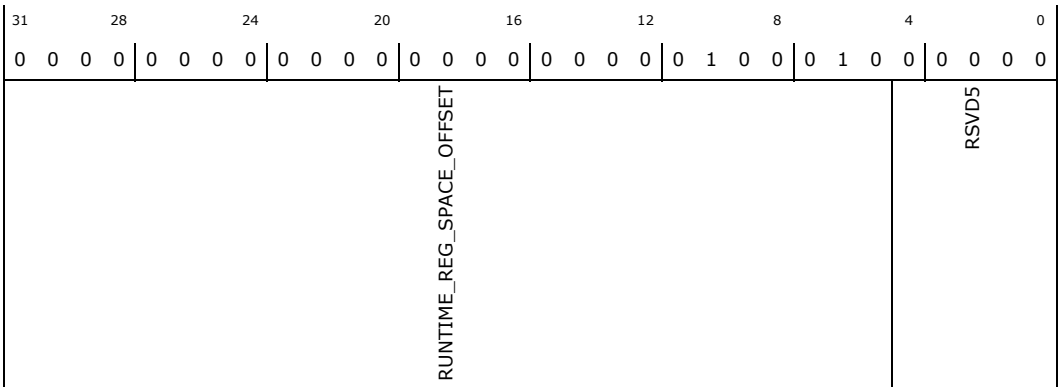
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000480h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 120h<br>RO | **DOORBELL_ARRAY_OFFSET:** Based on configuration, core automatically updates it |
| 1:0 | 0h<br>RO | **RSVD4:** Reserved |

## 19.6.7 RTSOFF—Offset 18h

Runtime Register Space Offset Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**RTSOFF:** [BAR] + 18h

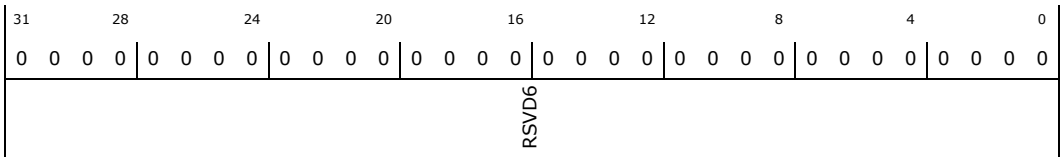
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000440h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:5 | 22h<br>RO | **RUNTIME_REG_SPACE_OFFSET:** Based on configuration, core automatically updates it |
| 4:0 | 0h<br>RO | **RSVD5:** Reserved |

## 19.6.8 Rsvd_HC—Offset 1Ch

reserved



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Rsvd_HC:** [BAR] + 1Ch

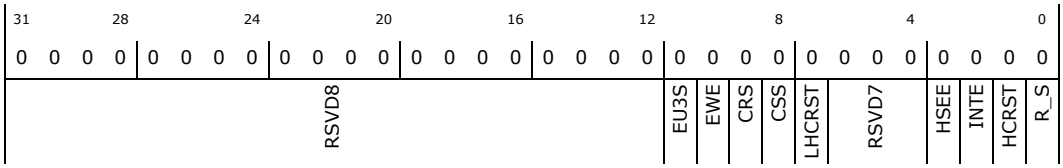
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **RSVD6:** Reserved. |

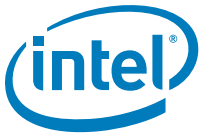
## 19.6.9 USBCMD—Offset 20h

USB Command Register Bit Definitions



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)



**USBCMD:** [BAR] + 20h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

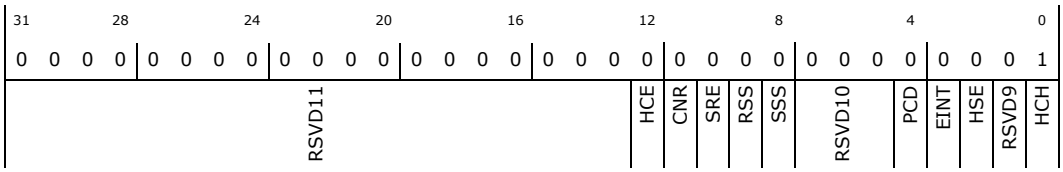
| Bit Range | Default & Access | Description |
|---|---|---|
| 31:12 | 0h<br>RO | **RSVD8:** reserved |
| 11 | 0h<br>RW | **EU3S:** Enable U3 MFINDEX Stop (EU3S) - RW. Default = 0. When set to 1, the xHC may stop the MFINDEX counting action if all Root Hub ports are in the U3, Disconnected, Disabled, or Powered-off state. When cleared to 0 the xHC may stop the MFINDEX counting action if all Root Hub ports are in the Disconnected, Disabled, Training, or Powered-off state. Refer to section 4.14.2 for more information. |
| 10 | 0h<br>RW | **EWE:** Enable Wrap Event (EWE) - RW. Default = 0. When set to 1, the xHC shall generate a MFINDEX Wrap Event every time the MFINDEX register transitions from 03FFFh to 0. When cleared to 0 no MFINDEX Wrap Events are generated. Refer to section 4.14.2 for more information. When this register is exposed by a Virtual Function (VF), the generation of MFINDEX Wrap Events to VFs shall be emulated by the VMM. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 9 | 0h<br>RW | **CRS:** Controller Restore State: This command is similar to the USBCMD. CRS bit in host mode and initiates the restore process. When software sets this bit to '1', the controller immediately sets DSTS.RSS to '1'. When the controller has finished the restore process, it sets DSTS.RSS to '0'. |
| 8 | 0h<br>RW | **CSS:** Controller Save State: This command is similar to the USBCMD. CSS bit in host mode and initiates the save process. When software sets this bit to '1', the controller immediately sets DSTS.SSS to '1'. When the controller has finished the save process, it sets DSTS.SSS to '0'. |
| 7 | 0h<br>RW | **LHCRST:** Light Host Controller Reset (LHCRST) RO or RW. Optional normative. Default = 0. If the Light HC Reset Capability (LHRC) bit in the HCCPARAMS register is 1, then this flag allows the driver to reset the xHC without affecting the state of the ports. A system software read of this bit as 0 indicates the Light Host Controller Reset has completed and it is safe for software to re-initialize the xHC. A software read of this bit as a 1 indicates the Light Host Controller Reset has not yet completed. If not implemented, a read of this flag shall always return a 0. All registers in the Aux Power well shall maintain the values that had been asserted prior to the Light Host Controller Reset. Refer to section 4.23.1 for more information. When this register is exposed by a Virtual Function (VF), this bit only generates a Light Reset to the xHC instance presented by the selected VF, e.g. Disable the VFs device slots and set the associated VF Run bit to Stopped. Refer to section 8 for more information. |
| 6:4 | 0h<br>RO | **RSVD7:** Reserved |
| 3 | 0h<br>RW | **HSEE:** Host System Error Enable (HSEE) RW. Default = 0. When this bit is a 1, and the HSE bit in the USBSTS register is a 1, the xHC shall assert out-of-band error signaling to the host. The signaling is acknowledged by software clearing the HSE bit. Refer to section 4.10.2.6 for more information. When this register is exposed by a Virtual Function (VF), the effect of the assertion of this bit on the Physical Function (PF0) is determined by the VMM. Refer to section 8 for more information. |
| 2 | 0h<br>RW | **INTE:** Interrupter Enable (INTE) RW. Default = 0. This bit provides system software with a means of enabling or disabling the host system interrupts generated by Interrupters. When this bit is a 1, then Interrupter host system interrupt generation is allowed, e.g. the xHC shall issue an interrupt at the next interrupt threshold if the host system interrupt mechanism (e.g. MSI, MSI-X, etc.) is enabled. The interrupt is acknowledged by a host system interrupt specific mechanism. When this register is exposed by a Virtual Function (VF), this bit only enables the set of Interrupters assigned to the selected VF. Refer to section 7.7.2 for more information. |
| 1 | 0h<br>RW | **HCRST:** Host Controller Reset (HCRST) RW. Default = 0. This control bit is used by software to reset the host controller. The effects of this bit on the xHC and the Root Hub registers are similar to a Chip Hardware Reset. When software writes a 1 to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on the USB is immediately terminated. A USB reset shall not be driven on USB2 downstream ports, however a Hot or Warm Reset shall be initiated on USB3 Root Hub downstream ports. PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Software shall reinitialize the host controller as described in Section 4.1 in order to return the host controller to an operational state. This bit is cleared to 0 by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a 0 to this bit and shall not write any xHC Operational or Runtime registers until while HCRST is 1. Note, the completion of the xHC reset process is not gated by the Root Hub port reset process. Software shall not set this bit to 1 when the HCHalted (HCH) bit in the USBSTS register is a 0. Attempting to reset an actively running host controller may result in undefined behavior. When this register is exposed by a Virtual Function (VF), this bit only resets the xHC instance presented by the selected VF. Refer to section 8 for more information. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 0 | 0h<br>RW | **R_S:** Run/Stop (R/S) RW. Default = 0. 1 = Run. 0 = Stop. When set to a 1, the xHC proceeds with execution of the schedule. The xHC continues execution as long as this bit is set to a 1. When this bit is cleared to 0, the xHC completes any current or queued commands or TDs, and any USB transactions associated with them, then halts. Refer to section 5.4.1.1 for more information on how R/S shall be managed. The xHC shall halt within 16 ms. after software clears the Run/Stop bit if the above conditions have been met. The HCHalted (HCH) bit in the USBSTS register indicates when the xHC has finished its pending pipelined transactions and has entered the stopped state. Software shall not write a 1 to this flag unless the xHC is in the Halted state (i.e. HCH in the USBSTS register is 1). Doing so may yield undefined results. Writing a 0 to this flag when the xHC is in the Running state (i.e. HCH = 0) and any Event Rings are in the Event Ring Full state (refer to section 4.9.4) may result in lost events. When this register is exposed by a Virtual Function (VF), this bit only controls the run state of the xHC instance presented by the selected VF. Refer to section 8 for more information. |

## 19.6.10 USBSTS—Offset 24h

USB Command Register Bit Definitions



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**USBSTS:** [BAR] + 24h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

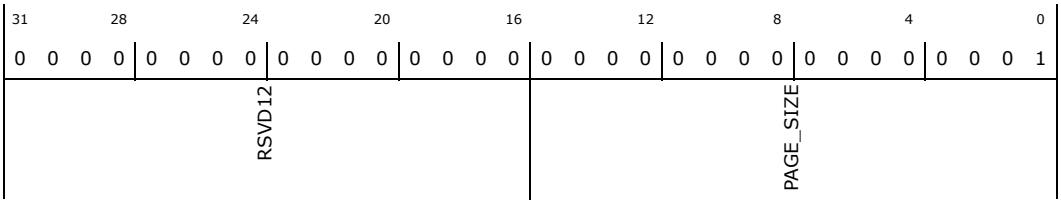
**Default:** 00000001h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:13 | 0h<br>RO | **RSVD11:** reserved |
| 12 | 0h<br>RO | **HCE:** Host Controller Error (HCE) - RO. Default = 0. 0' = No internal xHC error conditions exist '1' = Internal xHC error condition. This flag shall be set to indicate that an internal error condition has been detected which requires software to reset and reinitialize the xHC. Refer to section 4.24.1 of xhci specification for more information. |
| 11 | 0h<br>RO | **CNR:** Controller Not Ready (CNR) - RO. Default = '1'. '0' = Ready '1' = Not Ready. Software shall not write any Doorbell or Operational register of the xHC, other than the USBSTS register, until CNR = '0'. This flag is set by the xHC after a Chip Hardware Reset and cleared when the xHC is ready to begin accepting register writes. This flag shall remain cleared ('0') until the next Chip Hardware Reset. |
| 10 | 0h<br>RO | **SRE:** Save/Restore Error (SRE) -RW1C. Default = '0'. If an error occurs during a Save or Restore operation this bit shall be set to '1'. This bit shall be cleared to '0' when a Save or Restore operation is initiated or when written with '1'. Refer to section 4.23.2 of xhci specification for more information. |
| 9 | 0h<br>RO | **RSS:** Restore State Status: This bit is similar to the USBSTS.RSS in host mode. When the controller has finished the save process, it will complete the command by setting DSTS.RSS to '0'. |
| 8 | 0h<br>RO | **SSS:** Save State Status: This bit is similar to the USBSTS.SSS in host mode. When the controller has finished the save process, it will complete the command by setting DSTS.SSS to '0' |

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:5 | 0h<br>RO | **RSVD10:** reserved |
| 4 | 0h<br>RW | **PCD:** Reserved. |
| 3 | 0h<br>RO | **EINT:** Reserved. |
| 2 | 0h<br>RO | **HSE:** Reg field HSE |
| 1 | 0h<br>RO | **RSVD9:** reserved |
| 0 | 1h<br>RO | **HCH:** Reg field HCH |

## 19.6.11 PAGESIZE—Offset 28h

Page Size Register Bit Definitions. This register is used by software to enable or disable the reporting of the reception of specific USB Device Notification Transaction Packets. A Notification Enable (Nx, where x = 0 to 15) flag is defined for each of the 16 possible device notification types. If a flag is set for a specific notification type, a Device Notification Event shall be generated when the respective notification packet is received. After reset all notifications are disabled. Refer to section 6.4.2.7. This register shall be written as a Dword. Byte writes produce undefined results.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**PAGESIZE:** [BAR] + 28h

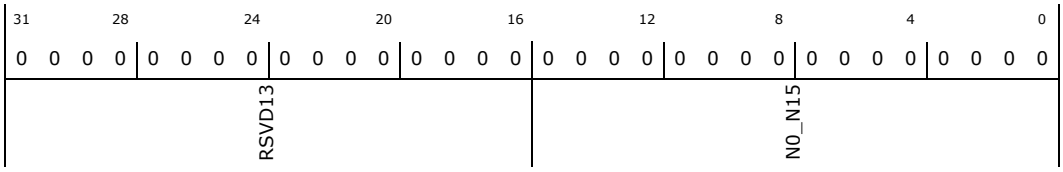
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000001h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0h<br>RO | **RSVD12:** reserved |
| 15:0 | 1h<br>RO | **PAGE_SIZE:** Reg field PAGE_SIZE |

## 19.6.12 DNCTRL—Offset 34h

Device Notification Register Bit Definitions.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DNCTRL:** [BAR] + 34h

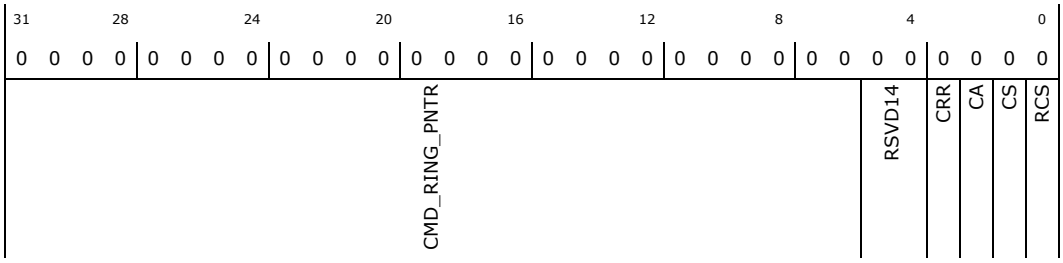
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0h<br>RO | **RSVD13:** reserved |
| 15:0 | 0h<br>RW | **N0_N15:** Reg field N0_N15 |

## 19.6.13 CRCR_LO—Offset 38h

Register CRCR_LO



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CRCR_LO:** [BAR] + 38h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

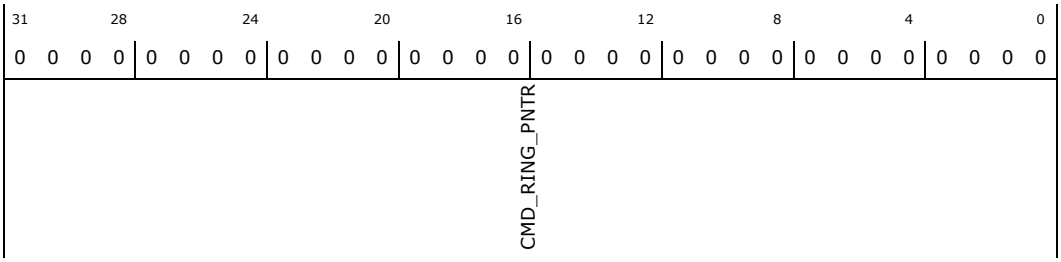
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:6 | 0h<br>RW | **CMD_RING_PNTR:** Command Ring Pointer - RW. Default = 0. This field defines high order bits of the initial value of the 64-bit Command Ring Dequeue Pointer. Writes to this field are ignored when Command Ring Running (CRR) = 1. If the CRCR is written while the Command Ring is stopped (CCR = 0), the value of this field shall be used to fetch the first Command TRB the next time the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. If the CRCR is not written while the Command Ring is stopped (CCR = 0) then the Command Ring shall begin fetching Command TRBs at the current value of the internal xHC Command Ring Dequeue Pointer. Reading this field always returns 0. |
| 5:4 | 0h<br>RO | **RSVD14:** reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 3 | 0h<br>RW | **CRR:** Command Ring Running (CRR) - RO. Default = 0. This flag is set to 1 if the Run/ Stop (R/S) bit is 1 and the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. It is cleared to 0 when the Command Ring is stopped after writing a 1 to the Command Stop (CS) or Command Abort (CA) flags, or if the R/S bit is cleared to 0. |
| 2 | 0h<br>RW | **CA:** Command Abort (CA) - RW1S. Default = 0. Writing a 1 to this bit shall immediately terminate the currently executing command, stop the Command Ring, and generate a Command Completion Event with the Completion Code set to Command Ring Stopped. Refer to section 4.6.1.2 for more information on aborting a command. The next write to the Host Controller Doorbell with DB Reason field set to Host Controller Command shall restart the Command Ring operation. Writes to this flag are ignored by the xHC if Command Ring Running (CRR) = 0. Reading this bit always returns 0. |
| 1 | 0h<br>RW | **CS:** Command Stop (CS) - RW1S. Default = 0. Writing a 1 to this bit shall stop the operation of the Command Ring after the completion of the currently executing command, and generate a Command Completion Event with the Completion Code set to Command Ring Stopped and the Command TRB Pointer set to the current value of the Command Ring Dequeue Pointer. Refer to section 4.6.1.1 for more information on stopping a command. The next write to the Host Controller Doorbell with DB Reason field set to Host Controller Command shall restart the Command Ring operation. Writes to this flag are ignored by the xHC if Command Ring Running (CRR) = 0. Reading this bit shall always return 0. |
| 0 | 0h<br>RW | **RCS:** Ring Cycle State (RCS) - RW. This bit identifies the value of the xHC Consumer Cycle State (CCS) flag for the TRB referenced by the Command Ring Pointer. Refer to section 4.9.3 for more information. Writes to this flag are ignored if Command Ring Running (CRR) is 1. If the CRCR is written while the Command Ring is stopped (CRR = 0), then the value of this flag shall be used to fetch the first Command TRB the next time the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. If the CRCR is not written while the Command Ring is stopped (CRR = 0), then the Command Ring shall begin fetching Command TRBs using the current value of the internal Command Ring CCS flag. Reading this flag always returns 0. |

## 19.6.14 CRCR_HI—Offset 3Ch

Register CRCR_HI



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CRCR_HI:** [BAR] + 3Ch

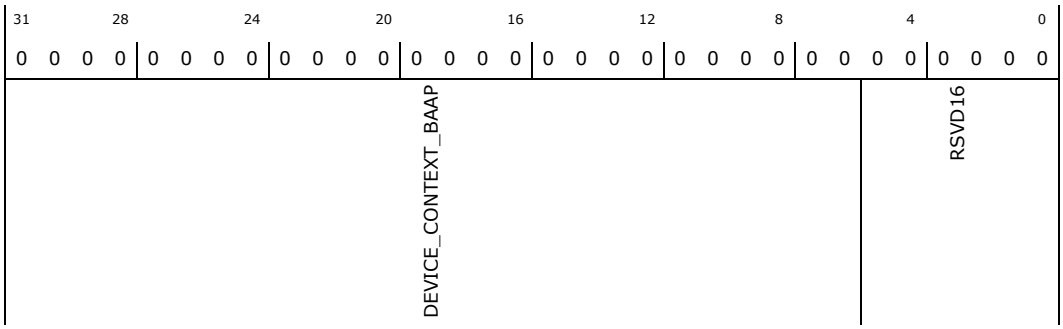
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **CMD_RING_PNTR:** Reg field CMD_RING_PNTR |

## 19.6.15 DCBAAP_LO—Offset 50h

Register DCBAAP_LO



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DCBAAP_LO:** [BAR] + 50h

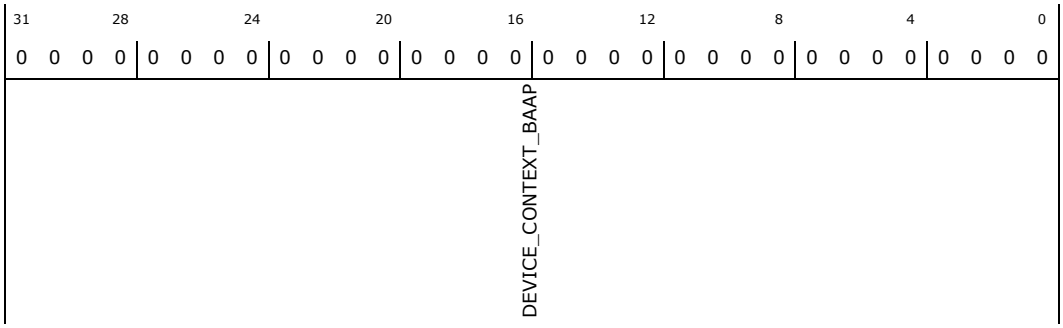
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:6 | 0h<br>RW | **DEVICE_CONTEXT_BAAP:** Reg field DEVICE_CONTEXT_BAAP |
| 5:0 | 0h<br>RO | **RSVD16:** reserved |

## 19.6.16 DCBAAP_HI—Offset 54h

Register DCBAAP_HI



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DCBAAP_HI:** [BAR] + 54h

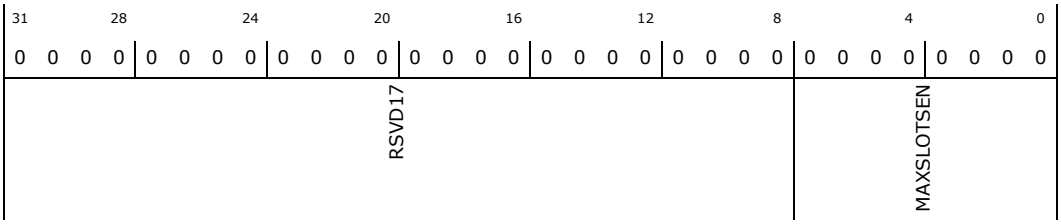
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DEVICE_CONTEXT_BAAP:** Reg field DEVICE_CONTEXT_BAAP |

## 19.6.17 CONFIG—Offset 58h

Configure Register Bit Definitions. This register is in the Aux Power well. It is only reset by platform hardware during a cold reset or in response to a Host Controller Reset (HCRST). The initial conditions of a port are described in section 4.19 of xhci specification .



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

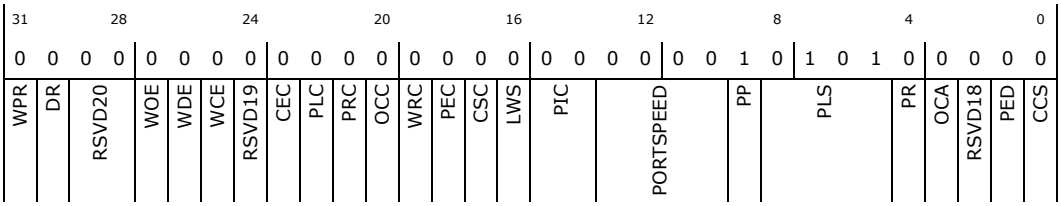
**CONFIG:** [BAR] + 58h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 0h<br>RO | **RSVD17:** reserved |
| 7:0 | 0h<br>RW | **MAXSLOTSEN:** Reg field MAXSLOTSEN |

## 19.6.18 PORTSC1—Offset 420h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**PORTSC1:** [BAR] + 420h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

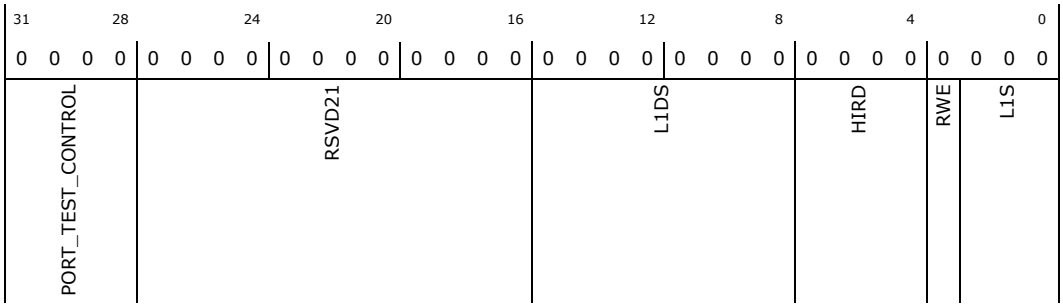
**Default:** 000002A0h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h<br>RW | **WPR:** Warm Port Reset (WPR) RW1S/RsvdZ. Default = 0. When software writes a 1 to this bit, the Warm Reset sequence as defined in the USB3 Specification is initiated and the PR flag is set to 1. Once initiated, the PR, PRC, and WRC flags shall reflect the progress of the Warm Reset sequence. This flag shall always return 0 when read. Refer to section 4.19.5.1. of XHCI specification. This flag only applies to USB3 protocol ports. For USB2 protocol ports it shall be RsvdZ. |
| 30 | 0h<br>RW | **DR:** Device Removable (DR) - RO. This flag indicates if this port has a removable device attached. 1 = Device is non-removable. 0 = Device is removable. |
| 29:28 | 0h<br>RO | **RSVD20:** reserved |
| 27 | 0h<br>RW | **WOE:** Wake on Over-current Enable (WOE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to over-current conditions as system wake-up eventsn. Refer to section 4.15 for operational model. |
| 26 | 0h<br>RW | **WDE:** Wake on Disconnect Enable (WDE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to device disconnects as system wake-up eventsn. Refer to section 4.15 for operational model. |
| 25 | 0h<br>RW | **WCE:** Wake on Connect Enable (WCE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to device connects as system wake-up events . Refer to section 4.15 for operational model. |
| 24 | 0h<br>RO | **RSVD19:** reserved |
| 23 | 0h<br>RW | **CEC:** Port Config Error Change (CEC) RW1CS/RsvdZ. Default = 0. This flag indicates that the port failed to configure its link partner. 0 = No change. 1 = Port Config Error detected. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.2 for more information on change bit usage. Note: This flag is valid only for USB3 protocol ports. For USB2 protocol ports this bit shall be RsvdZ. |
| 22 | 0h<br>RW | **PLC:** Port Link State Change (PLC) RW1CS. Default = 0. This flag is set to 1 due to the following PLS transitions mentioned in the XHCI specification |
| 21 | 0h<br>RW | **PRC:** Port Reset Change (PRC) RW1CS. Default = 0. This flag is set to 1 due to a '1' to '0' transition of Port Reset (PR). e.g. when any reset processing (Warm or Hot) on this port is complete. Note that this flag shall not be set to 1 if the reset processing was forced to terminate due to software clearing PP or PED to '0'. 0 = No change. 1 = Reset complete. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.5. Refer to section 4.19.2 for more information on change bit usage. |
| 20 | 0h<br>RW | **OCC:** Over-current Change (OCC) RW1CS. Default = 0. This bit shall be set to a 1 when there is a 0 to 1 or 1 to 0 transition of Over-current Active (OCA). Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage. |
| 19 | 0h<br>RW | **WRC:** Warm Port Reset Change (WRC) RW1CS/RsvdZ. Default = 0. This bit is set when Warm Reset processing on this port completes. 0 = No change. 1 = Warm Reset complete. Note that this flag shall not be set to 1 if the Warm Reset processing was forced to terminate due to software clearing PP or PED to '0'. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.5.1. Refer to section 4.19.2 for more information on change bit usage. This bit only applies to USB3 protocol ports. For USB2 protocol ports it shall be RsvdZ. |
| 18 | 0h<br>RW | **PEC:** Port Enabled/Disabled Change (PEC) RW1CS. Default = 0. 1 = change in PED. 0 = No change. Note that this flag shall not be set if the PED transition was due to software setting PP to 0. Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage. For a USB2 protocol port, this bit shall be set to 1 only when the port is disabled due to the appropriate conditions existing at the EOF2 point (refer to section 11.8.1 of the USB2 Specification for the definition of a Port Error). For a USB3 protocol port, this bit shall never be set to 1. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 17 | 0h<br>RW | **CSC:** Connect Status Change (CSC) RW1CS. Default = 0. 1 = Change in CCS. 0 = No change. This flag indicates a change has occurred in the ports Current Connect Status (CCS) or Cold Attach Status (CAS) bits. Note that this flag shall not be set if the CCS transition was due to software setting PP to 0, or the CAS transition was due to software setting WPR to 1. The xHC sets this bit to 1 for all changes to the port device connect status , even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, root hub hardware will be setting an already-set bit (i.e., the bit will remain 1). Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage. |
| 16 | 0h<br>RW | **LWS:** Port Link State Write Strobe (LWS) RW. Default = 0. When this bit is set to 1 on a write reference to this register, this flag enables writes to the PLS field. When 0, write data in PLS field is ignored. Reads to this bit return 0. |
| 15:14 | 0h<br>RW | **PIC:** Port Indicator Control (PIC) RWS. Default = 0. Writing to these bits has no effect if the Port Indicators (PIND) bit in the HCCPARAMS register is a 0. |
| 13:10 | 0h<br>RW | **PORTSPEED:** Port Speed (Port Speed) ROS. Default = 0. This field identifies the speed of the connected USB Device. This field is only relevant if a device is connected (CCS = 1) in all other cases this field shall indicate Undefined Speed. (more information in the XHCI specification) |
| 9 | 1h<br>RW | **PP:** Port Power (PP) RWS. Default = 1. This flag reflects a port's logical, power control state. Because host controllers can implement different methods of port power switching, this flag may or may not represent whether (VBus) power is actually applied to the port. When PP equals a '0' the port is nonfunctional and shall not report attaches, detaches, or Port Link State (PLS) changes. However, the port shall report over-current conditions when PP = 0 if PPC = 0. After modifying PP, software shall read PP and confirm that it is reached its target state before modifying it again , undefined behavior may occur if this procedure is not followed. 0 = This port is in the Powered-off state. 1 = This port is not in the Powered-off state. If the Port Power Control (PPC) flag in the HCCPARAMS register is '1', then xHC has port power control switches and this bit represents the current setting of the switch ('0' = off, '1' = on). If the Port Power Control (PPC) flag in the HCCPARAMS register is '0', then xHC does not have port power control switches and each port is hard wired to power, and not affected by this bit. When an over-current condition is detected on a powered port, the xHC shall transition the PP bit in each affected port from a 1 to 0 (removing power from the port). Note: If this is an SSIC Port, then the DSP Disconnect process is initiated by '1' to '0' transition of PP. Refer to section 5.1.2 in the SSIC Spec for more information. Refer to section 4.19.4 for more information. |
| 8:5 | 5h<br>RW | **PLS:** Port Link State (PLS) RWS. Default = RxDetect (5). This field is used to power manage the port and reflects its current link state. When the port is in the Enabled state, system software may set the link U state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port. |
| 4 | 0h<br>RW | **PR:** Port Reset (PR) RW1S. Default = 0. 1 = Port Reset signaling is asserted. 0 = Port is not in Reset. When software writes a 1 to this bit generating a 0 to 1 transition, the bus reset sequence is initiated ; USB2 protocol ports shall execute the bus reset sequence as defined in the USB2 Spec. USB3 protocol ports shall execute the Hot Reset sequence as defined in the USB3 Spec. PR remains set until reset signaling is completed by the root hub. Note that software shall write a 1 to this flag to transition a USB2 port from the Polling state to the Enabled state. Refer to sections 4.15.2.3 and 4.19.1.1. This flag is 0 if PP is 0. |
| 3 | 0h<br>RW | **OCA:** Over-current Active (OCA) RO. Default = 0. 1 = This port currently has an over-current condition. 0 = This port does not have an over-current condition. This bit shall automatically transition from a 1 to a 0 when the over-current condition is removed. |
| 2 | 0h<br>RO | **RSVD18:** reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 1 | 0h<br>RW | **PED:** Port Enabled/Disabled (PED) RW1CS. Default = 0. 1 = Enabled. 0 = Disabled. Ports may only be enabled by the xHC. Software cannot enable a port by writing a 1 to this flag. A port may be disabled by software writing a 1 to this flag. This flag shall automatically be cleared to 0 by a disconnect event or other fault condition. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller or bus events. When the port is disabled (PED = 0) downstream propagation of data is blocked on this port, except for reset. For USB2 protocol ports: When the port is in the Disabled state, software shall reset the port (PR = 1) to transition PED to 1 and the port to the Enabled state. For USB3 protocol ports: When the port is in the Polling state (after detecting an attach), the port shall automatically transition to the Enabled state and set PED to 1 upon the completion of successful link training. When the port is in the Disabled state, software shall write a 5 (RxDetect) to the PLS field to transition the port to the Disconnected state. Refer to section 4.19.1.2. PED shall automatically be cleared to 0 when PR is set to 1, and set to 1 when PR transitions from 1 to 0 after a successful reset. Refer to Port Reset (PR) bit for more information on how the PED bit is managed. Note that when software writes this bit to a 1, it shall also write a 0 to the PR bit . This flag is 0 if PP is 0. |
| 0 | 0h<br>RW | **CCS:** Current Connect Status (CCS) ROS. Default = 0. 1 = A device is connected to the port. 0 = A device is not connected. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change (CSC) bit to be set to 1. Refer to sections 4.19.3 and 4.19.4 for more details on the Connect Status Change (CSC) assertion conditions. This flag is 0 if PP is 0. |

## 19.6.19 PORTPMSC1—Offset 424h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**PORTPMSC1:** [BAR] + 424h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

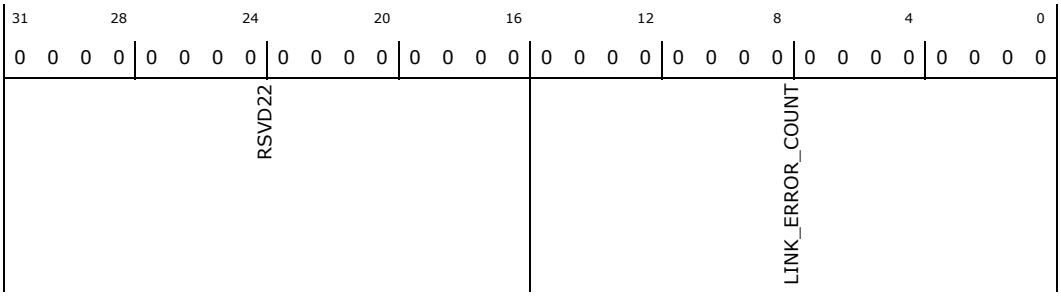
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:28 | 0h<br>RW | **PORT_TEST_CONTROL:** reserved |
| 27:16 | 0h<br>RO | **RSVD21:** reserved |
| 15:8 | 0h<br>RW | **L1DS:** Reg field L1DSLOT |

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:4 | 0h<br>RW | **HIRD:** Host Initiated Resume Duration (HIRD) - RW. Default = '0'. System software sets this field to indicate to the recipient device how long the xHC will drive resume if it (the xHC) initiates an exit from L1. The HIRD value is encoded as follows: Value Description 0h 50 s. (default) 1h 125 s. 2h 200 s. Fh 1.175 ms. The value of 0000b is interpreted as 50 s. Each incrementing value up adds 75 s. to the previous value. For example, 0001b is 125 s, 0010b is 200s and so on. Based on this rule, the maximum value resume drive time is at encoding value 1111b which represents 1.2ms. Note that the HIRD field is used by both software and hardware controlled LPM. Refer to section 4.23.5.1.1 of xhci specification for more information on HIRD use. Refer to Section 4.1 of the USB2 LPM spec for more information on the use of the HIRD field. |
| 3 | 0h<br>RW | **RWE:** Port Test Control |
| 2:0 | 0h<br>RO | **L1S:** L1 Status (L1S) - RO. Default = 0. This field is used by software to determine whether an L1based suspend request (LMP transaction) was successful, specifically: Value Meaning 0 Invalid - This field shall be ignored by software. 1 Success - Port successfully transitioned to L1 (ACK) 2 Not Yet - Device is unable to enter L1 at this time (NYET) 3 Not Supported -Device does not support L1 transitions (STALL) 4 Timeout/ Error -Device failed to respond to the LPM Transaction or an error occurred 5-7 Reserved The value of this field is only valid when the port resides in the L0 or L1 state (PLS = '0' or '2'). Refer to section 4.23.5.1.1 for more information. |

## 19.6.20 PORTLI—Offset 428h

Port Link Info Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**PORTLI:** [BAR] + 428h

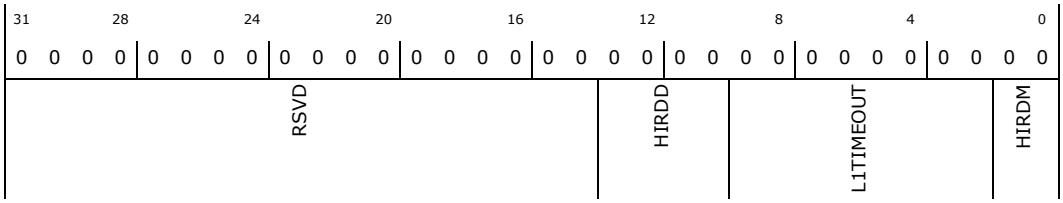
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0h<br>RO | **RSVD22:** reserved |
| 15:0 | 0h<br>RO | **LINK_ERROR_COUNT:** Reg field LINK_ERROR_COUNT |

## 19.6.21 PORTHLPMC—Offset 42Ch

The definition of the fields in the PORTHLPMC register depend on the USB protocol supported by the port. This register is in the Aux Power well. It is only reset by platform hardware during a cold reset or in response to a Host Controller Reset (HCRST).



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**PORTHLPMC:** [BAR] + 42Ch

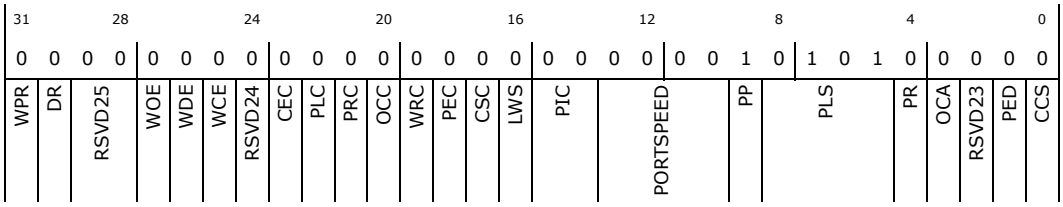
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

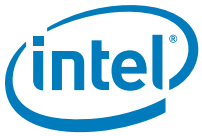
| Bit Range | Default & Access | Description |
|---|---|---|
| 31:14 | 0h<br>RO | **RSVD:** reserved |
| 13:10 | 0h<br>RW | **HIRDD:** Best Effort Service Latency Deep (BESLD) - RWS. Default = 0. System software sets this field to indicate to the recipient device how long the xHC will drive resume on an exit from U2. Refer to section 4.23.5.1.1.1 for more information on BESLD use. The BESLD value encoding is defined in Table 13. Refer to section 5.2.6 for information on how DBESLD may be used to establish an initial value for BESLD |
| 9:2 | 0h<br>RW | **L1TIMEOUT:** L1 Timeout RWS. Default = 00h. Timeout value for the L1 inactivity timer (LPM Timer). This field shall be set to 00h by the assertion of PR to 1. Refer to section 4.23.5.1.1.1 for more information on L1 Timeout operation. The following are permissible values: for 00h 128 s. (default). for 01h 256 s. for 02h 512 s. for 03h 768 s. . . . for FFh 65,280 s. |
| 1:0 | 0h<br>RW | **HIRDM:** Host Initiated Resume Duration Mode (HIRDM) - RWS. Default = 0h. Indicates which HIRD value should be used. The following are permissible values: for 0 Initiate L1 using BESL only on timeout. (default). for 1 Initiate L1 using BESLD on timeout. If rejected by device, initiate L1 using BESL. for 3-2 Reserved. |

## 19.6.22 PORTSC2—Offset 430h

A host controller shall implement one or more port registers. The number of port registers implemented by a particular instantiation of a host controller is documented in the HCSPARAMS1 register (Section 5.3.3). Software uses this information as an input parameter to determine how many ports need to be serviced



### Access Method



**Type:** Memory Mapped I/O Register (Size: 32 bits)

**PORTSC2:** [BAR] + 430h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

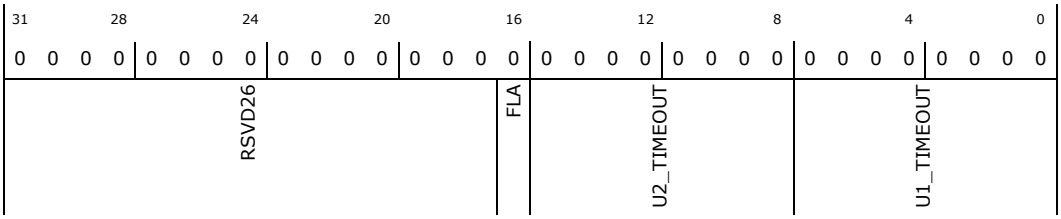
**Default:** 000002A0h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h<br>RW | **WPR:** Warm Port Reset (WPR) RW1S/RsvdZ. Default = 0. When software writes a 1 to this bit, the Warm Reset sequence as defined in the USB3 Specification is initiated and the PR flag is set to 1. Once initiated, the PR, PRC, and WRC flags shall reflect the progress of the Warm Reset sequence. This flag shall always return 0 when read. Refer to section 4.19.5.1. This flag only applies to USB3 protocol ports. For USB2 protocol ports it shall be RsvdZ. |
| 30 | 0h<br>RW | **DR:** Device Removable (DR) - RO. This flag indicates if this port has a removable device attached. 1 = Device is non-removable. 0 = Device is removable. |
| 29:28 | 0h<br>RO | **RSVD25:** reserved |
| 27 | 0h<br>RW | **WOE:** Wake on Over-current Enable (WOE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to over-current conditions as system wake-up eventsn. Refer to section 4.15 for operational model. |
| 26 | 0h<br>RW | **WDE:** Wake on Disconnect Enable (WDE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to device disconnects as system wake-up eventsn. Refer to section 4.15 for operational model. |
| 25 | 0h<br>RW | **WCE:** Wake on Connect Enable (WCE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to device connects as system wake-up events . Refer to section 4.15 for operational model. |
| 24 | 0h<br>RO | **RSVD24:** reserved |
| 23 | 0h<br>RW | **CEC:** Port Config Error Change (CEC) RW1CS/RsvdZ. Default = 0. This flag indicates that the port failed to configure its link partner. 0 = No change. 1 = Port Config Error detected. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.2 of XHCI specification for more information on change bit usage. Note: This flag is valid only for USB3 protocol ports. For USB2 protocol ports this bit shall be RsvdZ. |
| 22 | 0h<br>RW | **PLC:** Port Link State Change (PLC) RW1CS. Default = 0. This flag is set to 1 due to the PLS transitions in the XHCI specification |
| 21 | 0h<br>RW | **PRC:** Port Reset Change (PRC) RW1CS. Default = 0. This flag is set to 1 due to a '1' to '0' transition of Port Reset (PR). e.g. when any reset processing (Warm or Hot) on this port is complete. Note that this flag shall not be set to 1 if the reset processing was forced to terminate due to software clearing PP or PED to '0'. 0 = No change. 1 = Reset complete. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.5.of XHCI specification. Refer to section 4.19.2 of XHCI specification. for more information on change bit usage. |
| 20 | 0h<br>RW | **OCC:** Over-current Change (OCC) RW1CS. Default = 0. This bit shall be set to a 1 when there is a 0 to 1 or 1 to 0 transition of Over-current Active (OCA). Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage. |
| 19 | 0h<br>RW | **WRC:** Warm Port Reset Change (WRC) RW1CS/RsvdZ. Default = 0. This bit is set when Warm Reset processing on this port completes. 0 = No change. 1 = Warm Reset complete. Note that this flag shall not be set to 1 if the Warm Reset processing was forced to terminate due to software clearing PP or PED to '0'. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.5.1. Refer to section 4.19.2 for more information on change bit usage. This bit only applies to USB3 protocol ports. For USB2 protocol ports it shall be RsvdZ. |
| 18 | 0h<br>RW | **PEC:** Port Enabled/Disabled Change (PEC) RW1CS. Default = 0. 1 = change in PED. 0 = No change. Note that this flag shall not be set if the PED transition was due to software setting PP to 0. Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage. For a USB2 protocol port, this bit shall be set to 1 only when the port is disabled due to the appropriate conditions existing at the EOF2 point (refer to section 11.8.1 of the USB2 Specification for the definition of a Port Error). For a USB3 protocol port, this bit shall never be set to 1. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 17 | 0h<br>RW | **CSC:** Connect Status Change (CSC) RW1CS. Default = 0. 1 = Change in CCS. 0 = No change. This flag indicates a change has occurred in the ports Current Connect Status (CCS) or Cold Attach Status (CAS) bits. Note that this flag shall not be set if the CCS transition was due to software setting PP to 0, or the CAS transition was due to software setting WPR to 1. The xHC sets this bit to 1 for all changes to the port device connect status , even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, root hub hardware will be setting an already-set bit (i.e., the bit will remain 1). Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage. |
| 16 | 0h<br>RW | **LWS:** Port Link State Write Strobe (LWS) RW. Default = 0. When this bit is set to 1 on a write reference to this register, this flag enables writes to the PLS field. When 0, write data in PLS field is ignored. Reads to this bit return 0. |
| 15:14 | 0h<br>RW | **PIC:** Port Indicator Control (PIC) RWS. Default = 0. Writing to these bits has no effect if the Port Indicators (PIND) bit in the HCCPARAMS register is a 0 |
| 13:10 | 0h<br>RW | **PORTSPEED:** Port Speed (Port Speed) ROS. Default = 0. This field identifies the speed of the connected USB Device. This field is only relevant if a device is connected (CCS = 1) in all other cases this field shall indicate Undefined Speed. |
| 9 | 1h<br>RW | **PP:** Port Power (PP) RWS. Default = 1. This flag reflects a port's logical, power control state. Because host controllers can implement different methods of port power switching, this flag may or may not represent whether (VBus) power is actually applied to the port. When PP equals a '0' the port is nonfunctional and shall not report attaches, detaches, or Port Link State (PLS) changes. However, the port shall report over-current conditions when PP = 0 if PPC = 0. After modifying PP, software shall read PP and confirm that it is reached its target state before modifying it again , undefined behavior may occur if this procedure is not followed. 0 = This port is in the Powered-off state. 1 = This port is not in the Powered-off state. If the Port Power Control (PPC) flag in the HCCPARAMS register is '1', then xHC has port power control switches and this bit represents the current setting of the switch ('0' = off, '1' = on). If the Port Power Control (PPC) flag in the HCCPARAMS register is '0', then xHC does not have port power control switches and each port is hard wired to power, and not affected by this bit. When an over-current condition is detected on a powered port, the xHC shall transition the PP bit in each affected port from a 1 to 0 (removing power from the port). Note: If this is an SSIC Port, then the DSP Disconnect process is initiated by '1' to '0' transition of PP. Refer to section 5.1.2 in the SSIC Spec for more information. Refer to section 4.19.4 for more information. |
| 8:5 | 5h<br>RW | **PLS:** Port Link State (PLS) RWS. Default = RxDetect (5). This field is used to power manage the port and reflects its current link state. When the port is in the Enabled state, system software may set the link U state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port. |
| 4 | 0h<br>RW | **PR:** Port Reset (PR) RW1S. Default = 0. 1 = Port Reset signaling is asserted. 0 = Port is not in Reset. When software writes a 1 to this bit generating a 0 to 1 transition, the bus reset sequence is initiated ; USB2 protocol ports shall execute the bus reset sequence as defined in the USB2 Spec. USB3 protocol ports shall execute the Hot Reset sequence as defined in the USB3 Spec. PR remains set until reset signaling is completed by the root hub. Note that software shall write a 1 to this flag to transition a USB2 port from the Polling state to the Enabled state. Refer to sections 4.15.2.3 and 4.19.1.1. of XHCI specification. This flag is 0 if PP is 0. |
| 3 | 0h<br>RW | **OCA:** Over-current Active (OCA) RO. Default = 0. 1 = This port currently has an over-current condition. 0 = This port does not have an over-current condition. This bit shall automatically transition from a 1 to a 0 when the over-current condition is removed. |
| 2 | 0h<br>RO | **RSVD23:** reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 1 | 0h<br>RW | **PED:** Port Enabled/Disabled (PED) RW1CS. Default = 0. 1 = Enabled. 0 = Disabled. Ports may only be enabled by the xHC. Software cannot enable a port by writing a 1 to this flag. A port may be disabled by software writing a 1 to this flag. This flag shall automatically be cleared to 0 by a disconnect event or other fault condition. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller or bus events. When the port is disabled (PED = 0) downstream propagation of data is blocked on this port, except for reset. For USB2 protocol ports: When the port is in the Disabled state, software shall reset the port (PR = 1) to transition PED to 1 and the port to the Enabled state. For USB3 protocol ports: When the port is in the Polling state (after detecting an attach), the port shall automatically transition to the Enabled state and set PED to 1 upon the completion of successful link training. When the port is in the Disabled state, software shall write a 5 (RxDetect) to the PLS field to transition the port to the Disconnected state. Refer to section 4.19.1.2. of xhci specification. PED shall automatically be cleared to 0 when PR is set to 1, and set to 1 when PR transitions from 1 to 0 after a successful reset. Refer to Port Reset (PR) bit for more information on how the PED bit is managed. Note that when software writes this bit to a 1, it shall also write a 0 to the PR bit. This flag is 0 if PP is 0. |
| 0 | 0h<br>RW | **CCS:** Current Connect Status (CCS) ROS. Default = 0. 1 = A device is connected to the port. 0 = A device is not connected. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change (CSC) bit to be set to 1. Refer to sections 4.19.3 and 4.19.4 for more details on the Connect Status Change (CSC) assertion conditions. This flag is 0 if PP is 0. |

## 19.6.23 PORTPMSC2—Offset 434h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**PORTPMSC2:** [BAR] + 434h

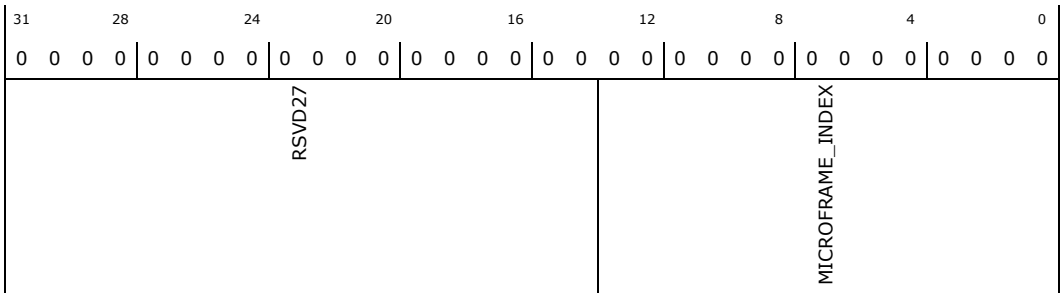
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:17 | 0h<br>RO | **RSVD26:** reserved |
| 16 | 0h<br>RW | **FLA:** Reg field FLA |
| 15:8 | 0h<br>RW | **U2_TIMEOUT:** Reg field U2_TIMEOUT |
| 7:0 | 0h<br>RW | **U1_TIMEOUT:** Reg field U1_TIMEOUT |

## 19.6.24 MFINDEX—Offset 440h

Microframe Index Register Bit Definitions.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

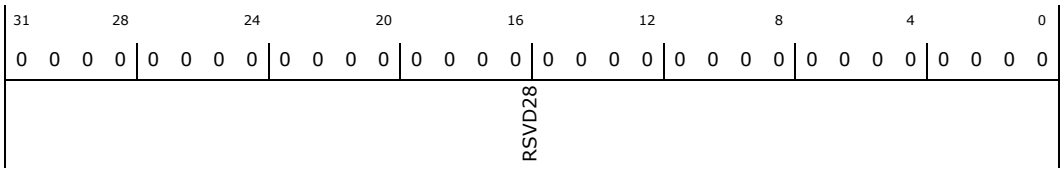
**MFINDEX:** [BAR] + 440h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:14 | 0h<br>RO | **RSVD27:** reserved |
| 13:0 | 0h<br>RO | **MICROFRAME_INDEX:** Reg field MICROFRAME_INDEX |

## 19.6.25 RsvdZ—Offset 444h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**RsvdZ:** [BAR] + 444h

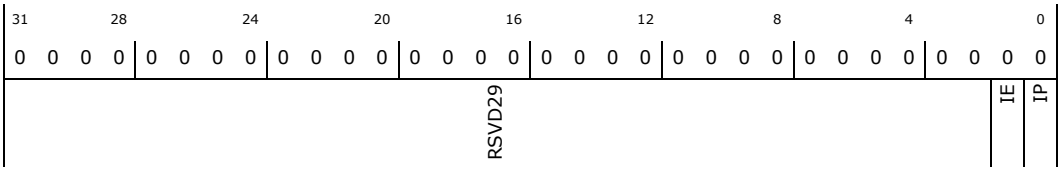
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **RSVD28:** reserved |

## 19.6.26 IMAN—Offset 460h

Interrupter Management Register Bit Definitions.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**IMAN:** [BAR] + 460h

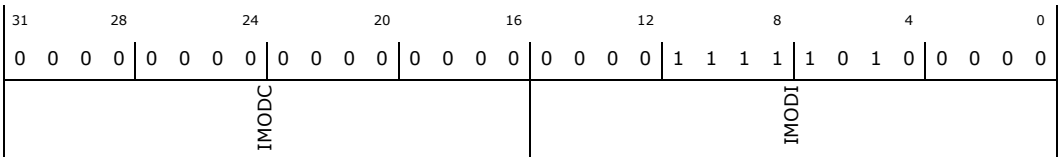
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 0h<br>RO | **RSVD29:** reserved |
| 1 | 0h<br>RW | **IE:** Interrupt Enable (IE) RW. Default = 0. This flag specifies whether the Interrupter is capable of generating an interrupt. When this bit and the IP bit are set (1), the Interrupter shall generate an interrupt when the Interrupter Moderation Counter reaches 0. If this bit is 0, then the Interrupter is prohibited from generating interrupts. |
| 0 | 0h<br>RW | **IP:** Interrupt Pending (IP) - RW1C. Default = 0. This flag represents the current state of the Interrupter. If IP = 1, an interrupt is pending for this Interrupter. A 0 value indicates that no interrupt is pending for the Interrupter. Refer to section 4.17.5 of XHCI specification for the conditions that modify the state of this flag. |

## 19.6.27 IMOD—Offset 464h

Interrupter Moderation Register. Software may use this register to pace (or even out) the delivery of interrupts to the host CPU. This register provides a guaranteed inter-interrupt delay between interrupts asserted by the xHC, regardless of USB traffic conditions. To independently validate configuration settings, software may use the following algorithm to convert the inter-interrupt Interval value to the common 'interrupts/sec' performance metric:



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**IMOD:** [BAR] + 464h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

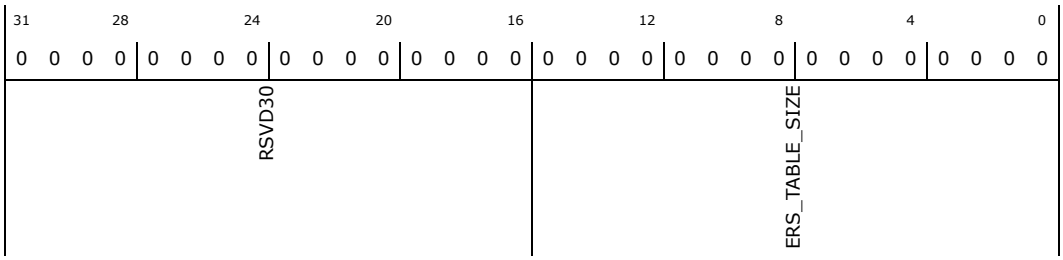
**Default:** 00000FA0h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0h<br>RW | **IMODC:** Interrupt Moderation Counter (IMODC) - RW. Default = undefined. Down counter. Loaded with the IMODI value whenever IP is cleared to '0', counts down to '0', and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags = '1', and EHB = '0'. This counter may be directly written by software at any time to alter the interrupt rate. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | fa0h<br>RW | **IMODI:** Interrupt Moderation Interval (IMODI) - RW. Default = '4000' (~1ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty. |

## 19.6.28 ERSTSZ—Offset 468h

Event Ring Segment Table Size Register Bit Definitions.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

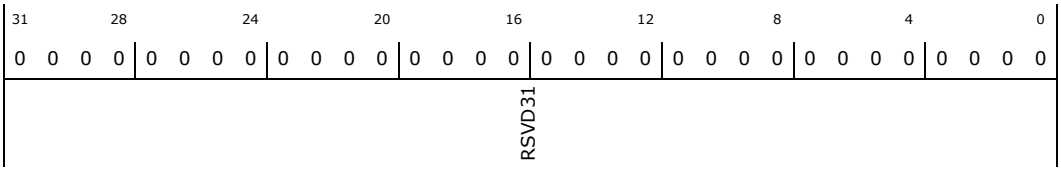
**ERSTSZ:** [BAR] + 468h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0h<br>RO | **RSVD30:** reserved |
| 15:0 | 0h<br>RW | **ERS_TABLE_SIZE:** Event Ring Segment Table Size RW. Default = 0. This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (5.3.4). For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring. For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled. |

## 19.6.29 RsvdP—Offset 46Ch



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**RsvdP:** [BAR] + 46Ch

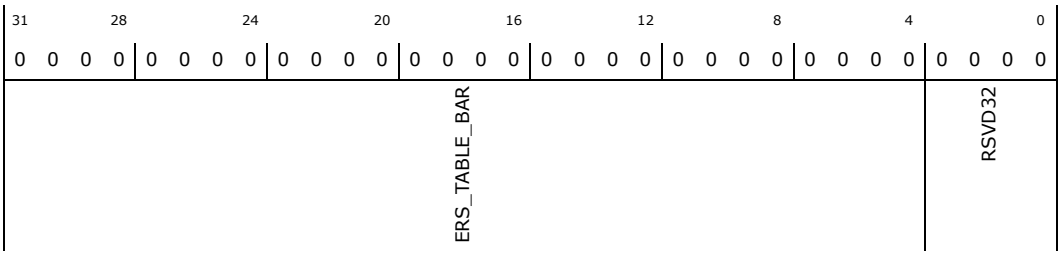
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **RSVD31:** reserved |

## 19.6.30 ERSTBA_LO—Offset 470h

Register ERSTBA_LO



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ERSTBA_LO:** [BAR] + 470h

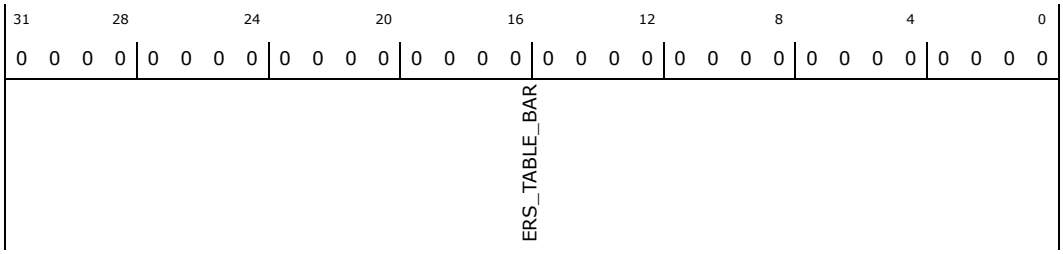
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:4 | 0h<br>RW | **ERS_TABLE_BAR:** Reg field ERS_TABLE_BAR |
| 3:0 | 0h<br>RO | **RSVD32:** reserved |

## 19.6.31 ERSTBA_HI—Offset 474h

Register ERSTBA_HI



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ERSTBA_HI:** [BAR] + 474h

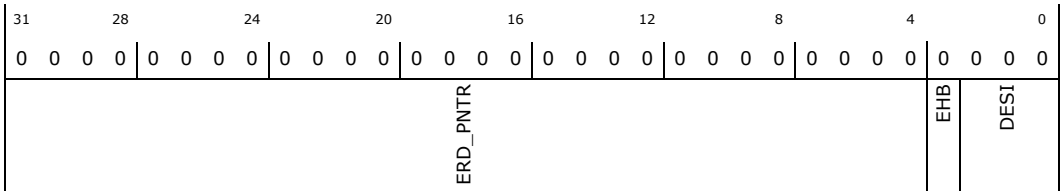
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **ERS_TABLE_BAR:** Reg field ERS_TABLE_BAR |

## 19.6.32 ERDP_LO—Offset 478h

Register ERDP_LO



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ERDP_LO:** [BAR] + 478h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

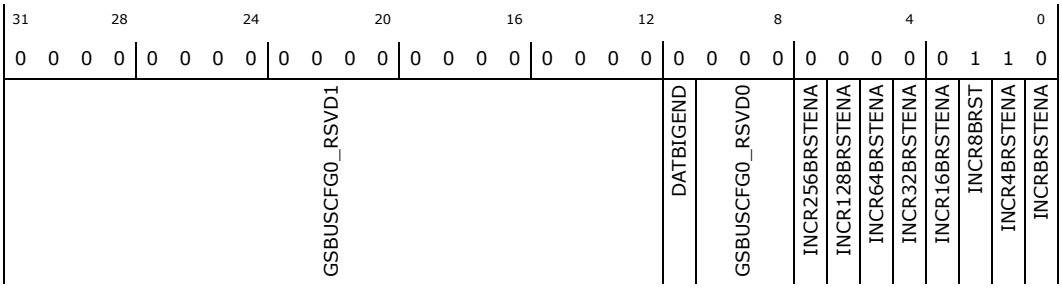
## 19.6.59 GSBUSCFG0—Offset C100h

Global SoC Bus Configuration Register 0



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**GSBUSCFG0:** [BAR] + C100h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

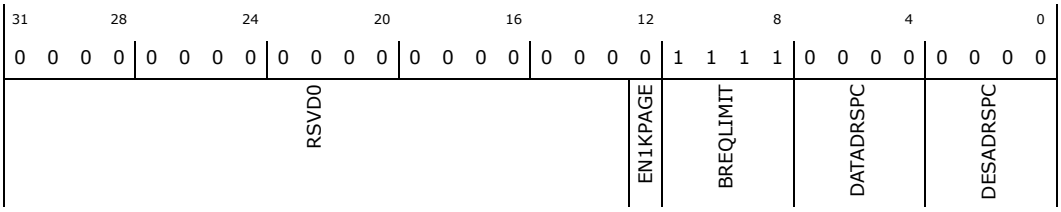
**Default:** 00000006h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:12 | 0h<br>RO | **GSBUSCFG0_RSVD1:** Reserved |
| 11 | 0h<br>RW | **DATBIGEND:** Data Access is Big-Endian (DatBigEnd). This bit controls the endian mode for data accesses. 0: Little-endian (default) 1: Big-endian In big-endian mode, DMA access (both read and write) for packet data will utilize a Byte Invariant Big-Endian mode (see Section Little-Endian and Big-Endian in the DWC SuperSpeed USB 3.0 Controller User Guide). Note: Since AXI requires byteinvariant endianness, setting DescBigend and DatBigEnd to one causes an address invariant transform to be applied, which is not appropriate.See section 9.3 and 9.4 of the AMBA AXI Specification. Hence for an AXI master (DWC_USB3_MBUS_TYPE=1), this bit must be set to zero. |
| 10:8 | 0h<br>RO | **GSBUSCFG0_RSVD0:** Reserved |
| 7 | 0h<br>RW | **INCR256BRSTENA:** INCR256 Burst Type Enable |
| 6 | 0h<br>RW | **INCR128BRSTENA:** INCR128 Burst Type Enable |
| 5 | 0h<br>RW | **INCR64BRSTENA:** INCR64 Burst Type Enable |

| Bit Range | Default & Access | Description |
|---|---|---|
| 4 | 0h<br>RW | **INCR32BRSTENA:** INCR32 Burst Type Enable |
| 3 | 0h<br>RW | **INCR16BRSTENA:** INCR16 Burst Type Enable |
| 2 | 1h<br>RW | **INCR8BRST:** INCR8 Burst Type Enable |
| 1 | 1h<br>RW | **INCR4BRSTENA:** INCR4 Burst Type Enable |
| 0 | 0h<br>RW | **INCRBRSTENA:** Undefined Length INCR Burst Type Enable (INCRBrstEna). Input to BUS-GM When enabled, this has higher priority than other burst types. For the AHB configuration. if this bit is set to 1, AHB master tries to do only one INCR burst for each transfer unless it has to break it at a 1Kbyte boundary. If this bit is set to 0, the AHB master may still use INCR burst type at the beginning and end bursts of transfers to align the address. The middle bursts are INCR4/8/16, depending when the type is enabled. |

## 19.6.60 GSBUSCFG1—Offset C104h

Global SoC Bus Configuration Register 1



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**GSBUSCFG1:** [BAR] + C104h

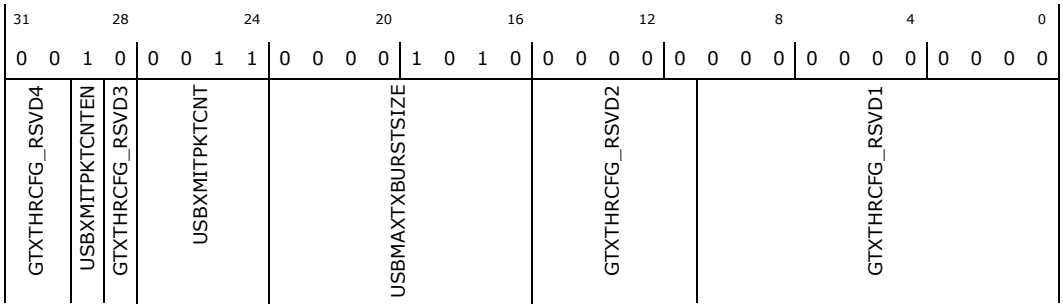
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

### Default: 00000F00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:13 | 0h<br>RO | **RSVD0:** reserved |
| 12 | 0h<br>RW | **EN1KPAGE:** 1k Page Boundary Enable: By default (this bit is disabled) the AXI breaks transfers at the 4k page boundary. When this bit is enabled, the AXI master (DMA data) breaks transfers at the 1k page boundary. |
| 11:8 | fh<br>RW | **BREQLIMIT:** AXI Pipelined Transfers Burst Request Limit (PipeTransLimit) The field controls the number of outstanding pipelined transfers requests the AXI master will push to the AXI slave. Once the AXI master reaches this limit, it will not make more requests on the AXI ARADDR and AWADDR buses until the associated data phases complete.This field is encoded as follows: h0: 1 request h1: 2 requests h2: 3 requests h3: 4 requests hF: 16 requests |
| 7:4 | 0h<br>RW | **DATADRSPC:** Reserved |
| 3:0 | 0h<br>RW | **DESADRSPC:** Reserved |

## 19.6.61 GTXTHRCFG—Offset C108h

Global Tx Threshold Control Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**GTXTHRCFG:** [BAR] + C108h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 230A0000h

|---|---|---|
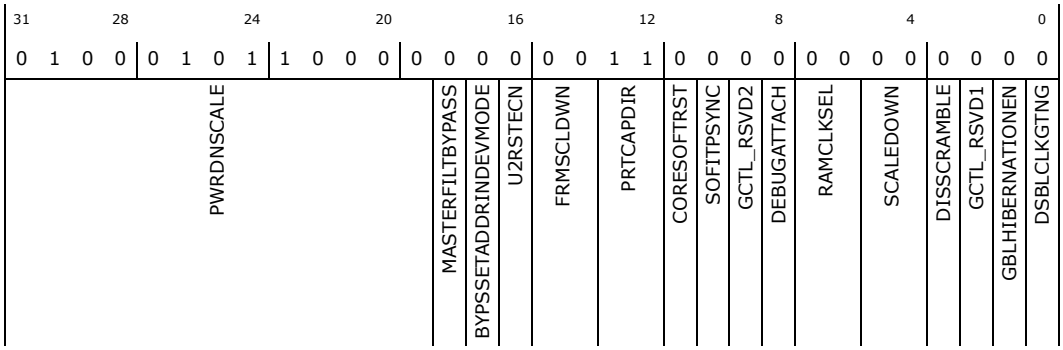
| 31:30 | 0h<br>RO | **GRXTHRCFG_RSVD3:** Reserved |
| 29 | 1h<br>RW | **USBRXPKTCNTSEL:** USB ReceivePacket Count Enable: This field enables/disables the USB reception multi-packet thresholding: n 0: The core can only start reception on the USB when the RX FIFO has space for at least one packet. n 1: The core can only start reception on the USB when the RX FIFO has space for at least USBRxPktCnt amount of packets. This mode is only valid in the host mode. It is only used for SuperSpeed. |
| 28 | 0h<br>RO | **GRXTHRCFG_RSVD2:** Reserved |
| 27:24 | 2h<br>RW | **USBRXPKTCNT:** USB Receive Packet Count: This field specifies space (in number of packets) that must be available in the RX FIFO before the core can start the corresponding USB RX transaction (burst). This field is only valid when the USB Receive Packet Count Enable field is set to one. The valid values are from 1 to 15. |
| 23:19 | 10h<br>RW | **USBMAXRXBURSTSIZE:** USB Maximum Receive Burst Size: This field is only valid when USBRxPktCntSel is one. This field specifies the Maximum Bulk IN burst the core should do. When the system bus is slower than the USB, RX FIFO can overrun during a long burst. User can program a smaller value to this field to limit the RX burst size that the core can do. It only applies to SS Bulk, Isochronous, and Interrupt IN endpoints in the host mode. Valid values are from 1 to 16. |
| 18:0 | 0h<br>RO | **GRXTHRCFG_RSVD1:** Reserved |

## 19.6.63 GCTL—Offset C110h

Global Common Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**GCTL:** [BAR] + C110h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

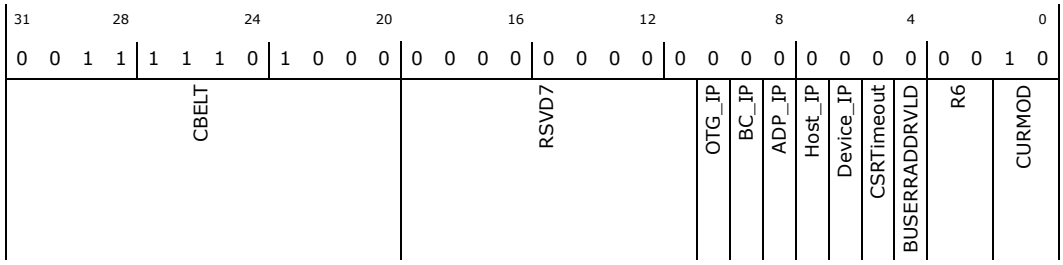
**Default:** 45803000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:19 | 08b0h RW | **PWRDNSCALE:** Reg field PWRDNSCALE |
| 18 | 0h RW | **MASTERFILTBYPASS:** Master Filter Bypass: When this bit is set to 1'b1, irrespective of the parameter DWC_USB3_EN_BUS_FILTERS chosen, all the filters in the DWC_usb3_filter module will be bypassed. The double synchronizers to mac_clk preceding the filters will also be bypassed. For enabling the filters, this bit should be 1'b0. |
| 17 | 0h RW | **BYPSSETADDRINDEVMODE:** |
| 16 | 0h RW | **U2RSTECN:** If the super speed connection fails during POLL or LMP exchange, the device connects at non-SS mode. If this bit is set, then device attempts three more times to connect at SS, even if it previously failed to operate in SS mode. |
| 15:14 | 0h RW | **FRMSCLDWN:** This field scales down device view of a SOF/USOF/ITP duration. For SS/HS mode: Value of 2'h3 implements interval to be 15. 625 us Value of 2'h2 implements interval to be 31.25 us Value of 2'h1 implements interval to be 62.5 us Value of 2'h0 implements interval to be125us For FS mode, the scale-down value is multiplied by 8. |
| 13:12 | 3h RW | **PRTCAPDIR:** Reg field PRTCAPDIR |
| 11 | 0h RW | **CORESOFTRST:** Core Soft Reset (CoreSoftReset) 1b0 - No soft reset 1b1 - Soft reset to core When you reset PHYs (using GUBS3PHYCFG or GUSB3PIPECTL registers), you must keep the core in reset state until PHY clocks are stable. This controls the bus, ram, and mac domain resets. |
| 10 | 0h RW | **SOFITPSYNC:** Sync ITP to reference clock |
| 9 | 0h RO | **GCTL_RSVD2:** Disable U1/U2 timer Scaledown (U1U2TimerScale) If set to '1' along with GCTL[5:4] (ScaleDown) = 2'bX1 disables the scale down of U1/U2 inactive timer values. This is for simulation mode only. |
| 8 | 0h RW | **DEBUGATTACH:** Debug Attach |
| 7:6 | 0h RW | **RAMCLKSEL:** Reg field RAMCLKSEL |
| 5:4 | 0h RW | **SCALEDOWN:** reg field SCALEDOWN |
| 3 | 0h RW | **DISSCRAMBLE:** Disable Scrambling |
| 2 | 0h RO | **GCTL_RSVD1:** Reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 1 | 0h<br>RW | **GBLHIBERNATIONEN:** This bit enables hibernation at the global level. If hibernation is not enabled via this bit, the PMU immediately accepts the D0-)D3 and D3-)D0 power state change requests, but does not save or restore any core state. In addition, the PMUs will never drive the PHY interfaces and let the core continue to drive the PHY interfaces. |
| 0 | 0h<br>RW | **DSBLCLKGTNG:** Disable Clock Gating |

## 19.6.64 GSTS—Offset C118h

Global Status Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**GSTS:** [BAR] + C118h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 3E800002h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 3e8h<br>RO | **CBELT:** Current BELT Value: In Host mode, this field indicates the minimum value of all received device BELT values and the BELT value that is set by the Set Latency Tolerance Value command. |
| 19:11 | 0h<br>RO | **RSVD7:** reserved |
| 10 | 0h<br>RO | **OTG_IP:** OTG Interrupt Pending: This field indicates that there is a pending interrupt pertaining to OTG in OEVT register. |
| 9 | 0h<br>RO | **BC_IP:** Battery Charger Interrupt Pending: This field indicates that there is a pending interrupt pertaining to BC in BCEVT register. |
| 8 | 0h<br>RO | **ADP_IP:** ADP Interrupt Pending: This field indicates that there is a pending interrupt pertaining to ADP in ADPEVT register. |
| 7 | 0h<br>RO | **Host_IP:** Host Interrupt Pending: This field indicates that there is a pending interrupt pertaining to xHC in the Host event queue. |
| 6 | 0h<br>RO | **Device_IP:** Device Interrupt Pending: This field indicates that there is a pending interrupt pertaining to peripheral (device) operation in the Device event queue. |
| 5 | 0h<br>RO | **CSRTimeout:** CSR Timeout: When this bit is 1'b1, it indicates that software performed a write or read to a core register that could not be completed within DWC_USB3_CSR_ACCESS_TIMEOUT bus clock cycles (default: 65535). |
| 4 | 0h<br>RO | **BUSERRADDRVLD:** Bus Error Address Valid |

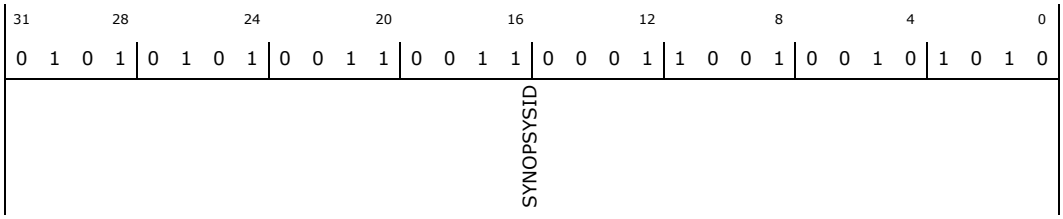
| 1:0 | 2h<br>RO | **CURMOD:** Reg field CURMOD |

## 19.6.65 GSNPSID—Offset C120h

flag Value After Reset: 0x5533210a Global Synopsys ID Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**GSNPSID:** [BAR] + C120h

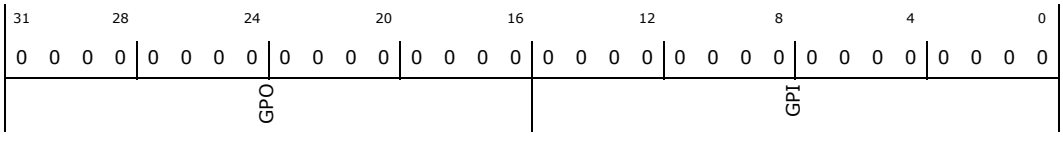
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 5533192Ah

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 5533192ah<br>RO | **SYNOPSYSID:** flag Value After Reset: 0x5533210a Reg field SYNOPSYSID |

## 19.6.66 GGPIO—Offset C124h

Global General Purpose Input/Output Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**GGPIO:** [BAR] + C124h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

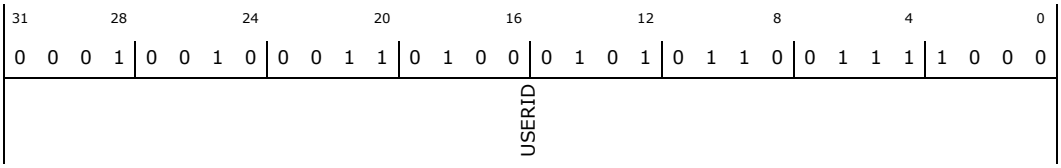
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0h<br>RW | **GPO:** General Purpose Output: This field's value is driven out on the gp_o[15:0] core output port. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 0h<br>RO | **GPI:** General Purpose Input: This field's read value reflects the gp_i[15:0] core input value. |

## 19.6.67 GUID—Offset C128h

flag Value After Reset: 0x8086a0 Global User ID Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**GUID:** [BAR] + C128h

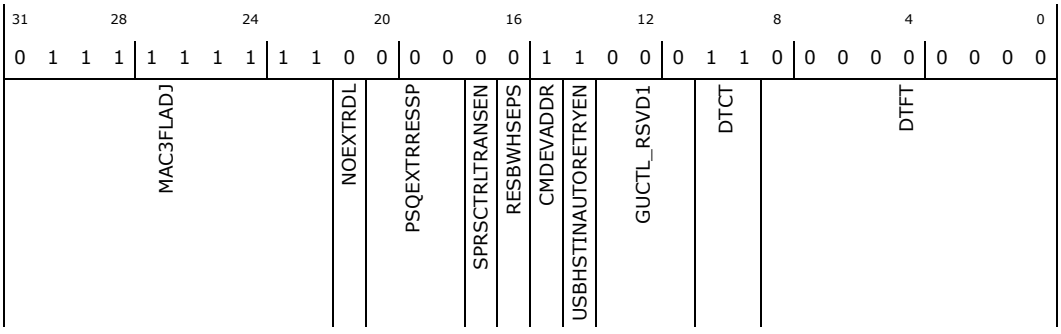
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 12345678h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 12345678h<br>RW | **USERID:** flag Value After Reset: 0x8086a0 Reg field USERID |

## 19.6.68 GUCTL—Offset C12Ch

flag Value After Reset: 0x200ce00 Global User Control Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**GUCTL:** [BAR] + C12Ch

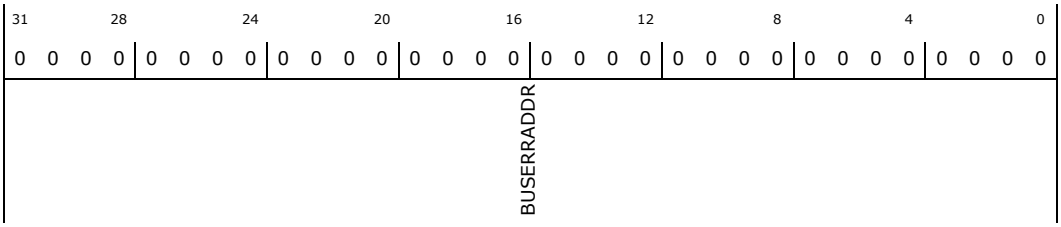
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 7FC0C600h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:22 | 1ffh RW | **MAC3FLADJ:** |
| 21 | 0h RW | **NOEXTRDL:** |
| 20:18 | 0h RW | **PSQEXTRRESSP:** |
| 17 | 0h RW | **SPRSCTRLTRANSEN:** Sparse Control Transaction Enable: Some devices are slow in responding to Control transfers. Scheduling multiple transactions in one microframe/ frame can cause these devices to misbehave. If this bit is set to 1'b1, the host controller schedules transactions for a Control transfer in different microframes/frames. |
| 16 | 0h RW | **RESBWHSEPS:** Reserving 85% Bandwidth for HS Periodic EPs |
| 15 | 1h RW | **CMDEVADDR:** Compliance Mode for Device Address: When this bit is 1'b1, Slot ID may have different value than Device Address if max_slot_enabled ( 128. n 1'b1: Increment Device Address on each Address Device command. n 1'b0: Device Address is equal to Slot ID. The xHCI compliance requires this bit to be set to 1'. The 0' mode is for debug purpose only. This all ows you to easily identify a device connected to a port in the Lecroy or Eliisys trace during hardware debug. This bit is valid in Host and DRD configuration and is used in host mode operation only. Ignore this bit in device mode. |
| 14 | 1h RW | **USBHSTINAUTORETRYEN:** Host IN Auto Retry: When set, this field enables the Auto Retry feature. For IN transfers (non-isochronous) that encounter data packets with CRC errors or internal overrun scenarios, the auto retry feature causes the Host core to reply to the device with a non-terminating retry ACK (that is, an ACK transaction packet with Retry = 1 and NumP != 0). If the Auto Retry feature is disabled (default), the core will respond with a terminating retry ACK (that is, an ACK transaction packet with Retry = 1 and NumP = 0). n 1'b0: Auto Retry Disabled n 1'b1: Auto Retry Enabled In device mode this bit should be 0 |
| 13:11 | 0h RO | **GUCTL_RSVD1:** |
| 10:9 | 3h RW | **DTCT:** Device Timeout Coarse Tuning: This field is a Host mode parameter which determines how long the host waits for a response from device before considering a timeout. The core first checks the DTCT value. If it is 0, then the timeout value is defined by the DTFT. If it is non-zero, then it uses the following timeout values: n 2'b00: 0 usec -) use DTFT value instead n 2'b01: 500 usec n 2'b10: 1.5 msec n 2'b11: 6.5 msec |
| 8:0 | 0h RW | **DTFT:** Device Timeout Fine Tuning: This field is a Host mode parameter which determines how long the host waits for a response from device before considering a timeout. For DTFT field to take effect, DTCT must be set to 2'b00. The DTFT value is the number of 125 MHz clocks * 256 to count before considering a device timeout. For the 125 MHz clk (8 ns period), this is calculated as follows: (DTFT value) * 256 * (8 ns) Quick Reference: n if DTFT = 0x2, 2*256*8 = 4usec timeout n if DTFT = 0x5, 5*256*8 = 10usec timeout n if DTFT = 0xA, 10*256*8 = 20usec timeout n if DTFT = 0x10, 16*256*8 = 32usec timeout n if DTFT = 0x19, 25*256*8 = 51usec timeout n if DTFT = 0x31, 49*256*8 = 100usec timeout n if DTFT = 0x62, 98*256*8 = 200usec timeout |

## 19.6.69 GBUSERRADDRLO—Offset C130h

Register GBUSERRADDRLO



### Access Method

|---|---|---|
| 14 | 1h RW | **ABORTRXDETU2EXIT:** |
| 13 | 0h RW | **SKIPRXDET:** Skip Rx Detect: When set, the core skips Rx Detection if pipe3_RxElecIdle is low. Skip is defined as waiting for the appropriate timeout, then repeating the operation. |
| 12 | 0h RW | **LFPSP0ALGN:** LFPS P0 Align: When set, n The core deasserts LFPS transmission on the clock edge that it requests Phy power state 0 when exiting U1, U2, or U3 low power states. Otherwise, LFPS transmission is asserted one clock earlier. n The core requests symbol transmission two pipe3_rx_pclks periods after the PHY asserts PhyStatus as a result of the PHY switching from P1 or P2 state to P0 state. Currently, this bit is only used in USB 3.0 HUB with Synopsys PHY. For other USB 3.0 Host, Device, and DRD cores, this is not required. |

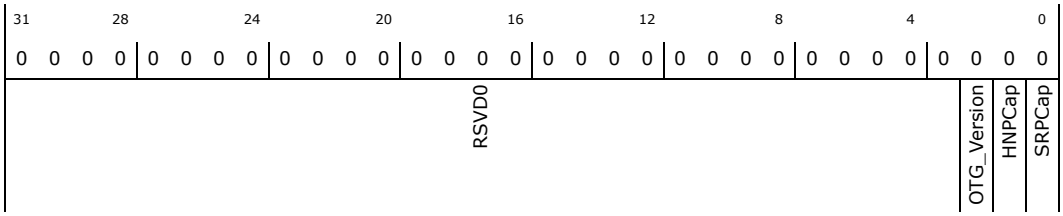
## 19.6.250 OCFG—Offset CC00h

OTG Configuration Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OCFG:** [BAR] + CC00h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

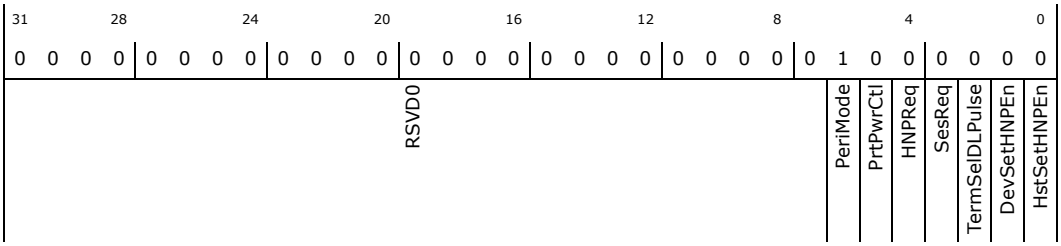
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:3 | 0h RO | **RSVD0:** reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 2 | 0h<br>RW | **OTG_Version:** |
| 1 | 0h<br>RW | **HNPCap:** RSP/HNP Capability: The terminology RSP is used when the core is operating in SS mode, and HNP is used when the core is operating in non-SS mode. The application uses this bit to control the DWC_usb3 core's RSP/HNP capabilities. n 1'b0: RSP/HNP capability is not enabled. n 1'b1: RSP/HNP capability is enabled. Note: This bit is writable only if RSP/HNP mode is specified for Mode of Operation in coreConsultant, that is when DWC_USB3_EN_OTG != 0 and DWC_USB3_MODE = DRD. If RSP/HNP mode is not specified, this bit is Read Only, and is set to 1'b0. |
| 0 | 0h<br>RW | **SRPCap:** SRP Capability: The application uses this bit to control the DWC_usb3 core's SRP capabilities. n 1'b0: SRP capability is not enabled. n 1'b1: SRP capability is enabled. If this bit is not set for B-device, it cannot request the connected A-device (host) to activate Vbus and start a session. If this bit is not set for A-device, it cannot detect the SRP from B-device (device) to activate Vbus and start a session. Note: This bit is writable only if OTG is enabled in coreConsultant (DWC_USB3_EN_OTG !=0). If OTG is not enabled, then this bit is Read Only and is set to 1'b0. |

## 19.6.251 OCTL—Offset CC04h

OTG Control Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OCTL:** [BAR] + CC04h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

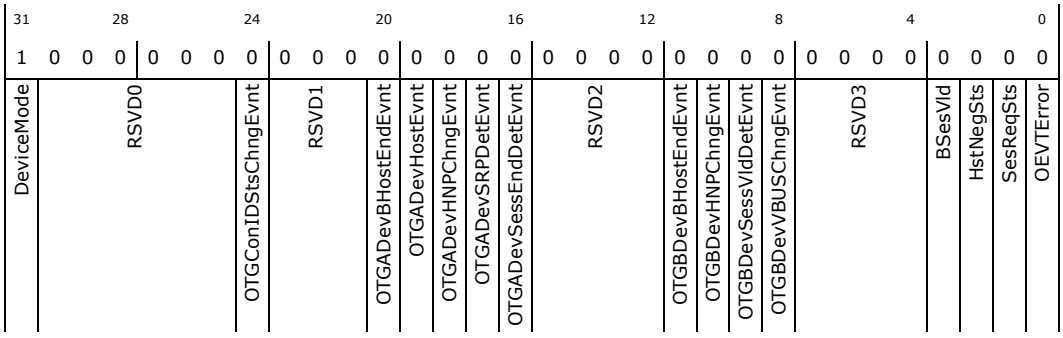
### Default: 00000040h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:7 | 0h<br>RO | **RSVD0:** reserved |
| 6 | 1h<br>RW | **PeriMode:** Peripheral Mode: Application uses this bit to program the core to work as a peripheral or as a host. n 1'b0: The OTG device acts as a host n 1'b1: The OTG device acts as a peripheral |
| 5 | 0h<br>RW | **PrtPwrCtl:** Port Power Control: Application sets this bit to initiate Vbus drive when it is an A-device. The application should clearthis bit only if it wants to switch off the Vbus to B-device. The core clears this bit in the following conditions: n Transition from any state to A-IDLE state defined in OTG2.0 state machine. n When AIDL_BDIS_TOUT occurs in A_SUSPEND n When A_WAIT_BCON_TOUT occurs in A_WAIT_BCON n Transition to any B- state defined in OTG2.0 state machine |
| 4 | 0h<br>RW | **HNPReq:** HNP Request: n 1'b0: No HNP request n 1'b1: HNP request The application sets this bit to initiate a HNP request to the connected USB host. The application clears this bit by writing a 1'b0 when either of the following is detected: n OEVT.OTGBDevBHostEndEvnt n OEVT.OTGBDevVBusChngEvnt |

| Bit Range | Default & Access | Description |
|---|---|---|
| 3 | 0h<br>RW | **SesReq:** Session Request: n 1'b0: No session request n 1'b1: Session request The application sets this bit to initiate a session request on the USB. Writing 1'b1 to this field will trigger the core to send SRP (data line pulsing) on PHY interface. In the absence of OEVT.OTGBDevSessVldDetEvnt after a session request, the application must wait for atleast TB_SRP_FAIL time (6 secs) before initiating another session request. This field returns 1'b0 when read. |
| 2 | 0h<br>RW | **TermSelDLPulse:** TermSel DLine Pulsing Selection: This bit selects utmi_termselect to drive data line pulse during SRP. n 1'b0: Data line pulsing using utmi_txvalid (default). n 1'b1: Data line pulsing using utmi_termsel. |
| 1 | 0h<br>RW | **DevSetHNPEn:** Device Set RSP/HNP Enable: n 1'b0: RSP/HNP is not enabled in the application n 1'b1: RSP/HNP is enabled in the application The application sets this bit in the following scenario: n In HS/FS mode, when it successfully receives a SetFeature.SetHNPEnable command from the connected USB host. n In SS mode, when it has sent a b3_ntf_hst_rel to the A-device, or the A-device has sent an a3_ntf_host_req. Note: The terminology RSP is used when the core is operating in SS mode, and HNP is used when the core is operating in non-SS mode. |
| 0 | 0h<br>RW | **HstSetHNPEn:** Host Set RSP/HNP Enable: n 1'b0: Host Set RSP/HNP is not enabled n 1'b1: Host Set RSP/HNP is enabled The application sets this bit in the following scenario: n In HS/FS mode, when it has successfully enabled HNP (using the SetFeature.SetHNPEnable command) from the connected device. n In SS mode, when it has successfully enabled b3_rsp_enable feature in RSP-capable Device using SetFeature command while operating as an A-Host, or when it has received a b3_ntf_hst_rel through SetFeature command while operating as A-peripheral. Note: The terminology RSP is used when the core is operating in SS mode, and HNP is used when the core is operating in non-SS mode. |

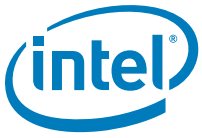
## 19.6.252 OEVT—Offset CC08h

Value After Reset: 0x0 OTG Events Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)



**OEVT:** [BAR] + CC08h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 80000000h

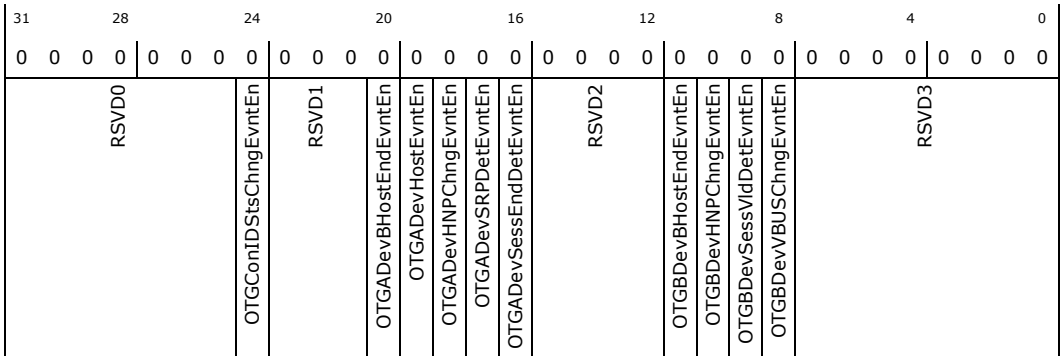
| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 1h<br>RO | **DeviceMode:** Device Mode: Indicates whether the device is in A-device or B-device mode based on utmiotg_iddig n 1'b0: A-Device mode n1'b1: B-Device mode The rest of the OTG Event Information bits (OTGxxxxEvtInfo) in OEVT register will be based on the contents of this field. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 30:25 | 0h<br>RO | **RSVD0:** reserved |
| 24 | 0h<br>RO | **OTGConIDStsChngEvnt:** Write Behavior: oneToClear Connector ID Status Change Event: Set in both A-Dev/B-Dev Mode. This event is generated when there is a change in connector ID status. |
| 23:21 | 0h<br>RO | **RSVD1:** reserved |
| 20 | 0h<br>RO | **OTGADevBHostEndEvnt:** Write Behavior: oneToClear A-device B-Host End Event: Set in A-device Mode Only. The event is generated when B-device hascompleted its host role. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation. |
| 19 | 0h<br>RO | **OTGADevHostEvnt:** Write Behavior: oneToClear A-device host event: Set in A-device Mode Only. This event is generated when A-device enters host role. In HS/FS mode, it occurs after the initial connect to a B-device as A-host as well as when there is a role change from A-peripheral to A-host. Note: This bit is applicable only for OTG 2.0 mode of operation. |
| 18 | 0h<br>RO | **OTGADevHNPChngEvnt:** Write Behavior: oneToClear A-Dev HNP Change Event: Set in A-device Mode Only. The event is generated when there is an HNP attempt. Note: This bit is applicable only for OTG 2.0 mode of operation. |
| 17 | 0h<br>RO | **OTGADevSRPDetEvnt:** Write Behavior: oneToClear SRP Detect Event: Set in A-device Mode Only. This event is asserted when a session request from the B-device is detected via SRP. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation. |
| 16 | 0h<br>RO | **OTGADevSessEndDetEvnt:** Write Behavior: oneToClear Session End Detected Event: Set in A-device Mode Only. This event is asserted when the utmisrp_avalid signal goes low indicating the end of a session. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation |
| 15:12 | 0h<br>RO | **RSVD2:** Reserved |
| 11 | 0h<br>RO | **OTGBDevBHostEndEvnt:** Write Behavior: oneToClear B-Device B-Host End Event: Set in B-device Mode Only. This event is generated when B-device has completed its host role. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation. |
| 10 | 0h<br>RO | **OTGBDevHNPChngEvnt:** Write Behavior: oneToClear B-Dev HNP Change Event: Set in B-Device Mode only. This event is generated when there is a Success or Failure of an HNP attempt. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation. |
| 9 | 0h<br>RO | **OTGBDevSessVldDetEvnt:** Write Behavior: oneToClear Session Valid Detected Event: Set in B-device Mode Only. This event is asserted when there is a valid Vbus from A-device and B-device succeeds in starting a session. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation. |
| 8 | 0h<br>RO | **OTGBDevVBUSChngEvnt:** Write Behavior: oneToClear Vbus Change Event: Set in B-device Mode Only. This event is asserted when the utmisrp_bvalid signal goes low (indicating the end of a session), or goes high. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation. |
| 7:4 | 0h<br>RO | **RSVD3:** reserved |
| 3 | 0h<br>RO | **BSesVld:** Indicates the Device mode transceiver status. Indicates the Device mode transceiver status. The core updates this bit when OEVTEN.OTGBDevVBUSChngEvnt is set. 1b0: B-session is not valid 1b1: B-session is valid Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation. |
| 2 | 0h<br>RO | **HstNegSts:** Host Negotiation Status: The core updates this bit when any of the following bits is set: n OEVTEN.OTGADevHNPChngEvnt n OEVTEN.OTGBDevHNPChngEvnt This bit indicates Host Negotiation Success or Failure. n 1'b0: Host negotiation failure. In A-device, for HS/FS, this indicates an imminent end of session indication from the core. In B-device, for HS/LS, it indicates that the timer used to wait for an A-device to signal a connection (b_ase0_brst_tmout in OTG 2.0) timed out resulting in B-device staying as B-peripheral. n 1'b1: Host negotiation success. This indicates that the host negotiation was successful. Note: This bit is a pplicable only for OTG 2.0 mode of operation. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 1 | 0h<br>RO | **SesReqSts:** Session Request Status: The core updates this bit when OEVTEN.OTGBDevSessVldDetEvnt is set. o 1'b0: Session request due to Vbus. This indicates that the session started due to Vbus without SRP detection by A-host. o 1'b1: Session request due to SRP. This indicates that the session started as a result of successful SRP detection by A-host. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation. |
| 0 | 0h<br>RO | **OEVTError:** Write Behavior: oneToClear OTG Event Error: There are no errors currently defined. |

## 19.6.253 OEVTEN—Offset CC0Ch

OTG Events Enable Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OEVTEN:** [BAR] + CC0Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

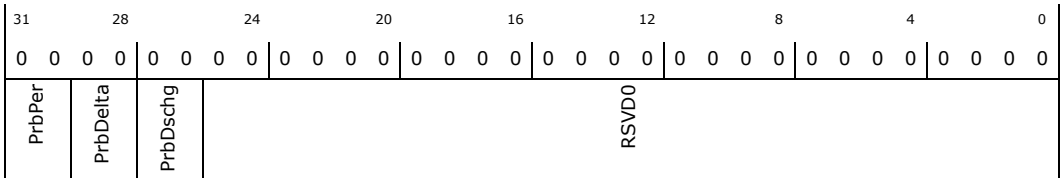
## 19.6.255 ADPCFG—Offset CC20h

ADP Configuration Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ADPCFG:** [BAR] + CC20h

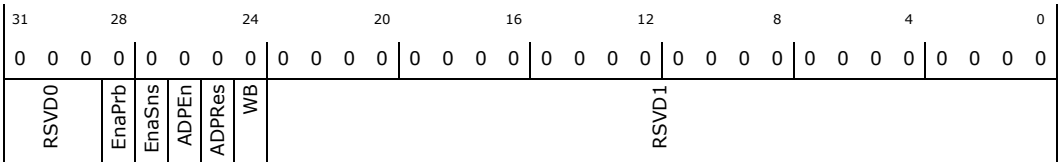
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RW | **PrbPer:** Probe Period: These bits set the T_ADP_PRB as follows: n 2'b00: 0.775 sec n 2'b01: 1.55 sec n 2'b10: 2.275 sec n 2'b11: Reserved The scaledown values for PrbPer are: n 2'b00: 12.5ms n 2'b01: 18.75ms n 2'b10: 25 ms n 2'b11: 31.25 ms |
| 29:28 | 0h<br>RW | **PrbDelta:** Probe Delta: These bits set the resolution for RTIM value. They are defined in units of 32 kHz clock cycles as follows: n2'b00: 1 cycles n 2'b01: 2 cycles n 2'b10: 3 cycles n 2'b11: 4 cycles For example, if this value is chosen to be 2'b01, it means that RTIM increments for every two 32 kHz clock cycles. |
| 27:26 | 0h<br>RW | **PrbDschg:** Probe Discharge: These bits set the time for TADP_DSCHG. They are defined as follows: n 2'b00: 4 msec n 2'b01: 8 msec n 2'b10: 16 msec n 2'b11: 32 msec The scaledown values for the PrbDschg are as follows: n 2'b00: 62.5 us n 2'b01: 125 us n 2'b10: 250 us n 2'b11: 500 us |
| 25:0 | 0h<br>RO | **RSVD0:** reserved |

## 19.6.256 ADPCTL—Offset CC24h

ADP Control Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ADPCTL:** [BAR] + CC24h

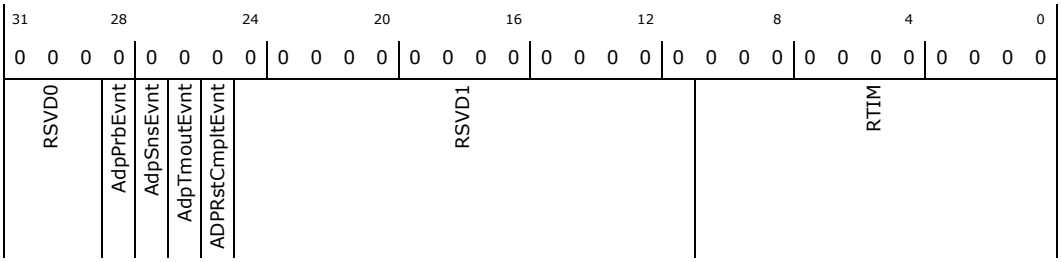
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RO | **RSVD0:** reserved |
| 28 | 0h<br>RW | **EnaPrb:** Enable Probe: When set to 1'b1 along with ADPEn, the core performs a probe operation. |
| 27 | 0h<br>RW | **EnaSns:** ADP Enable: When set to 1'b1, the core performs either ADP probing or sensing based on EnaPrb and EnaSns. ADPEn = 1'b0 gates the suspend clock for major portion of ADP related logic. |
| 26 | 0h<br>RW | **ADPEn:** ADP Enable: When set to 1'b1, the core performs either ADP probing or sensing based on EnaPrb and EnaSns. ADPEn = 1'b0 gates the suspend clock for major portion of ADP related logic. |
| 25 | 0h<br>RW | **ADPRes:** ADP Reset: When set to 1'b1, the ADP controller is reset. This bit is auto-cleared after the reset procedure is complete in the ADP controller. |
| 24 | 0b<br>RO | **WB:** Write Busy: n 1'b0: Write Completed n 1'b1: Write in Progress The application can read or write ADPCFG and ADPCTL registers only if this field is cleared. Hardware sets this bit when the write is in progress in the Suspend clock domain. |
| 23:0 | 0h<br>RO | **RSVD1:** reserved |

## 19.6.257 ADPEVT—Offset CC28h

ADP Event Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ADPEVT:** [BAR] + CC28h

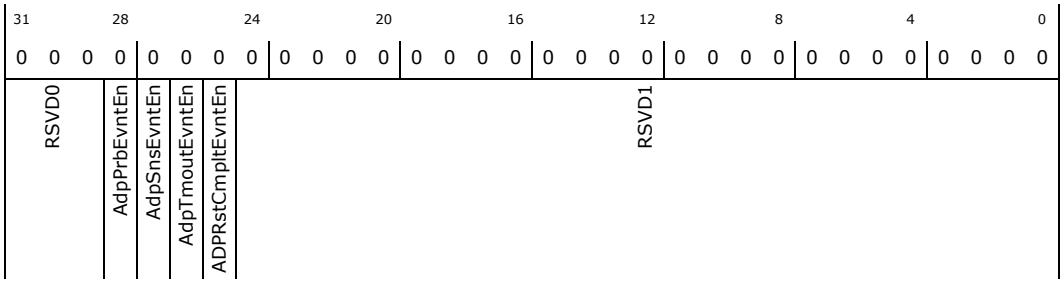
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RO | **RSVD0:** Reserved |
| 28 | 0h<br>RO | **AdpPrbEvnt:** Write Behavior: oneToClear ADP Probe Event: When this event is set, it means that the Vbus voltage is greater than VadpPrb or VadpPrb is reached. |
| 27 | 0h<br>RO | **AdpSnsEvnt:** Write Behavior: oneToClear ADP Sense Event: When this event is set, it means that the Vbus voltage is greater than VadpSns or VadpSns is reached. |
| 26 | 0h<br>RO | **AdpTmoutEvnt:** Write Behavior: oneToClear ADP Timeout Event: This event is relevant when ADP probe command is executed. When this event is set, it means that the ramp time is completed (GADPCTL.RTIM has reached its terminal value of 0x7FF). This is a debug feature that allows software to read the ramp time after each cycle. |
| 25 | 0h<br>RO | **ADPRstCmpltEvnt:** Write Behavior: oneToClear This event, when set, indicates that the ADP Reset command is successful |
| 24:11 | 0h<br>RO | **RSVD1:** reserved |
| 10:0 | 0h<br>RO | **RTIM:** RAMP TIME: These bits capture the latest time it took for Vbus to ramp from VADP_SINK to VADP_PRB. The bits are defined in units of 32 kHz clock cycles as follows: n 0x000: 1 cycles n 0x001: 2 cycles n 0x002: 3 cycles and so on till, n 0x7FF: 2048 cycles A time of 1024 cycles at 32 kHz corresponds to a time of 32 msec. Note for scaledown ramp_timeout, n PrbDelta = 2'b00 =) 6250 us n PrbDelta = 2'b01 =) 3125 us n PrbDelta = 2'b10 =) 1562.5 us n PrbDelta = 2'b11 =) 781.25 us |

## 19.6.258 ADPEVTEN—Offset CC2Ch

ADP Event Enable Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ADPEVTEN:** [BAR] + CC2Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

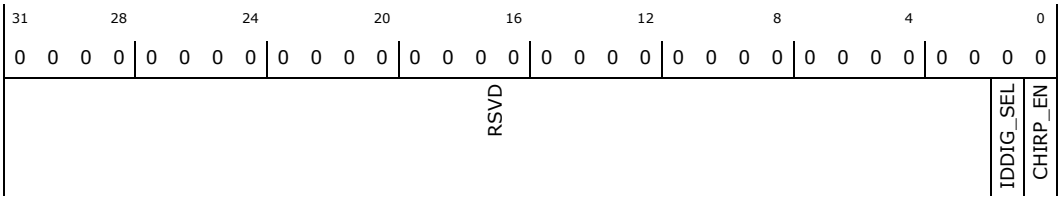
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RO | **RSVD0:** Reserved |
| 28 | 0h<br>RW | **AdpPrbEvntEn:** ADP Probe Event Enable: When this bit is set, ADPPrbEvnt in ADPEVT register is enabled. |
| 27 | 0h<br>RW | **AdpSnsEvntEn:** ADP Sense Event Enable: When this bit is set, AdpSnsEvntEn in ADPEVT register is enabled. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 26 | 0h<br>RW | **AdpTmoutEvntEn:** ADP Timeout Event Enable: When this bit is set, AdpTmoutEvntEn in ADPEVT register is enabled. |
| 25 | 0h<br>RW | **ADPRstCmpltEvntEn:** ADP Reset complete Event Enable: When this bit is set, ADPRstCmpltEvnt in ADPEVT register is enabled. |
| 24:0 | 0h<br>RO | **RSVD1:** Reserved |

## 19.6.259 BCFG—Offset CC30h

BC Configuration Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BCFG:** [BAR] + CC30h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 0h<br>RO | **RSVD:** |
| 1 | 0h<br>RW | **IDDIG_SEL:** |

# 20 Intel® High Definition Audio

The Intel® High Definition Audio (Intel® HD Audio) is an architecture and infrastructure to support high-quality audio implementations for PCs.

***Note:*** The High Definition Audio interface is multiplexed on the same balls as LPE_I2S[1:0].

***Note:*** When High Definition Audio is active, the LPE Audio functionality is disabled.

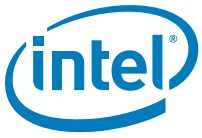
The Intel® High Definition Audio (Intel® HD Audio) controller consists of a set of DMA engines that are used to move samples of digitally encoded data between system memory and internal/external CODECs. The controller communicates with the internal/external CODECs over the Intel® HD Audio serial link.The output DMA engines move digital data from system memory to a D-A converter in a CODEC. The SoC implements a single Serial Data Output (SDO) signal that is connected to the external CODECs. The input DMA engines move digital data from the A-D converter in the CODEC to system memory. The platform supports up to two external CODECs by implementing two Serial Data Input (SDI) signals, each being dedicated to a single CODEC.

Audio software renders outbound, and processes inbound data to/from buffers in memory. The location of the individual buffers is described by a Buffer Descriptor List that is fetched and processed by the audio controller. The data in the buffers is arranged in a pre-defined format. The output DMA engines fetch the digital data from memory and reformat it based on the programmed sample rate, bits/sample and number of channels. The data from the output DMA engines is then combined and serially sent to the CODEC(s) over the Intel® HD Audio link. The input DMA engines receive data from the CODEC(s) over the Intel® HD Audio link and format the data based on the programmable attributes for that stream. The data is then written to memory in the predefined format for software to process. Each DMA engine moves one "stream" of data. A single CODEC can accept or generate multiple "streams" of data, one for each A-D or D-A converter in the CODEC. Multiple CODECs can accept the same output "stream" processed by a single DMA engine.

Codec commands and responses are also transported to and from the CODEC via DMA engines. The DMA engine dedicated to transporting commands from the Command Output Ring Buffer (CORB) in memory to the CODEC(s) is called the CORB engine. The DMA engine dedicated to transporting responses from the CODEC(s) to the Response Input Ring Buffer in memory is called the RIRB engine. Every command sent to a CODEC yields a response from that CODEC. Some commands are "broadcast" type commands in which case a response will be generated from each CODEC. A CODEC may also be programmed to generate unsolicited responses, which the RIRB engine also processes. The platform also supports Programmed IO-based Immediate Command/Response transport mechanism that can be used by BIOS prior to memory initialization.

## 20.1 Signal Descriptions

Please see Chapter 2, "Physical Interfaces" for additional details.



The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

**Table 223. Signals**

| Signal Name | Direction Plat. Power | Description |
|---|---|---|
| **HDA_RST#** | O VAUD | **Intel HD Audio Reset:** Master H/W reset to external Codecs |
| **HDA_SYNC** | O VAUD | **Intel HD Audio Sync:** 48 kHz fixed rate |
| **HDA_CLK** | O VAUD | **Intel HD Audio Bit Clock (Output):** 24 MHz serial data clock generated by the Intel HD Audio controller |
| **HDA_SDO** | O VAUD | **Intel HD Audio Data Out:** Serial TDM data output to the Codec(s). The serial output is double-pumped for a bit rate of 48 Mb/s |
| **HDA_SDI[1:0]** | I/O VAUD | **Intel HD Audio Serial Data In[1:0]:** Serial TDM data input from the CODEC(s). The serial input is single-pumped for a bit rate of 24 Mb/s. |
| **HDA_LPE_RCOMP** | O | Impedance/ current Compensation Output. |

The signals in the table above are all muxed and maybe used by other functions.

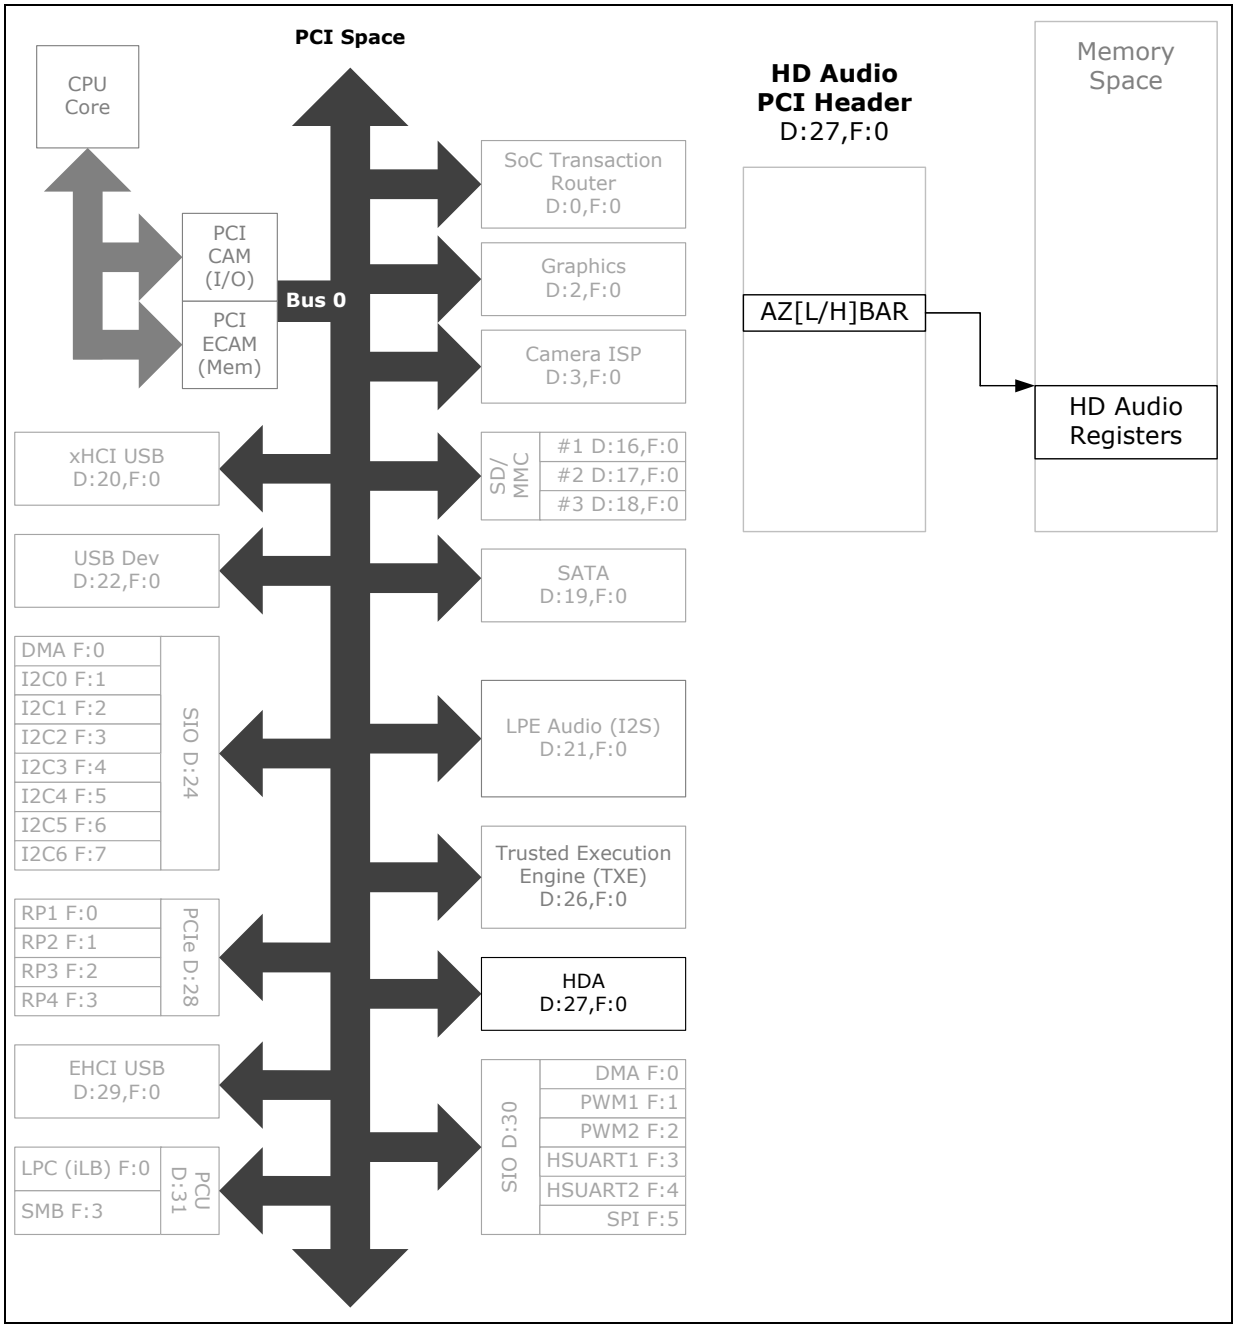
## 20.2 Features

The Intel® HD Audio Controller supports the following features:

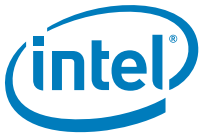
- Supports MSI and legacy interrupt delivery
- Support for ACPI D3 and D0 Device States
- Supports up to:
  - 6 streams (three input, three output)
  - 16 channels per stream
  - 32 bits/sample
  - 192 kHz sample rate
- 24 MHz HDA_CLK supports
  - SDO double pumped at 48 Mb/s
  - SDI single pumped at 24 Mb/s
- Supports 1.5V mode only
- Supports optional Immediate Command/Response mechanism

## 20.3 References

High Definition Audio Specification, Revision 1.0a



- http://www.intel.com/content/www/us/en/standards/high-definition-audio-specification.html



## 20.4 Register Map

See Chapters 3 and 4 for additional information.

***Note:*** PCI mode is supported, but not PCIe mode. Must set TM1.HAPD bit to 1b for PCI mode.

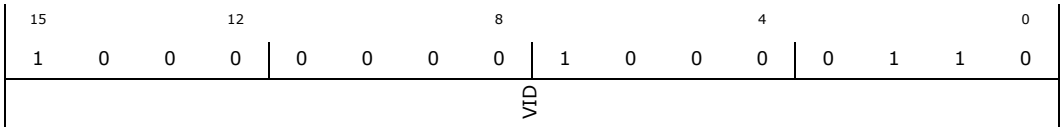
## 20.5.1 VID—Offset 0h



Vendor ID

### Access Method

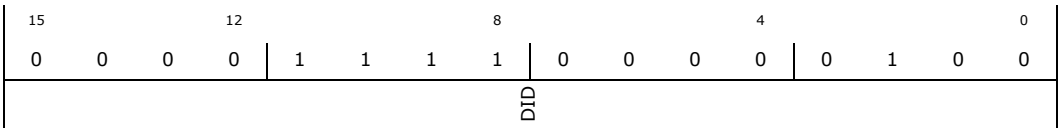
**Type:** PCI Configuration Register (Size: 16 bits)

**VID:** [B:0, D:27, F:0] + 0h

**Default:** 8086h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 8086h<br>RO | **VID:** Vendor ID |

## 20.5.2 DID—Offset 2h



Device ID

### Access Method

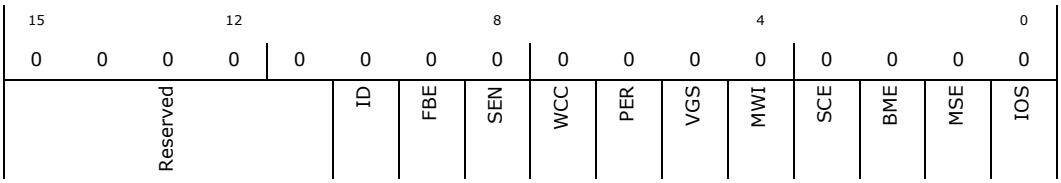
**Type:** PCI Configuration Register (Size: 16 bits)

**DID:** [B:0, D:27, F:0] + 2h

**Default:** 0F04h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 0f04h<br>RO | **DID:** Device ID: This field identifies the particular device. DID[15:7] indicates SoC, DID[6:1]=6'b000010 indicates HDAudio device, DID[0] comes from fuse indicates HDAudio SKU |

## 20.5.3 CMD—Offset 4h



Command

### Access Method

**Type:** PCI Configuration Register (Size: 16 bits)

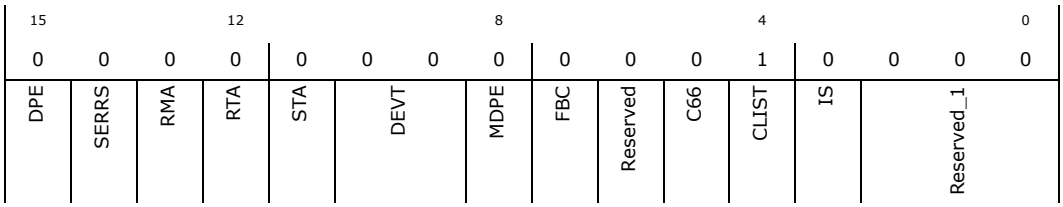
**CMD:** [B:0, D:27, F:0] + 4h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:11 | 0000h<br>RO | **Reserved:** Reserved |
| 10 | 0h<br>RW | **ID:** Interrupt Disable |
| 9 | 0h<br>RO | **FBE:** Fast back to back enable. Not implemented. |
| 8 | 0h<br>RW | **SEN:** SERR enable |
| 7 | 0h<br>RO | **WCC:** Wait Cycle Control. Not implemented. |
| 6 | 0h<br>RW | **PER:** Parity error response. Not implemented. |
| 5 | 0h<br>RO | **VGS:** VGA Pallete Snoop. Not implemented. |
| 4 | 0h<br>RO | **MWI:** Memory write and invalidate enable. Not implemented. |
| 3 | 0h<br>RO | **SCE:** Special cycle enable. Not implemented. |
| 2 | 0h<br>RW | **BME:** Bus master enable |

| Bit Range | Default & Access | Description |
|---|---|---|
| 1 | 0h<br>RW | **MSE:** Memory space enable |
| 0 | 0h<br>RO | **IOS:** I/O space enabled. Not implemented. |

## 20.5.4 STS—Offset 6h



Status

### Access Method

**Type:** PCI Configuration Register (Size: 16 bits)

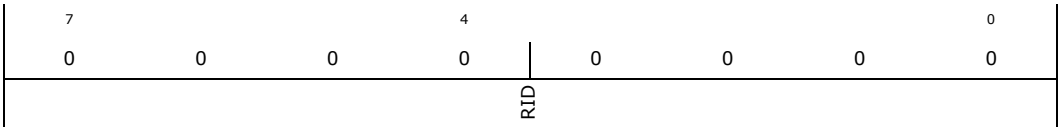
**STS:** [B:0, D:27, F:0] + 6h

**Default:** 0010h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15 | 0h<br>RO | **DPE:** Detected parity error. Not implemented. |
| 14 | 0h<br>RO | **SERRS:** SERR Status |
| 13 | 0h<br>WOC | **RMA:** Recieved master abort |
| 12 | 0h<br>RO | **RTA:** Recieved target abort. Not implemented. |
| 11 | 0h<br>RO | **STA:** Signaled target abort. Not implemented. |
| 10:9 | 0h<br>RO | **DEVT:** DEVSEL timing status. Not implemented. |
| 8 | 0h<br>RO | **MDPE:** Master data parity error. Not implemented. |
| 7 | 0h<br>RO | **FBC:** Fast back to back capable. Not implemented. |
| 6 | 0h<br>RO | **Reserved:** Reserved |
| 5 | 0h<br>RO | **C66:** 66MHz capable. Not implemented. |
| 4 | 1h<br>RO | **CLIST:** Capabilities list exist |
| 3 | 0h<br>RO | **IS:** Interrupt Status. Shows legacy interrupt signal status. Doesn't apply to MSI. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 2:0 | 0h<br>RO | **Reserved_1:** reserved |

## 20.5.5 RID—Offset 8h



Revision ID

### Access Method

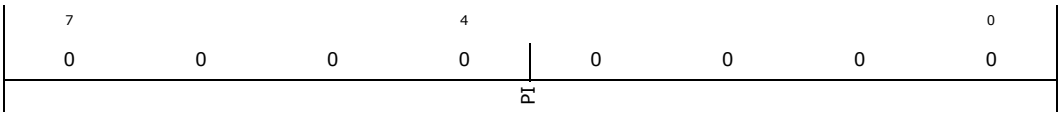
**Type:** PCI Configuration Register (Size: 8 bits)

**RID:** [B:0, D:27, F:0] + 8h

**Default:** 00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:0 | 0h<br>RO | **RID:** Revision ID |

## 20.5.6 PI—Offset 9h



Programming Interface

### Access Method

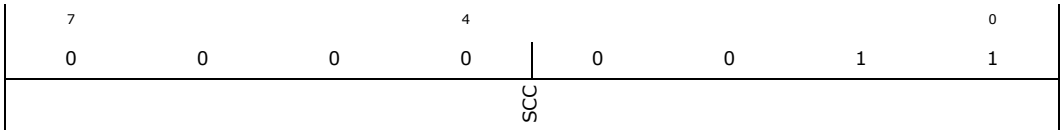
**Type:** PCI Configuration Register (Size: 8 bits)

**PI:** [B:0, D:27, F:0] + 9h

**Default:** 00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:0 | 0h<br>RO | **PI:** Programming Interface |

## 20.5.7 SCC—Offset Ah



Sub Class Code

### Access Method

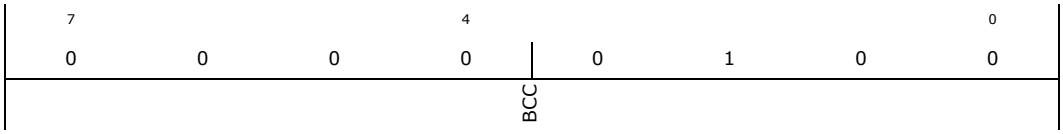
**Type:** PCI Configuration Register (Size: 8 bits)

**SCC:** [B:0, D:27, F:0] + Ah

**Default:** 03h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:0 | 03h<br>RO | **SCC:** Sub Class Code |

## 20.5.8 BCC—Offset Bh



Base Class Code

### Access Method

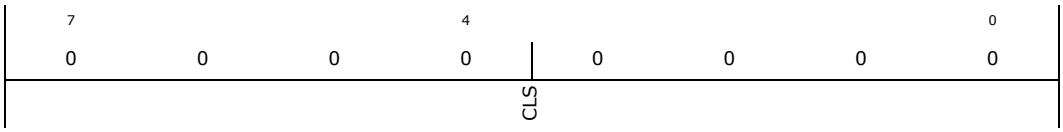
**Type:** PCI Configuration Register (Size: 8 bits)

**BCC:** [B:0, D:27, F:0] + Bh

**Default:** 04h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:0 | 04h<br>RO | **BCC:** Base Class Code |

## 20.5.9 CLS—Offset Ch



Cache line size

### Access Method

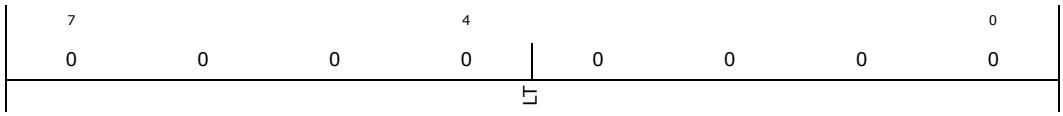
**Type:** PCI Configuration Register (Size: 8 bits)

**CLS:** [B:0, D:27, F:0] + Ch

**Default:** 00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:0 | 0h<br>RW | **CLS:** Cache line size |

## 20.5.10 LT—Offset Dh



Latency timer

### Access Method

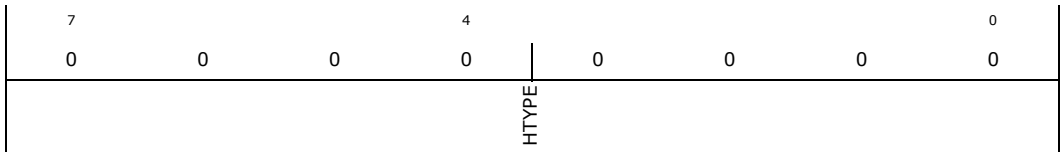
**Type:** PCI Configuration Register (Size: 8 bits)

**LT:** [B:0, D:27, F:0] + Dh

**Default:** 00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:0 | 0h<br>RO | **LT:** Latency timer |

## 20.5.11 HTYPE—Offset Eh



Header type

### Access Method

**Type:** PCI Configuration Register (Size: 8 bits)

**HTYPE:** [B:0, D:27, F:0] + Eh

**Default:** 00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:0 | 0h<br>RO | **HTYPE:** Header type |

## 20.5.12 BIST—Offset Fh

Built in self test. Not implemented.

### Access Method

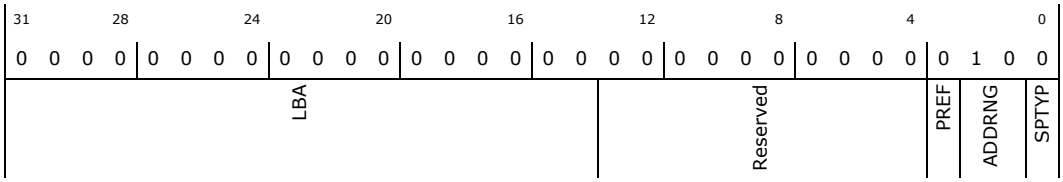
**Type:** PCI Configuration Register (Size: 8 bits)

**BIST:** [B:0, D:27, F:0] + Fh

**Default:** 00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:0 | 0h<br>RO | **BIST:** Built in self test. Not implemented. |

## 20.5.13 AZLBAR—Offset 10h



Lower Base Address (BAR)

### Access Method

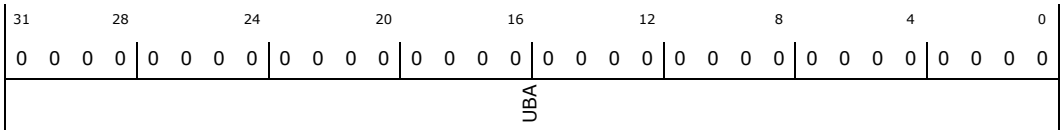
**Type:** PCI Configuration Register (Size: 32 bits)

**AZLBAR:** [B:0, D:27, F:0] + 10h

**Default:** 00000004h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:14 | 0h<br>RW | **LBA:** Lower Base Address |
| 13:4 | 0h<br>RO | **Reserved:** Reserved |
| 3 | 0h<br>RO | **PREF:** Prefetchable |
| 2:1 | 2h<br>RO | **ADDRNG:** Address Range |
| 0 | 0h<br>RO | **SPTYP:** Space Type (Memory) |

## 20.5.14 AZUBAR—Offset 14h



Upper Base Address (BAR)

### Access Method

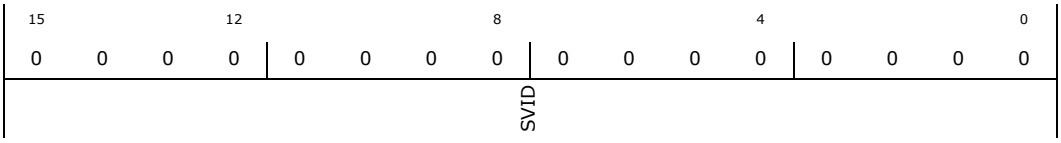
**Type:** PCI Configuration Register (Size: 32 bits)

**AZUBAR:** [B:0, D:27, F:0] + 14h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **UBA:** Upper Base Address |

## 20.5.15 SVID—Offset 2Ch



subsystem vendor ID

### Access Method

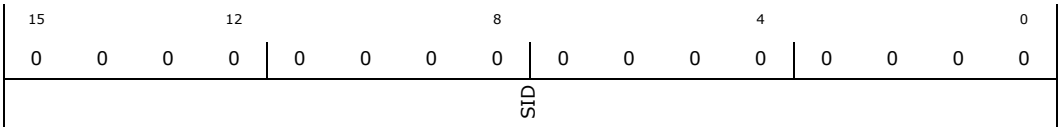
**Type:** PCI Configuration Register (Size: 16 bits)

**SVID:** [B:0, D:27, F:0] + 2Ch

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 0h RWO | **SVID:** subsystem vendor ID. This field is written by BIOS. No hardware action is taken according to this register |

## 20.5.16 SID—Offset 2Eh



subsystem ID

### Access Method

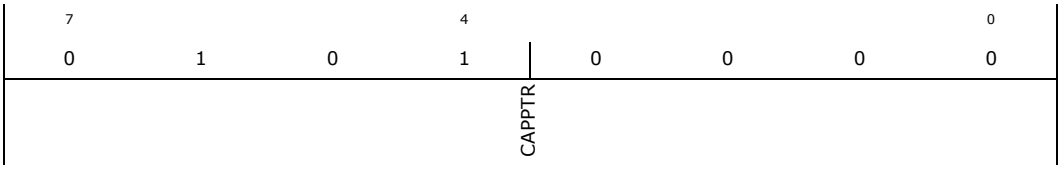
**Type:** PCI Configuration Register (Size: 16 bits)

**SID:** [B:0, D:27, F:0] + 2Eh

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 0h RWO | **SID:** subsystem ID. This field is written by BIOS. No hardware action is taken according to this register |

## 20.5.17 CAPPTR—Offset 34h



Capabilities pointer

### Access Method

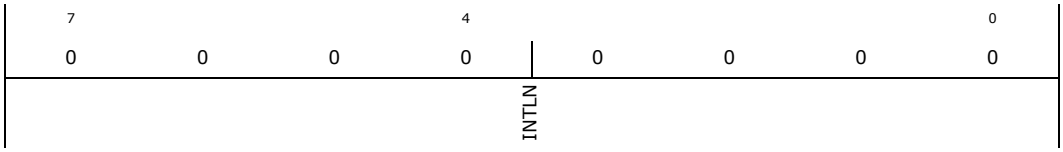
**Type:** PCI Configuration Register (Size: 8 bits)

**CAPPTR:** [B:0, D:27, F:0] + 34h

**Default:** 50h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:0 | 50h<br>RO | **CAPPTR:** Capabilities pointer |

## 20.5.18 INTLN—Offset 3Ch



Interrupt Line

### Access Method

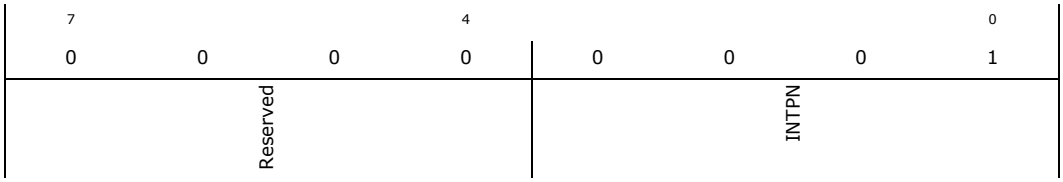
**Type:** PCI Configuration Register (Size: 8 bits)

**INTLN:** [B:0, D:27, F:0] + 3Ch

### Default: 00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:0 | 0h<br>RW | **INTLN:** Interrupt Line |

## 20.5.19 INTPN—Offset 3Dh



Interrupt Pin

### Access Method

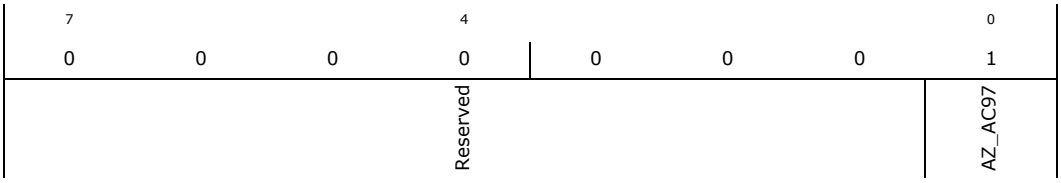
**Type:** PCI Configuration Register (Size: 8 bits)

**INTPN:** [B:0, D:27, F:0] + 3Dh

### Default: 01h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:4 | 0h<br>RO | **Reserved:** Reserved |
| 3:0 | 1h<br>RO | **IP (INTPN):** Interrupt Pin |

## 20.5.20 AZCTL—Offset 40h



Azalia controller

### Access Method

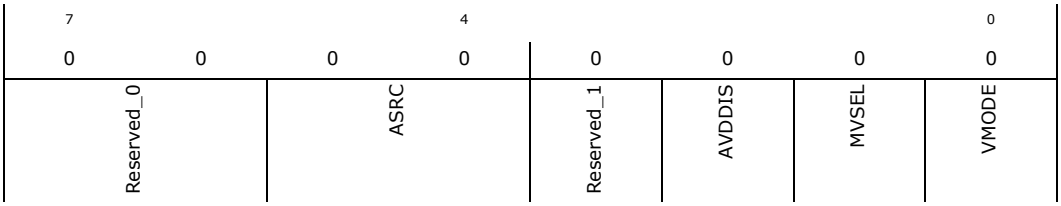
**Type:** PCI Configuration Register (Size: 8 bits)

**AZCTL:** [B:0, D:27, F:0] + 40h

**Default:** 01h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:1 | 0h<br>RO | **Reserved:** Reserved |
| 0 | 1h<br>RO | **AZ_AC97# (AZ_AC97):** This register is always 1'b1 indicating Azalia |

## 20.5.21 IOBC—Offset 42h



IO Buffer control

### Access Method

**Type:** PCI Configuration Register (Size: 8 bits)

**IOBC:** [B:0, D:27, F:0] + 42h

**Default:** 00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:6 | 0h<br>RO | **Reserved_0:** Reserved |
| 5:4 | 0h<br>RO | **ASRC:** Audio buffer slew rate control |
| 3 | 0h<br>RO | **Reserved_1:** Reserved |
| 2 | 0h<br>RO | **AVDDIS:** Automatic voltage detector disable |
| 1 | 0h<br>RO | **MVSEL:** Manual voltage select |

| Bit Range | Default & Access | Description |
|---|---|---|
| 0 | 0h<br>RO | **VMODE:** voltage mode |

## 20.5.22 TM1—Offset 43h

Test mode 1

### Access Method

**Type:** PCI Configuration Register (Size: 8 bits)

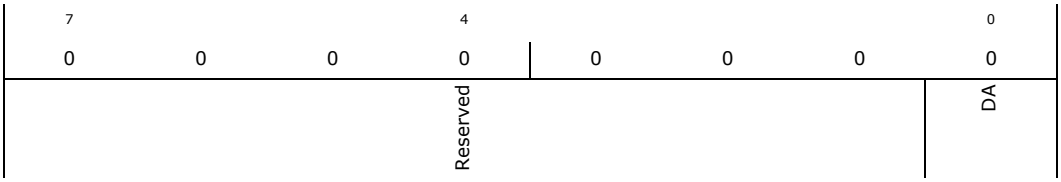
**TM1:** [B:0, D:27, F:0] + 43h

**Default:** 57h

| 7 | | | 4 | | | | 0 |
|---|---|---|---|---|---|---|---|
| 0 | 1 | 0 | 1 | 0 | 1 | 1 | 1 |
| RSVD | RSVD | RSVD | RSVD | HAPD | RSVD | RSVD | RSVD |

| Bit Range | Default & Access | Description |
|---|---|---|
| 7 | 0h<br>RO | **Reserved (RSVD):** Reserved. |
| 6 | 1h<br>RO | **Reserved (RSVD):** Reserved. |
| 5 | 0h<br>RO | **Reserved (RSVD):** Reserved. |
| 4 | 1h<br>RO | **Reserved (RSVD):** Reserved. |
| 3 | 0h<br>RWO | **HAPD:** HD Audio PCI/PCIe# device |
| 2 | 1h<br>RO | **Reserved (RSVD):** Reserved. |
| 1 | 1h<br>RO | **Reserved (RSVD):** Reserved. |
| 0 | 1h<br>RO | **Reserved (RSVD):** Reserved. |

## 20.5.23 DCKCTL—Offset 4Ch



Docking control

### Access Method

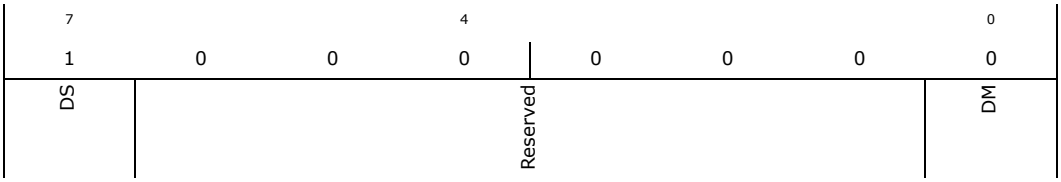
**Type:** PCI Configuration Register (Size: 8 bits)

**DCKCTL:** [B:0, D:27, F:0] + 4Ch

**Default:** 00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:1 | 0h<br>RO | **Reserved:** reserved |
| 0 | 0h<br>RW | **DA:** Dock attach |

## 20.5.24 DCKSTS—Offset 4Dh



Docking status

### Access Method

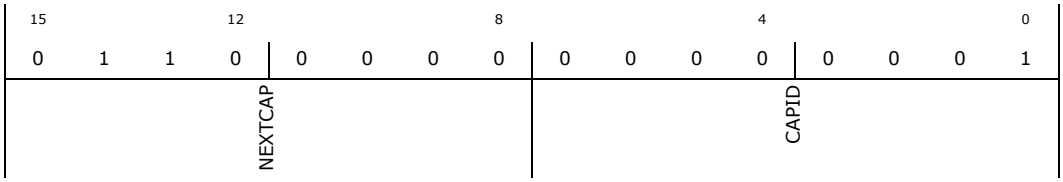
**Type:** PCI Configuration Register (Size: 8 bits)

**DCKSTS:** [B:0, D:27, F:0] + 4Dh

**Default:** 80h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7 | 1h<br>RWO | **DS:** Docking support |
| 6:1 | 0h<br>RO | **Reserved:** reserved |
| 0 | 0h<br>RO | **DM:** Dock Mated |

## 20.5.25 PID—Offset 50h



Power Management Capability ID

### Access Method

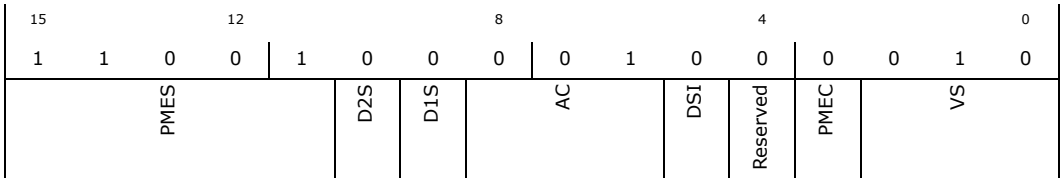
**Type:** PCI Configuration Register (Size: 16 bits)

**PID:** [B:0, D:27, F:0] + 50h

**Default:** 6001h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 60h<br>RO | **NEXTCAP:** Next Capability. |
| 7:0 | 01h<br>RO | **CAPID:** Capability ID. |

## 20.5.26 PC—Offset 52h



Power Management Capabilities

### Access Method

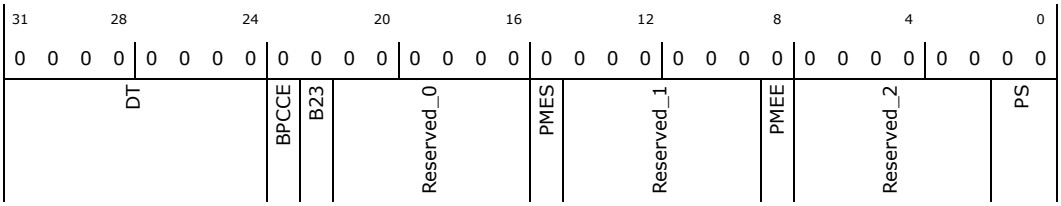
**Type:** PCI Configuration Register (Size: 16 bits)

**PC:** [B:0, D:27, F:0] + 52h

**Default:** C842h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:11 | 19h<br>RO | **PMES:** PME_Support (PMES): Indicates PME# can be generated from D3 and D0 states. |
| 10 | 0h<br>RO | **D2S:** D2 state. Not supported. |
| 9 | 0h<br>RO | **D1S:** D1 state. Not supported. |
| 8:6 | 1h<br>RO | **AC:** Aux Current |
| 5 | 0h<br>RO | **DSI:** Device specific initialization |
| 4 | 0h<br>RO | **Reserved:** Reserved |
| 3 | 0h<br>RO | **PMEC:** PME Clock. Does not apply. |
| 2:0 | 2h<br>RO | **VS:** Version (VS): Indicates support for Revision 1.1 of the PCI Power Management Specification. |

## 20.5.27 PCS—Offset 54h



Power Management control and status

### Access Method

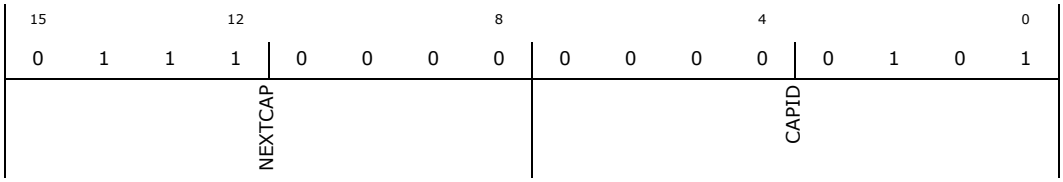
**Type:** PCI Configuration Register (Size: 32 bits)

**PCS:** [B:0, D:27, F:0] + 54h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 0h<br>RO | **DT:** Data. Does not apply. |
| 23 | 0h<br>RO | **BPCCE:** Bus power control enable. Does not apply. |
| 22 | 0h<br>RO | **B23:** Does not apply. |
| 21:16 | 0h<br>RO | **Reserved_0:** Reserved |
| 15 | 0h<br>RW1C | **PMES:** PME Status (PMES): This bit is set when the Intel HD Audio controller would normally assert the PME# signal independent of the state of the PME_En bit. This bit resides in the Suspend well. This bit is in the Suspend well and cleared on a power-on reset. Software must not make assumptions about the reset state of this bit and must set it appropriately. |
| 14:9 | 0h<br>RO | **Reserved_1:** Reserved |
| 8 | 0h<br>RW | **PMEE:** PME enable |
| 7:2 | 0h<br>RO | **Reserved_2:** reserved |
| 1:0 | 0h<br>RW | **PS:** Power State (PS): This field is used both to determine the current power state of the Intel HD Audio controller and to set a new power state. The values are: 00 D0 state 11 D3HOT state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, the Intel HD Audio controllers configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. When software changes this value from the D3HOT state to the D0 state, an internal warm (soft) reset is generated, and software must re-initialize the function. |

## 20.5.28 MID—Offset 60h



MSI Capability ID

### Access Method

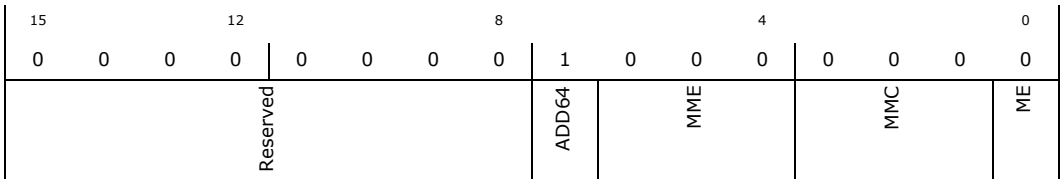
**Type:** PCI Configuration Register (Size: 16 bits)

**MID:** [B:0, D:27, F:0] + 60h

**Default:** 7005h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 70h<br>RO | **NEXTCAP:** Next Capability. The value of this field depends on the TM1.HAPD bit. When TM1.HAPD is 0, this field has a value of 70h where it points to the PCI Express capability structure. When TM1.HAPD bit is 1, this field has a value of 00h to indicate that this is the last capability structure in the list. |
| 7:0 | 05h<br>RO | **CAPID:** Capability ID. |

## 20.5.29 MMC—Offset 62h



MSI Message Control

### Access Method

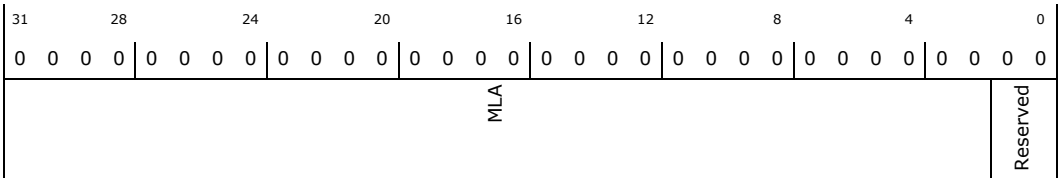
**Type:** PCI Configuration Register (Size: 16 bits)

**MMC:** [B:0, D:27, F:0] + 62h

**Default:** 0080h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 0h<br>RO | **Reserved:** Reserved |
| 7 | 1h<br>RO | **ADD64:** 64-bit Address support |
| 6:4 | 0h<br>RO | **MME:** Multiple Message Enable |
| 3:1 | 0h<br>RO | **MMC:** Multiple Message Capable |
| 0 | 0h<br>RW | **ME:** MSI Enable (ME): If set to 1 an MSI will be generated instead of an INTx# signal. If set to 0, an MSI may not be generated. |

## 20.5.30 MMLA—Offset 64h



MSI Lower Address

### Access Method

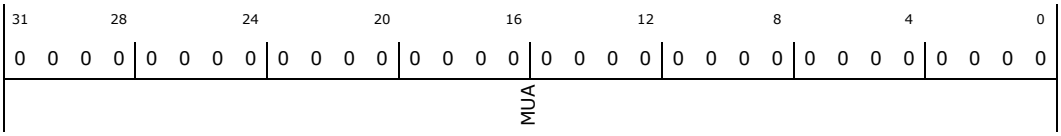
**Type:** PCI Configuration Register (Size: 32 bits)

**MMLA:** [B:0, D:27, F:0] + 64h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 0h<br>RW | **MLA:** MSI Lower Address |
| 1:0 | 0h<br>RO | **Reserved:** Reserved |

## 20.5.31 MMUA—Offset 68h



MSI Upper Address

### Access Method

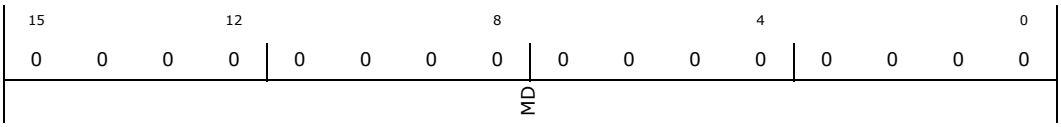
**Type:** PCI Configuration Register (Size: 32 bits)

**MMUA:** [B:0, D:27, F:0] + 68h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **MUA:** MSI Upper Address |

## 20.5.32 MMD—Offset 6Ch



MSI Data

### Access Method

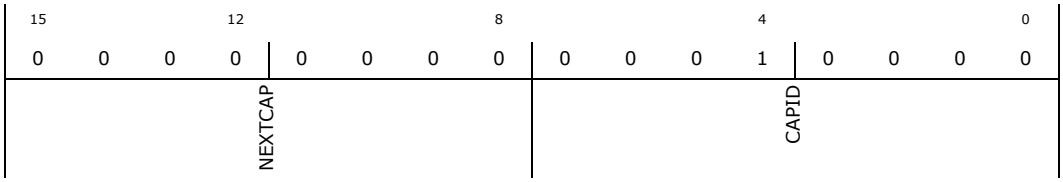
**Type:** PCI Configuration Register (Size: 16 bits)

**MMD:** [B:0, D:27, F:0] + 6Ch

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 0h<br>RW | **MD:** MSI Data |

## 20.5.33 PXID—Offset 70h



PCIe Capability ID

### Access Method

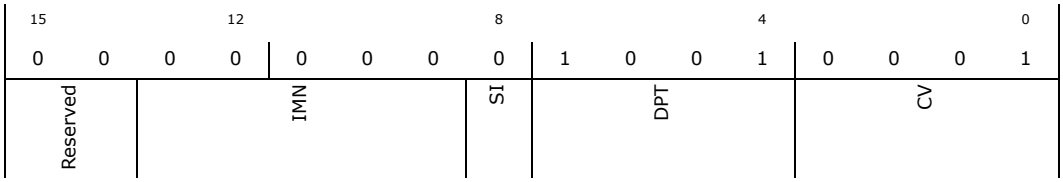
**Type:** PCI Configuration Register (Size: 16 bits)

**PXID:** [B:0, D:27, F:0] + 70h

**Default:** 0010h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 00h RO | **NEXTCAP:** Next Capability. |
| 7:0 | 10h RO | **CAPID:** Capability ID. |

## 20.5.34 PXC—Offset 72h



PCI express capabilities

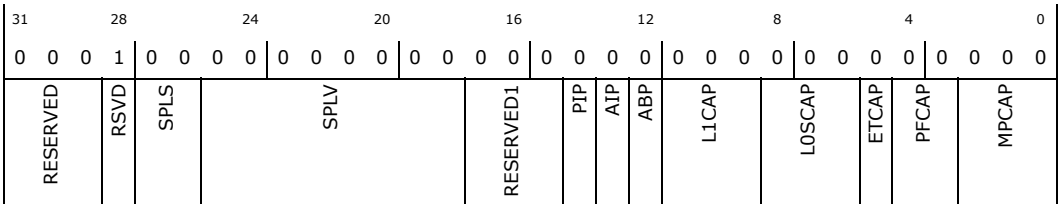
### Access Method

**Type:** PCI Configuration Register (Size: 16 bits)

**PXC:** [B:0, D:27, F:0] + 72h

**Default:** 0091h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:14 | 0h RO | **Reserved:** reserved |
| 13:9 | 0h RO | **IMN:** Interrupt message number |
| 8 | 0h RO | **SI:** Slot implemented |
| 7:4 | 9h RO | **DPT:** Device/port type |
| 3:0 | 1h RO | **CV:** Capability version |



## 20.5.35 DEVCAP—Offset 74h

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**DEVCAP:** [B:0, D:27, F:0] + 74h

**Default:** 10000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h RO | **RESERVED:** reserved |
| 28 | 1h RO | **Reserved (RSVD):** Reserved. |
| 27:26 | 0h RO | **SPLS:** Captured Slot Power Limit Scale |
| 25:18 | 0h RO | **SPLV:** Captured Slot Power Limit Value |
| 17:15 | 0h RO | **RESERVED1:** reserved |
| 14 | 0h RO | **PIP:** Power Indicator Present |
| 13 | 0h RO | **AIP:** Attention Indicator Present |
| 12 | 0h RO | **ABP:** Attention Button Present |
| 11:9 | 0h RWO | **L1CAP:** Endpoint L1 Acceptable Latency |
| 8:6 | 0h RWO | **L0SCAP:** Endpoint L0s Acceptable Latency |
| 5 | 0h RO | **ETCAP:** Extended Tag Field Support |
| 4:3 | 0h RO | **PFCAP:** Phantom Functions Supported |
| 2:0 | 0h RO | **MPCAP:** Max Payload Size Supported |

## 20.5.36 DEVC—Offset 78h

Device control

### Access Method

**Type:** PCI Configuration Register (Size: 16 bits)

**DEVC:** [B:0, D:27, F:0] + 78h

**Default:** 0800h

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

|---|---|---|
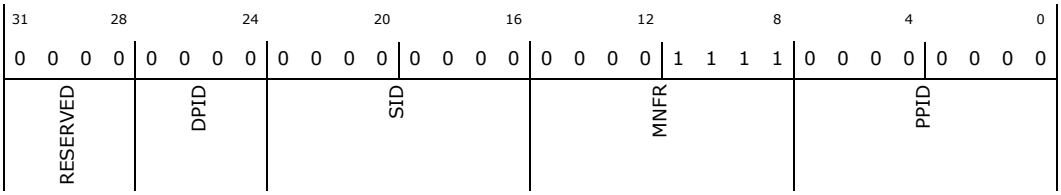
| 15:6 | 0h<br>RO | **RESERVED:** RESERVED |
| 5 | 0h<br>RO | **TXP:** Transactions Pending |
| 4 | 1h<br>RO | **AUXDET:** AUX Power Detected |
| 3 | 0h<br>RO | **URDET:** Unsupported Request Detected |
| 2 | 0h<br>RO | **FEDET:** Fatal Error Detected |
| 1 | 0h<br>RO | **NFEDET:** Non-Fatal Error Detected |
| 0 | 0h<br>RO | **CEDET:** Correctable Error Detected |

## 20.5.38 MANID—Offset F8h



Manufacturer ID

### Access Method

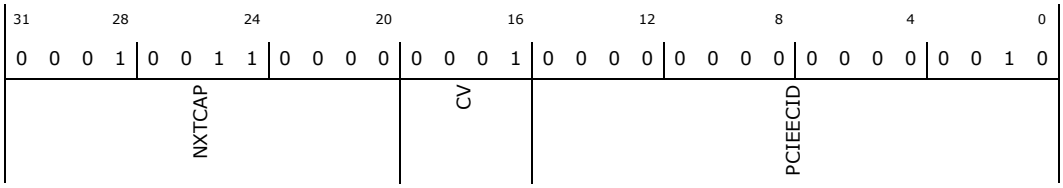
**Type:** PCI Configuration Register (Size: 32 bits)

**MANID:** [B:0, D:27, F:0] + F8h

### Default: 00000F00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:28 | 0h<br>RO | **RESERVED:** RESERVED |
| 27:24 | 0h<br>RO | **DPID:** Dot Portion Process ID |
| 23:16 | 0h<br>RO | **SID:** Stepping ID |
| 15:8 | 0Fh<br>RO | **MNFR:** Manufacturer |
| 7:0 | 0h<br>RO | **PPID:** Process Portion Process ID |

## 20.5.39 VCCAP—Offset 100h



Virtual Channel Cap Header

### Access Method

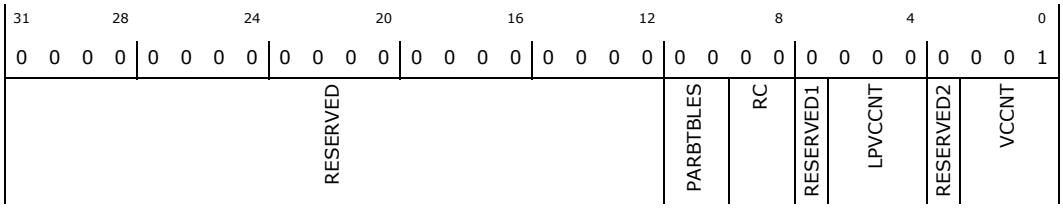
**Type:** PCI Configuration Register (Size: 32 bits)

**VCCAP:** [B:0, D:27, F:0] + 100h

**Default:** 13010002h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 130h RWO | **NXTCAP:** Next Capability Offset (NXTCAP): Points to the next capability header, which is the Root Complex Link Declaration Enhanced Capability Header. This register is RWO to support removing the Root Complex Topology Capability from the PCI Express Extended Capability List. For systems which support the Root Complex Topology Capability Structure, boot BIOS should write a 130h to this register, otherwise boot BIOS should write a 000h to this register. |
| 19:16 | 1h RWO | **CV:** Capability Version (CV): This register is RWO to support removing the PCI Express Extended Capabilities from Azalia. For systems which support the PCI Express Virtual Channel capability and the Root Complex Topology Capability Structure, boot BIOS should write a 1h to this register, otherwise boot BIOS should write a 0h to this register. |
| 15:0 | 2h RWO | **PCIEECID:** PCI Express Extended Capability ID (PCIEECID): This register is RWO to support removing the PCI Express Extended Capabilities from Azalia. For systems which support the PCI Express Virtual Channel capability and the Root Complex Topology Capability Structure, boot BIOS should write a 0002h to this register, otherwise boot BIOS should write a 0000h to this register. |

## 20.5.40 PVCCAP1—Offset 104h



Port VC Capability

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

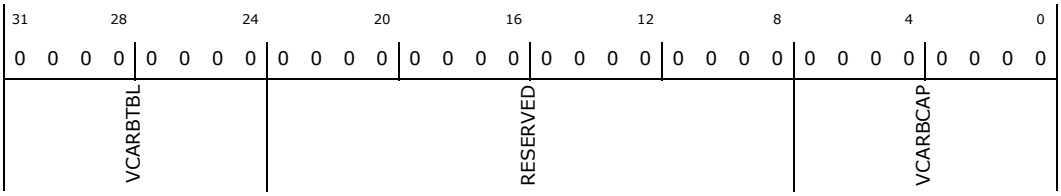
**PVCCAP1:** [B:0, D:27, F:0] + 104h

**Default:** 00000001h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:12 | 0h RO | **RESERVED:** RESERVED |

| Bit Range | Default & Access | Description |
|---|---|---|
| 11:10 | 0h<br>RO | **PARBTBLES:** Port Arbitration Table Entry Size |
| 9:8 | 0h<br>RO | **RC:** Reference Clock |
| 7 | 0h<br>RO | **RESERVED1:** RESERVED |
| 6:4 | 0h<br>RO | **LPVCCNT:** Low Priority Extended VC Count |
| 3 | 0h<br>RO | **RESERVED2:** RESERVED |
| 2:0 | 1h<br>RO | **VCCNT:** Extended VC Count |

## 20.5.41 PVCCAP2—Offset 108h



Port VC Capability 2

### Access Method

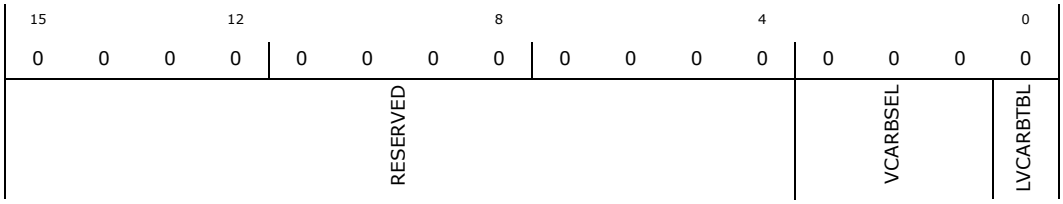
**Type:** PCI Configuration Register (Size: 32 bits)

**PVCCAP2:** [B:0, D:27, F:0] + 108h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 0h<br>RO | **VCARBTBL:** VC Arbitration Table Offset |
| 23:8 | 0h<br>RO | **RESERVED:** RESERVED |
| 7:0 | 0h<br>RO | **VCARBCAP:** VC Arbitration Capability |

## 20.5.42 PVCCTL—Offset 10Ch



Port VC Control

### Access Method

**Type:** PCI Configuration Register (Size: 16 bits)

**PVCCTL:** [B:0, D:27, F:0] + 10Ch

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:4 | 0h<br>RO | **RESERVED:** RESERVED |
| 3:1 | 0h<br>RO | **VCARBSEL:** VC Arbitration Select |
| 0 | 0h<br>RO | **LVCARBTBL:** Load VC Arbitration Table |

## 20.5.43 PVCSTS—Offset 10Eh

Port VC Status

### Access Method

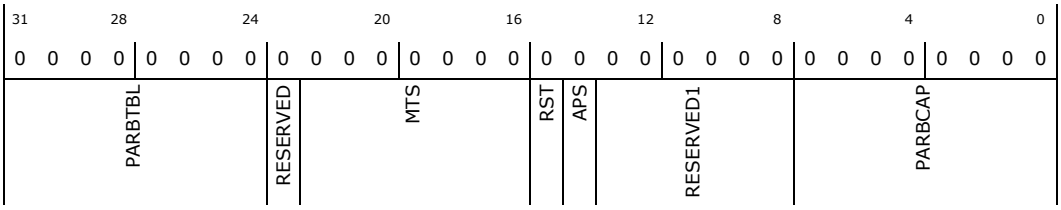
**Type:** PCI Configuration Register (Size: 16 bits)

**PVCSTS:** [B:0, D:27, F:0] + 10Eh

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:1 | 0h<br>RO | **RESERVED:** RESERVED |
| 0 | 0h<br>RO | **VCARBTBLSTS:** VC Arbitration Table Status |

## 20.5.44 VC0CAP—Offset 110h



VC0 Resource Capability

### Access Method

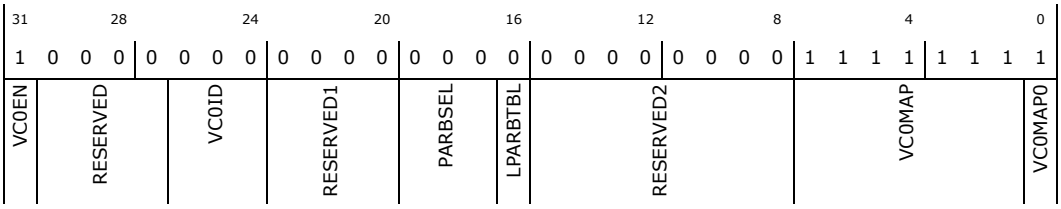
**Type:** PCI Configuration Register (Size: 32 bits)

**VC0CAP:** [B:0, D:27, F:0] + 110h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 0h<br>RO | **PARBTBL:** Port Arbitration Table Offset |
| 23 | 0h<br>RO | **RESERVED:** RESERVED |
| 22:16 | 0h<br>RO | **MTS:** Maximum Time Slots |
| 15 | 0h<br>RO | **RST:** Reject Snoop Transactions |
| 14 | 0h<br>RO | **APS:** Advanced Packet Switching |
| 13:8 | 0h<br>RO | **RESERVED1:** RESERVED |
| 7:0 | 0h<br>RO | **PARBCAP:** Port Arbitration Capability |

## 20.5.45 VC0CTL—Offset 114h



VC0 Resource Control

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

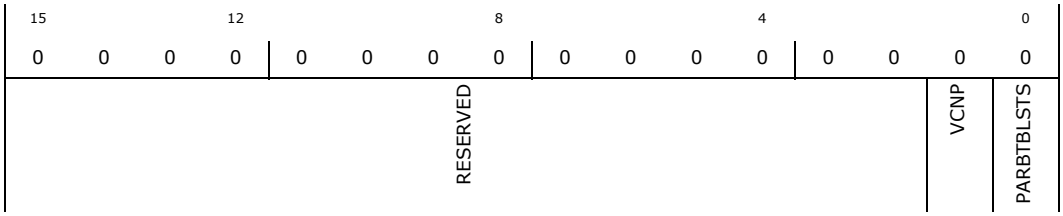
**VC0CTL:** [B:0, D:27, F:0] + 114h

### Default: 800000FFh

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 1h<br>RO | **VC0EN:** VC0 Enable |
| 30:27 | 0h<br>RO | **RESERVED:** RESERVED |
| 26:24 | 0h<br>RO | **VC0ID:** VC0 ID |

| Bit Range | Default & Access | Description |
|---|---|---|
| 23:20 | 0h<br>RO | **RESERVED1:** RESERVED |
| 19:17 | 0h<br>RO | **PARBSEL:** Port Arbitration Select |
| 16 | 0h<br>RO | **LPARBTBL:** Load Port Arbitration Table |
| 15:8 | 0h<br>RO | **RESERVED2:** RESERVED |
| 7:1 | 7Fh<br>RW | **VC0MAP:** TC/VC0 Map |
| 0 | 1h<br>RO | **VC0MAP0:** TC/VC0 Map |

## 20.5.46 VC0STS—Offset 11Ah



VC0 Resource Status

### Access Method

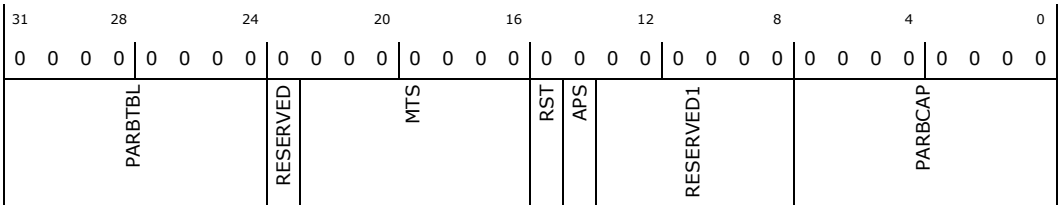
**Type:** PCI Configuration Register (Size: 16 bits)

**VC0STS:** [B:0, D:27, F:0] + 11Ah

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:2 | 0h<br>RO | **RESERVED:** RESERVED |
| 1 | 0h<br>RO | **VCNP:** VC0 Negotiation Pending |
| 0 | 0h<br>RO | **PARBTBLSTS:** Port Arbitration Table Status |

## 20.5.47 VCICAP—Offset 11Ch



VCi Resource Capabilities

### Access Method

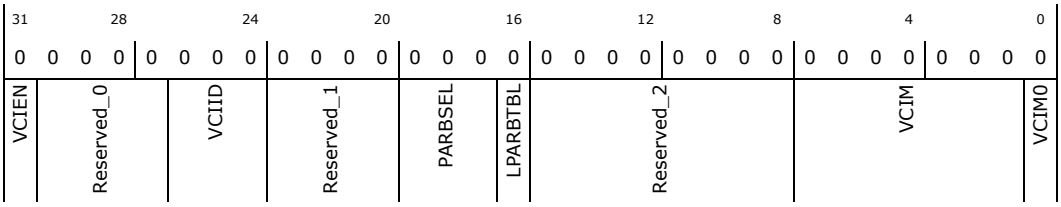
**Type:** PCI Configuration Register (Size: 32 bits)

**VCICAP:** [B:0, D:27, F:0] + 11Ch

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 0h<br>RO | **PARBTBL:** Port Arbitration Table Offset |
| 23 | 0h<br>RO | **RESERVED:** RESERVED |
| 22:16 | 0h<br>RO | **MTS:** Maximum Time Slots |
| 15 | 0h<br>RO | **RST:** Reject Snoop Transactions |
| 14 | 0h<br>RO | **APS:** Advanced Packet Switching |
| 13:8 | 0h<br>RO | **RESERVED1:** RESERVED |
| 7:0 | 0h<br>RO | **PARBCAP:** Port Arbitration Capability |

## 20.5.48 VCICTL—Offset 120h



VCi control register

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

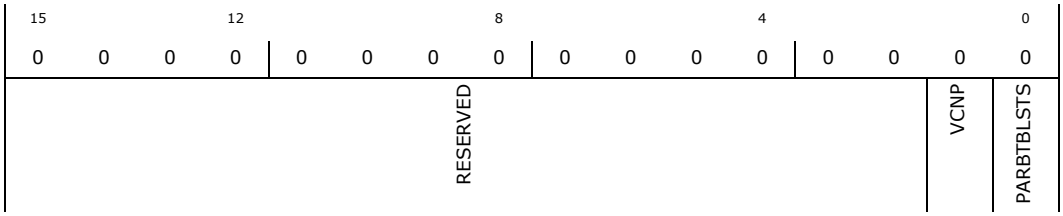
**VCICTL:** [B:0, D:27, F:0] + 120h

### Default: 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h<br>RW | **VCIEN:** VCi Enable |
| 30:27 | 0h<br>RO | **Reserved_0:** Reserved |
| 26:24 | 0h<br>RW | **VCIID:** VCi ID |
| 23:20 | 0h<br>RO | **Reserved_1:** Reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 19:17 | 0h<br>RO | **PARBSEL:** Port arbitration select. Doesn't apply. |
| 16 | 0h<br>RO | **LPARBTBL:** Load port arbitration table. Dosn't apply. |
| 15:8 | 0h<br>RO | **Reserved_2:** reserved |
| 7:1 | 0h<br>RW | **VCIM:** TC/VCi map |
| 0 | 0h<br>RO | **VCIM0:** TC/VCi map bit 0. Not used. |

## 20.5.49 VCISTS—Offset 126h



VCi Resource Status

### Access Method

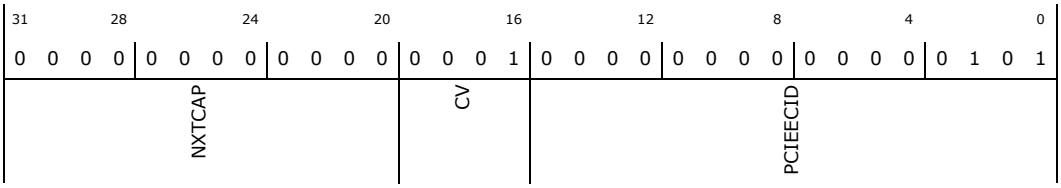
**Type:** PCI Configuration Register (Size: 16 bits)

**VCISTS:** [B:0, D:27, F:0] + 126h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:2 | 0h<br>RO | **RESERVED:** RESERVED |
| 1 | 0h<br>RO | **VCNP:** VCi Negotiation Pending |
| 0 | 0h<br>RO | **PARBTBLSTS:** Port Arbitration Table Status |

## 20.5.50 RCCAP—Offset 130h



Root Complex Link Declaration Capability Header

### Access Method

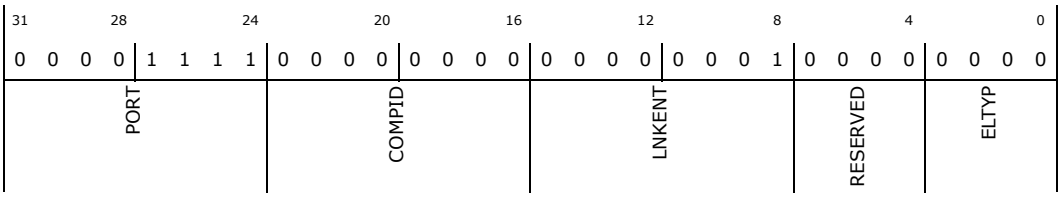
**Type:** PCI Configuration Register (Size: 32 bits)

**RCCAP:** [B:0, D:27, F:0] + 130h

**Default:** 00010005h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RO | **NXTCAP:** Next Capability Offset |
| 19:16 | 1h<br>RO | **CV:** Capability Version |
| 15:0 | 5h<br>RO | **PCIEECID:** PCI Express Extended Capability ID |

## 20.5.51 ESD—Offset 134h



Element Self Description

### Access Method

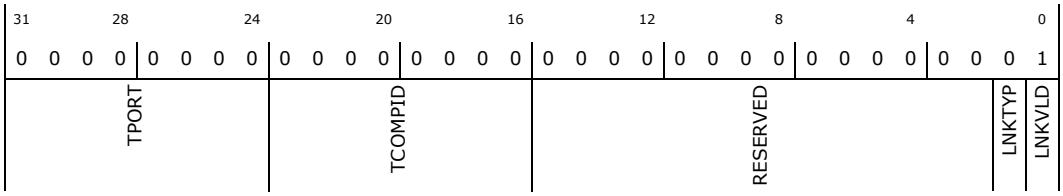
**Type:** PCI Configuration Register (Size: 32 bits)

**ESD:** [B:0, D:27, F:0] + 134h

### Default: 0F000100h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 0Fh<br>RO | **PORT:** Port Number |
| 23:16 | 00h<br>RO | **COMPID:** Component ID |
| 15:8 | 01h<br>RO | **LNKENT:** Number of Link Entries |
| 7:4 | 0h<br>RO | **RESERVED:** RESERVED |
| 3:0 | 0h<br>RO | **ELTYP:** Element Type |

## 20.5.52 L1DESC—Offset 140h



Link 1 Description

### Access Method

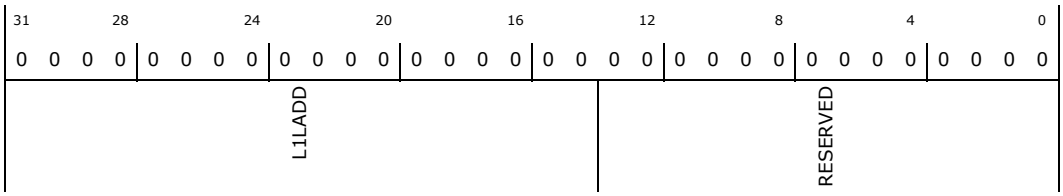
**Type:** PCI Configuration Register (Size: 32 bits)

**L1DESC:** [B:0, D:27, F:0] + 140h

**Default:** 00000001h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 0h<br>RO | **TPORT:** Target Port Number |
| 23:16 | 0h<br>RO | **TCOMPID:** Target Component ID |
| 15:2 | 0h<br>RO | **RESERVED:** RESERVED |
| 1 | 0h<br>RO | **LNKTYP:** Link Type |
| 0 | 1h<br>RO | **LNKVLD:** Link Valid |

## 20.5.53 L1LADD—Offset 148h



Link 1 Lower Address

### Access Method

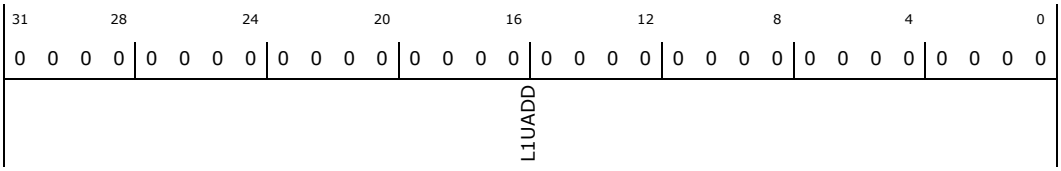
**Type:** PCI Configuration Register (Size: 32 bits)

**L1LADD:** [B:0, D:27, F:0] + 148h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:14 | 0h<br>RO | **L1LADD:** Link 1 Lower Address |
| 13:0 | 0h<br>RO | **RESERVED:** RESERVED |

## 20.5.54 L1UADD—Offset 14Ch



Link 1 Upper Address

### Access Method

**Type:** PCI Configuration Register (Size: 32 bits)

**L1UADD:** [B:0, D:27, F:0] + 14Ch

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **L1UADD:** Link 1 Upper Address |

## 20.6 HD Audio Memory Mapped I/O Registers

### Table 225. Summary of HD Audio Memory Mapped I/O Registers—AZLBAR

| Offset | Size | Register ID—Description | Default Value |
|---|---|---|---|
| 0h | 2 | "GCAP—Offset 0h" on page 2713 | 4401h |

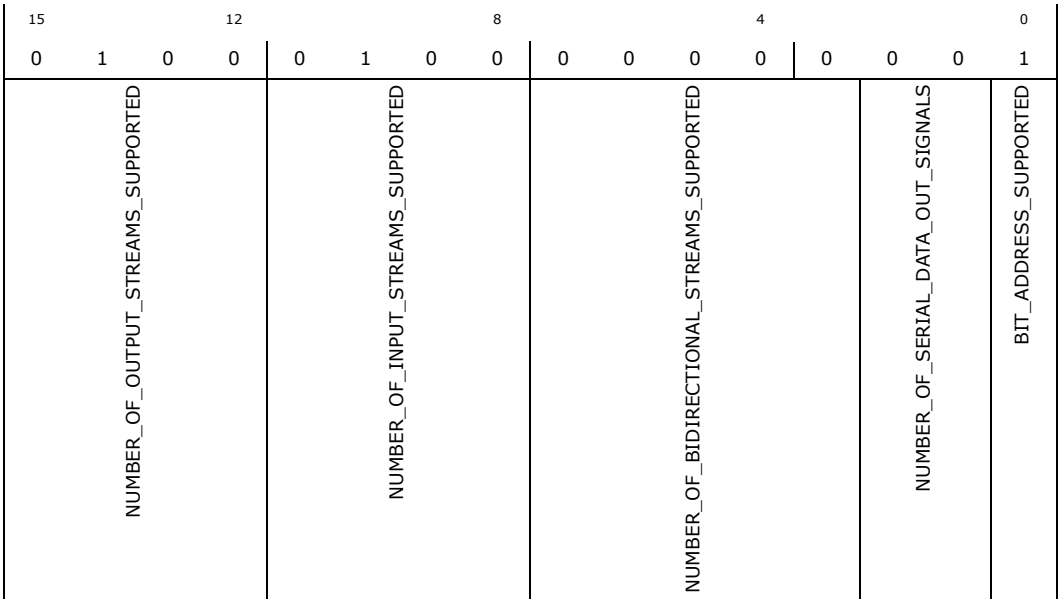
| 2144h | 4 | "OSD2LPIBA—Offset 2144h" on page 2808 | 00000000h |
| 2164h | 4 | "OSD3LPIBA—Offset 2164h" on page 2809 | 00000000h |

## 20.6.1 GCAP—Offset 0h

Global Capabilities



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**GCAP:** [AZLBAR] + 0h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

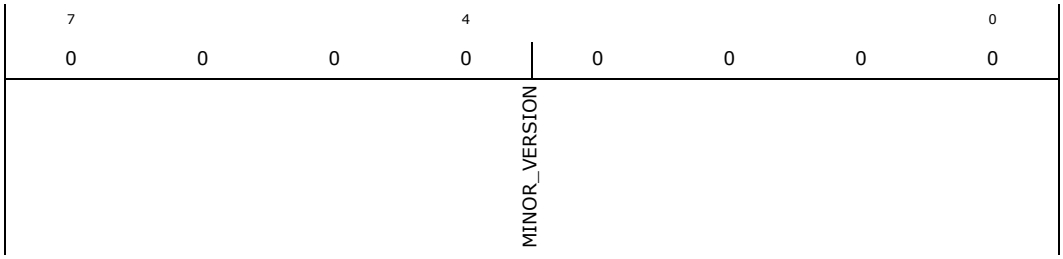
**Default:** 4401h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:12 | 4h<br>RW | **NUMBER_OF_OUTPUT_STREAMS_SUPPORTED:** 0011b indicates that in this SoC, Intel HD Audio controller supports three output streams. |
| 11:8 | 4h<br>RW | **NUMBER_OF_INPUT_STREAMS_SUPPORTED:** 0011b indicates that in this SoC, Intel HD Audio controller supports three output streams. |
| 7:3 | 00h<br>RO | **NUMBER_OF_BIDIRECTIONAL_STREAMS_SUPPORTED:** 00000b indicates that the Intel HD Audio controller supports 0 bidirectional streams. |
| 2:1 | 0h<br>RO | **NUMBER_OF_SERIAL_DATA_OUT_SIGNALS:** 00b indicates that the Intel HD Audio controller supports one Serial Data Output signal. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 0 | 01h<br>RW | **BIT_ADDRESS_SUPPORTED:** A 1 indicates that the Intel HD Audio controller supports 64 bit addressing for BDL addresses data buffer addresses and command buffer addresses. |

## 20.6.2 VMIN—Offset 2h

Minor Version



### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**VMIN:** [AZLBAR] + 2h

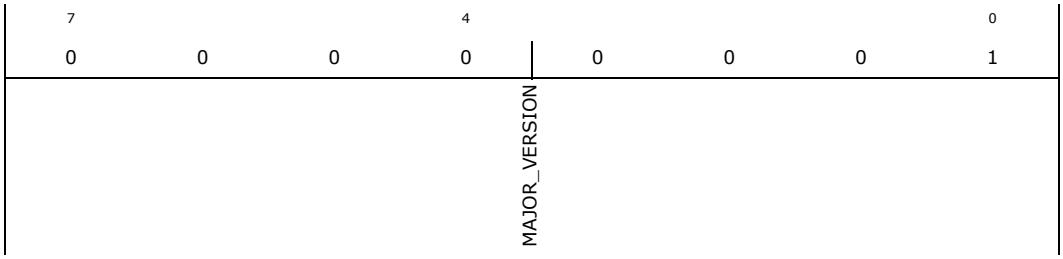
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:0 | 00h<br>RO | **MINOR_VERSION:** Indicates SoC supports minor revision number 00h of the Intel HD Audio specification. |

## 20.6.3 VMAJ—Offset 3h

Major Version



### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**VMAJ:** [AZLBAR] + 3h

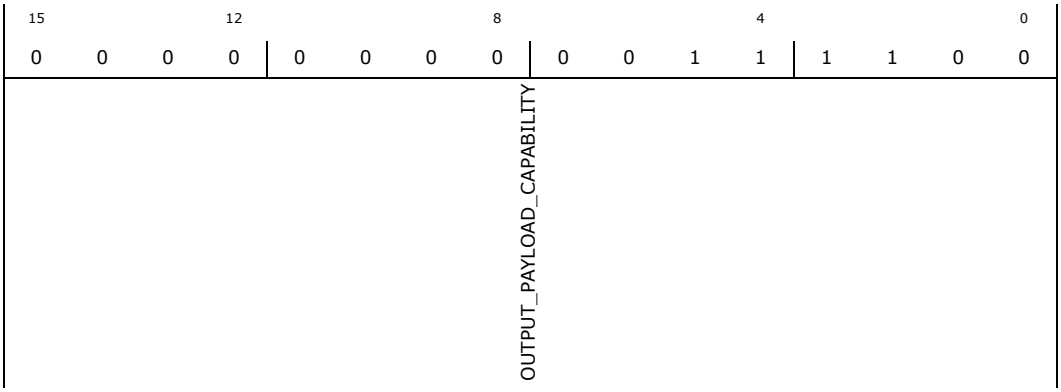
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 01h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:0 | 01h<br>RO | **MAJOR_VERSION:** Indicates SoC supports major revision number 1 of the Intel HD Audio specification. |

## 20.6.4 OUTPAY—Offset 4h

Output Payload Capability



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OUTPAY:** [AZLBAR] + 4h

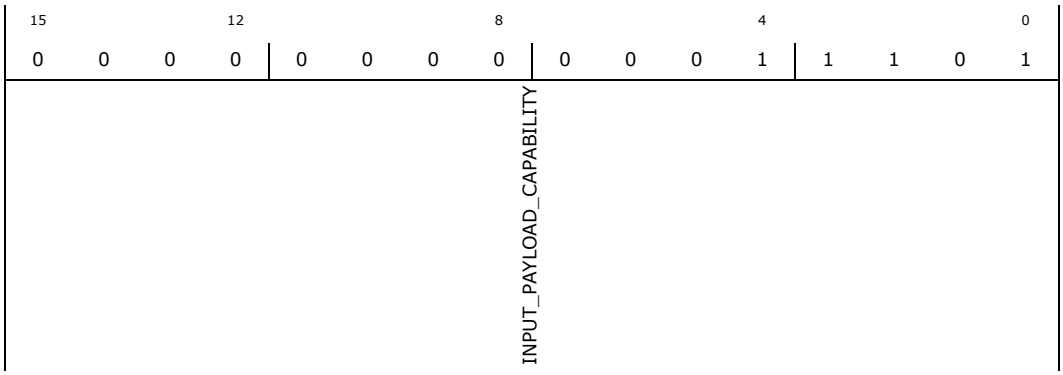
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 003Ch

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 003Ch<br>RO | **OUTPUT_PAYLOAD_CAPABILITY:** Indicates the total output payload available on the link. This does not include bandwidth used for command and control. This measurement is in 16 bit word quantities per 48 kHz frame. The default link clock speed of 24.000 MHz the data is double pumped provides 1000 bits per frame or 62.5 words in total. 40 bits are used for command and control leaving 60 words available for data payload. 00h 0 words 01h 1 word payload FFh 255h word payload |

## 20.6.5 INPAY—Offset 6h

Input Payload Capability



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**INPAY:** [AZLBAR] + 6h

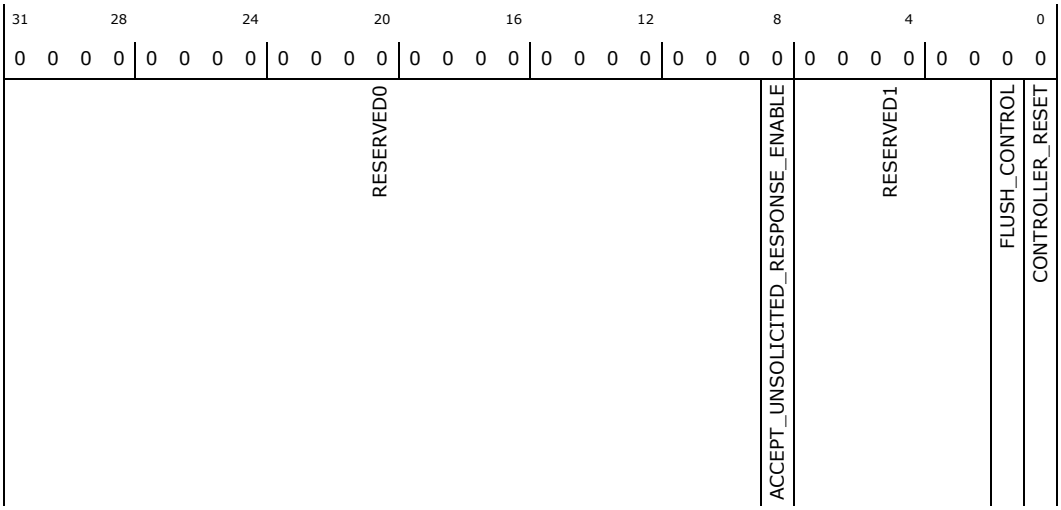
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 001Dh

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 001Dh<br>RO | **INPUT_PAYLOAD_CAPABILITY:** Indicates the total input payload available on the link. This does not include bandwidth used for response. This measurement is in 16 bit word quantities per 48 kHz frame. The default link clock speed of 24.000 MHz provides 500 bits per frame or 31.25 words in total. 36 bits are used for response leaving 29 words for data payload. 00h 0 words 01h 1 word payload FFh 255h word payload |

## 20.6.6 GCTL—Offset 8h

Global Control



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**GCTL:** [AZLBAR] + 8h

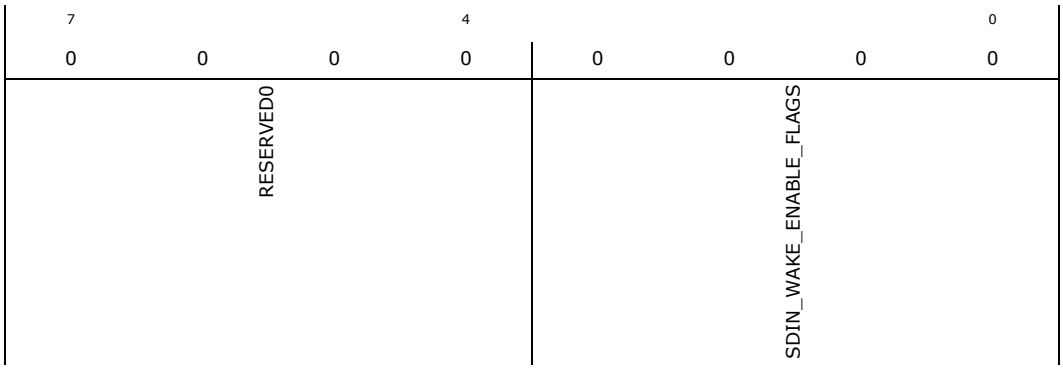
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:9 | 0h<br>RO | **RESERVED0:** reserved |
| 8 | 0h<br>RW | **ACCEPT_UNSOLICITED_RESPONSE_ENABLE:** If UNSOL is a 1 Unsolicited Responses from the codecs are accepted by the controller and placed into the Response Input Ring Buffer. If UNSOL is a 0 unsolicited responses are not accepted and dropped on the floor. |
| 7:2 | 00h<br>RO | **RESERVED1:** reserved |
| 1 | 0h<br>RW | **FLUSH_CONTROL:** Writing a 1 to this bit initiates a flush. When the flush completion is received by the controller hardware sets the Flush Status bit and clears this Flush Control bit. Before a flush cycle is initiated the DMA Position Buffer must be programmed with a valid memory address by software but the DMA Position Buffer bit 0 need not be set to enable the position reporting mechanism. Also all streams must be stopped the associated RUN bit must be 0 . When the flush is initiated the controller will flush pipelines to memory to guarantee that the hardware is ready to transition to a D3 state. Setting this bit is not a critical step in the power state transition if the content of the FIFOs is not critical. |
| 0 | 0h<br>RW | **CONTROLLER_RESET:** Writing a 0 to this bit causes the Intel HD Audio controller to be reset. All state machines FIFO s and non Suspend well memory mapped configuration registers except ECAP and PCI Configuration Registers in the controller will be reset. The Intel HD Audio link RESET signal will be asserted and all other link signals will be driven to their reset values. After the hardware has completed sequencing into the reset state it will report a 0 in this bit. Software must read a 0 from this bit to verify that the controller is in reset. Writing a 1 to this bit causes the controller to exit its reset state and de assert the Intel HD Audio link RESET signal. Software is responsible forsetting clearing this bit such that the minimum Intel HD Audio link RESET signal assertion pulse width specification is met. When the controller hardware is ready to begin operation it will report a1 in this bit. Software must read a 1 from this bit before accessing any controller registers. The CRST bit defaults to a 0 after hardware reset therefore software needs to write a 1 to this bit to begin operation. Note thatthe CORB RIRB RUN bits and all Stream RUN bits must be verified cleared to zero before CRST is written to 0 asserted in order to assure a clean re start. When setting or clearing CRST software must ensure that minimum link timing requirements minimum RESET assertion time etc. are met. When CRST is 0 indicating that the controller is in reset writes to all Intel HD Audio memory mapped registers are ignored as if the device is not present. The only exception is the Global Control register containing the CRST bit itself. The Global Control register is write able as a DWord Word or Byte even when CRST is 0 if the byte enable for the byte containing the CRST bit Byte Enable 0 is active. If Byte Enable 0 is not active writes to the Global Control register will be ignored when CRST is 0. When CRST is 0 reads to Intel HD Audio memory mapped registers will return their default value except for registers that are not reset with PLTRST or on a D3hot gt D0 transition. |

## 20.6.7 WAKEEN—Offset Ch

Wake Enable



### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**WAKEEN:** [AZLBAR] + Ch

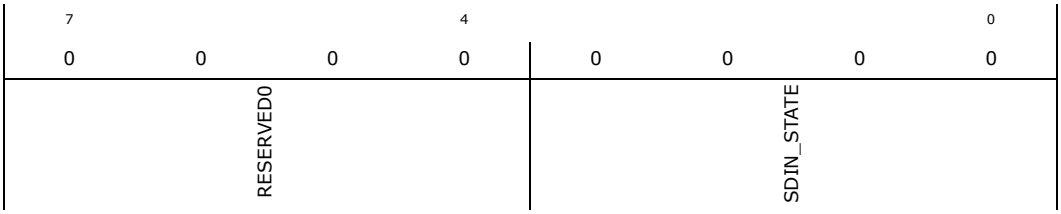
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:4 | 0h<br>RO | **RESERVED0:** reserved |
| 3:0 | 0h<br>RW | **SDIN_WAKE_ENABLE_FLAGS:** Bits which control which SDI signal s may generate a wake event. A 1 bit in the bit mask indicates that the associated SDIN signal is enabled to generate a wake. |

## 20.6.8 WAKESTS—Offset Eh

Wake Status



### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**WAKESTS:** [AZLBAR] + Eh

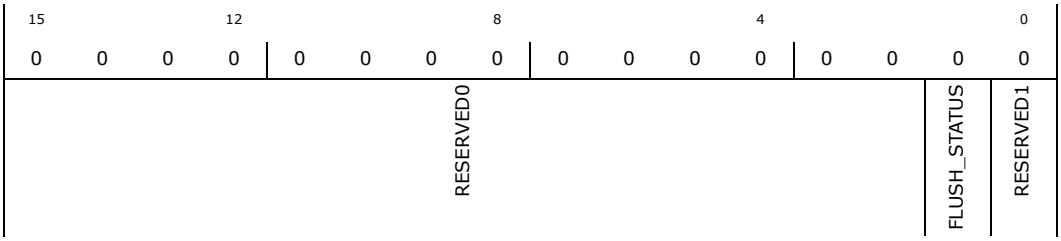
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:4 | 0h<br>RO | **RESERVED0:** reserved |
| 3:0 | 0h<br>RO | **SDIN_STATE:** Flag bits that indicate which SDI signal s received a State Change event. The bits are cleared by writing 1 s to them. |

## 20.6.9 GSTS—Offset 10h

Global Status



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**GSTS:** [AZLBAR] + 10h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

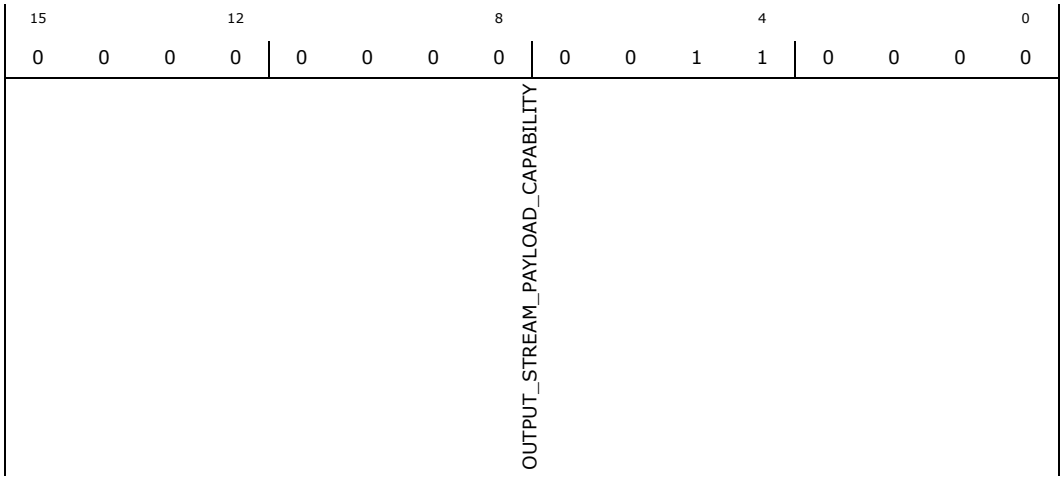
**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:2 | 0000h<br>RO | **RESERVED0:** reserved |
| 1 | 0h<br>RW | **FLUSH_STATUS:** This bit is set to a 1 by the hardware to indicate that the flush cycle initiated when the FCNTRL bit was set has completed. Software must write a 1to clear this bit before the next time FCNTRL is set. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 0 | 0h<br>RO | **RESERVED1:** reserved |

## 20.6.10 OUTSTRMPAY—Offset 18h

Output Stream Payload Capability



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OUTSTRMPAY:** [AZLBAR] + 18h

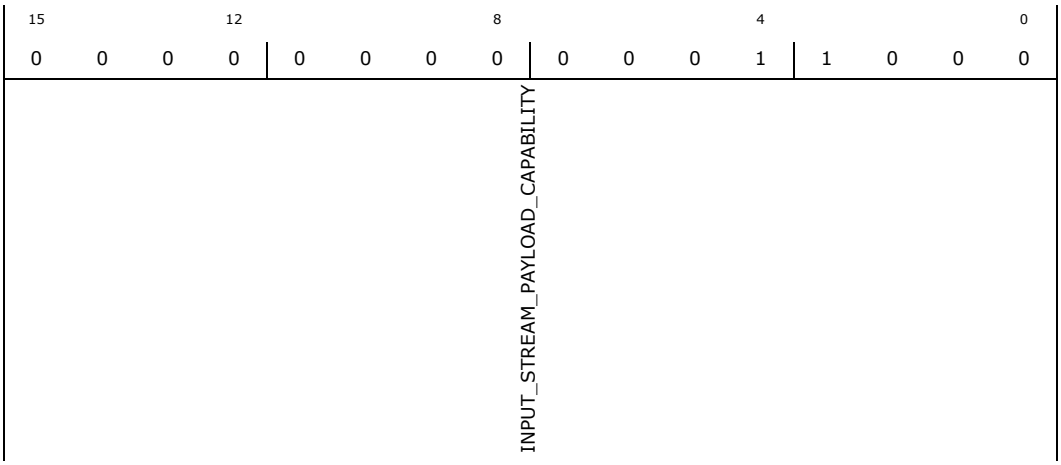
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0030h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 0030h<br>RO | **OUTPUT_STREAM_PAYLOAD_CAPABILITY:** Indicates maximum number of words per frame for any single output stream. This measurement is in 16 bit word quantities per 48 kHz frame. 48 Words 96B is the maximum supported therefore a value of 30h is reported in this register. Software must ensure that a format which would cause more words per frame than indicated is not programmed into the Output Stream Descriptor register. 00h 0 words 01h 1 word payload FFh 255h word payload |

## 20.6.11 INSTRMPAY—Offset 1Ah

Input Stream Payload Capability



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**INSTRMPAY:** [AZLBAR] + 1Ah

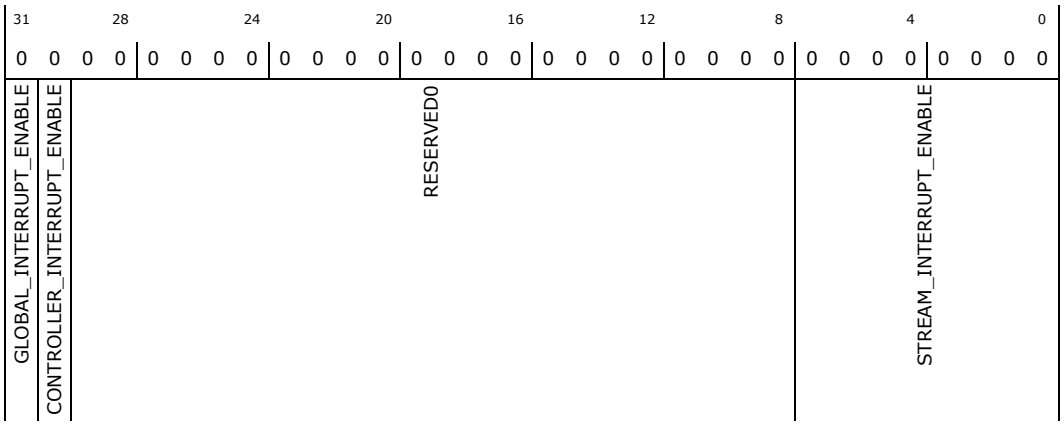
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0018h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 0018h<br>RO | **INPUT_STREAM_PAYLOAD_CAPABILITY:** Indicates maximum number of words per frame for any single input stream. This measurement is in 16 bit word quantities per 48 kHz frame. 24 Words 48B is the maximum supported therefore a value of 18h is reported in this register. Software must ensure that a format which would cause more words per frame than indicated is not programmed into the Input Stream Descriptor register. 00h 0 words 01h 1 word payload FFh 255h word payload |

## 20.6.12 INTCTL—Offset 20h

Interrupt Control



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**INTCTL:** [AZLBAR] + 20h

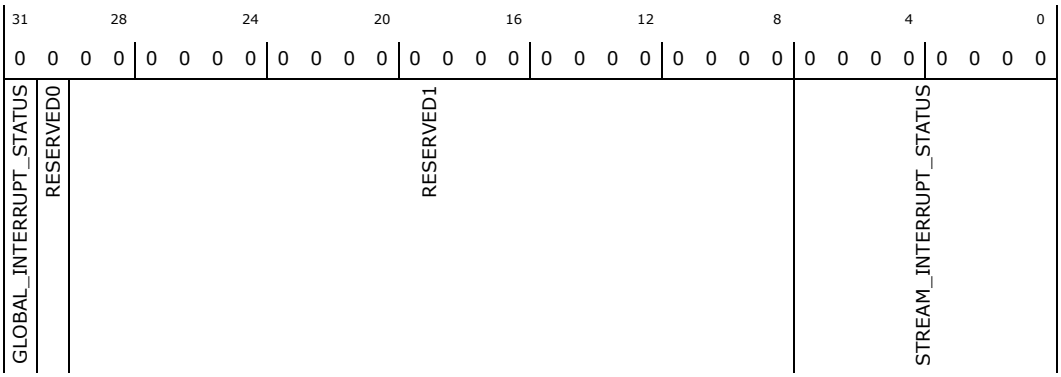
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h<br>RW | **GLOBAL_INTERRUPT_ENABLE:** Global bit to enable device interrupt generation. When set to 1 the Intel HD Audio function is enabled to generate an interrupt. This control is in addition to any bits in the bus specific address space such as the Interrupt Enable bit in the PCI Configuration Space. This bit is not affected by controller reset. |
| 30 | 0h<br>RW | **CONTROLLER_INTERRUPT_ENABLE:** Enables the general interrupt for controller functions. When set to 1 and GIE is enabled the controller generates an interrupt when the CIS bit gets set. This bit is not affected by controller reset. |
| 29:8 | 0h<br>RO | **RESERVED0:** reserved |
| 7:0 | 00h<br>RW | **STREAM_INTERRUPT_ENABLE:** When set to 1 the individual Streams are enabled to generate an interrupt when the corresponding stream status bits get set. A stream interrupt will be caused as a result of a buffer with IOC 1 in the BDL entry being completed or as a result of a FIFO error underrun or overrun occurring. Control over the generation of each of these sources is in the associated Stream Descriptor. The streams are numbered and the SIE bits assigned sequentially based on their order in the register set. Bit 0 Input Stream 1 Bit 1 Input Stream 2 Bit 2 Input Stream 3 Bit 3 Input Stream 4 Bit 4 Output Stream 1 Bit 5 Output Stream 2 Bit 6 Output Stream 3 Bit 7 Output Stream 4 |

## 20.6.13 INTSTS—Offset 24h

Interrupt Status



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**INTSTS:** [AZLBAR] + 24h

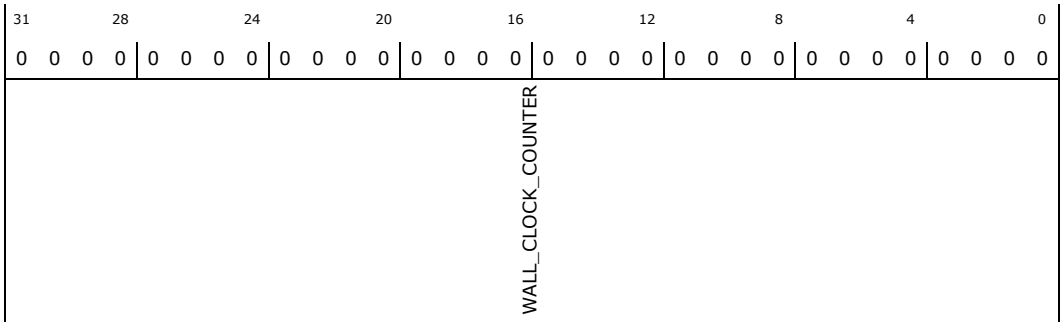
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h<br>RO | **GLOBAL_INTERRUPT_STATUS:** This bit is an OR of all of the interrupt status bits in this register. |
| 30 | 0h<br>RO | **RESERVED0:** Status of general controller interrupt. A 1 indicates that an interrupt condition occurred due to a Response Interrupt a Response Buffer Overrun Interrupt CORB Memory Error Interrupt Error Present Interrupt Intel Reserved or a SDIN State Change event. The exact cause can be determined by interrogating other registers. Note that a HW interrupt will not be generated unless the corresponding enable bit is set. This bit is an OR of all of the stated interrupt status bits for this register. |
| 29:8 | 0h<br>RO | **RESERVED1:** reserved |
| 7:0 | 00h<br>RW | **STREAM_INTERRUPT_STATUS:** A 1 indicates that an interrupt condition occurred on the corresponding Stream. Note that a HW interrupt will not be generated unless the corresponding enable bit is set. This bit is an OR of all of an individual stream s interrupt status bits. The streams are numbered and the SIS bits assigned sequentially based on their order in the register set. Bit 0 Input Stream 1 Bit 1 Input Stream 2 Bit 2 Input Stream 3 Bit 3 Input Stream 4 Bit 4 Output Stream 1 Bit 5 Output Stream 2 Bit 6 Output Stream 3 Bit 7 Output Stream 4 |

## 20.6.14 WALCLK—Offset 30h

Wall Clock Counter



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**WALCLK:** [AZLBAR] + 30h

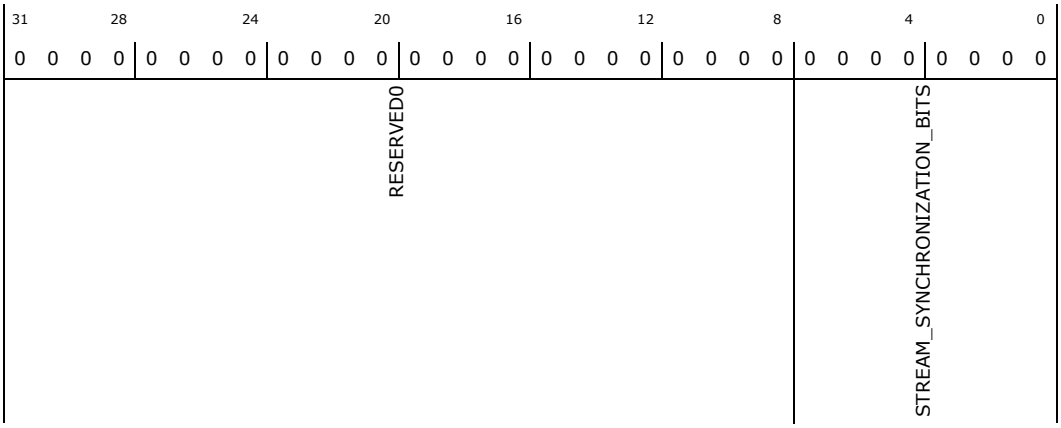
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **WALL_CLOCK_COUNTER:** 32 bit counter that is incremented on each link BCLK period and rolls over from FFFF_FFFFh to 0000_0000h. This counter will roll over to zero with a period of approximately 179 seconds. This counter is enabled while the BCLK bit is set to 1. Software uses this counter to synchronize between multiple controllers. Will be reset on controller reset. |

## 20.6.15 SSYNC—Offset 38h

Stream Synchronization



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSYNC:** [AZLBAR] + 38h

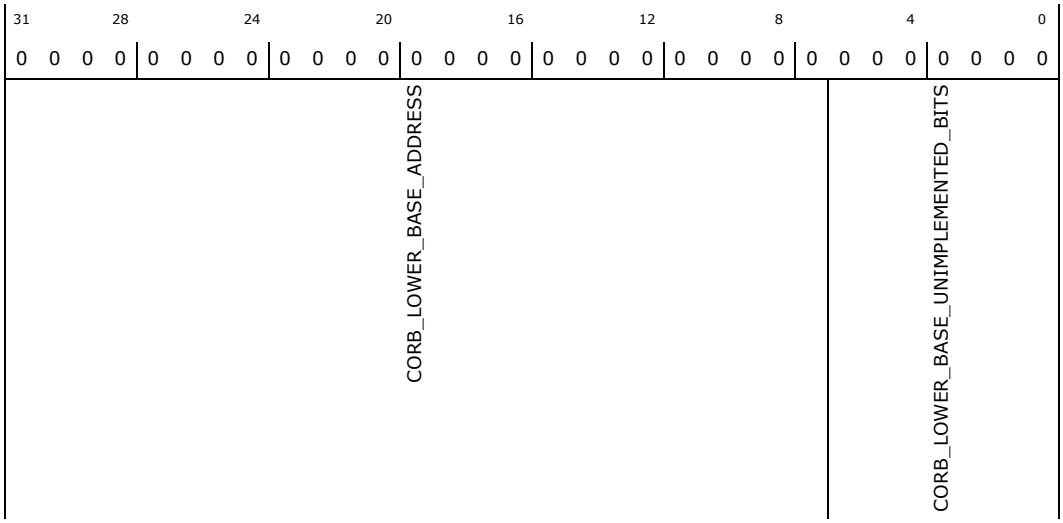
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 0h<br>RO | **RESERVED0:** reserved |
| 7:0 | 00h<br>RW | **STREAM_SYNCHRONIZATION_BITS:** The Stream Synchronization bits when set to 1 block data from being sent on or received from the link. Each bit controls the associated Stream Descriptor bit 0 corresponds to the first Stream Descriptor etc. To synchronously start a set of DMA engines the bits in the SSYNC register are first set to a 1. The RUN bits for the associated Stream Descriptors are then set to a 1 to start the DMA engines. When all streams are ready FIFORDY 1 the associated SSYNC bits can all be set to 0 at the same time and transmission or reception of bits to or from the link will begin together at the start of the next full link frame. To synchronously stop streams first the bits are set in the SSYNC register and then the individual RUN bits in the Stream Descriptors are cleared by software. The streams are numbered and the SSYNC bits assigned sequentially based on their order in the register set. Bit 0 Input Stream 1 Bit 1 Input Stream 2 Bit 2 Input Stream 3 Bit 3 Input Stream 4 Bit 4 Output Stream 1 Bit 5 Output Stream 2 Bit 6 Output Stream 3 Bit 7 Output Stream 4 Each bit can be reset by their respective stream reset. |

## 20.6.16 CORBLBASE—Offset 40h

CORB Lower Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CORBLBASE:** [AZLBAR] + 40h

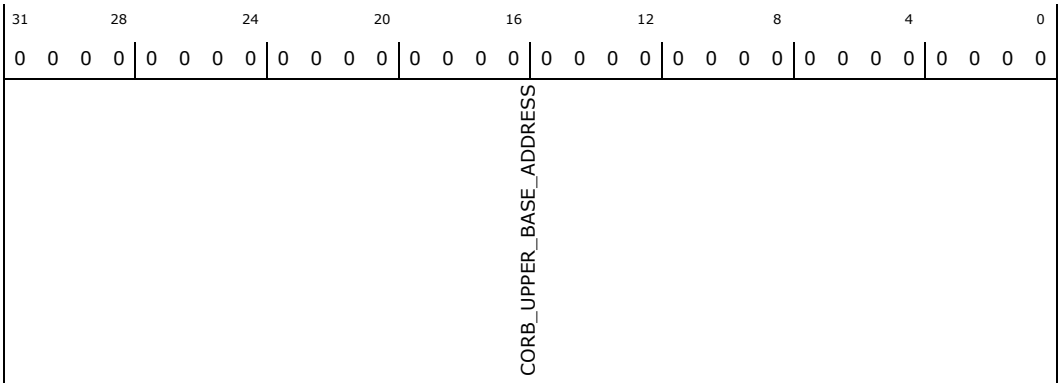
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:7 | 0h<br>RW | **CORB_LOWER_BASE_ADDRESS:** Lower address of the Command Output Ring Buffer allowing the CORB Base Address to be assigned on any 64 B boundary. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted. |
| 6:0 | 00h<br>RO | **CORB_LOWER_BASE_UNIMPLEMENTED_BITS:** Hardwired to 0. This requires the CORB to be allocated with 128 byte granularity to allow for cache line fetch optimizations. |

## 20.6.17 CORBUBASE—Offset 44h

CORB Upper Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CORBUBASE:** [AZLBAR] + 44h

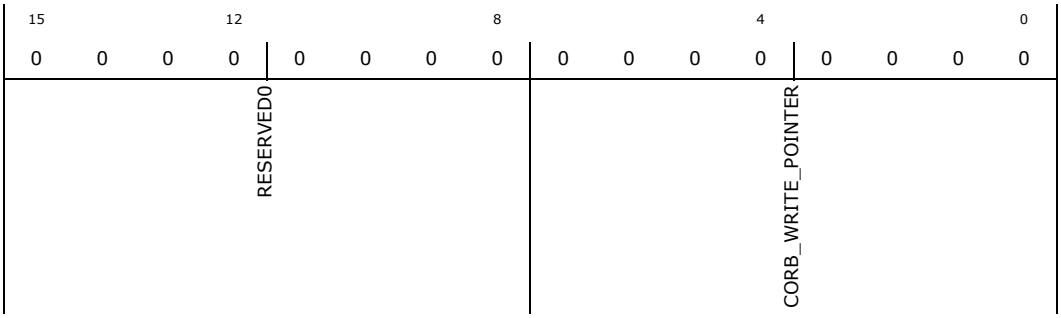
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **CORB_UPPER_BASE_ADDRESS:** Upper 32 bits of address of the Command Output Ring Buffer. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted. |

## 20.6.18 CORBWP—Offset 48h

CORB Write Pointer



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**CORBWP:** [AZLBAR] + 48h

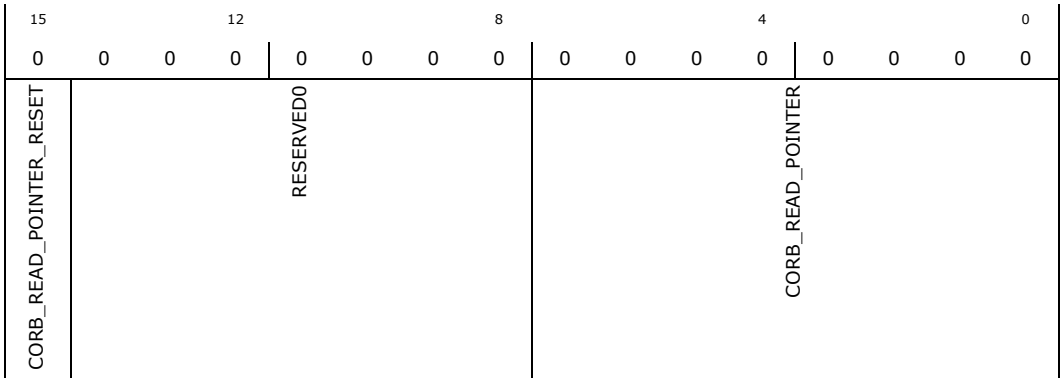
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 00h<br>RO | **RESERVED0:** reserved |
| 7:0 | 00h<br>RW | **CORB_WRITE_POINTER:** Software writes the last valid CORB entry offset into this field in Dword granularity. The DMA engine fetches commands from the CORB until the Read Pointer matches the Write Pointer. Supports 256 CORB entries 256 x 4B 1KB . This field may be written while the DMA engine is running. |

## 20.6.19 CORBRP—Offset 4Ah

CORB Read Pointer



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**CORBRP:** [AZLBAR] + 4Ah

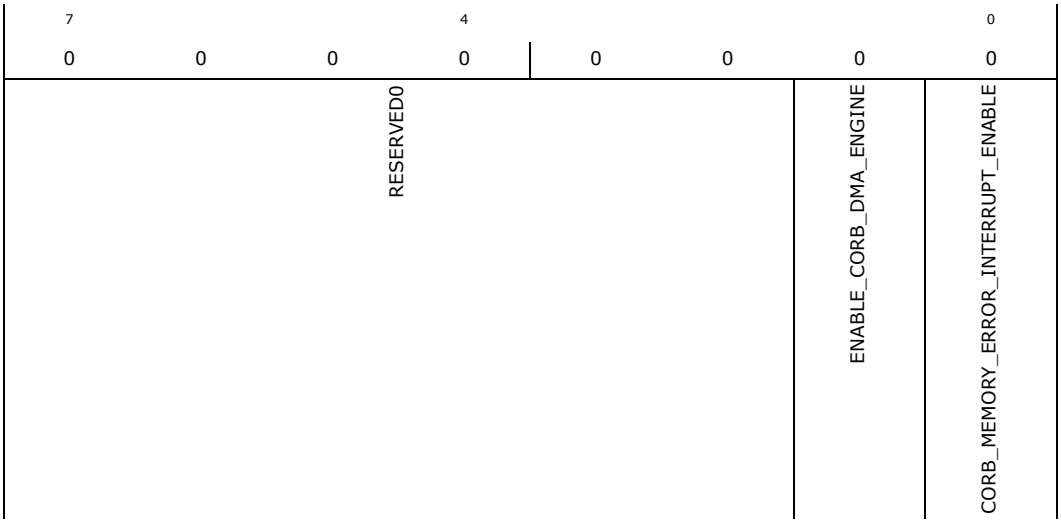
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15 | 0h<br>RW | **CORB_READ_POINTER_RESET:** Software writes a 1 to this bit to reset the CORB Read Pointer to 0 and clear any residual pre fetched commands in the CORB hardware buffer within the Intel Audio controller. The hardware will physically update this bit to 1 when the CORB Pointer reset is complete. Software must read a 1 to verify that the reset completed correctly. Software must clear this bit back to 0 and read back the 0 to verify that the clear completed correctly. The CORB DMA engine must be stopped prior to resetting the Read Pointer or else DMA transfer may be corrupted. |
| 14:8 | 00h<br>RO | **RESERVED0:** reserved |
| 7:0 | 00h<br>RO | **CORB_READ_POINTER:** Software reads this field to determine how many commands it can write to the CORB without over running. The value read indicates the CORB Read Pointer offset in Dword granularity. The offset entry read from this field has been successfully fetched by the DMA controller and may be over written by software. Supports 256 CORB entries 256 x 4B 1KB . This field may be read while the DMA engine is running. |

## 20.6.20 CORBCTL—Offset 4Ch

CORB Control



### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**CORBCTL:** [AZLBAR] + 4Ch

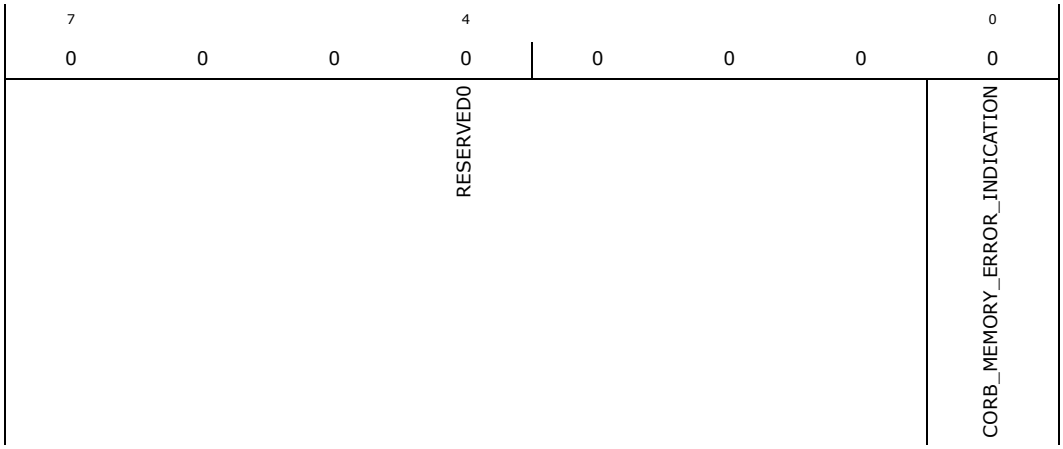
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:2 | 00h<br>RO | **RESERVED0:** reserved |
| 1 | 0h<br>RW | **ENABLE_CORB_DMA_ENGINE:** 0 DMA Stop 1 DMA Run After SW writes a 0 to this bit the HW may not stop immediately. The hardware will physically update the bit to a 0 when the DMA engine is truly stopped. SW must read a 0 from this bit to verify that the DMA is truly stopped. |
| 0 | 0h<br>RW | **CORB_MEMORY_ERROR_INTERRUPT_ENABLE:** If this bit is set and GIE and CIE are enabled the controller will generate an interrupt if the MEI status bit is set. |

## 20.6.21 CORBSTS—Offset 4Dh

CORB Status



### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**CORBSTS:** [AZLBAR] + 4Dh

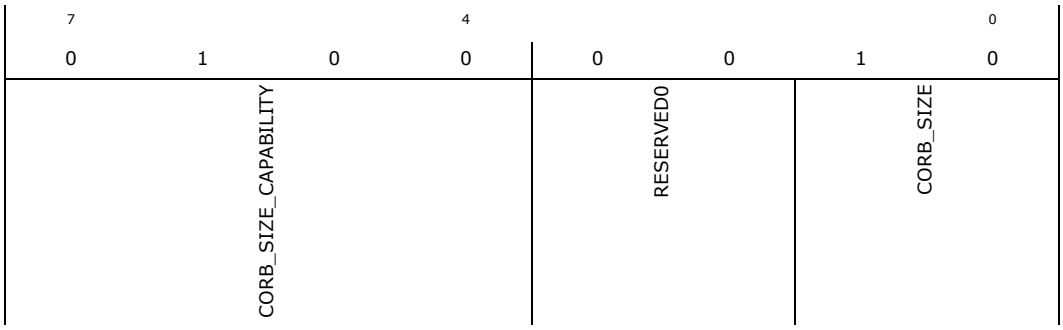
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:1 | 00h<br>RO | **RESERVED0:** reserved |
| 0 | 0h<br>RW | **CORB_MEMORY_ERROR_INDICATION:** If this status bit is set the controller has detected an error in the pathway between the controller and memory. This may be an ECC bit error or any other type of detectable data error which renders the command data fetched invalid. Software can clear this bit by writing a 1 to it. However this type of error leaves the audio subsystem in an unviable state and typically requires CRST . |

## 20.6.22 CORBSIZE—Offset 4Eh

CORB Size



### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**CORBSIZE:** [AZLBAR] + 4Eh

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

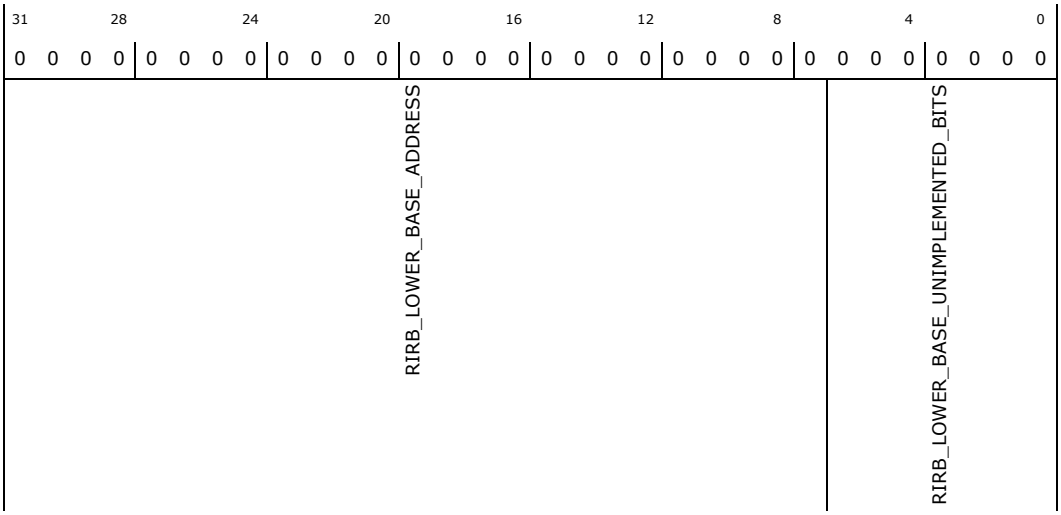
**Default:** 42h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:4 | 4h<br>RO | **CORB_SIZE_CAPABILITY:** 0100b indicates that the HD Audio controller only supports a CORB size of 256 CORB entries 1024B . |

| Bit Range | Default & Access | Description |
|---|---|---|
| 3:2 | 0h<br>RO | **RESERVED0:** reserved |
| 1:0 | 02h<br>RO | **CORB_SIZE:** Hardwired to 10b which sets the CORB size to 256 entries 1024B . |

## 20.6.23 RIRBLBASE—Offset 50h

RIRB Lower Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**RIRBLBASE:** [AZLBAR] + 50h

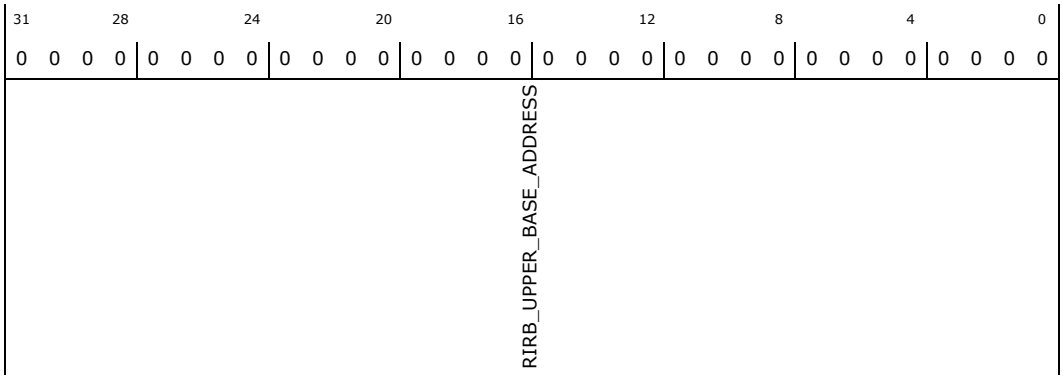
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:7 | 0h<br>RW | **RIRB_LOWER_BASE_ADDRESS:** Lower address of the Response Input Ring Buffer allowing the RIRB Base Address to be assigned on any 64 B boundary. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted. |
| 6:0 | 00h<br>RO | **RIRB_LOWER_BASE_UNIMPLEMENTED_BITS:** Hardwired to 0 to force 128 byte buffer alignment for cache line fetch optimizations. |

## 20.6.24 RIRBUBASE—Offset 54h

RIRB Upper Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**RIRBUBASE:** [AZLBAR] + 54h

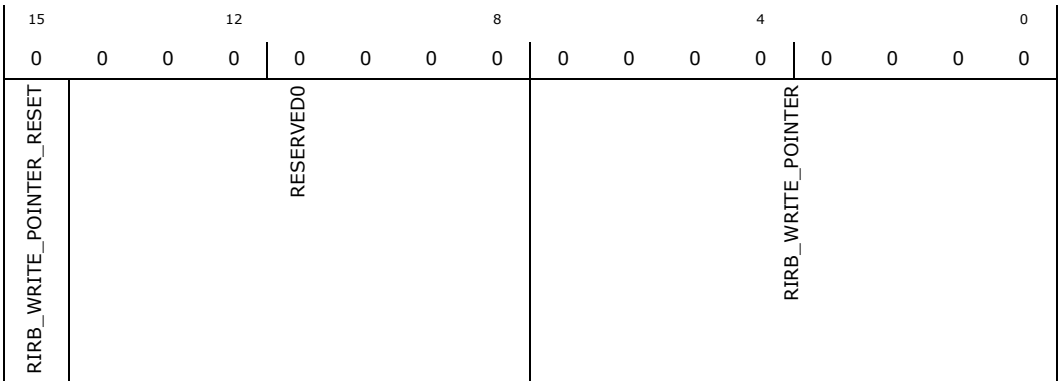
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **RIRB_UPPER_BASE_ADDRESS:** Upper 32 bits of address of the Response Input Ring Buffer. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted. |

## 20.6.25 RIRBWP—Offset 58h

RIRB Write Pointer



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**RIRBWP:** [AZLBAR] + 58h

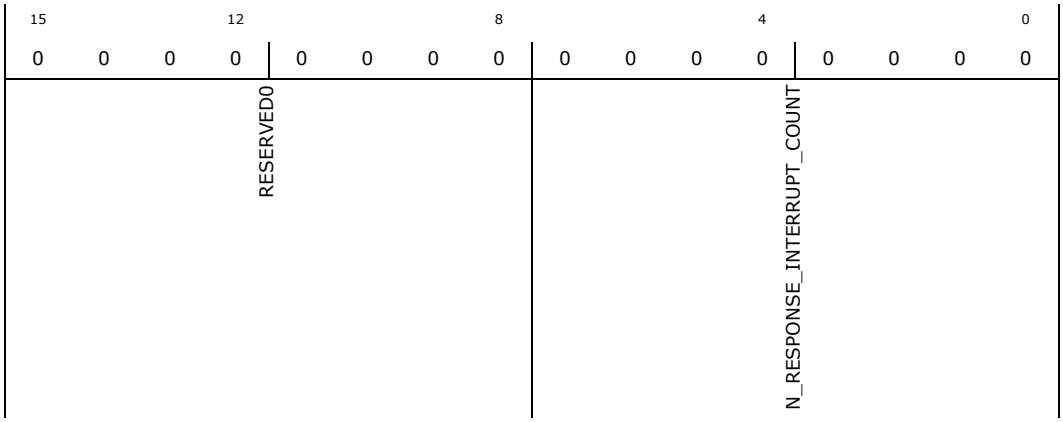
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15 | 0h<br>WO | **RIRB_WRITE_POINTER_RESET:** Software writes a 1 to this bit to reset the RIRB Write Pointer to 0 s. The RIRB DMA engine must be stopped prior to resetting the Write Pointer or else DMA transfer may be corrupted. This bit will always be read as 0. |
| 14:8 | 00h<br>RO | **RESERVED0:** reserved |
| 7:0 | 00h<br>RO | **RIRB_WRITE_POINTER:** Indicates the last valid RIRB entry written by the DMA controller. Software reads this field to determine how many responses it can read from the RIRB. The value read indicates the RIRB Write Pointer offset in 2 Dword RIRB entry units since each RIRB entry is 2 Dwords long . Supports up to 256 RIRB entries 256 x 8B 2KB . This field may be read while the DMA engine is running. |

## 20.6.26 RINTCNT—Offset 5Ah

Response Interrupt Count



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**RINTCNT:** [AZLBAR] + 5Ah

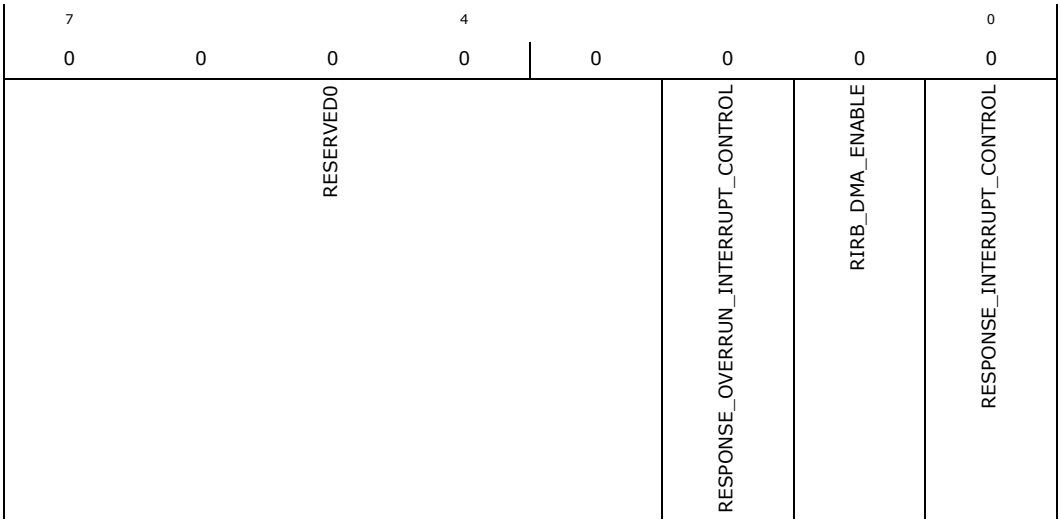
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 00h RO | **RESERVED0:** reserved |
| 7:0 | 00h RW | **N_RESPONSE_INTERRUPT_COUNT:** 0000_0001b 1 Response sent to RIRB 1111_1111b 255 Responses sent to RIRB 0000_0000b 256 Responses sent to RIRB The DMA engine should be stopped when changing this field or else an interrupt may be lost. Note that each Response occupies 2 Dwords in the RIRB. This is compared to the total number of responses that have been returned as opposed to the number of frames in which there were responses. If more than one codec responds in one frame then the count is increased by the number of responses received in the frame. |

## 20.6.27 RIRBCTL—Offset 5Ch

RIRB Control



### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**RIRBCTL:** [AZLBAR] + 5Ch

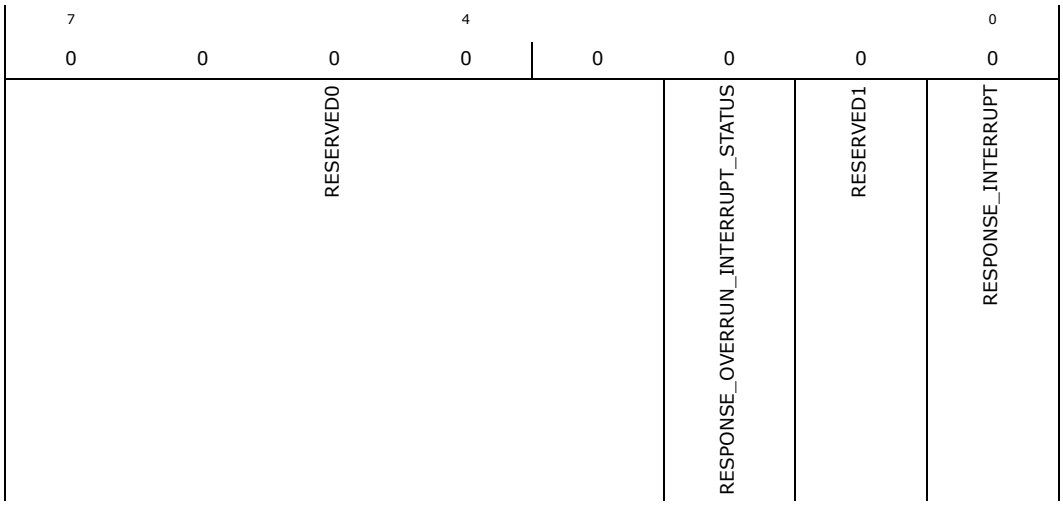
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:3 | 00h<br>RO | **RESERVED0:** reserved |
| 2 | 0h<br>RW | **RESPONSE_OVERRUN_INTERRUPT_CONTROL:** If this bit is set and GIE and CIE are enabled the hardware will generate an interrupt when the Response Overrun Interrupt Status bit is set. |
| 1 | 0h<br>RW | **RIRB_DMA_ENABLE:** 0 DMA Stop 1 DMA Run After SW writes a 0 to this bit the HW may not stop immediately. The hardware will physically update the bit to a 0 when the DMA engine is truly stopped. SW must read a 0 from this bit to verify that the DMA is truly stopped. |
| 0 | 0h<br>RW | **RESPONSE_INTERRUPT_CONTROL:** 0 Disable Interrupt 1 Generate an interrupt if GIE and CIE are enabled after N number of Responses are sent to the RIRB buffer OR when an empty Response slot is encountered on all SDI_x inputs whichever occurs first . The N counter is reset when the interrupt is generated. |

## 20.6.28 RIRBSTS—Offset 5Dh

RIRB Status



### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**RIRBSTS:** [AZLBAR] + 5Dh

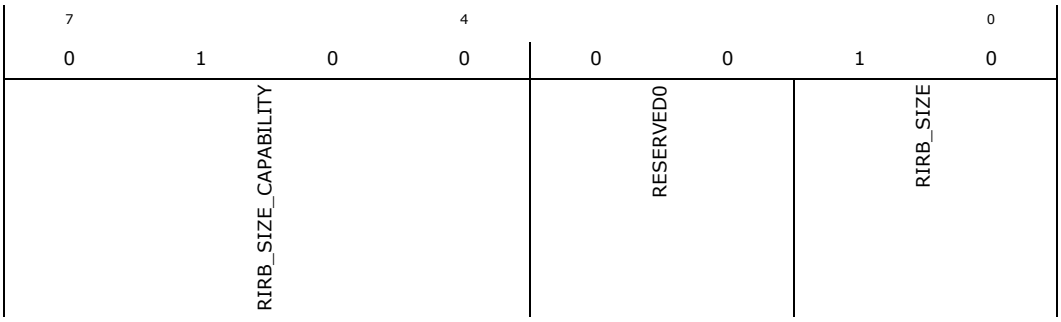
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:3 | 00h<br>RO | **RESERVED0:** reserved |
| 2 | 0h<br>RW | **RESPONSE_OVERRUN_INTERRUPT_STATUS:** Hardware sets this bit to a 1 when the RIRB DMA engine is not able to write the incoming responses to memory before additional incoming responses overrun the internal FIFO. When the overrun occurs the hardware will drop the responses which overrun the buffer. An interrupt may be generated if the Response Overrun Interrupt Control bit is set. Note that this status bit is set even if an interrupt is not enabled for this event. Software clears this flag by writing a 1 to this bit. |
| 1 | 0h<br>RO | **RESERVED1:** reserved |
| 0 | 0h<br>RW | **RESPONSE_INTERRUPT:** Hardware sets this bit to a 1 when an interrupt has been generated after N number of Responses are sent to the RIRB buffer OR when an empty Response slot is encountered on all SDI x inputs whichever occurs first . Note that this status bit is set even if an interrupt is not enabled for this event. Software clears this flag by writing a 1 to this bit. |

## 20.6.29 RIRBSIZE—Offset 5Eh

RIRB Size



### Access Method

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**RIRBSIZE:** [AZLBAR] + 5Eh

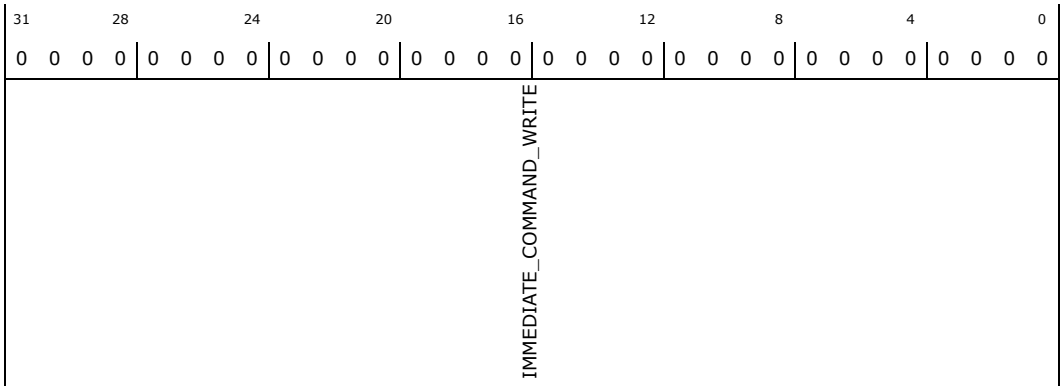
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 42h

| Bit Range | Default & Access | Description |
|---|---|---|
| 7:4 | 4h<br>RO | **RIRB_SIZE_CAPABILITY:** 0100b indicates that the HD Audio controller only supports a RIRB size of 256 RIRB entries 2048B . |
| 3:2 | 0h<br>RO | **RESERVED0:** reserved |
| 1:0 | 02h<br>RO | **RIRB_SIZE:** Hardwired to 10b which sets the RIRB size to 256 entries 2048B . |

## 20.6.30 IC—Offset 60h

Immediate Command



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**IC:** [AZLBAR] + 60h

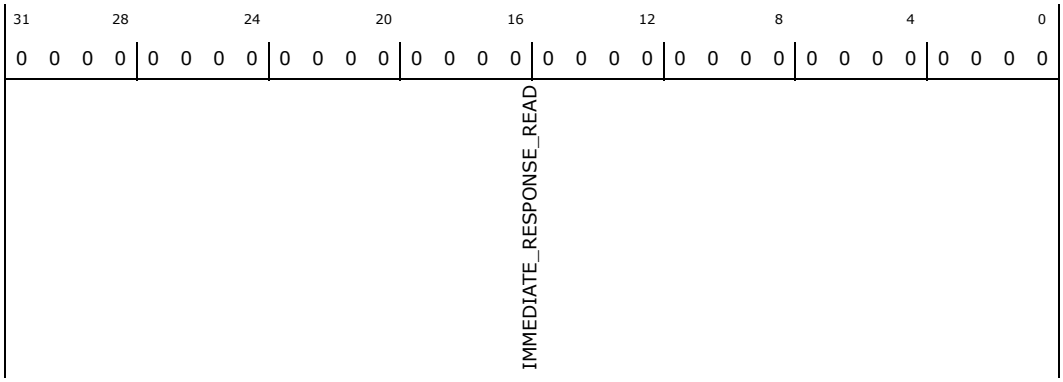
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **IMMEDIATE_COMMAND_WRITE:** The command to be sent to the codec via the Immediate Command mechanism is written to this register. The command stored in this register is sent out over the link during the next available frame after a 1 is written to the ICB bit. |

## 20.6.31 IR—Offset 64h

Immediate Response



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**IR:** [AZLBAR] + 64h

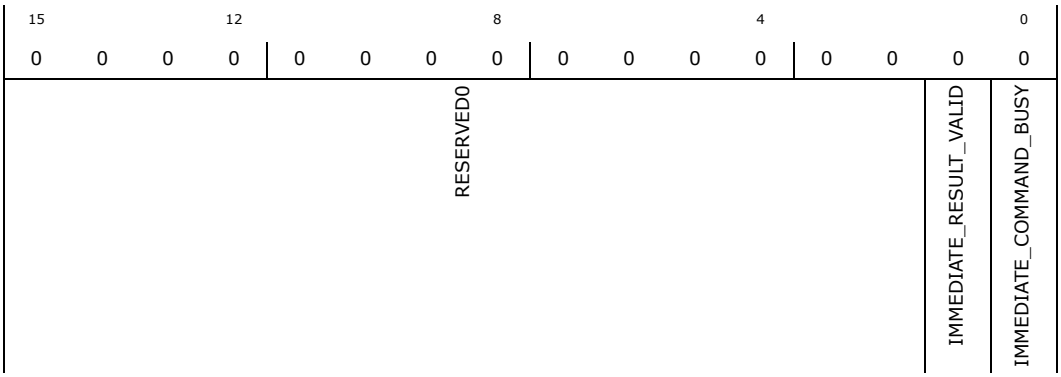
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **IMMEDIATE_RESPONSE_READ:** This register contains the response received from a codec resulting from a command sent via the Immediate Command mechanism. If multiple codecs responded in the same frame there is no guarantee as to which response will be latched. Therefore broadcast type commands must not be issued via the Immediate Command mechanism. |

## 20.6.32 ICS—Offset 68h

Immediate Command Status



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ICS:** [AZLBAR] + 68h

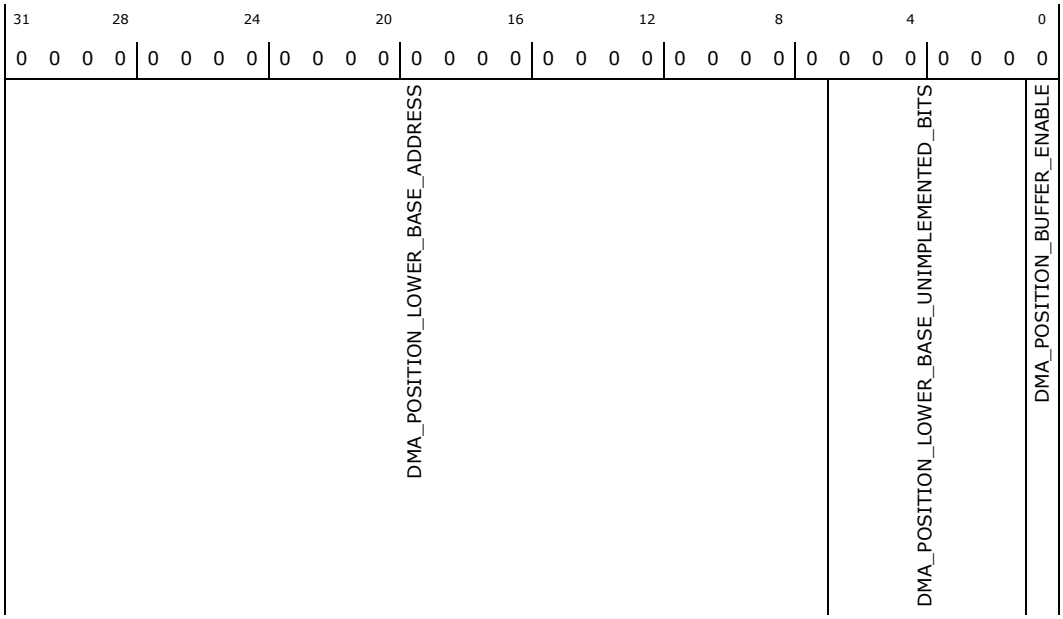
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:2 | 0000h<br>RO | **RESERVED0:** reserved |
| 1 | 0h<br>RW | **IMMEDIATE_RESULT_VALID:** This bit is set to a 1 by hardware when a new response is latched into the IRR register. This is a status flag indicating that software may read the response from the Immediate Response register. Software must clear this bit by writing a one to it before issuing a new command so that the software may determine when a new response has arrived. |
| 0 | 0h<br>RW | **IMMEDIATE_COMMAND_BUSY:** When this bit as read as a 0 it indicates that a new command may be issued using the Immediate Command mechanism. When this bit transitions from a 0 to a 1 via software writing a 1 the controller issues the command currently stored in the Immediate Command register to the codec over the link. When the corresponding response is latched into the Immediate Response register the controller hardware sets the IRV flag and clears the ICB bit back to 0. SW may write this bit to a 0 if the bit fails to return to 0 after a reasonable timeout period. Note that an Immediate Command must not be issued while the CORB RIRB mechanism is operating otherwise the responses conflict. This must be enforced by software. |

## 20.6.33 DPLBASE—Offset 70h

DMA Position Lower Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DPLBASE:** [AZLBAR] + 70h

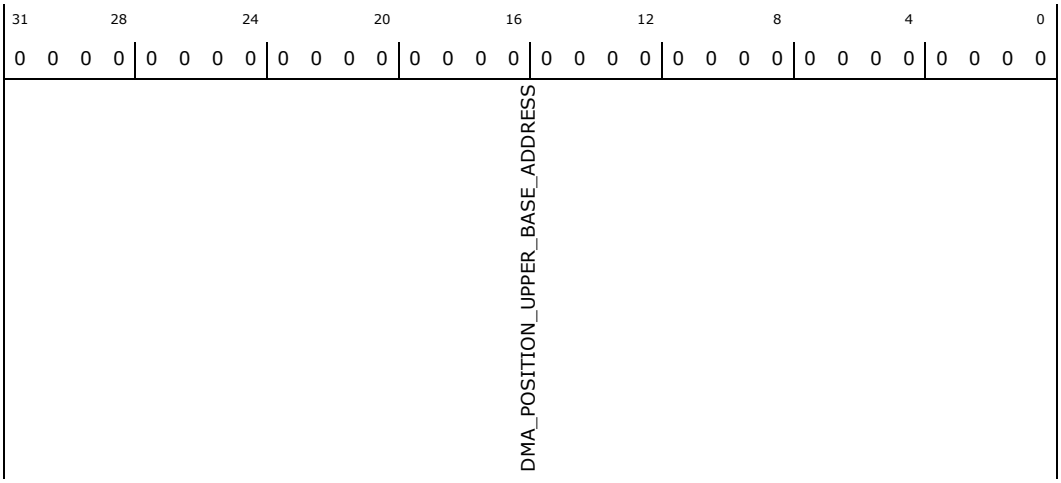
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:7 | 0h<br>RW | **DMA_POSITION_LOWER_BASE_ADDRESS:** Lower 32 bits of the DMA Position Buffer Base Address. This register field must not be written when any DMA engine is running or the DMA transfer may be corrupted. This same address is used by the Flush Control and must be programmed with a valid value before the FLCNRTL bit is set. |
| 6:1 | 00h<br>RO | **DMA_POSITION_LOWER_BASE_UNIMPLEMENTED_BITS:** Hardwired to 0 to force 128 byte buffer alignment for cache line write optimizations. |
| 0 | 0h<br>RW | **DMA_POSITION_BUFFER_ENABLE:** When this bit is set to a 1 the controller will write the DMA positions of each of the DMA engines to the buffer in main memory periodically typically once frame . Software can use this value to know what data in memory is valid data. The controller must guarantee that the values in the DMA Position Buffer that the software can read represent positions in the stream for which valid data exists in the Stream s DMA buffer. This has particular relevance in systems which support isochronous transfer the stream positions in the software visible memory buffer must represent stream data which has reached the Global Observation point. |

## 20.6.34 DPUBASE—Offset 74h

DMA position Upper Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DPUBASE:** [AZLBAR] + 74h

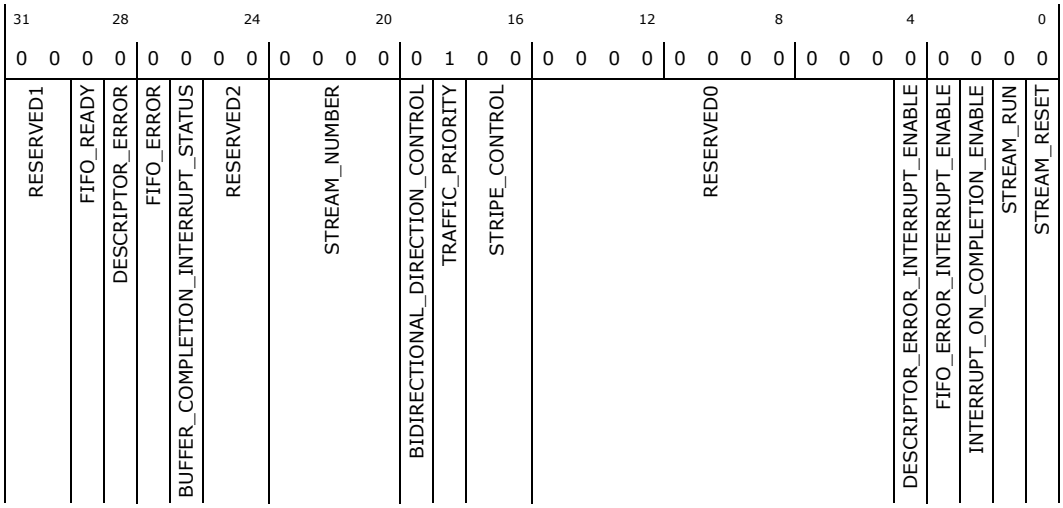
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DMA_POSITION_UPPER_BASE_ADDRESS:** Upper 32 bits of address of the DMA Position Buffer Base Address. This register field must not be written when the DMA engine is running or the DMA transfer may be corrupted. |

## 20.6.35 ISD0CTL_STS—Offset 80h

Input Stream Descriptor 0 Control and status



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD0CTL_STS:** [AZLBAR] + 80h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

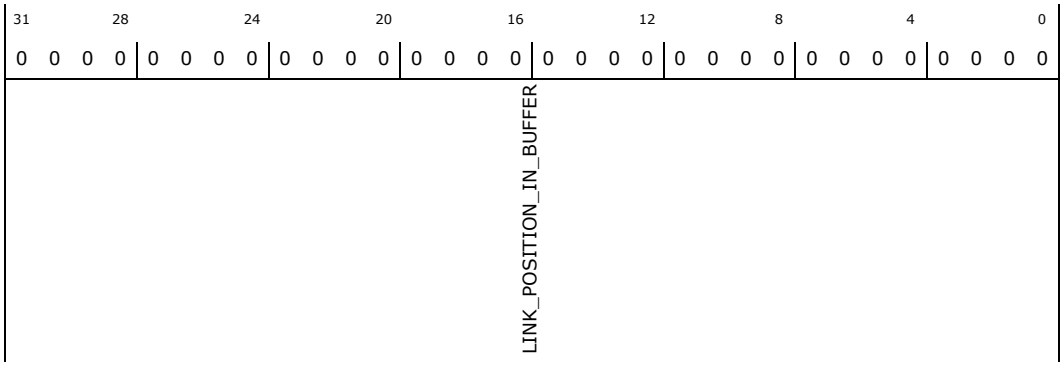
**Default:** 00040000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RO | **RESERVED1:** reserved |
| 29 | 0h<br>RO | **FIFO_READY:** For input streams the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. |
| 28 | 0h<br>RW | **DESCRIPTOR_ERROR:** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort a Parity or ECC error on the bus or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it. |
| 27 | 0h<br>RW | **FIFO_ERROR:** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. For an input stream this indicates a FIFO overrun occurring while the RUN bit is set. When this happens the FIFO pointers don t increment and the incoming data is not written into the FIFO thereby being lost. |
| 26 | 0h<br>RW | **BUFFER_COMPLETION_INTERRUPT_STATUS:** This bit is set to 1 by the hardware after the last sample of a buffer has been processed AND if the Interrupt on Completion IOC bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position. |
| 25:24 | 0h<br>RO | **RESERVED2:** reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 23:20 | 0h<br>RW | **STREAM_NUMBER:** This value reflects the Tag associated with the data being transferred on the link. When an input stream is detected on any of the SDIx signals that match this value the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number two different SDIx inputs may not be configured with the same stream number. 0000 Reserved Indicates Unused 0001 Stream 1 1110 Stream 14 1111 Stream 15 |
| 19 | 0h<br>RO | **BIDIRECTIONAL_DIRECTION_CONTROL:** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0. |
| 18 | 01h<br>RO | **TRAFFIC_PRIORITY:** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers. |
| 17:16 | 0h<br>RO | **STRIPE_CONTROL:** This field is meaningless for input streams. |
| 15:5 | 000h<br>RO | **RESERVED0:** reserved |
| 4 | 0h<br>RW | **DESCRIPTOR_ERROR_INTERRUPT_ENABLE:** Controls whether an interrupt is generated when the Descriptor Error Status DESE bit is set. |
| 3 | 0h<br>RW | **FIFO_ERROR_INTERRUPT_ENABLE:** This bit controls whether the occurrence of a FIFO error overrun for input will cause an interrupt or not. If this bit is not set bit 3 in the Status register will be set but the interrupt will not occur. Either way the samples will be dropped. |
| 2 | 0h<br>RW | **INTERRUPT_ON_COMPLETION_ENABLE:** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set bit 2 in the Status register will be set but the interrupt will not occur. |
| 1 | 0h<br>RW | **STREAM_RUN:** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine. |
| 0 | 0h<br>RW | **STREAM_RESET:** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers except the SRST bit itself and FIFO s for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation it will report a0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted. |

## 20.6.36 ISD0LPIB—Offset 84h

Input Stream Descriptor 0 Link Position in Buffer



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD0LPIB:** [AZLBAR] + 84h

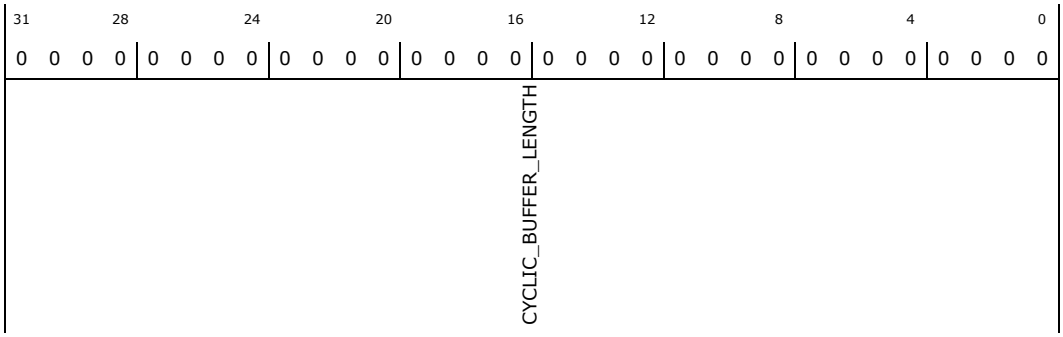
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **LINK_POSITION_IN_BUFFER:** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0. |

## 20.6.37 ISD0CBL—Offset 88h

Input Stream Descriptor 0 Cyclic Buffer Length



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD0CBL:** [AZLBAR] + 88h

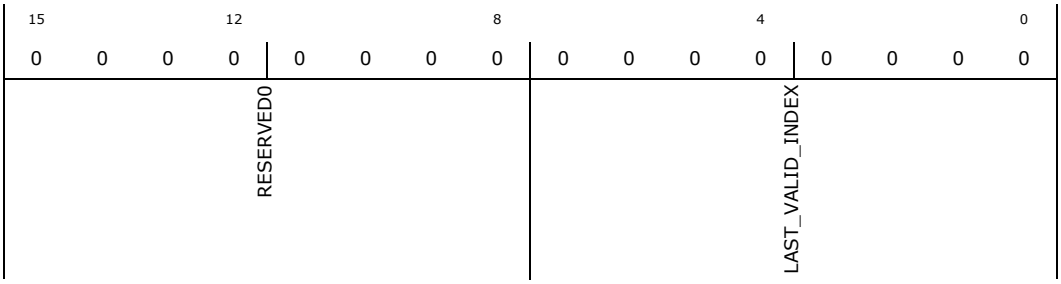
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **CYCLIC_BUFFER_LENGTH:** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer LPIB will be reset when it reaches this value. Software may only write to this register after Global Reset Controller Reset or Stream Reset has occurred. This value should only be modified when the RUN bit is 0 . Once the RUN bit has been set to enable the engine software must not write to this register until after the next reset is asserted or transfers may be corrupted. |

## 20.6.38 ISD0LVI—Offset 8Ch

Input Stream Descriptor 0 Last Valid Index



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ISD0LVI:** [AZLBAR] + 8Ch

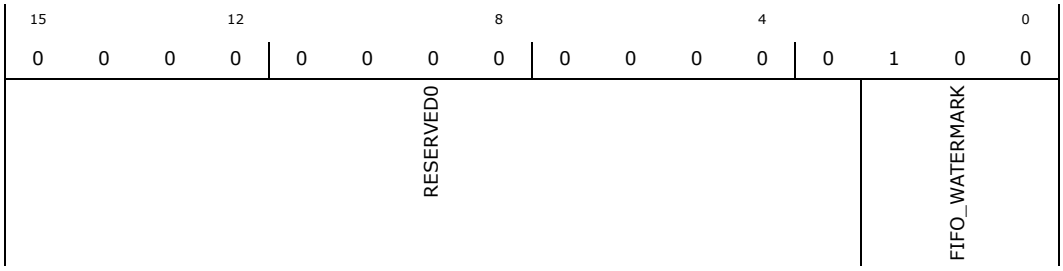
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 00h<br>RO | **RESERVED0:** reserved |
| 7:0 | 00h<br>RW | **LAST_VALID_INDEX:** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1 i.e. there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is 0 |

## 20.6.39 ISD0FIFOW—Offset 8Eh

Input Stream Descriptor 0 FIFO Eviction Watermark



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ISD0FIFOW:** [AZLBAR] + 8Eh

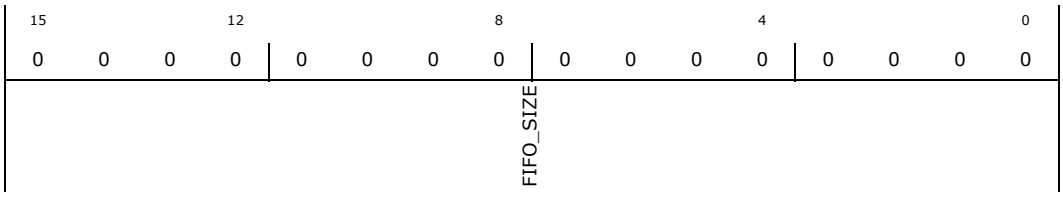
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0004h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:3 | 0000h RO | **RESERVED0:** reserved |
| 2:0 | 04h RO | **FIFO_WATERMARK:** Indicates the minimum number of bytes accumulated in the FIFO before the controller will start an eviction of data. The HD Audio controller hardwires the FIFO Watermark either 32B or 64B based on the following. For input streams the FIFOW value is determined by the EM3.ISRWS SEM3.ISRWS field. |

## 20.6.40 ISD0FIFOS—Offset 90h

Input Stream Descriptor 0 FIFO Size



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ISD0FIFOS:** [AZLBAR] + 90h

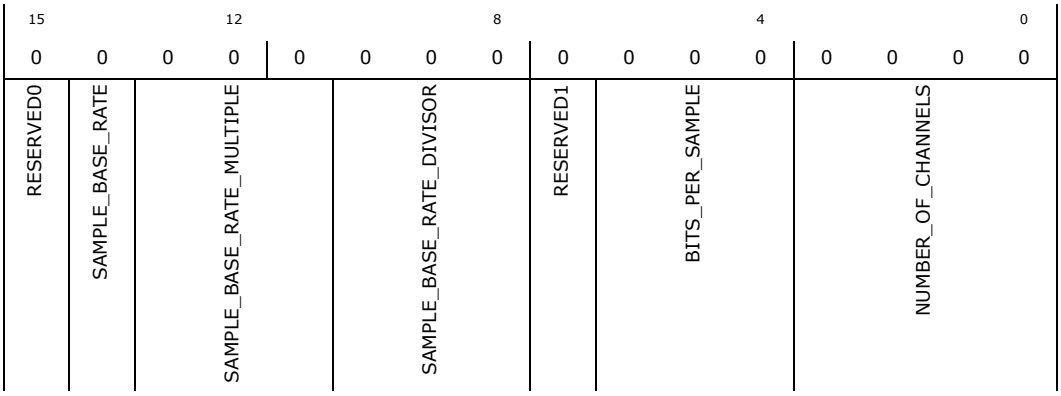
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 00h<br>RW | **FIFO_SIZE:** Indicates the maximum number of bytes that could be revicted by the controller at one time. This is the maximum number of bytes that may have been received from the link but not yet DMA d into memory and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on factors including the stream format programmed in ISD0FMT register. As the default value is zero, SW must write to the respective ISD0FMT register to kick of the FIFO size calculation, and read back to find out the HW allocated FIFO size. |

## 20.6.41 ISD0FMT—Offset 92h

Input Stream Descriptor 0 Format



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ISD0FMT:** [AZLBAR] + 92h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

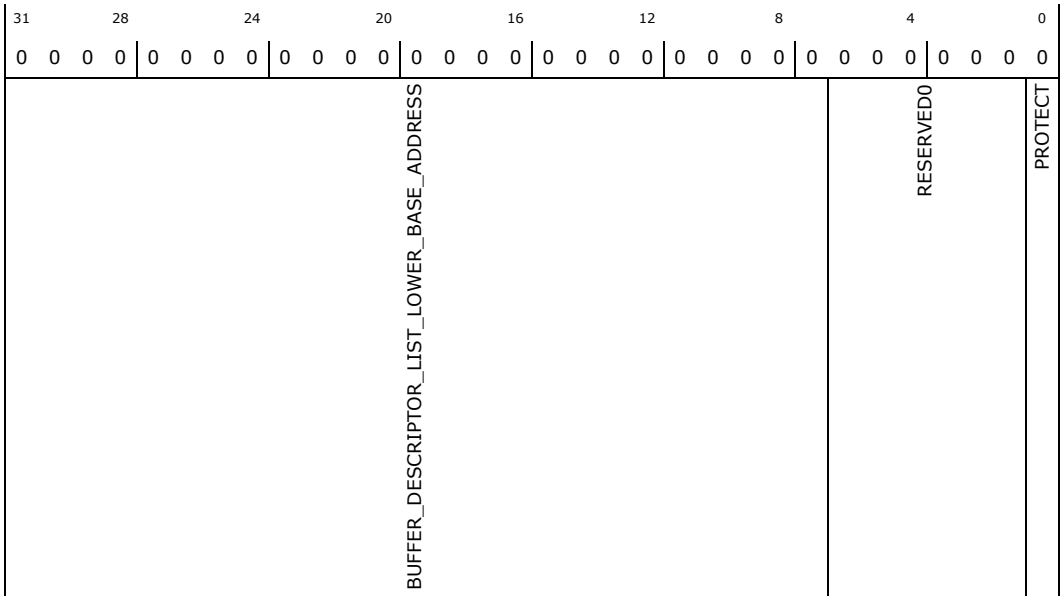
**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15 | 0h<br>RO | **RESERVED0:** reserved |
| 14 | 0h<br>RW | **SAMPLE_BASE_RATE:** Sample Base Rate (BASE): 0=48kHz 1=44.1kHz |
| 13:11 | 0h<br>RW | **SAMPLE_BASE_RATE_MULTIPLE:** Sample Base Rate Multiple (MULT): 000=48kHz/ 44.1kHz or less 001=x2 96kHz 88.2kHz 32kHz 010=x3 144kHz 011=x4 192kHz 176.4kHz 100-111 Reserved |
| 10:8 | 0h<br>RW | **SAMPLE_BASE_RATE_DIVISOR:** Sample Base Rate Divisor (DIV): 000 Divide by 1, 48kHz 44.1kHz 001 Divide by 2, 24kHz 22.05kHz 010 Divide by 3, 16kHz 32kHz 011 Divide by 4, 11.025kHz 100 Divide by 5, 9.6kHz 101 Divide by 6, 8kHz 110 Divide by 7 111 Divide by 8, 6kHz |
| 7 | 0h<br>RO | **RESERVED1:** reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 6:4 | 0h<br>RW | **BITS_PER_SAMPLE:** Bits per Sample (BITS): 000=8 bits. The data will be packed in memory in 8 bit containers on 16 bit boundaries 001=16 bits. The data will be packed in memory in 16 bit containers on 16 bit boundaries 010=20 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 011=24 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 100=32 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 101-111 Reserved |
| 3:0 | 0h<br>RW | **NUMBER_OF_CHANNELS:** Number of channels in each frame of the stream 0000=1 0001=2 1111=16 |

## 20.6.42 ISD0BDLPLBA—Offset 98h

Input Stream Descriptor 0 Buffer Descriptor List Pointer Lower Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD0BDLPLBA:** [AZLBAR] + 98h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

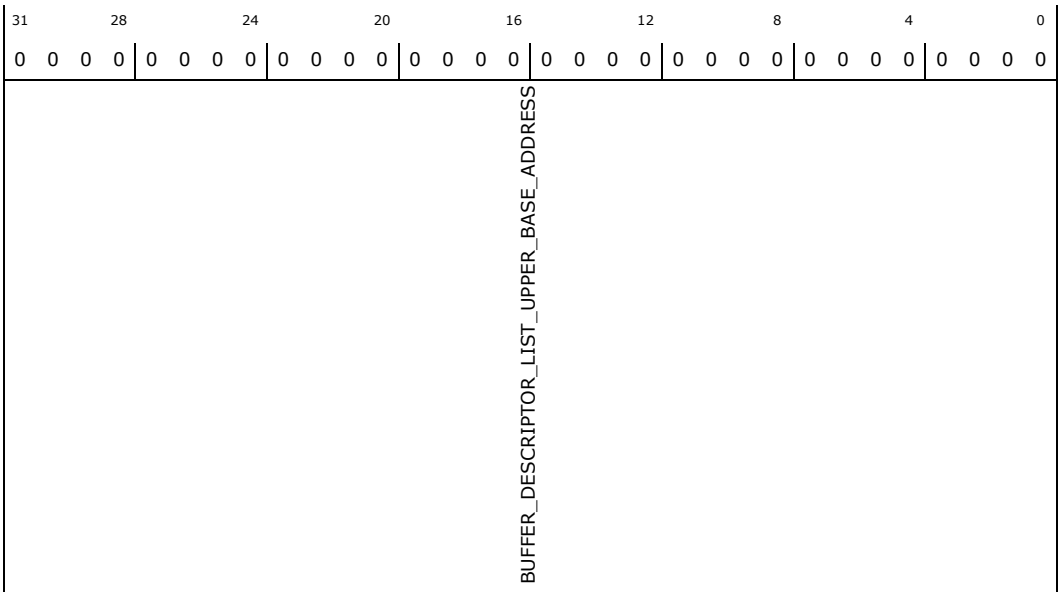
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:7 | 0h<br>RW | **BUFFER_DESCRIPTOR_LIST_LOWER_BASE_ADDRESS:** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted. Intel Reserved comment This field becomes WO and 0 s will be read when the Protect bit is set to 1. |
| 6:1 | 00h<br>RO | **RESERVED0:** reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 0 | 0h<br>RW | **PROTECT:** When this bit is set to 1 bits 31 7 0 of this register are WO and will return 0 s when read. When this bit is cleared to 0 bits 31 7 0 are RW. Note that this bit can only be changed when all four bytes of this register are written in a single write operation. If less than four bytes are written this bit retains its previous value. This bit is Intel Reserved. |

## 20.6.43 ISD0BDLPUBA—Offset 9Ch

Input Stream Descriptor 0 Buffer Descriptor List Pointer Upper Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD0BDLPUBA:** [AZLBAR] + 9Ch

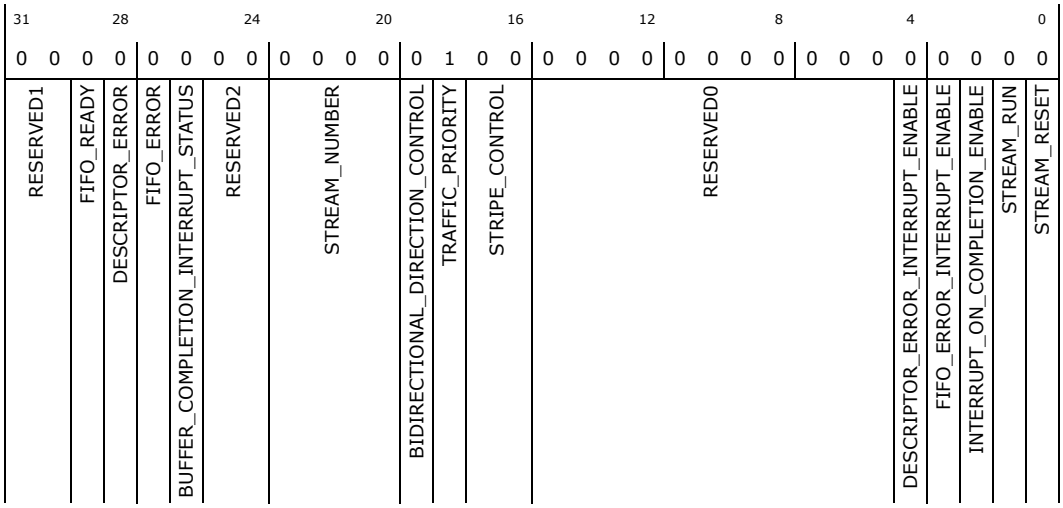
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **BUFFER_DESCRIPTOR_LIST_UPPER_BASE_ADDRESS:** Upper 32 bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. |

## 20.6.44 ISD1CTL_STS—Offset A0h

Input Stream Descriptor 1 Control and status



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD1CTL_STS:** [AZLBAR] + A0h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

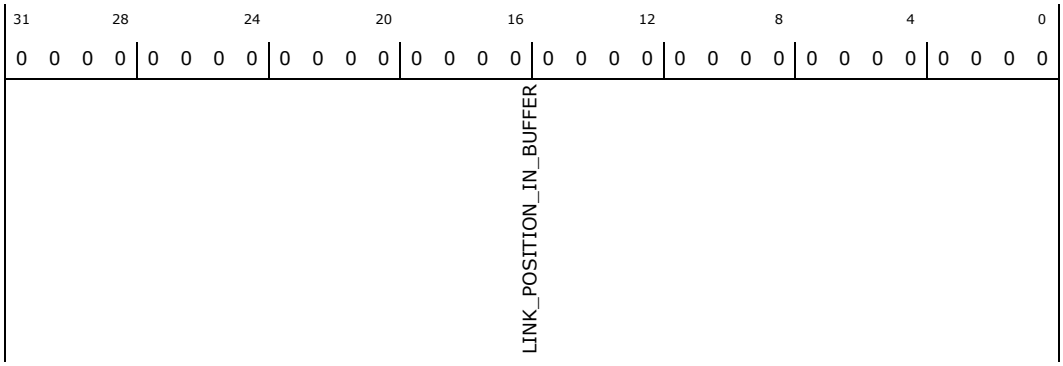
**Default:** 00040000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RO | **RESERVED1:** reserved |
| 29 | 0h<br>RO | **FIFO_READY:** For input streams the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. |
| 28 | 0h<br>RW | **DESCRIPTOR_ERROR:** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort a Parity or ECC error on the bus or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it. |
| 27 | 0h<br>RW | **FIFO_ERROR:** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. For an input stream this indicates a FIFO overrun occurring while the RUN bit is set. When this happens the FIFO pointers don t increment and the incoming data is not written into the FIFO thereby being lost. |
| 26 | 0h<br>RW | **BUFFER_COMPLETION_INTERRUPT_STATUS:** This bit is set to 1 by the hardware after the last sample of a buffer has been processed AND if the Interrupt on Completion IOC bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position. |
| 25:24 | 0h<br>RO | **RESERVED2:** reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 23:20 | 0h<br>RW | **STREAM_NUMBER:** This value reflects the Tag associated with the data being transferred on the link. When an input stream is detected on any of the SDIx signals that match this value the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number two different SDIx inputs may not be configured with the same stream number. 0000 Reserved Indicates Unused 0001 Stream 1 1110 Stream 14 1111 Stream 15 |
| 19 | 0h<br>RO | **BIDIRECTIONAL_DIRECTION_CONTROL:** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0. |
| 18 | 01h<br>RO | **TRAFFIC_PRIORITY:** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers. |
| 17:16 | 0h<br>RO | **STRIPE_CONTROL:** This field is meaningless for input streams. |
| 15:5 | 000h<br>RO | **RESERVED0:** reserved |
| 4 | 0h<br>RW | **DESCRIPTOR_ERROR_INTERRUPT_ENABLE:** Controls whether an interrupt is generated when the Descriptor Error Status DESE bit is set. |
| 3 | 0h<br>RW | **FIFO_ERROR_INTERRUPT_ENABLE:** This bit controls whether the occurrence of a FIFO error overrun for input will cause an interrupt or not. If this bit is not set bit 3 in the Status register will be set but the interrupt will not occur. Either way the samples will be dropped. |
| 2 | 0h<br>RW | **INTERRUPT_ON_COMPLETION_ENABLE:** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set bit 2 in the Status register will be set but the interrupt will not occur. |
| 1 | 0h<br>RW | **STREAM_RUN:** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine. |
| 0 | 0h<br>RW | **STREAM_RESET:** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers except the SRST bit itself and FIFO s for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation it will report a0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted. |

## 20.6.45 ISD1LPIB—Offset A4h

Input Stream Descriptor 1 Link Position in Buffer



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD1LPIB:** [AZLBAR] + A4h

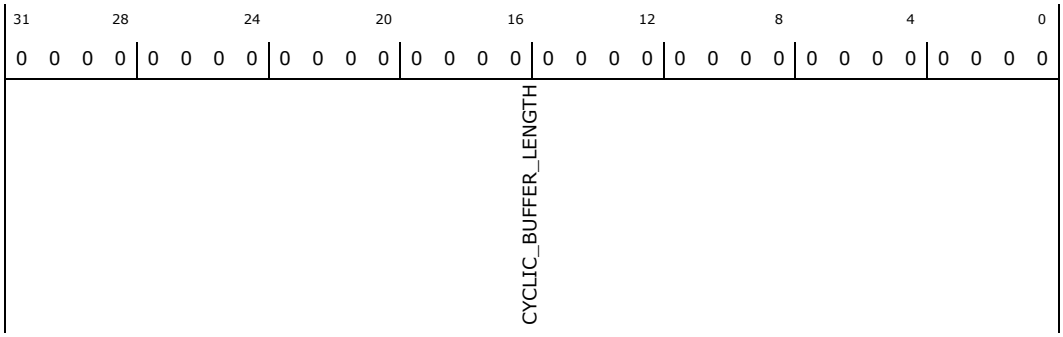
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **LINK_POSITION_IN_BUFFER:** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0. |

## 20.6.46 ISD1CBL—Offset A8h

Input Stream Descriptor 1 Cyclic Buffer Length



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD1CBL:** [AZLBAR] + A8h

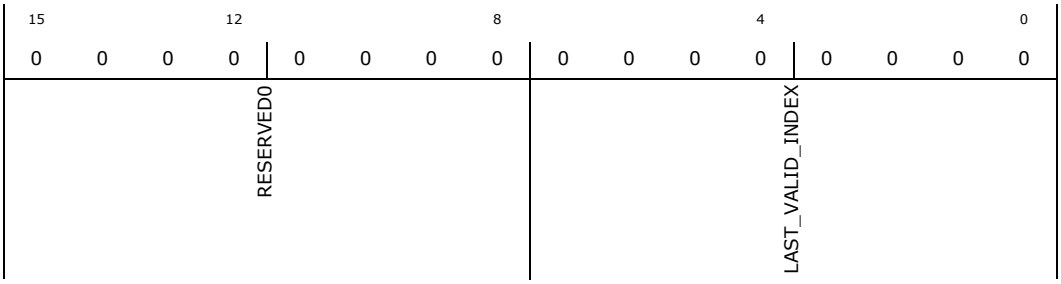
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **CYCLIC_BUFFER_LENGTH:** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer LPIB will be reset when it reaches this value. Software may only write to this register after Global Reset Controller Reset or Stream Reset has occurred. This value should only be modified when the RUN bit is 0 . Once the RUN bit has been set to enable the engine software must not write to this register until after the next reset is asserted or transfers may be corrupted. |

## 20.6.47 ISD1LVI—Offset ACh

Input Stream Descriptor 1 Last Valid Index



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ISD1LVI:** [AZLBAR] + ACh

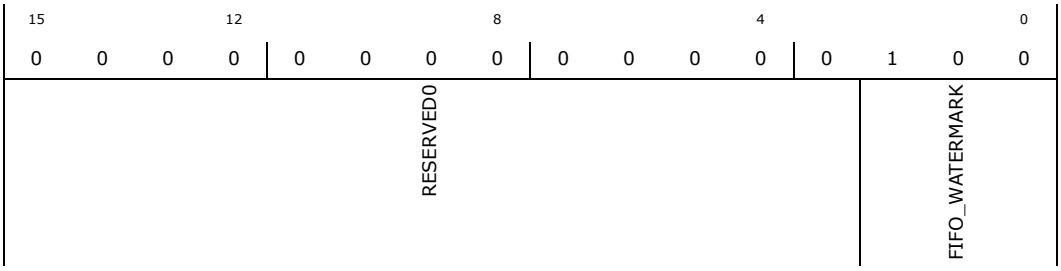
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 00h<br>RO | **RESERVED0:** reserved |
| 7:0 | 00h<br>RW | **LAST_VALID_INDEX:** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1 i.e. there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is 0 |

## 20.6.48 ISD1FIFOW—Offset AEh

Input Stream Descriptor 1 FIFO Eviction Watermark



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ISD1FIFOW:** [AZLBAR] + AEh

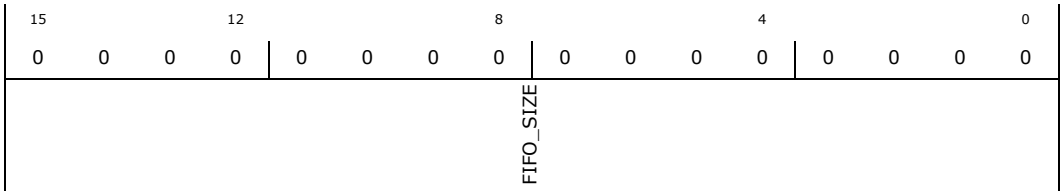
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0004h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:3 | 0000h RO | **RESERVED0:** reserved |
| 2:0 | 04h RO | **FIFO_WATERMARK:** Indicates the minimum number of bytes accumulated in the FIFO before the controller will start an eviction of data. The HD Audio controller hardwires the FIFO Watermark either 32B or 64B based on the following. For input streams the FIFOW value is determined by the EM3.ISRWS SEM3.ISRWS field. |

## 20.6.49 ISD1FIFOS—Offset B0h

Input Stream Descriptor 1 FIFO Size



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ISD1FIFOS:** [AZLBAR] + B0h

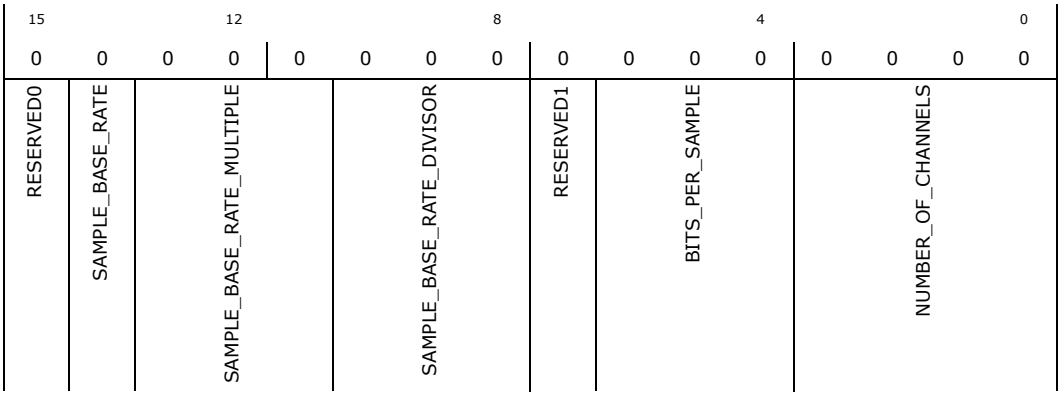
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 00h RW | **FIFO_SIZE:** Indicates the maximum number of bytes that could be revicted by the controller at one time. This is the maximum number of bytes that may have been received from the link but not yet DMA d into memory and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on factors including the stream format programmed in ISD1FMT register. As the default value is zero, SW must write to the respective ISD1FMT register to kick of the FIFO size calculation, and read back to find out the HW allocated FIFO size. |

## 20.6.50 ISD1FMT—Offset B2h

Input Stream Descriptor 1 Format



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ISD1FMT:** [AZLBAR] + B2h

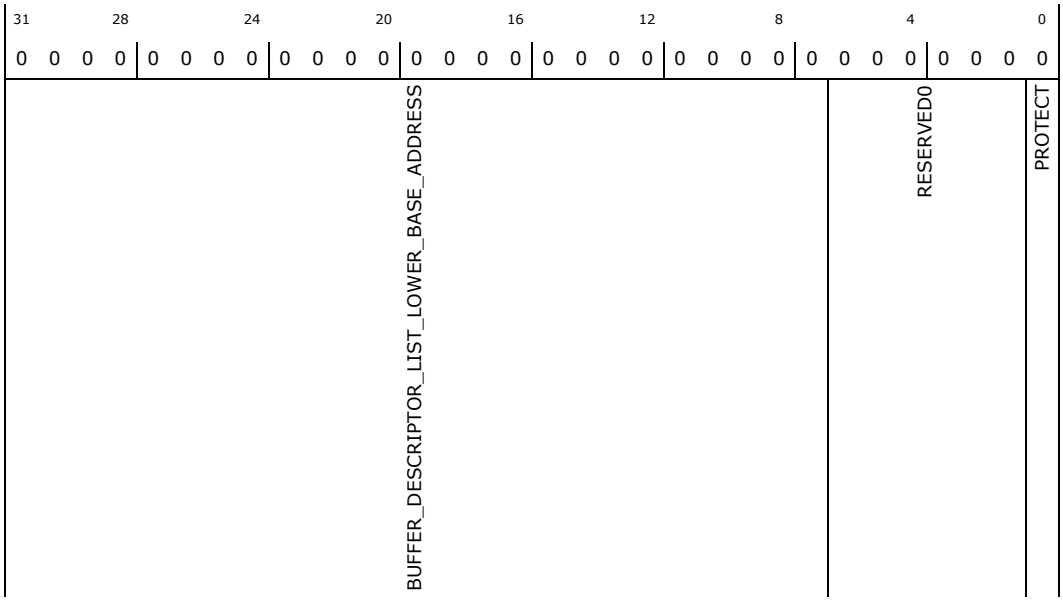
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15 | 0h<br>RO | **RESERVED0:** reserved |
| 14 | 0h<br>RW | **SAMPLE_BASE_RATE:** Sample Base Rate (BASE): 0=48kHz 1=44.1kHz |
| 13:11 | 0h<br>RW | **SAMPLE_BASE_RATE_MULTIPLE:** Sample Base Rate Multiple (MULT): 000=48kHz/ 44.1kHz or less 001=x2 96kHz 88.2kHz 32kHz 010=x3 144kHz 011=x4 192kHz 176.4kHz 100-111 Reserved |
| 10:8 | 0h<br>RW | **SAMPLE_BASE_RATE_DIVISOR:** Sample Base Rate Divisor (DIV): 000 Divide by 1, 48kHz 44.1kHz 001 Divide by 2, 24kHz 22.05kHz 010 Divide by 3, 16kHz 32kHz 011 Divide by 4, 11.025kHz 100 Divide by 5, 9.6kHz 101 Divide by 6, 8kHz 110 Divide by 7 111 Divide by 8, 6kHz |
| 7 | 0h<br>RO | **RESERVED1:** reserved |
| 6:4 | 0h<br>RW | **BITS_PER_SAMPLE:** Bits per Sample (BITS): 000=8 bits. The data will be packed in memory in 8 bit containers on 16 bit boundaries 001=16 bits. The data will be packed in memory in 16 bit containers on 16 bit boundaries 010=20 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 011=24 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 100=32 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 101-111 Reserved |
| 3:0 | 0h<br>RW | **NUMBER_OF_CHANNELS:** Number of channels in each frame of the stream 0000=1 0001=2 1111=16 |

## 20.6.51 ISD1BDLPLBA—Offset B8h

Input Stream Descriptor 1 Buffer Descriptor List Pointer Lower Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD1BDLPLBA:** [AZLBAR] + B8h

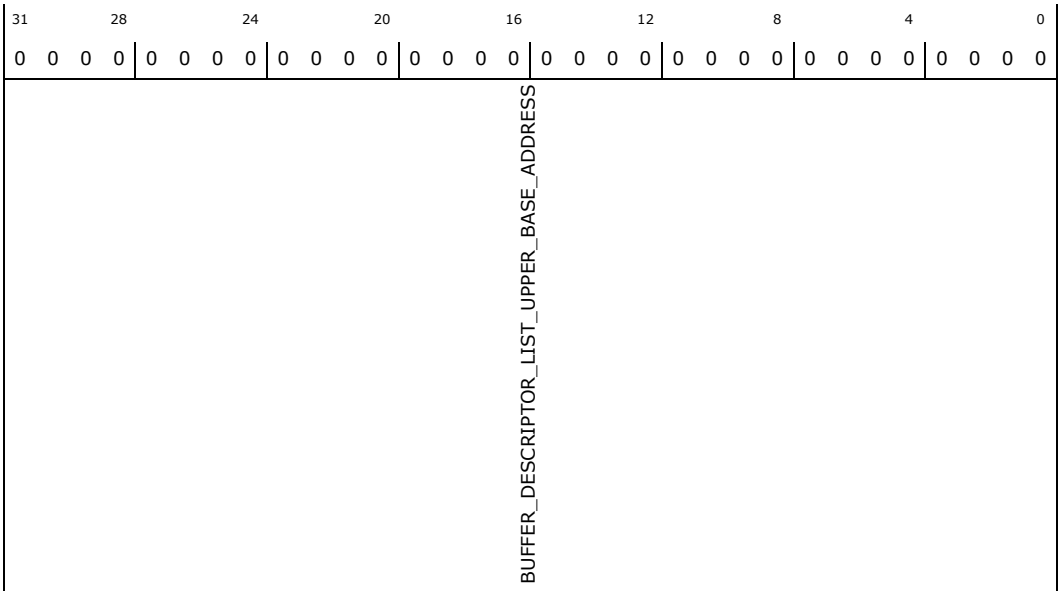
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:7 | 0h<br>RW | **BUFFER_DESCRIPTOR_LIST_LOWER_BASE_ADDRESS:** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted. Intel Reserved comment This field becomes WO and 0 s will be read when the Protect bit is set to 1. |
| 6:1 | 00h<br>RO | **RESERVED0:** reserved |
| 0 | 0h<br>RW | **PROTECT:** When this bit is set to 1 bits 31 7 0 of this register are WO and will return 0 s when read. When this bit is cleared to 0 bits 31 7 0 are RW. Note that this bit can only be changed when all four bytes of this register are written in a single write operation. If less than four bytes are written this bit retains its previous value. This bit is Intel Reserved. |

## 20.6.52 ISD1BDLPUBA—Offset BCh

Input Stream Descriptor 1 Buffer Descriptor List Pointer Upper Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD1BDLPUBA:** [AZLBAR] + BCh

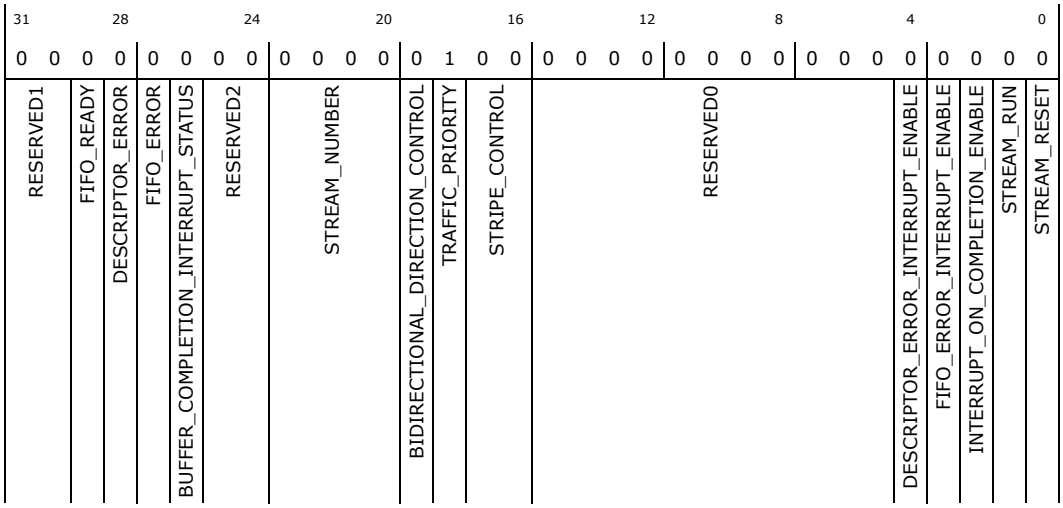
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **BUFFER_DESCRIPTOR_LIST_UPPER_BASE_ADDRESS:** Upper 32 bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. |

## 20.6.53 ISD2CTL_STS—Offset C0h

Input Stream Descriptor 2 Control and status



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD2CTL_STS:** [AZLBAR] + C0h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

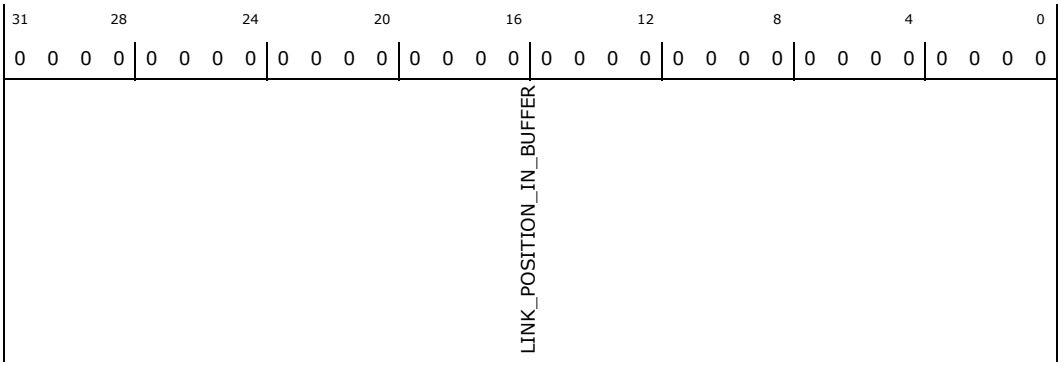
**Default:** 00040000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RO | **RESERVED1:** reserved |
| 29 | 0h<br>RO | **FIFO_READY:** For input streams the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. |
| 28 | 0h<br>RW | **DESCRIPTOR_ERROR:** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort a Parity or ECC error on the bus or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it. |
| 27 | 0h<br>RW | **FIFO_ERROR:** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. For an input stream this indicates a FIFO overrun occurring while the RUN bit is set. When this happens the FIFO pointers don t increment and the incoming data is not written into the FIFO thereby being lost. |
| 26 | 0h<br>RW | **BUFFER_COMPLETION_INTERRUPT_STATUS:** This bit is set to 1 by the hardware after the last sample of a buffer has been processed AND if the Interrupt on Completion IOC bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position. |
| 25:24 | 0h<br>RO | **RESERVED2:** reserved |
| 23:20 | 0h<br>RW | **STREAM_NUMBER:** This value reflects the Tag associated with the data being transferred on the link. When an input stream is detected on any of the SDIx signals that match this value the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number two different SDIx inputs may not be configured with the same stream number. 0000 Reserved Indicates Unused 0001 Stream 1 1110 Stream 14 1111 Stream 15 |
| 19 | 0h<br>RO | **BIDIRECTIONAL_DIRECTION_CONTROL:** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0. |
| 18 | 01h<br>RO | **TRAFFIC_PRIORITY:** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers. |
| 17:16 | 0h<br>RO | **STRIPE_CONTROL:** This field is meaningless for input streams. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:5 | 000h<br>RO | **RESERVED0:** reserved |
| 4 | 0h<br>RW | **DESCRIPTOR_ERROR_INTERRUPT_ENABLE:** Controls whether an interrupt is generated when the Descriptor Error Status DESE bit is set. |
| 3 | 0h<br>RW | **FIFO_ERROR_INTERRUPT_ENABLE:** This bit controls whether the occurrence of a FIFO error overrun for input will cause an interrupt or not. If this bit is not set bit 3 in the Status register will be set but the interrupt will not occur. Either way the samples will be dropped. |
| 2 | 0h<br>RW | **INTERRUPT_ON_COMPLETION_ENABLE:** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set bit 2 in the Status register will be set but the interrupt will not occur. |
| 1 | 0h<br>RW | **STREAM_RUN:** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine. |
| 0 | 0h<br>RW | **STREAM_RESET:** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers except the SRST bit itself and FIFO s for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation it will report a0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted. |

## 20.6.54 ISD2LPIB—Offset C4h

Input Stream Descriptor 2 Link Position in Buffer



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD2LPIB:** [AZLBAR] + C4h

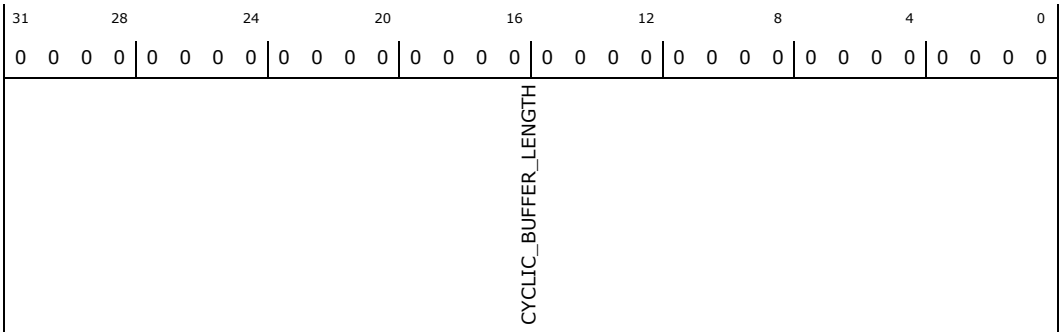
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **LINK_POSITION_IN_BUFFER:** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0. |

## 20.6.55 ISD2CBL—Offset C8h

Input Stream Descriptor 2 Cyclic Buffer Length



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD2CBL:** [AZLBAR] + C8h

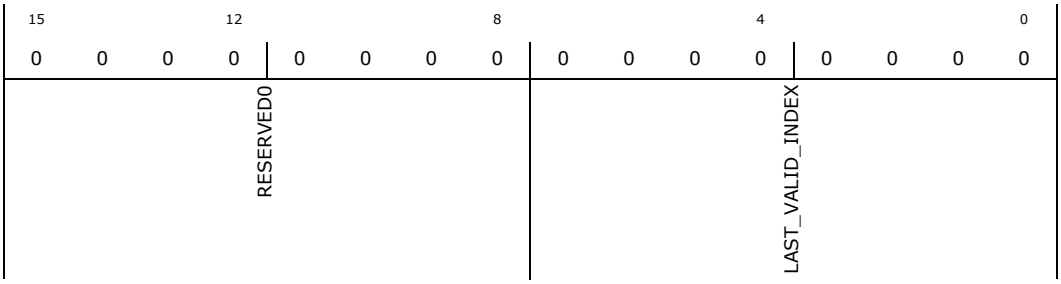
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **CYCLIC_BUFFER_LENGTH:** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer LPIB will be reset when it reaches this value. Software may only write to this register after Global Reset Controller Reset or Stream Reset has occurred. This value should only be modified when the RUN bit is 0 . Once the RUN bit has been set to enable the engine software must not write to this register until after the next reset is asserted or transfers may be corrupted. |

## 20.6.56 ISD2LVI—Offset CCh

Input Stream Descriptor 2 Last Valid Index



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ISD2LVI:** [AZLBAR] + CCh

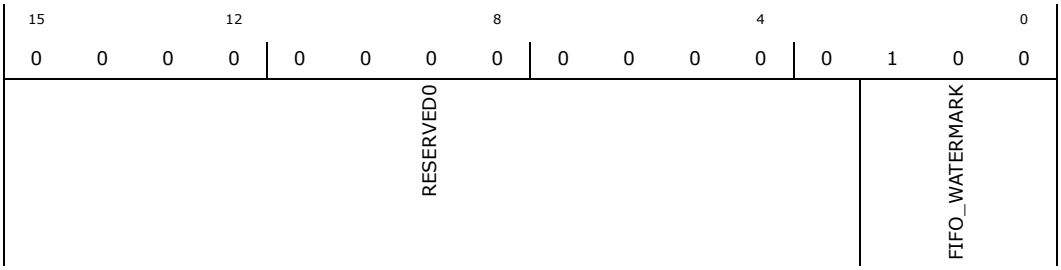
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 00h<br>RO | **RESERVED0:** reserved |
| 7:0 | 00h<br>RW | **LAST_VALID_INDEX:** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1 i.e. there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is 0 |

## 20.6.57 ISD2FIFOW—Offset CEh

Input Stream Descriptor 2 FIFO Eviction Watermark



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ISD2FIFOW:** [AZLBAR] + CEh

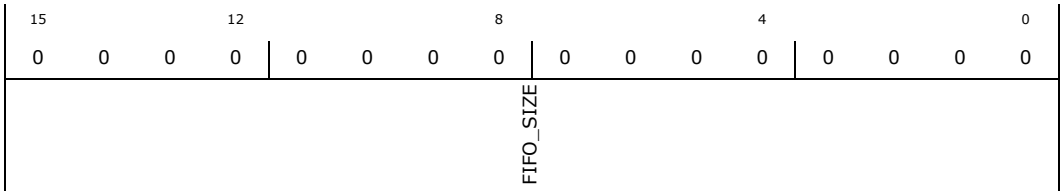
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0004h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:3 | 0000h<br>RO | **RESERVED0:** reserved |
| 2:0 | 04h<br>RO | **FIFO_WATERMARK:** Indicates the minimum number of bytes accumulated in the FIFO before the controller will start an eviction of data. The HD Audio controller hardwires the FIFO Watermark either 32B or 64B based on the following. For input streams the FIFOW value is determined by the EM3.ISRWS SEM3.ISRWS field. |

## 20.6.58 ISD2FIFOS—Offset D0h

Input Stream Descriptor 2 FIFO Size



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ISD2FIFOS:** [AZLBAR] + D0h

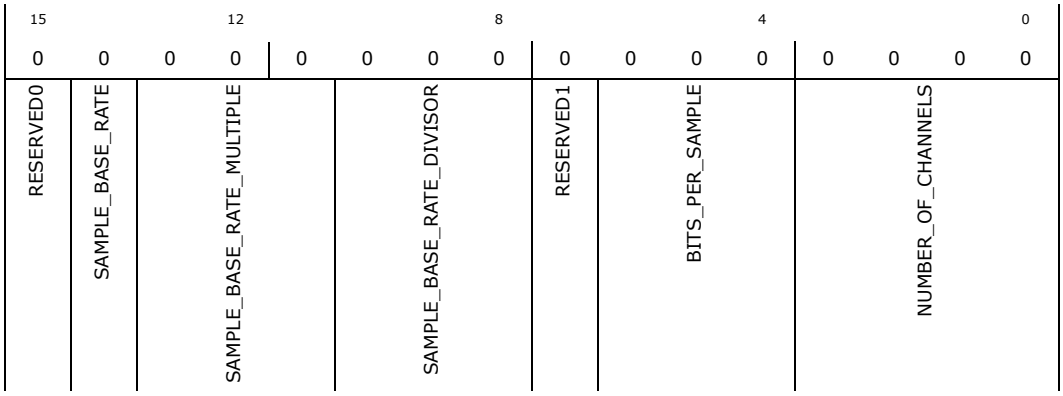
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 00h<br>RW | **FIFO_SIZE:** Indicates the maximum number of bytes that could be revicted by the controller at one time. This is the maximum number of bytes that may have been received from the link but not yet DMA d into memory and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on factors including the stream format programmed in ISD2FMT register. As the default value is zero, SW must write to the respective ISD2FMT register to kick of the FIFO size calculation, and read back to find out the HW allocated FIFO size. |

## 20.6.59 ISD2FMT—Offset D2h

Input Stream Descriptor 2 Format



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ISD2FMT:** [AZLBAR] + D2h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

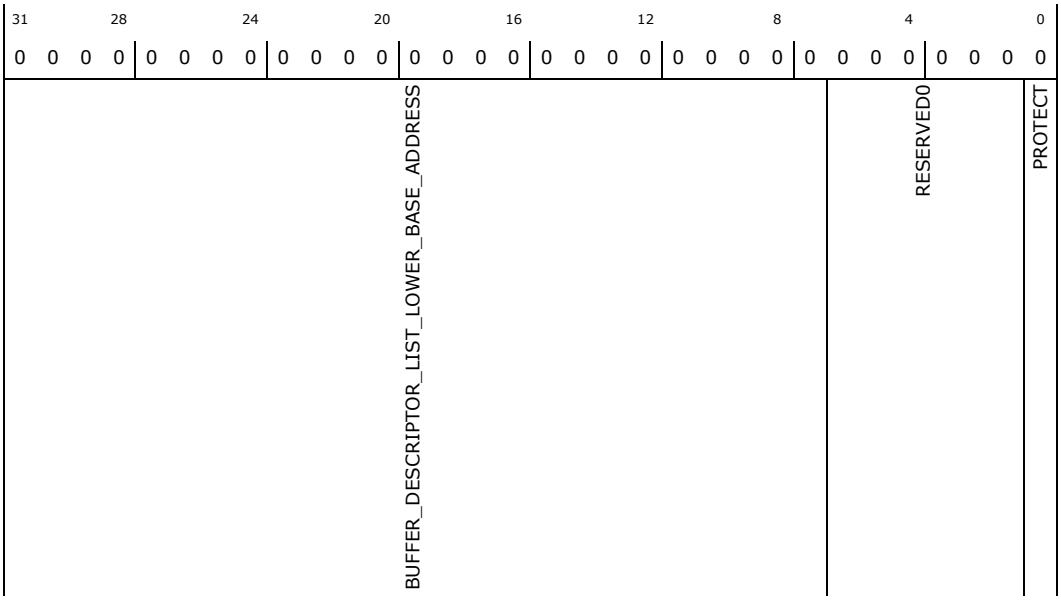
**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15 | 0h<br>RO | **RESERVED0:** reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 14 | 0h<br>RW | **SAMPLE_BASE_RATE:** Sample Base Rate (BASE): 0=48kHz 1=44.1kHz |
| 13:11 | 0h<br>RW | **SAMPLE_BASE_RATE_MULTIPLE:** Sample Base Rate Multiple (MULT): 000=48kHz/ 44.1kHz or less 001=x2 96kHz 88.2kHz 32kHz 010=x3 144kHz 011=x4 192kHz 176.4kHz 100-111 Reserved |
| 10:8 | 0h<br>RW | **SAMPLE_BASE_RATE_DIVISOR:** Sample Base Rate Divisor (DIV): 000 Divide by 1, 48kHz 44.1kHz 001 Divide by 2, 24kHz 22.05kHz 010 Divide by 3, 16kHz 32kHz 011 Divide by 4, 11.025kHz 100 Divide by 5, 9.6kHz 101 Divide by 6, 8kHz 110 Divide by 7 111 Divide by 8, 6kHz |
| 7 | 0h<br>RO | **RESERVED1:** reserved |
| 6:4 | 0h<br>RW | **BITS_PER_SAMPLE:** Bits per Sample (BITS): 000=8 bits. The data will be packed in memory in 8 bit containers on 16 bit boundaries 001=16 bits. The data will be packed in memory in 16 bit containers on 16 bit boundaries 010=20 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 011=24 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 100=32 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 101-111 Reserved |
| 3:0 | 0h<br>RW | **NUMBER_OF_CHANNELS:** Number of channels in each frame of the stream 0000=1 0001=2 1111=16 |

## 20.6.60 ISD2BDLPLBA—Offset D8h

Input Stream Descriptor 2 Buffer Descriptor List Pointer Lower Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD2BDLPLBA:** [AZLBAR] + D8h

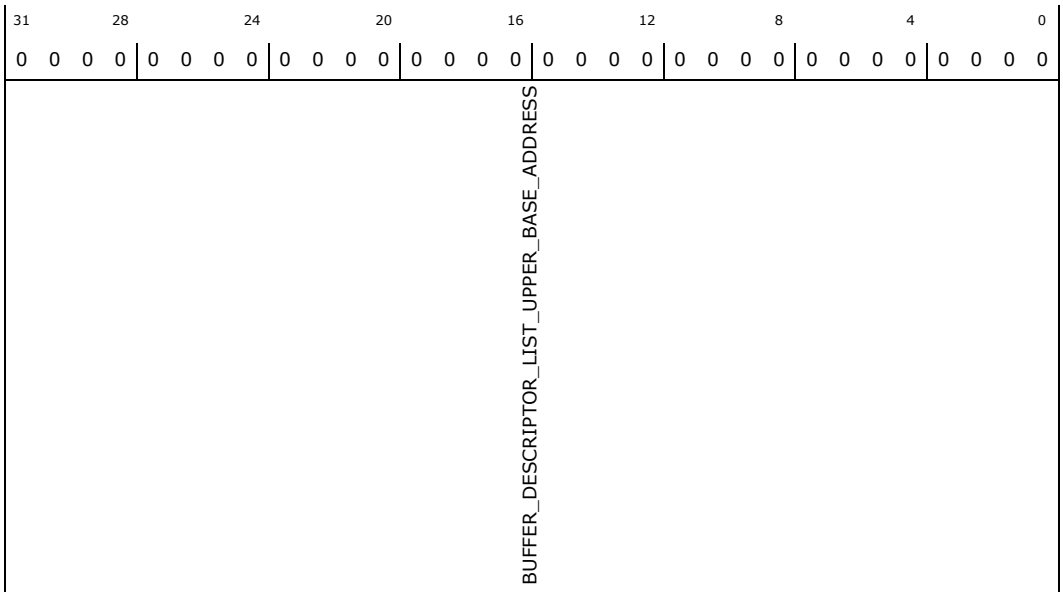
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:7 | 0h<br>RW | **BUFFER_DESCRIPTOR_LIST_LOWER_BASE_ADDRESS:** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted. Intel Reserved comment This field becomes WO and 0 s will be read when the Protect bit is set to 1. |
| 6:1 | 00h<br>RO | **RESERVED0:** reserved |
| 0 | 0h<br>RW | **PROTECT:** When this bit is set to 1 bits 31 7 0 of this register are WO and will return 0 s when read. When this bit is cleared to 0 bits 31 7 0 are RW. Note that this bit can only be changed when all four bytes of this register are written in a single write operation. If less than four bytes are written this bit retains its previous value. This bit is Intel Reserved. |

## 20.6.61 ISD2BDLPUBA—Offset DCh

Input Stream Descriptor 2 Buffer Descriptor List Pointer Upper Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD2BDLPUBA:** [AZLBAR] + DCh

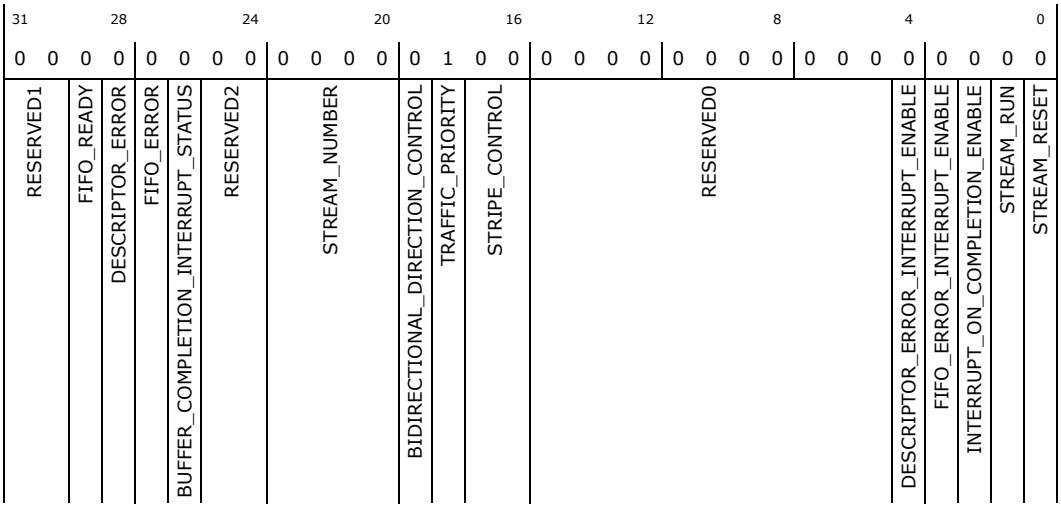
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **BUFFER_DESCRIPTOR_LIST_UPPER_BASE_ADDRESS:** Upper 32 bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. |

## 20.6.62 ISD3CTL_STS—Offset E0h

Input Stream Descriptor 3 Control and status



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD3CTL_STS:** [AZLBAR] + E0h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

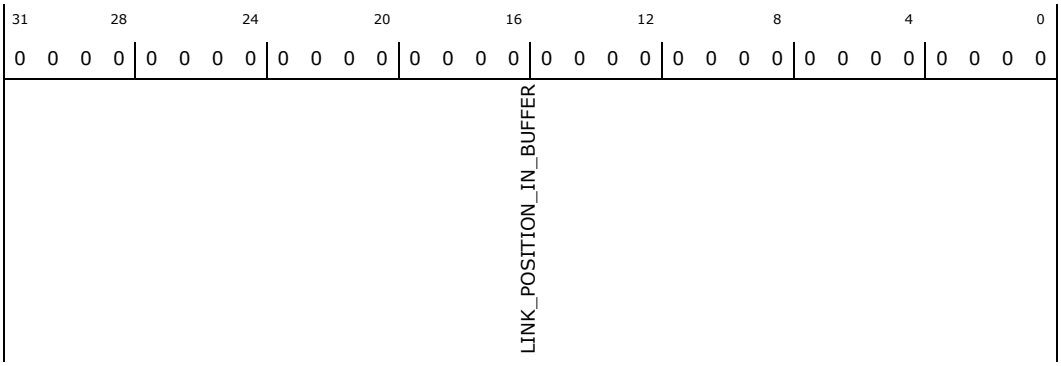
**Default:** 00040000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RO | **RESERVED1:** reserved |
| 29 | 0h<br>RO | **FIFO_READY:** For input streams the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set. |
| 28 | 0h<br>RW | **DESCRIPTOR_ERROR:** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort a Parity or ECC error on the bus or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it. |
| 27 | 0h<br>RW | **FIFO_ERROR:** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. For an input stream this indicates a FIFO overrun occurring while the RUN bit is set. When this happens the FIFO pointers don t increment and the incoming data is not written into the FIFO thereby being lost. |
| 26 | 0h<br>RW | **BUFFER_COMPLETION_INTERRUPT_STATUS:** This bit is set to 1 by the hardware after the last sample of a buffer has been processed AND if the Interrupt on Completion IOC bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position. |
| 25:24 | 0h<br>RO | **RESERVED2:** reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 23:20 | 0h<br>RW | **STREAM_NUMBER:** This value reflects the Tag associated with the data being transferred on the link. When an input stream is detected on any of the SDIx signals that match this value the data samples are loaded into the FIFO associated with this descriptor. Note that while a single SDIx input may contain data from more than one stream number two different SDIx inputs may not be configured with the same stream number. 0000 Reserved Indicates Unused 0001 Stream 1 1110 Stream 14 1111 Stream 15 |
| 19 | 0h<br>RO | **BIDIRECTIONAL_DIRECTION_CONTROL:** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0. |
| 18 | 01h<br>RO | **TRAFFIC_PRIORITY:** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers. |
| 17:16 | 0h<br>RO | **STRIPE_CONTROL:** This field is meaningless for input streams. |
| 15:5 | 000h<br>RO | **RESERVED0:** reserved |
| 4 | 0h<br>RW | **DESCRIPTOR_ERROR_INTERRUPT_ENABLE:** Controls whether an interrupt is generated when the Descriptor Error Status DESE bit is set. |
| 3 | 0h<br>RW | **FIFO_ERROR_INTERRUPT_ENABLE:** This bit controls whether the occurrence of a FIFO error overrun for input will cause an interrupt or not. If this bit is not set bit 3 in the Status register will be set but the interrupt will not occur. Either way the samples will be dropped. |
| 2 | 0h<br>RW | **INTERRUPT_ON_COMPLETION_ENABLE:** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set bit 2 in the Status register will be set but the interrupt will not occur. |
| 1 | 0h<br>RW | **STREAM_RUN:** When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine. |
| 0 | 0h<br>RW | **STREAM_RESET:** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers except the SRST bit itself and FIFO s for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation it will report a0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted. |

## 20.6.63 ISD3LPIB—Offset E4h

Input Stream Descriptor 3 Link Position in Buffer



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD3LPIB:** [AZLBAR] + E4h

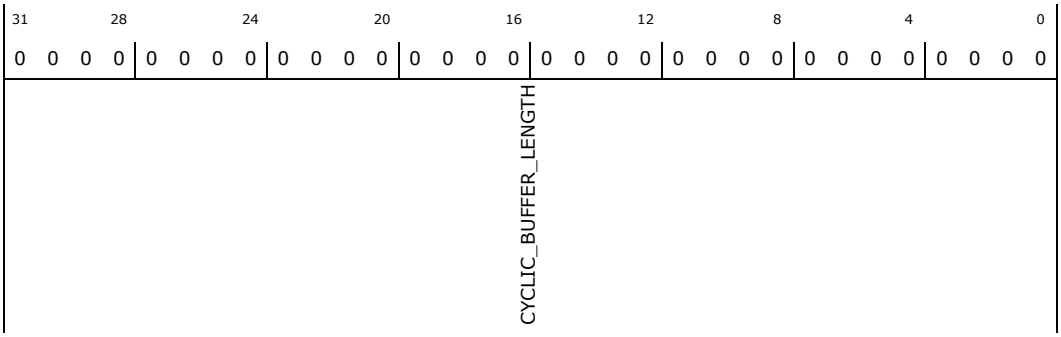
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **LINK_POSITION_IN_BUFFER:** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0. |

## 20.6.64 ISD3CBL—Offset E8h

Input Stream Descriptor 3 Cyclic Buffer Length



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD3CBL:** [AZLBAR] + E8h

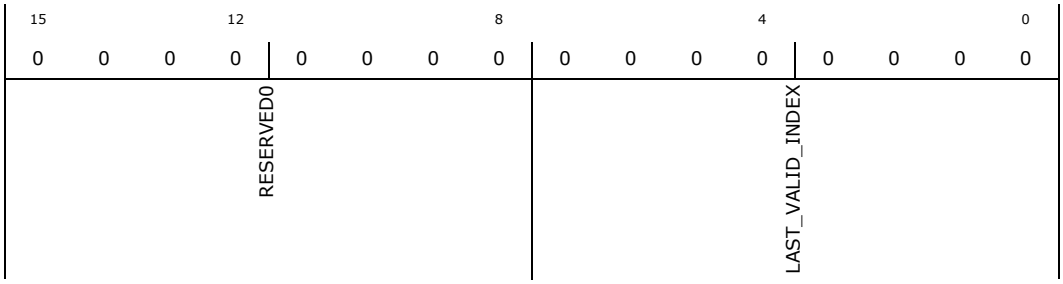
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **CYCLIC_BUFFER_LENGTH:** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer LPIB will be reset when it reaches this value. Software may only write to this register after Global Reset Controller Reset or Stream Reset has occurred. This value should only be modified when the RUN bit is 0 . Once the RUN bit has been set to enable the engine software must not write to this register until after the next reset is asserted or transfers may be corrupted. |

## 20.6.65 ISD3LVI—Offset ECh

Input Stream Descriptor 3 Last Valid Index



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ISD3LVI:** [AZLBAR] + ECh

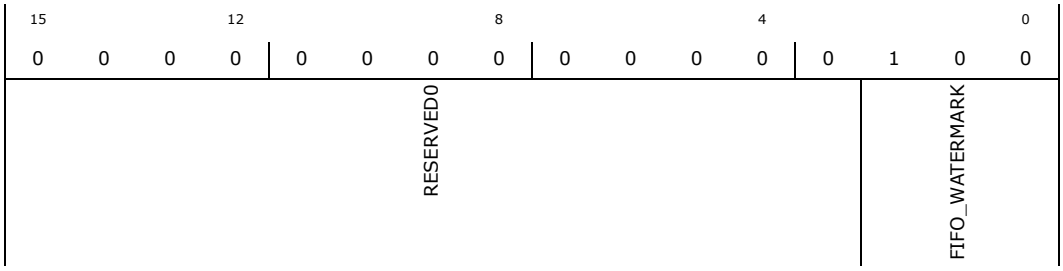
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 00h RO | **RESERVED0:** reserved |
| 7:0 | 00h RW | **LAST_VALID_INDEX:** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1 i.e. there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is 0 |

## 20.6.66 ISD3FIFOW—Offset EEh

Input Stream Descriptor 3 FIFO Eviction Watermark



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ISD3FIFOW:** [AZLBAR] + EEh

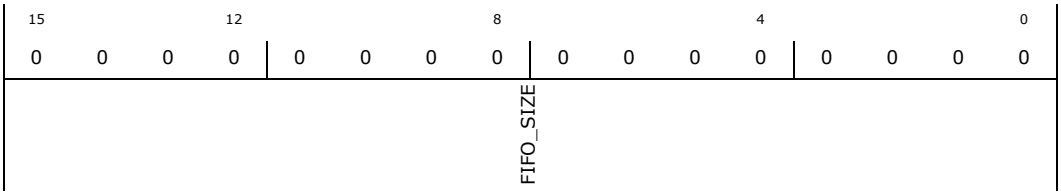
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0004h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:3 | 0000h<br>RO | **RESERVED0:** reserved |
| 2:0 | 04h<br>RO | **FIFO_WATERMARK:** Indicates the minimum number of bytes accumulated in the FIFO before the controller will start an eviction of data. The HD Audio controller hardwires the FIFO Watermark either 32B or 64B based on the following. For input streams the FIFOW value is determined by the EM3.ISRWS SEM3.ISRWS field. |

## 20.6.67 ISD3FIFOS—Offset F0h

Input Stream Descriptor 3 FIFO Size



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ISD3FIFOS:** [AZLBAR] + F0h

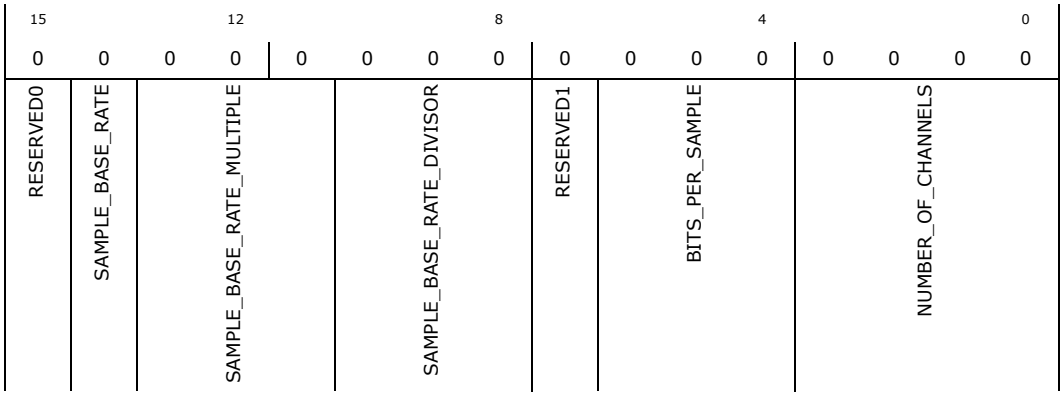
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 00h<br>RW | **FIFO_SIZE:** Indicates the maximum number of bytes that could be revicted by the controller at one time. This is the maximum number of bytes that may have been received from the link but not yet DMA d into memory and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on factors including the stream format programmed in ISD3FMT register. As the default value is zero, SW must write to the respective ISD3FMT register to kick of the FIFO size calculation, and read back to find out the HW allocated FIFO size. |

## 20.6.68 ISD3FMT—Offset F2h

Input Stream Descriptor 3 Format



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**ISD3FMT:** [AZLBAR] + F2h

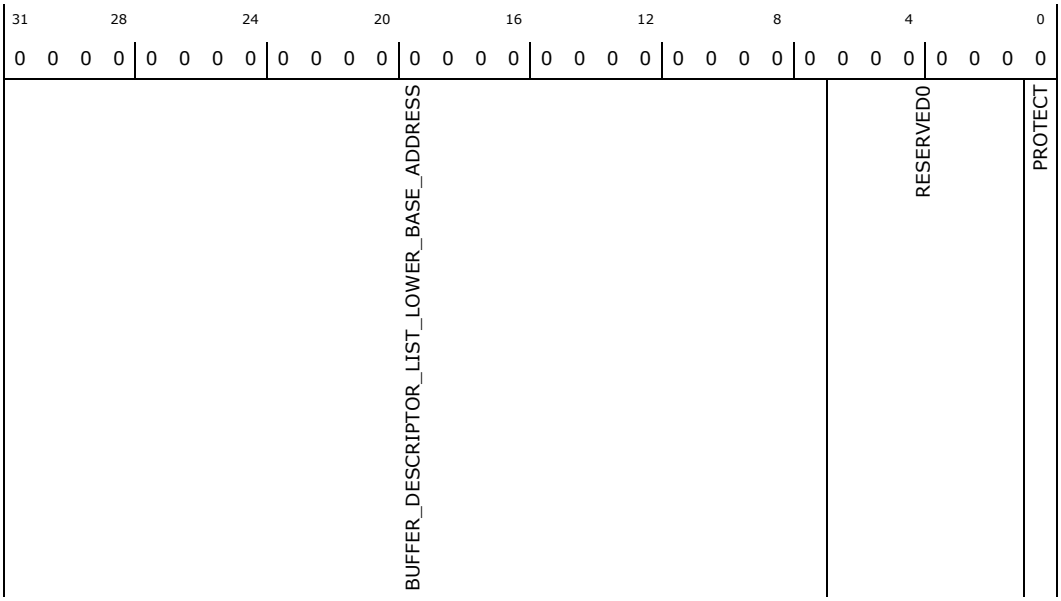
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15 | 0h<br>RO | **RESERVED0:** reserved |
| 14 | 0h<br>RW | **SAMPLE_BASE_RATE:** 0 48 kHz 1 44.1 kHz |
| 13:11 | 0h<br>RW | **SAMPLE_BASE_RATE_MULTIPLE:** Sample Base Rate Multiple (MULT): 000=48kHz/ 44.1kHz or less 001=x2 96kHz 88.2kHz 32kHz 010=x3 144kHz 011=x4 192kHz 176.4kHz 100-111 Reserved |
| 10:8 | 0h<br>RW | **SAMPLE_BASE_RATE_DIVISOR:** Sample Base Rate Divisor (DIV): 000 Divide by 1, 48kHz 44.1kHz 001 Divide by 2, 24kHz 22.05kHz 010 Divide by 3, 16kHz 32kHz 011 Divide by 4, 11.025kHz 100 Divide by 5, 9.6kHz 101 Divide by 6, 8kHz 110 Divide by 7 111 Divide by 8, 6kHz |
| 7 | 0h<br>RO | **RESERVED1:** reserved |
| 6:4 | 0h<br>RW | **BITS_PER_SAMPLE:** Bits per Sample (BITS): 000=8 bits. The data will be packed in memory in 8 bit containers on 16 bit boundaries 001=16 bits. The data will be packed in memory in 16 bit containers on 16 bit boundaries 010=20 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 011=24 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 100=32 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 101-111 Reserved |
| 3:0 | 0h<br>RW | **NUMBER_OF_CHANNELS:** Number of channels in each frame of the stream 0000=1 0001=2 1111=16 |

## 20.6.69 ISD3BDLPLBA—Offset F8h

Input Stream Descriptor 3 Buffer Descriptor List Pointer Lower Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD3BDLPLBA:** [AZLBAR] + F8h

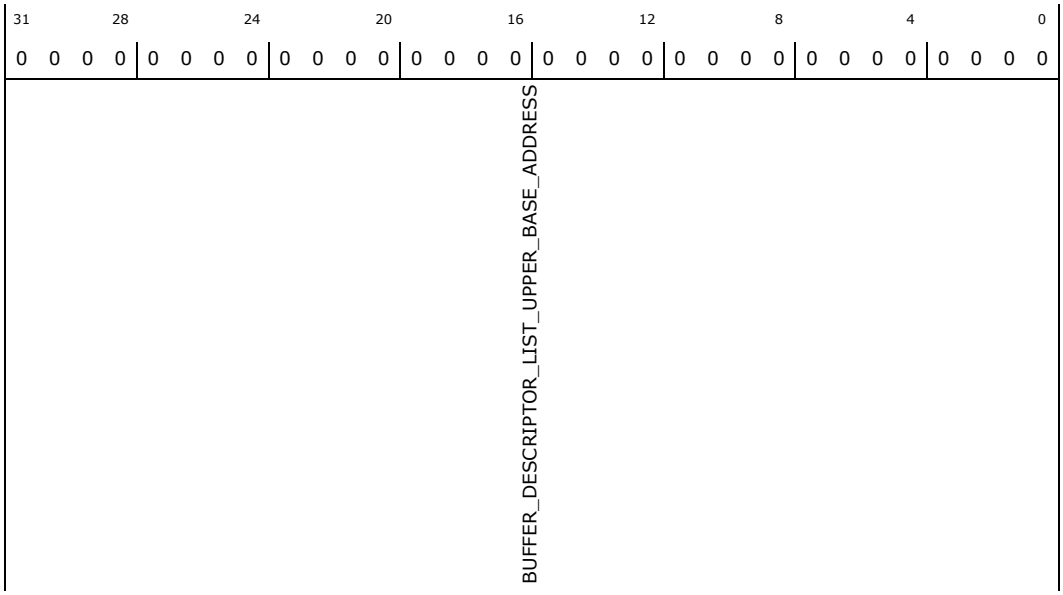
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:7 | 0h<br>RW | **BUFFER_DESCRIPTOR_LIST_LOWER_BASE_ADDRESS:** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted. Intel Reserved comment This field becomes WO and 0 s will be read when the Protect bit is set to 1. |
| 6:1 | 00h<br>RO | **RESERVED0:** reserved |
| 0 | 0h<br>RW | **PROTECT:** When this bit is set to 1 bits 31 7 0 of this register are WO and will return 0 s when read. When this bit is cleared to 0 bits 31 7 0 are RW. Note that this bit can only be changed when all four bytes of this register are written in a single write operation. If less than four bytes are written this bit retains its previous value. This bit is Intel Reserved. |

## 20.6.70 ISD3BDLPUBA—Offset FCh

Input Stream Descriptor 3 Buffer Descriptor List Pointer Upper Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD3BDLPUBA:** [AZLBAR] + FCh

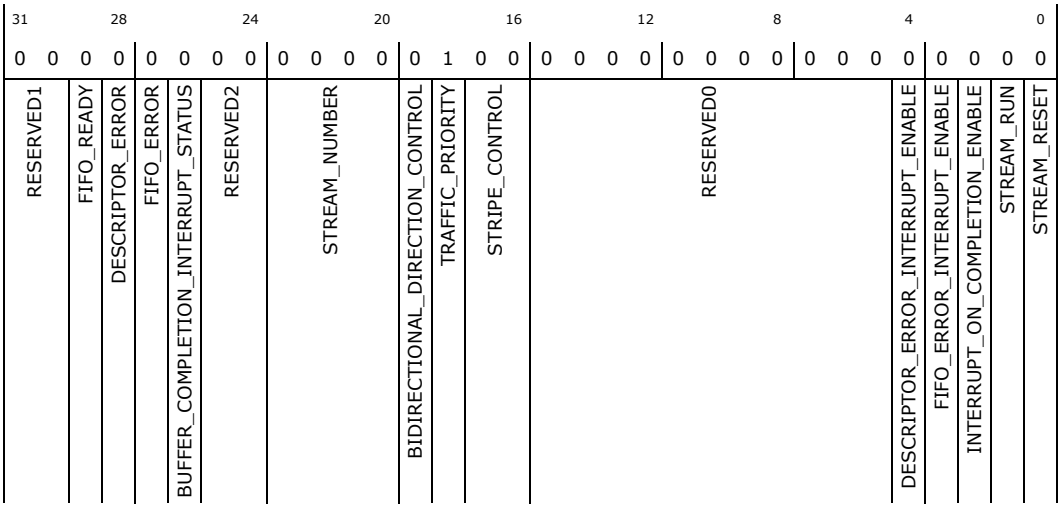
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **BUFFER_DESCRIPTOR_LIST_UPPER_BASE_ADDRESS:** Upper 32 bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. |

## 20.6.71 OSD0CTL_STS—Offset 100h

Output Stream Descriptor 0 Control and status



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD0CTL_STS:** [AZLBAR] + 100h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

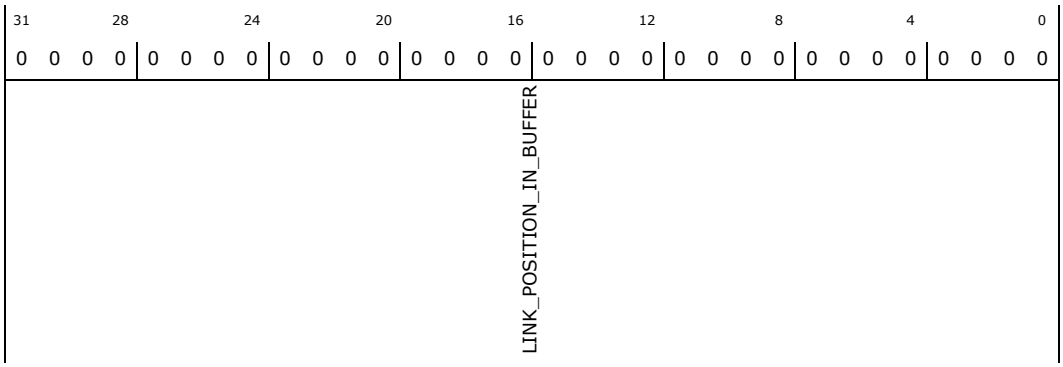
**Default:** 00040000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RO | **RESERVED1:** reserved |
| 29 | 0h<br>RO | **FIFO_READY:** For output streams the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link. This bit defaults to 0 on reset because the FIFO is cleared on a reset. |
| 28 | 0h<br>RW | **DESCRIPTOR_ERROR:** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort a Parity or ECC error on the bus or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it. |
| 27 | 0h<br>RW | **FIFO_ERROR:** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. For an output stream this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send. |
| 26 | 0h<br>RW | **BUFFER_COMPLETION_INTERRUPT_STATUS:** This bit is set to 1 by the hardware after the last sample of a buffer has been processed AND if the Interrupt on Completion IOC bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position. |
| 25:24 | 0h<br>RO | **RESERVED2:** reserved |
| 23:20 | 0h<br>RW | **STREAM_NUMBER:** This value reflects the Tag associated with the data being transferred on the link. When data controlled by this descriptor is sent out over the link it will have this stream number encoded on the SYNC signal. 0000 Reserved Indicates Unused 0001 Stream 1 1110 Stream 14 1111 Stream 15 |
| 19 | 0h<br>RO | **BIDIRECTIONAL_DIRECTION_CONTROL:** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0. |
| 18 | 01h<br>RO | **TRAFFIC_PRIORITY:** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers. |
| 17:16 | 0h<br>RO | **STRIPE_CONTROL:** For output streams it controls the number of SDO signals to stripe data across. Only one SDO is supported in the HD Audio controller. Therefore it is hardwired to 0 s. |
| 15:5 | 000h<br>RO | **RESERVED0:** reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 4 | 0h<br>RW | **DESCRIPTOR_ERROR_INTERRUPT_ENABLE:** Controls whether an interrupt is generated when the Descriptor Error Status DESE bit is set. |
| 3 | 0h<br>RW | **FIFO_ERROR_INTERRUPT_ENABLE:** This bit controls whether the occurrence of a FIFO error under run for output will cause an interrupt or not. If this bit is not set bit 3 in the Status register will be set but the interrupt will not occur. Either way the samples will be dropped. |
| 2 | 0h<br>RW | **INTERRUPT_ON_COMPLETION_ENABLE:** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set bit 2 in the Status register will be set but the interrupt will not occur. |
| 1 | 0h<br>RW | **STREAM_RUN:** When set to 1 the DMA engine associated with this output stream will be enabled to transfer data in the main memory to FIFO. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this output stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine. |
| 0 | 0h<br>RW | **STREAM_RESET:** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers except the SRST bit itself and FIFO s for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation it will report a0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted. |

## 20.6.72 OSD0LPIB—Offset 104h

Output Stream Descriptor 0 Link Position in Buffer



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD0LPIB:** [AZLBAR] + 104h

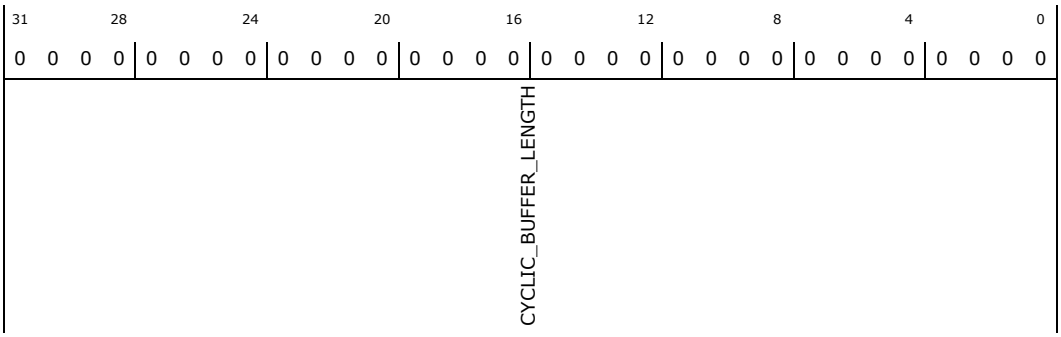
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **LINK_POSITION_IN_BUFFER:** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0. |

## 20.6.73 OSD0CBL—Offset 108h

Output Stream Descriptor 0 Cyclic Buffer Length



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD0CBL:** [AZLBAR] + 108h

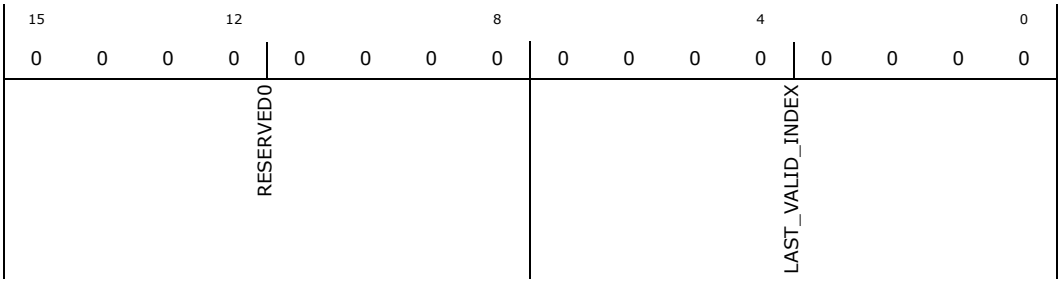
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **CYCLIC_BUFFER_LENGTH:** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer LPIB will be reset when it reaches this value. Software may only write to this register after Global Reset Controller Reset or Stream Reset has occurred. This value should only be modified when the RUN bit is 0 . Once the RUN bit has been set to enable the engine software must not write to this register until after the next reset is asserted or transfers may be corrupted. |

## 20.6.74 OSD0LVI—Offset 10Ch

Output Stream Descriptor 0 Last Valid Index



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OSD0LVI:** [AZLBAR] + 10Ch

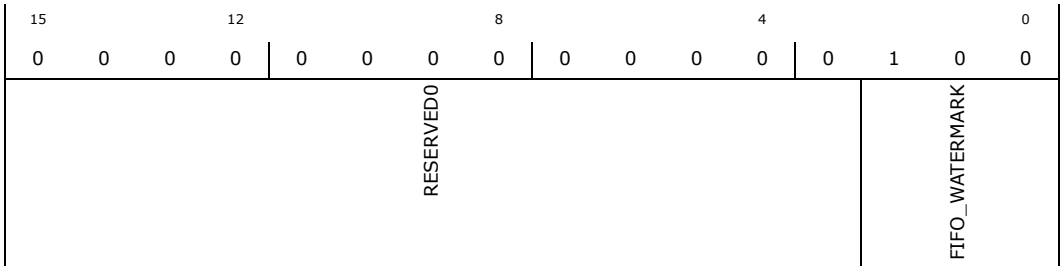
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 00h RO | **RESERVED0:** reserved |
| 7:0 | 00h RW | **LAST_VALID_INDEX:** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1 i.e. there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is 0 |

## 20.6.75 OSD0FIFOW—Offset 10Eh

Output Stream Descriptor 0 FIFO Fetch Watermark



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OSD0FIFOW:** [AZLBAR] + 10Eh

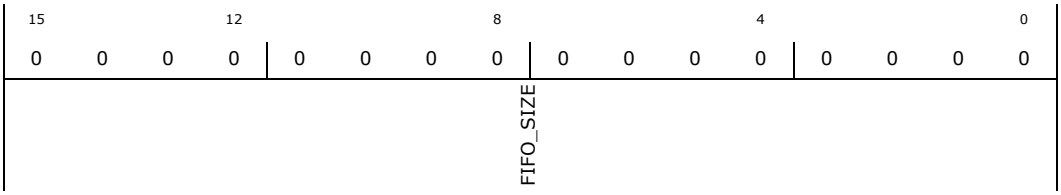
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0004h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:3 | 0000h RO | **RESERVED0:** reserved |
| 2:0 | 04h RO | **FIFO_WATERMARK:** Indicates the minimum number of bytes free in the FIFO before the controller will start a fetch of data. The HD Audio controller hardwires the FIFO Watermark either 32B or 64B based on the following. For output streams the FIFOW value is determined by the EM4.OSRWS SEM4.OSRWS field. |

## 20.6.76 OSD0FIFOS—Offset 110h

Output Stream Descriptor 0 FIFO Size



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OSD0FIFOS:** [AZLBAR] + 110h

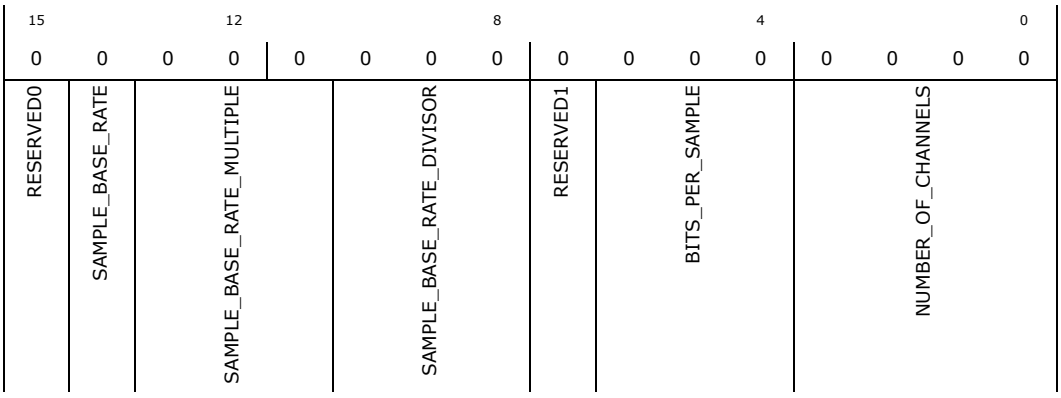
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 00h<br>RW | **FIFO_SIZE:** Indicates the maximum number of bytes that could be fetched by the controller at one time. This is the maximum number of bytes that may have been DMA d into memory but not yet transmitted on the link and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on factors including the stream format programmed in OSD0FMT register. As the default value is zero, SW must write to the OSD0FMT register to kick of the FIFO size calculation and read back to find out the HW allocated FIFO size. |

## 20.6.77 OSD0FMT—Offset 112h

Output Stream Descriptor 0 Format



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OSD0FMT:** [AZLBAR] + 112h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

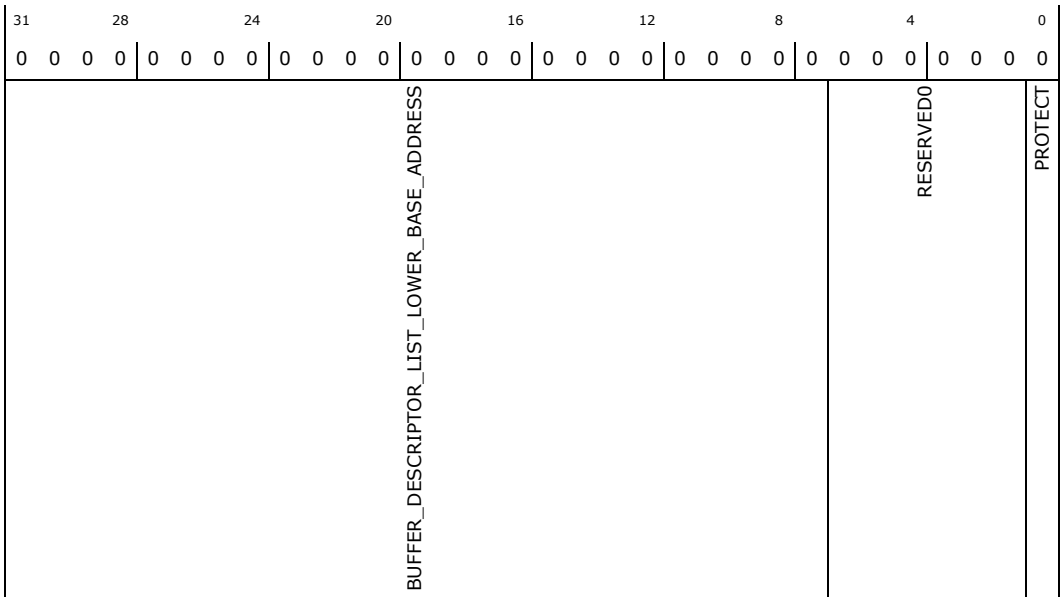
**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15 | 0h<br>RO | **RESERVED0:** reserved |
| 14 | 0h<br>RW | **SAMPLE_BASE_RATE:** Sample Base Rate (BASE): 0=48kHz 1=44.1kHz |
| 13:11 | 0h<br>RW | **SAMPLE_BASE_RATE_MULTIPLE:** Sample Base Rate Multiple (MULT): 000=48kHz/ 44.1kHz or less 001=x2 96kHz 88.2kHz 32kHz 010=x3 144kHz 011=x4 192kHz 176.4kHz 100-111 Reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 10:8 | 0h<br>RW | **SAMPLE_BASE_RATE_DIVISOR:** Sample Base Rate Divisor (DIV): 000 Divide by 1, 48kHz 44.1kHz 001 Divide by 2, 24kHz 22.05kHz 010 Divide by 3, 16kHz 32kHz 011 Divide by 4, 11.025kHz 100 Divide by 5, 9.6kHz 101 Divide by 6, 8kHz 110 Divide by 7 111 Divide by 8, 6kHz |
| 7 | 0h<br>RO | **RESERVED1:** reserved |
| 6:4 | 0h<br>RW | **BITS_PER_SAMPLE:** Bits per Sample (BITS): 000=8 bits. The data will be packed in memory in 8 bit containers on 16 bit boundaries 001=16 bits. The data will be packed in memory in 16 bit containers on 16 bit boundaries 010=20 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 011=24 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 100=32 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 101-111 Reserved |
| 3:0 | 0h<br>RW | **NUMBER_OF_CHANNELS:** Number of channels in each frame of the stream 0000=1 0001=2 1111=16 |

## 20.6.78 OSD0BDLPLBA—Offset 118h

Output Stream Descriptor 0 Buffer Descriptor List Pointer Lower Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD0BDLPLBA:** [AZLBAR] + 118h

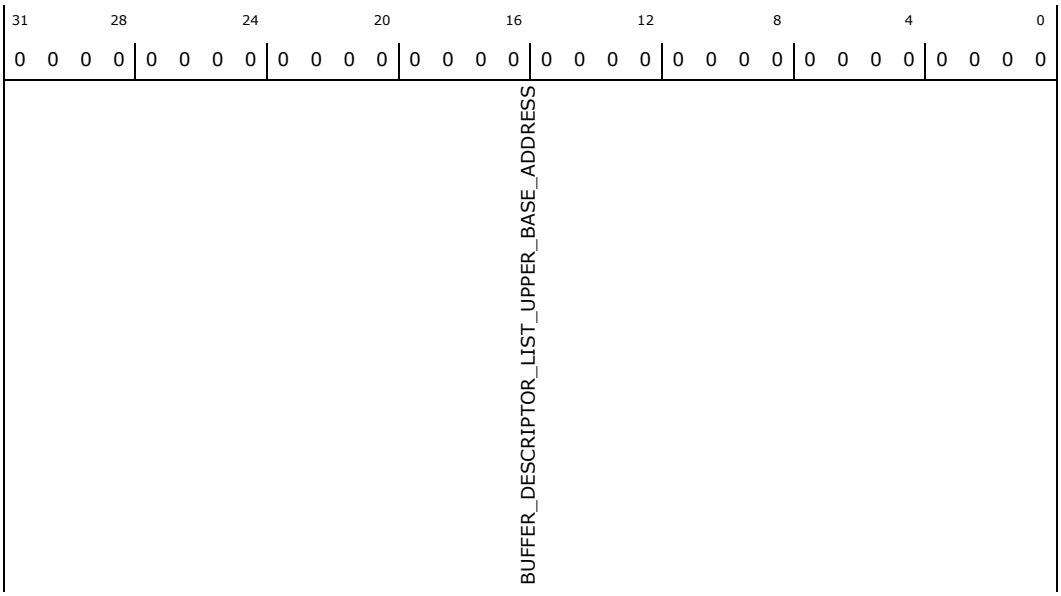
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:7 | 0h<br>RW | **BUFFER_DESCRIPTOR_LIST_LOWER_BASE_ADDRESS:** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted. Intel Reserved comment This field becomes WO and 0 s will be read when the Protect bit is set to 1. |
| 6:1 | 00h<br>RO | **RESERVED0:** reserved |
| 0 | 0h<br>RW | **PROTECT:** When this bit is set to 1 bits 31 7 0 of this register are WO and will return 0 s when read. When this bit is cleared to 0 bits 31 7 0 are RW. Note that this bit can only be changed when all four bytes of this register are written in a single write operation. If less than four bytes are written this bit retains its previous value. This bit is Intel Reserved. |

## 20.6.79 OSD0BDLPUBA—Offset 11Ch

Output Stream Descriptor 0 Buffer Descriptor List Pointer Upper Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD0BDLPUBA:** [AZLBAR] + 11Ch

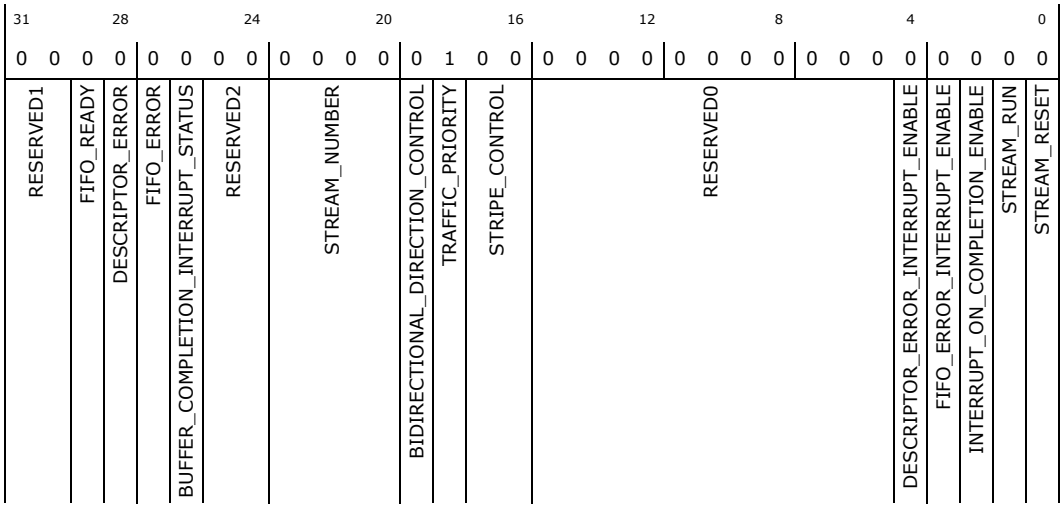
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **BUFFER_DESCRIPTOR_LIST_UPPER_BASE_ADDRESS:** Upper 32 bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. |

## 20.6.80 OSD1CTL_STS—Offset 120h

Output Stream Descriptor 1 Control and status



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD1CTL_STS:** [AZLBAR] + 120h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00040000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RO | **RESERVED1:** reserved |
| 29 | 0h<br>RO | **FIFO_READY:** For output streams the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link. This bit defaults to 0 on reset because the FIFO is cleared on a reset. |
| 28 | 0h<br>RW | **DESCRIPTOR_ERROR:** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort a Parity or ECC error on the bus or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it. |
| 27 | 0h<br>RW | **FIFO_ERROR:** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. For an output stream this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send. |
| 26 | 0h<br>RW | **BUFFER_COMPLETION_INTERRUPT_STATUS:** This bit is set to 1 by the hardware after the last sample of a buffer has been processed AND if the Interrupt on Completion IOC bit is set in the command byte of the buffer descriptor. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted. |

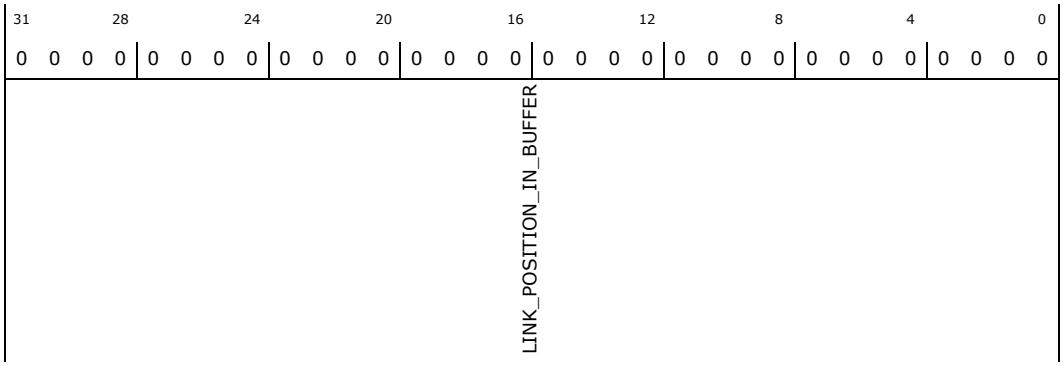
## 20.6.81 OSD1LPIB—Offset 124h

Output Stream Descriptor 1 Link Position in Buffer



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD1LPIB:** [AZLBAR] + 124h

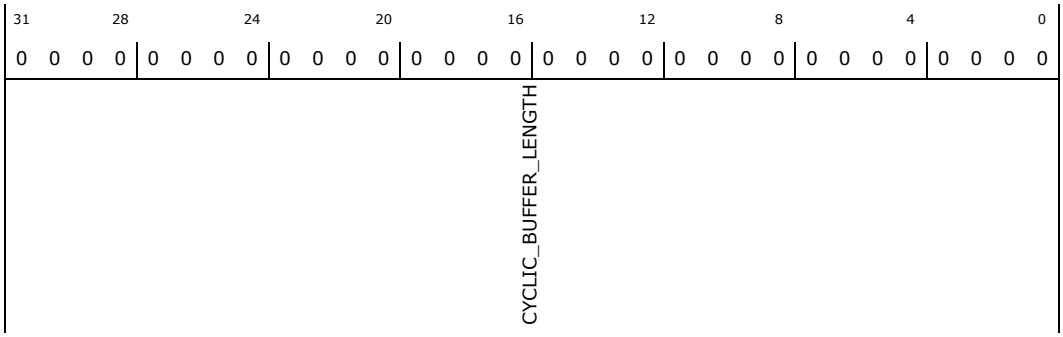
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **LINK_POSITION_IN_BUFFER:** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0. |

## 20.6.82 OSD1CBL—Offset 128h

Output Stream Descriptor 1 Cyclic Buffer Length



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD1CBL:** [AZLBAR] + 128h

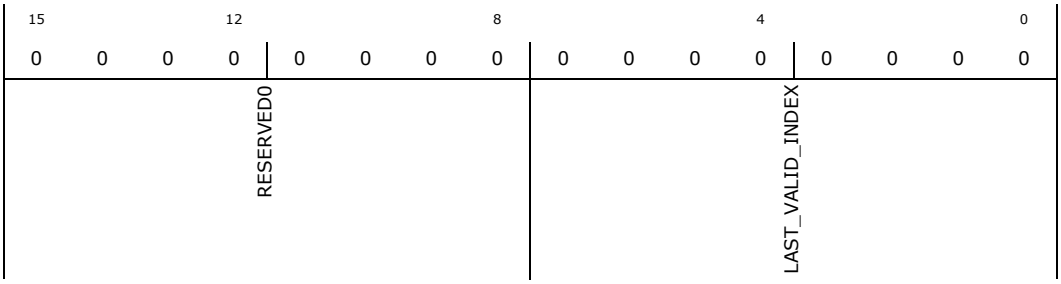
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **CYCLIC_BUFFER_LENGTH:** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer LPIB will be reset when it reaches this value. Software may only write to this register after Global Reset Controller Reset or Stream Reset has occurred. This value should only be modified when the RUN bit is 0 . Once the RUN bit has been set to enable the engine software must not write to this register until after the next reset is asserted or transfers may be corrupted. |

## 20.6.83 OSD1LVI—Offset 12Ch

Output Stream Descriptor 1 Last Valid Index



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OSD1LVI:** [AZLBAR] + 12Ch

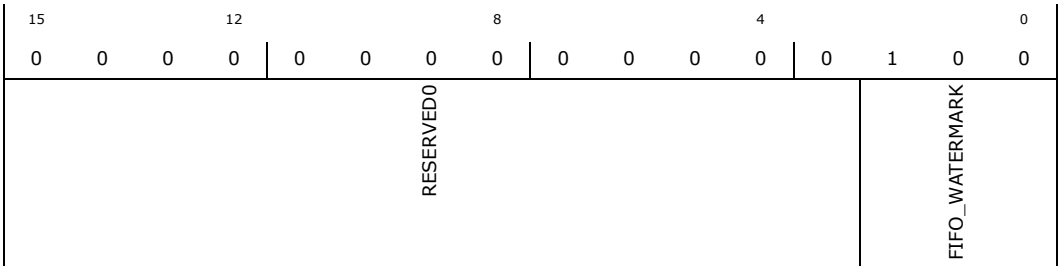
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 00h RO | **RESERVED0:** reserved |
| 7:0 | 00h RW | **LAST_VALID_INDEX:** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1 i.e. there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is 0 |

## 20.6.84 OSD1FIFOW—Offset 12Eh

Output Stream Descriptor 1 FIFO Fetch Watermark



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OSD1FIFOW:** [AZLBAR] + 12Eh

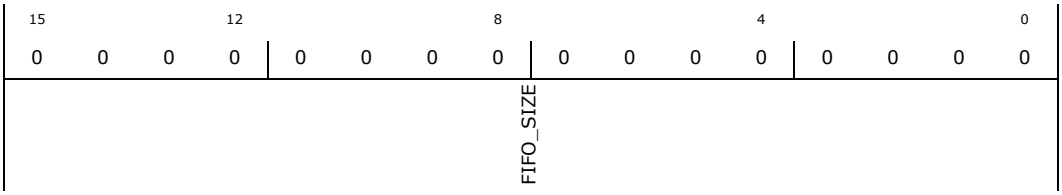
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0004h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:3 | 0000h RO | **RESERVED0:** reserved |
| 2:0 | 04h RO | **FIFO_WATERMARK:** Indicates the minimum number of bytes free in the FIFO before the controller will start a fetch of data. The HD Audio controller hardwires the FIFO Watermark either 32B or 64B based on the following. For output streams the FIFOW value is determined by the EM4.OSRWS SEM4.OSRWS field. |

## 20.6.85 OSD1FIFOS—Offset 130h

Output Stream Descriptor 1 FIFO Size



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OSD1FIFOS:** [AZLBAR] + 130h

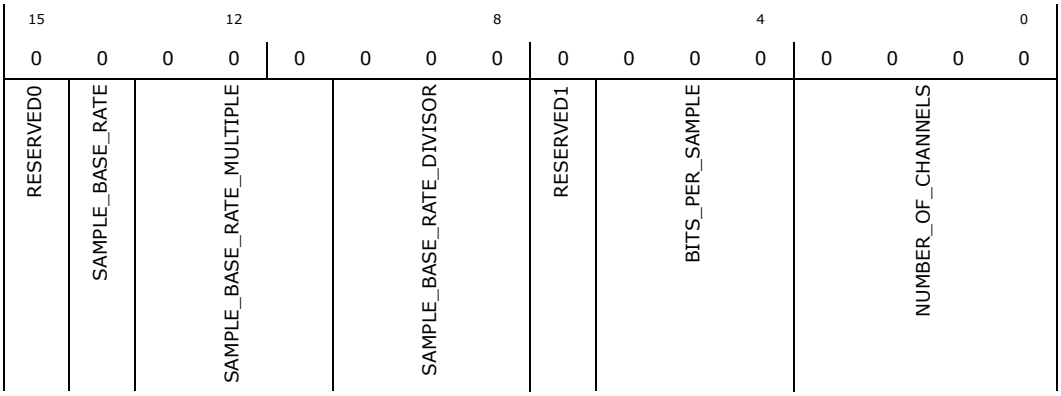
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 00h RW | **FIFO_SIZE:** Indicates the maximum number of bytes that could be fetched by the controller at one time. This is the maximum number of bytes that may have been DMA d into memory but not yet transmitted on the link and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on factors including the stream format programmed in OSD1FMT register. As the default value is zero, SW must write to the OSD1FMT register to kick of the FIFO size calculation and read back to find out the HW allocated FIFO size. |

## 20.6.86 OSD1FMT—Offset 132h

Output Stream Descriptor 1 Format



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OSD1FMT:** [AZLBAR] + 132h

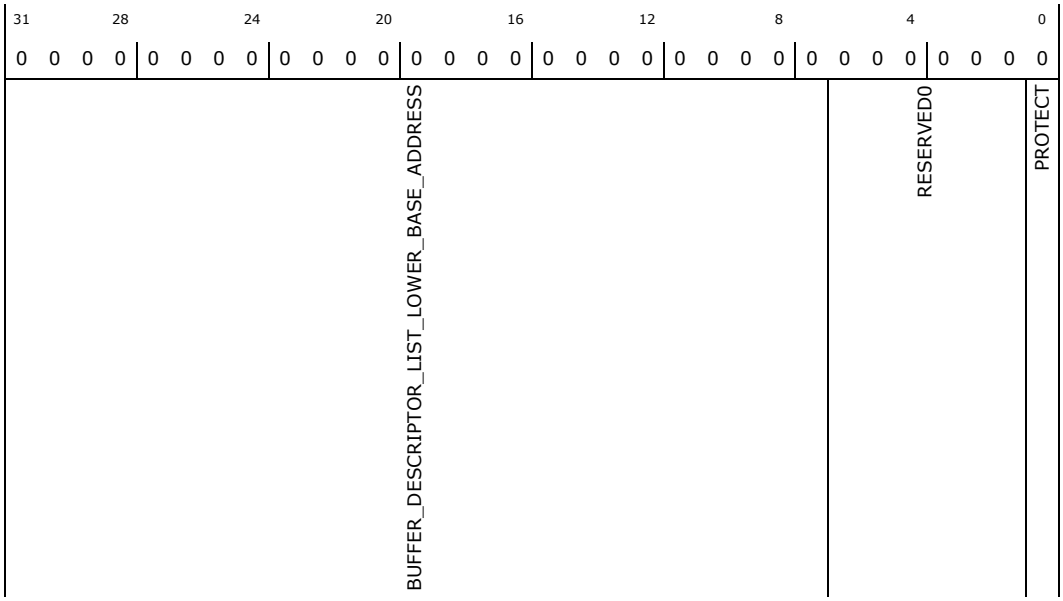
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15 | 0h<br>RO | **RESERVED0:** reserved |
| 14 | 0h<br>RW | **SAMPLE_BASE_RATE:** Sample Base Rate (BASE): 0=48kHz 1=44.1kHz |
| 13:11 | 0h<br>RW | **SAMPLE_BASE_RATE_MULTIPLE:** Sample Base Rate Multiple (MULT): 000=48kHz/ 44.1kHz or less 001=x2 96kHz 88.2kHz 32kHz 010=x3 144kHz 011=x4 192kHz 176.4kHz 100-111 Reserved |
| 10:8 | 0h<br>RW | **SAMPLE_BASE_RATE_DIVISOR:** Sample Base Rate Divisor (DIV): 000 Divide by 1, 48kHz 44.1kHz 001 Divide by 2, 24kHz 22.05kHz 010 Divide by 3, 16kHz 32kHz 011 Divide by 4, 11.025kHz 100 Divide by 5, 9.6kHz 101 Divide by 6, 8kHz 110 Divide by 7 111 Divide by 8, 6kHz |
| 7 | 0h<br>RO | **RESERVED1:** reserved |
| 6:4 | 0h<br>RW | **BITS_PER_SAMPLE:** Bits per Sample (BITS): 000=8 bits. The data will be packed in memory in 8 bit containers on 16 bit boundaries 001=16 bits. The data will be packed in memory in 16 bit containers on 16 bit boundaries 010=20 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 011=24 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 100=32 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 101-111 Reserved |
| 3:0 | 0h<br>RW | **NUMBER_OF_CHANNELS:** Number of channels in each frame of the stream 0000=1 0001=2 1111=16 |

## 20.6.87 OSD1BDLPLBA—Offset 138h

Output Stream Descriptor 1 Buffer Descriptor List Pointer Lower Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD1BDLPLBA:** [AZLBAR] + 138h

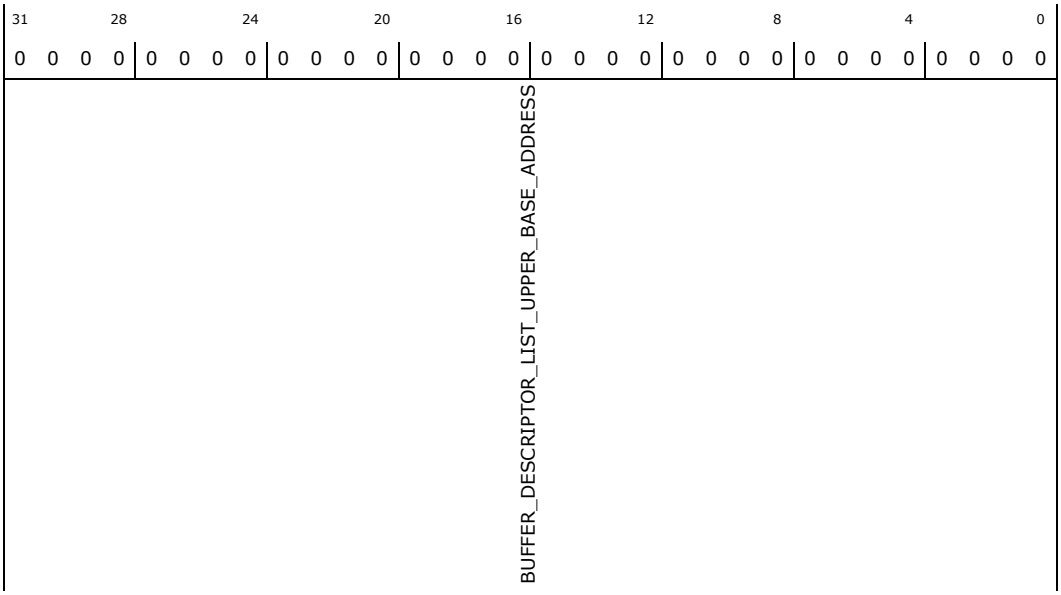
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:7 | 0h<br>RW | **BUFFER_DESCRIPTOR_LIST_LOWER_BASE_ADDRESS:** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted. Intel Reserved comment This field becomes WO and 0 s will be read when the Protect bit is set to 1. |
| 6:1 | 00h<br>RO | **RESERVED0:** reserved |
| 0 | 0h<br>RW | **PROTECT:** When this bit is set to 1 bits 31 7 0 of this register are WO and will return 0 s when read. When this bit is cleared to 0 bits 31 7 0 are RW. Note that this bit can only be changed when all four bytes of this register are written in a single write operation. If less than four bytes are written this bit retains its previous value. This bit is Intel Reserved. |

## 20.6.88 OSD1BDLPUBA—Offset 13Ch

Output Stream Descriptor 1 Buffer Descriptor List Pointer Upper Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD1BDLPUBA:** [AZLBAR] + 13Ch

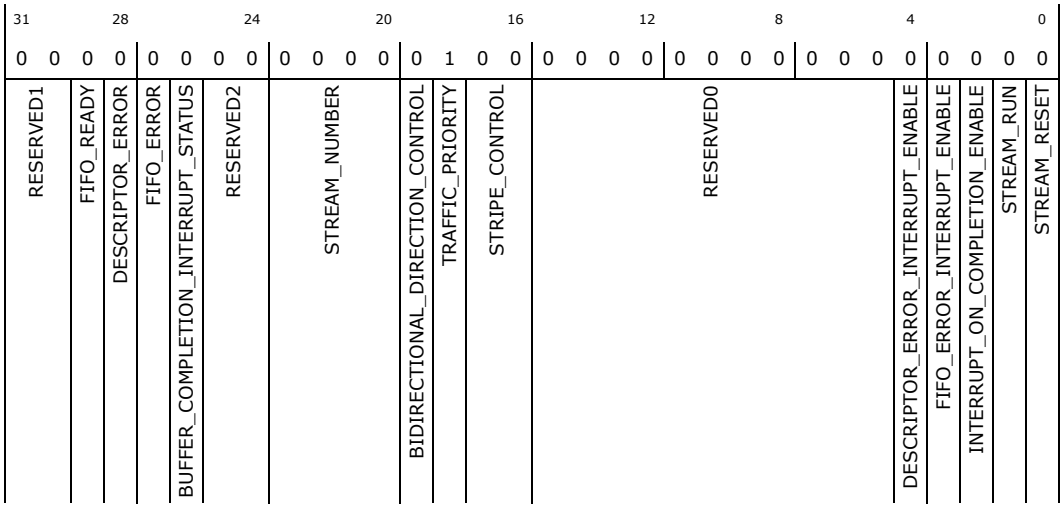
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **BUFFER_DESCRIPTOR_LIST_UPPER_BASE_ADDRESS:** Upper 32 bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. |

## 20.6.89 OSD2CTL_STS—Offset 140h

Output Stream Descriptor 2 Control and status



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD2CTL_STS:** [AZLBAR] + 140h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

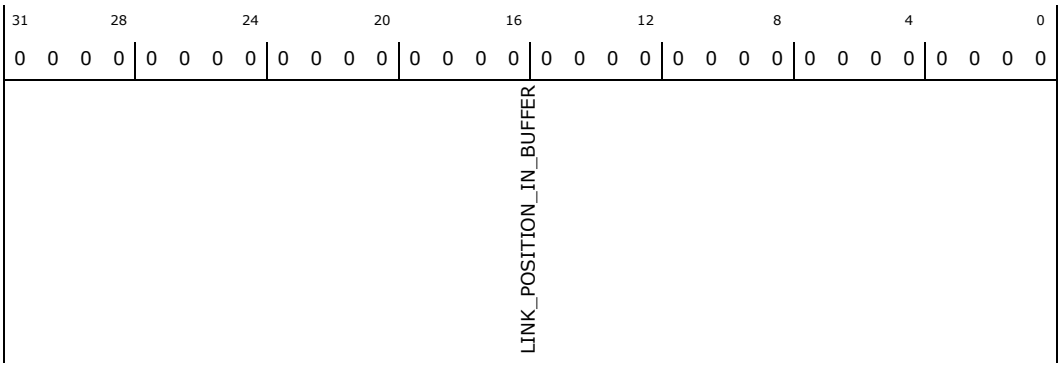
**Default:** 00040000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RO | **RESERVED1:** reserved |
| 29 | 0h<br>RO | **FIFO_READY:** For output streams the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link. This bit defaults to 0 on reset because the FIFO is cleared on a reset. |
| 28 | 0h<br>RW | **DESCRIPTOR_ERROR:** Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort a Parity or ECC error on the bus or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it. |
| 27 | 0h<br>RW | **FIFO_ERROR:** Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. For an output stream this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send. |
| 26 | 0h<br>RW | **BUFFER_COMPLETION_INTERRUPT_STATUS:** This bit is set to 1 by the hardware after the last sample of a buffer has been processed AND if the Interrupt on Completion IOC bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position. |
| 25:24 | 0h<br>RO | **RESERVED2:** reserved |
| 23:20 | 0h<br>RW | **STREAM_NUMBER:** This value reflects the Tag associated with the data being transferred on the link. When data controlled by this descriptor is sent out over the link it will have this stream number encoded on the SYNC signal. 0000 Reserved Indicates Unused 0001 Stream 1 1110 Stream 14 1111 Stream 15 |
| 19 | 0h<br>RO | **BIDIRECTIONAL_DIRECTION_CONTROL:** This bit is only meaningful for Bidirectional streams. Therefore this bit is hardwired to 0. |
| 18 | 01h<br>RO | **TRAFFIC_PRIORITY:** Hardwired to 1 indicating that all streams will use VC1 if it is enabled throughout the PCI Express registers. |
| 17:16 | 0h<br>RO | **STRIPE_CONTROL:** For output streams it controls the number of SDO signals to stripe data across. Only one SDO is supported in the HD Audio controller. Therefore it is hardwired to 0 s. |
| 15:5 | 000h<br>RO | **RESERVED0:** reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 4 | 0h<br>RW | **DESCRIPTOR_ERROR_INTERRUPT_ENABLE:** Controls whether an interrupt is generated when the Descriptor Error Status DESE bit is set. |
| 3 | 0h<br>RW | **FIFO_ERROR_INTERRUPT_ENABLE:** This bit controls whether the occurrence of a FIFO error under run for output will cause an interrupt or not. If this bit is not set bit 3 in the Status register will be set but the interrupt will not occur. Either way the samples will be dropped. |
| 2 | 0h<br>RW | **INTERRUPT_ON_COMPLETION_ENABLE:** This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set bit 2 in the Status register will be set but the interrupt will not occur. |
| 1 | 0h<br>RW | **STREAM_RUN:** When set to 1 the DMA engine associated with this output stream will be enabled to transfer data in the main memory to FIFO. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this output stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine. |
| 0 | 0h<br>RW | **STREAM_RESET:** Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers except the SRST bit itself and FIFO s for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation it will report a0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted. |

## 20.6.90 OSD2LPIB—Offset 144h

Output Stream Descriptor 2 Link Position in Buffer



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD2LPIB:** [AZLBAR] + 144h

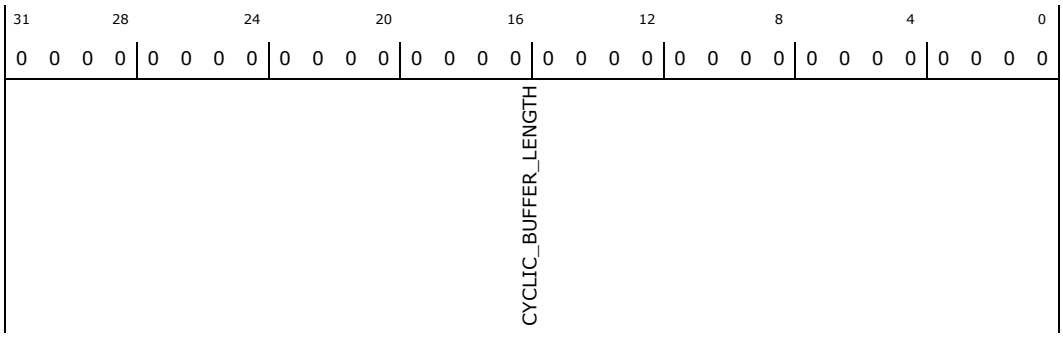
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **LINK_POSITION_IN_BUFFER:** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0. |

## 20.6.91 OSD2CBL—Offset 148h

Output Stream Descriptor 2 Cyclic Buffer Length



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD2CBL:** [AZLBAR] + 148h

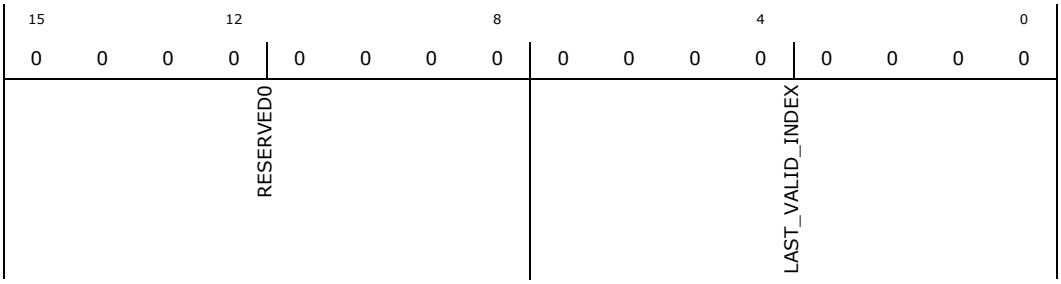
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **CYCLIC_BUFFER_LENGTH:** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer LPIB will be reset when it reaches this value. Software may only write to this register after Global Reset Controller Reset or Stream Reset has occurred. This value should only be modified when the RUN bit is 0 . Once the RUN bit has been set to enable the engine software must not write to this register until after the next reset is asserted or transfers may be corrupted. |

## 20.6.92 OSD2LVI—Offset 14Ch

Output Stream Descriptor 2 Last Valid Index



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OSD2LVI:** [AZLBAR] + 14Ch

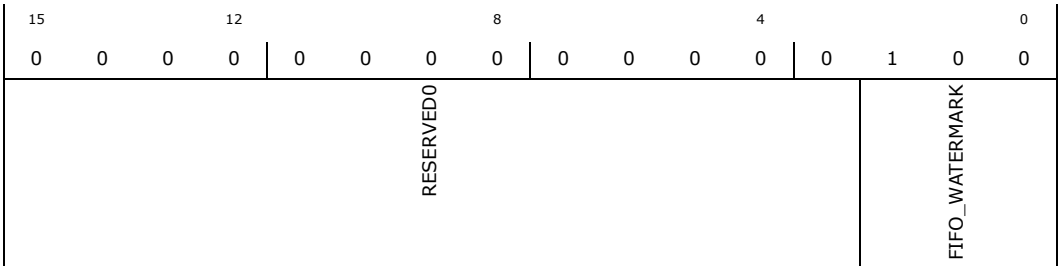
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 00h RO | **RESERVED0:** reserved |
| 7:0 | 00h RW | **LAST_VALID_INDEX:** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1 i.e. there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is 0 |

## 20.6.93 OSD2FIFOW—Offset 14Eh

Output Stream Descriptor 2 FIFO Fetch Watermark



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OSD2FIFOW:** [AZLBAR] + 14Eh

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

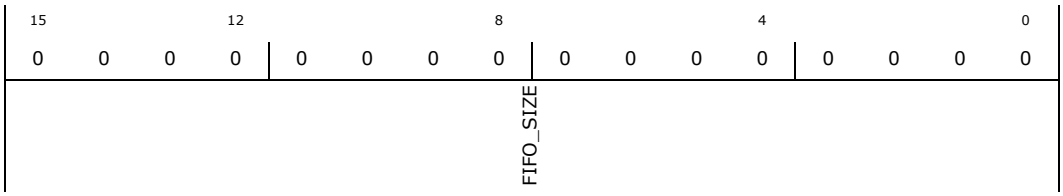
**Default:** 0004h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:3 | 0000h RO | **RESERVED0:** reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 2:0 | 04h<br>RO | **FIFO_WATERMARK:** Indicates the minimum number of bytes free in the FIFO before the controller will start a fetch of data. The HD Audio controller hardwires the FIFO Watermark either 32B or 64B based on the following. For output streams the FIFOW value is determined by the EM4.OSRWS SEM4.OSRWS field. |

## 20.6.94 OSD2FIFOS—Offset 150h

Output Stream Descriptor 2 FIFO Size



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OSD2FIFOS:** [AZLBAR] + 150h

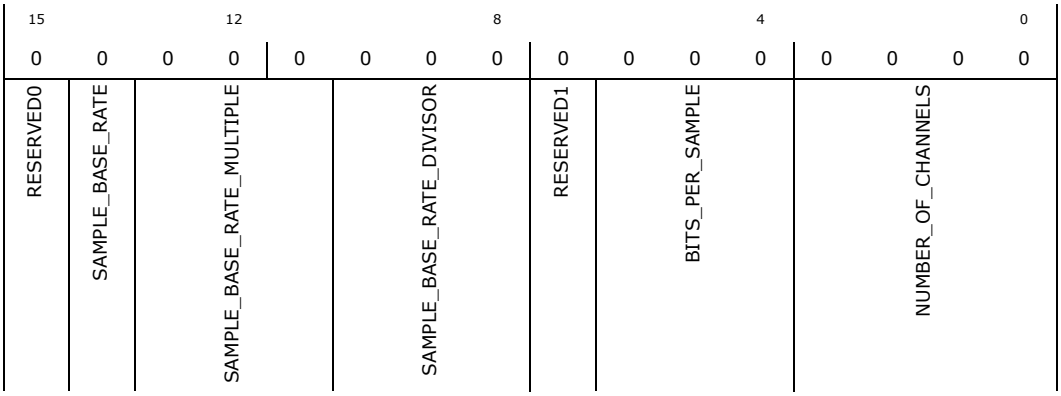
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 00h<br>RW | **FIFO_SIZE:** Indicates the maximum number of bytes that could be fetched by the controller at one time. This is the maximum number of bytes that may have been DMA d into memory but not yet transmitted on the link and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on factors including the stream format programmed in OSD2FMT register. As the default value is zero, SW must write to the OSD2FMT register to kick of the FIFO size calculation and read back to find out the HW allocated FIFO size. |

## 20.6.95 OSD2FMT—Offset 152h

Output Stream Descriptor 2 Format



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OSD2FMT:** [AZLBAR] + 152h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|

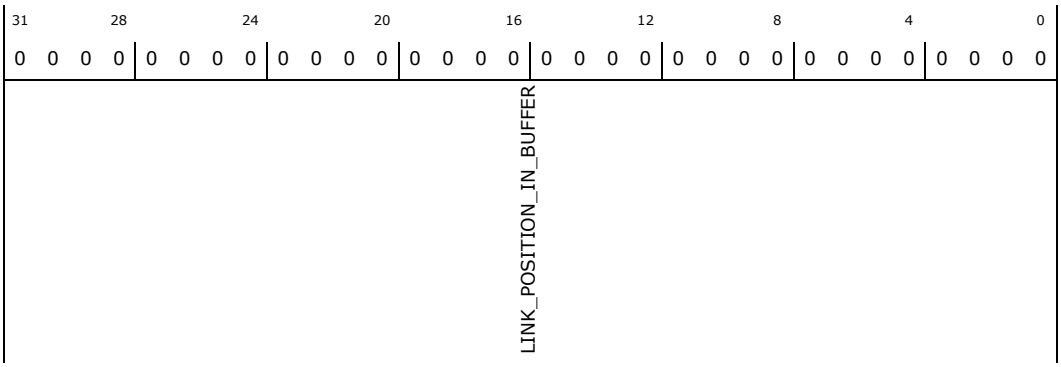
## 20.6.99 OSD3LPIB—Offset 164h

Output Stream Descriptor 3 Link Position in Buffer



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD3LPIB:** [AZLBAR] + 164h

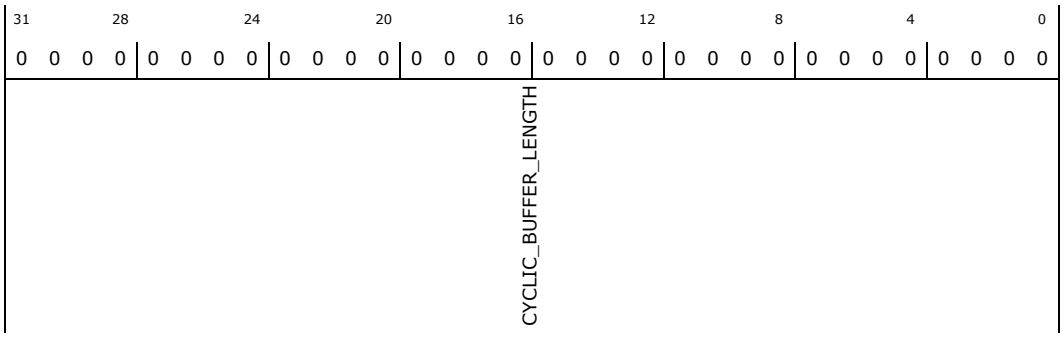
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **LINK_POSITION_IN_BUFFER:** Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0. |

## 20.6.100 OSD3CBL—Offset 168h

Output Stream Descriptor 3 Cyclic Buffer Length



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD3CBL:** [AZLBAR] + 168h

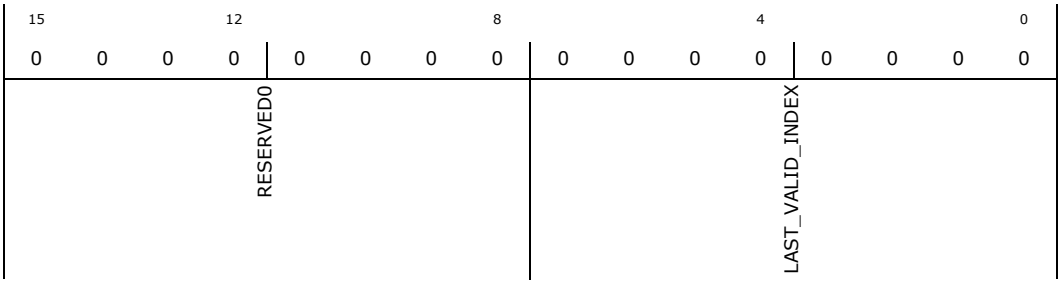
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **CYCLIC_BUFFER_LENGTH:** Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer LPIB will be reset when it reaches this value. Software may only write to this register after Global Reset Controller Reset or Stream Reset has occurred. This value should only be modified when the RUN bit is 0 . Once the RUN bit has been set to enable the engine software must not write to this register until after the next reset is asserted or transfers may be corrupted. |

## 20.6.101 OSD3LVI—Offset 16Ch

Output Stream Descriptor 3 Last Valid Index



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OSD3LVI:** [AZLBAR] + 16Ch

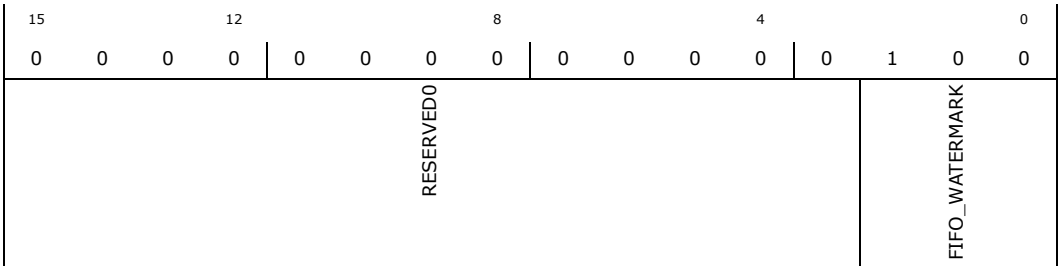
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 00h RO | **RESERVED0:** reserved |
| 7:0 | 00h RW | **LAST_VALID_INDEX:** The value written to this register indicates the index for the last valid Buffer Descriptor in the BDL. After the controller has processed this descriptor it will wrap back to the first descriptor in the list and continue processing. LVI must be at least 1 i.e. there must be at least two valid entries in the buffer descriptor list before DMA operations can begin. This value should only be modified when the RUN bit is 0 |

## 20.6.102 OSD3FIFOW—Offset 16Eh

Output Stream Descriptor 3 FIFO Fetch Watermark



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OSD3FIFOW:** [AZLBAR] + 16Eh

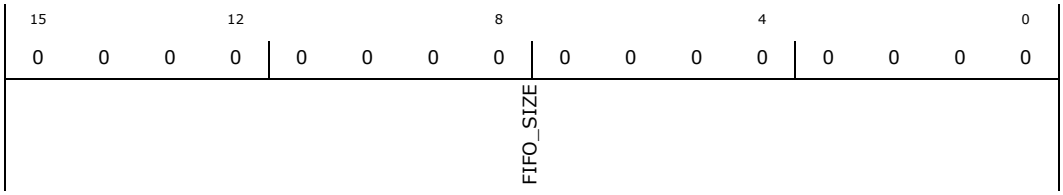
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0004h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:3 | 0000h<br>RO | **RESERVED0:** reserved |
| 2:0 | 04h<br>RO | **FIFO_WATERMARK:** Indicates the minimum number of bytes free in the FIFO before the controller will start a fetch of data. The HD Audio controller hardwires the FIFO Watermark either 32B or 64B based on the following. For output streams the FIFOW value is determined by the EM4.OSRWS SEM4.OSRWS field. |

## 20.6.103 OSD3FIFOS—Offset 170h

Output Stream Descriptor 3 FIFO Size



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OSD3FIFOS:** [AZLBAR] + 170h

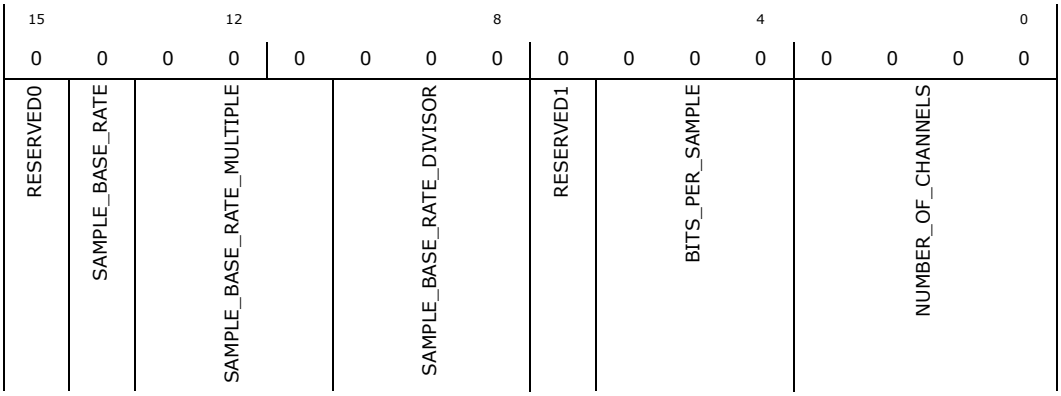
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:0 | 00h<br>RW | **FIFO_SIZE:** Indicates the maximum number of bytes that could be fetched by the controller at one time. This is the maximum number of bytes that may have been DMA d into memory but not yet transmitted on the link and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on factors including the stream format programmed in OSD3FMT register. As the default value is zero, SW must write to the OSD3FMT register to kick of the FIFO size calculation and read back to find out the HW allocated FIFO size. |

## 20.6.104 OSD3FMT—Offset 172h

Output Stream Descriptor 3 Format



### Access Method

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**OSD3FMT:** [AZLBAR] + 172h

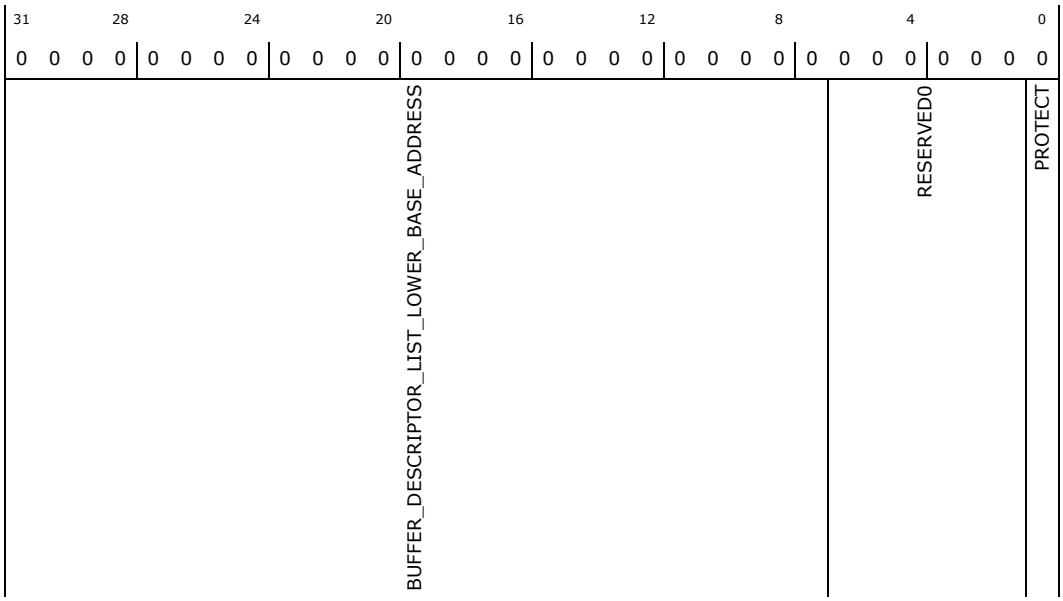
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 15 | 0h<br>RO | **RESERVED0:** reserved |
| 14 | 0h<br>RW | **SAMPLE_BASE_RATE:** Sample Base Rate (BASE): 0=48kHz 1=44.1kHz |
| 13:11 | 0h<br>RW | **SAMPLE_BASE_RATE_MULTIPLE:** Sample Base Rate Multiple (MULT): 000=48kHz/ 44.1kHz or less 001=x2 96kHz 88.2kHz 32kHz 010=x3 144kHz 011=x4 192kHz 176.4kHz 100-111 Reserved |
| 10:8 | 0h<br>RW | **SAMPLE_BASE_RATE_DIVISOR:** Sample Base Rate Divisor (DIV): 000 Divide by 1, 48kHz 44.1kHz 001 Divide by 2, 24kHz 22.05kHz 010 Divide by 3, 16kHz 32kHz 011 Divide by 4, 11.025kHz 100 Divide by 5, 9.6kHz 101 Divide by 6, 8kHz 110 Divide by 7 111 Divide by 8, 6kHz |
| 7 | 0h<br>RO | **RESERVED1:** reserved |
| 6:4 | 0h<br>RW | **BITS_PER_SAMPLE:** Bits per Sample (BITS): 000=8 bits. The data will be packed in memory in 8 bit containers on 16 bit boundaries 001=16 bits. The data will be packed in memory in 16 bit containers on 16 bit boundaries 010=20 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 011=24 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 100=32 bits. The data will be packed in memory in 32 bit containers on 32 bit boundaries 101-111 Reserved |
| 3:0 | 0h<br>RW | **NUMBER_OF_CHANNELS:** Number of channels in each frame of the stream 0000=1 0001=2 1111=16 |

## 20.6.105 OSD3BDLPLBA—Offset 178h

Output Stream Descriptor 3 Buffer Descriptor List Pointer Lower Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD3BDLPLBA:** [AZLBAR] + 178h

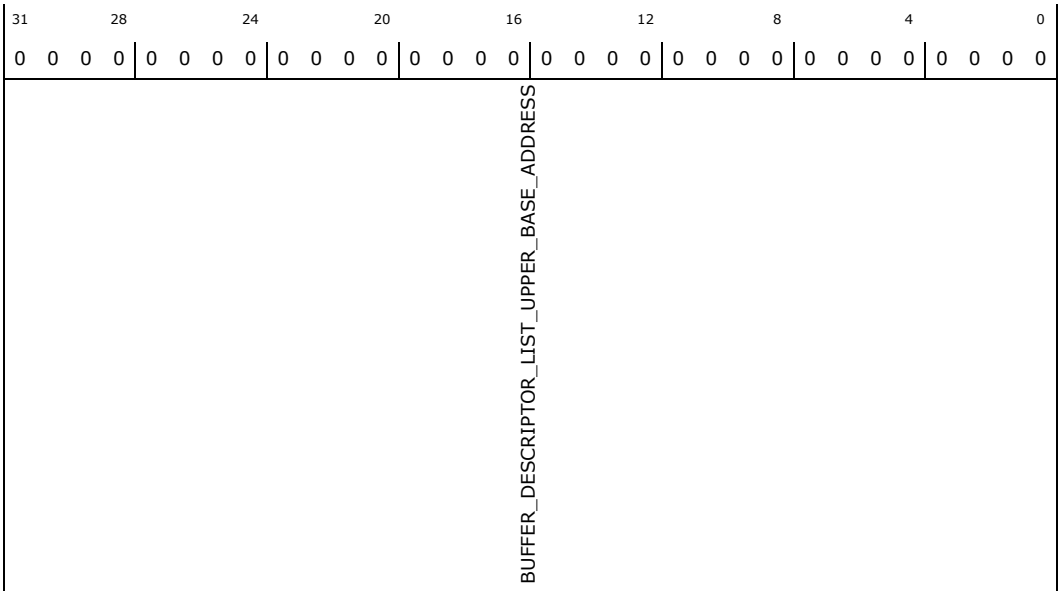
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:7 | 0h<br>RW | **BUFFER_DESCRIPTOR_LIST_LOWER_BASE_ADDRESS:** Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted. Intel Reserved comment This field becomes WO and 0 s will be read when the Protect bit is set to 1. |
| 6:1 | 00h<br>RO | **RESERVED0:** reserved |
| 0 | 0h<br>RW | **PROTECT:** When this bit is set to 1 bits 31 7 0 of this register are WO and will return 0 s when read. When this bit is cleared to 0 bits 31 7 0 are RW. Note that this bit can only be changed when all four bytes of this register are written in a single write operation. If less than four bytes are written this bit retains its previous value. This bit is Intel Reserved. |

## 20.6.106 OSD3BDLPUBA—Offset 17Ch

Output Stream Descriptor 3 Buffer Descriptor List Pointer Upper Base Address



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD3BDLPUBA:** [AZLBAR] + 17Ch

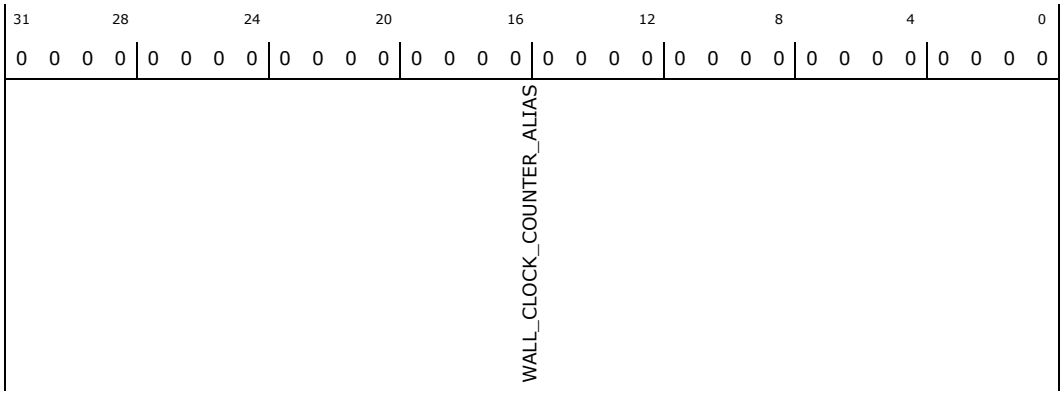
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **BUFFER_DESCRIPTOR_LIST_UPPER_BASE_ADDRESS:** Upper 32 bit address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or the DMA transfer may be corrupted. |

## 20.6.107 WLCLKA—Offset 2030h

Wall Clock Alias



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**WLCLKA:** [AZLBAR] + 2030h

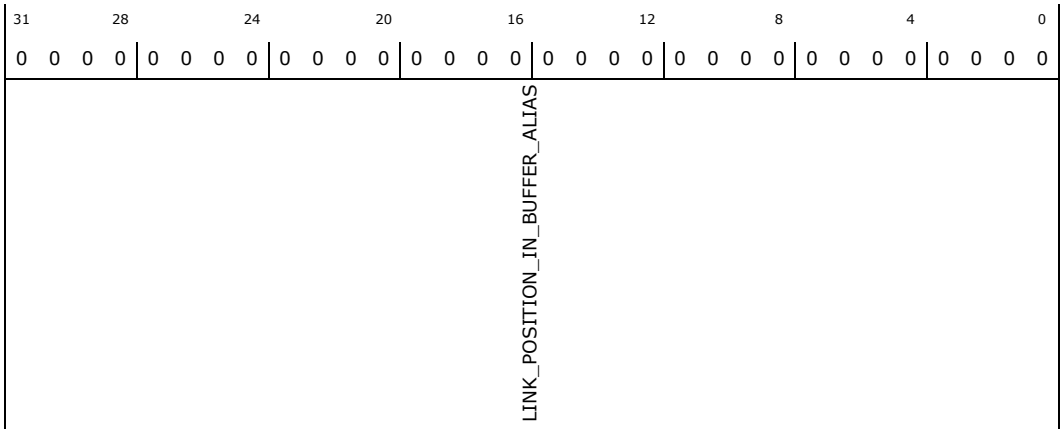
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **WALL_CLOCK_COUNTER_ALIAS:** This is an alias of the WALCK register. 32 bit counter that is incremented on each link BCLK period and rolls over from FFFF_FFFFh to 0000_0000h. This counter will roll over to zero with a period of approximately 179 seconds. This counter is enabled while the BCLK bit is set to 1. Software uses this counter to synchronize between multiple controllers. Will be reset on controller reset. |

## 20.6.108 ISD0LPIBA—Offset 2084h

Input Stream Descriptor 0 Link Position in Buffer Alias



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD0LPIBA:** [AZLBAR] + 2084h

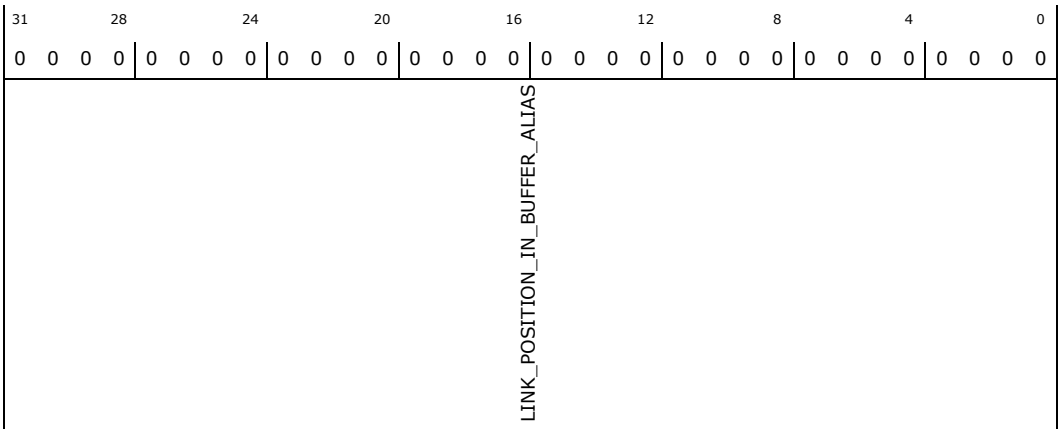
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **LINK_POSITION_IN_BUFFER_ALIAS:** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0. |

## 20.6.109 ISD1LPIBA—Offset 20A4h

Input Stream Descriptor 1 Link Position in Buffer Alias



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD1LPIBA:** [AZLBAR] + 20A4h

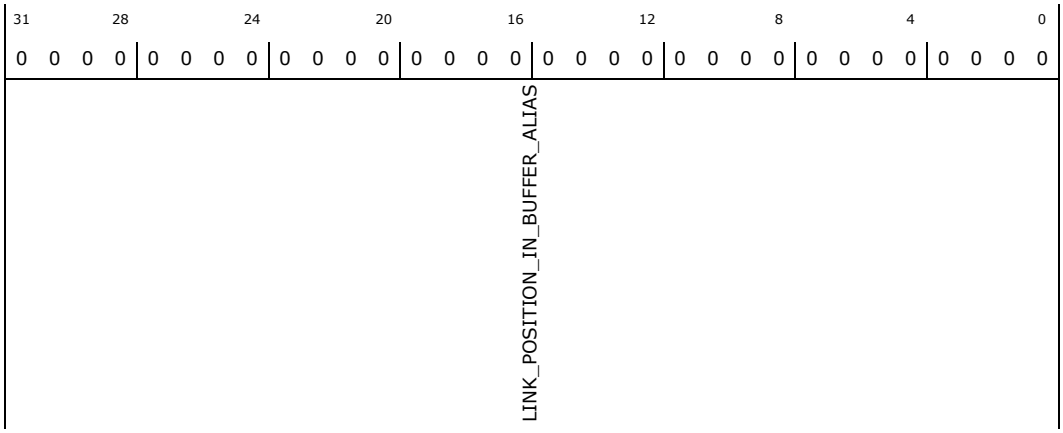
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **LINK_POSITION_IN_BUFFER_ALIAS:** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0. |

## 20.6.110 ISD2LPIBA—Offset 20C4h

Input Stream Descriptor 2 Link Position in Buffer Alias



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD2LPIBA:** [AZLBAR] + 20C4h

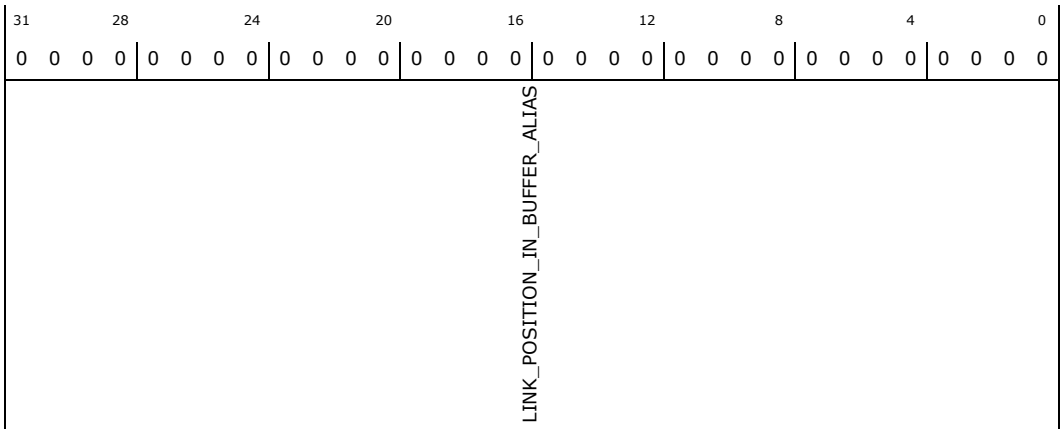
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **LINK_POSITION_IN_BUFFER_ALIAS:** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0. |

## 20.6.111 ISD3LPIBA—Offset 20E4h

Input Stream Descriptor 3 Link Position in Buffer Alias



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ISD3LPIBA:** [AZLBAR] + 20E4h

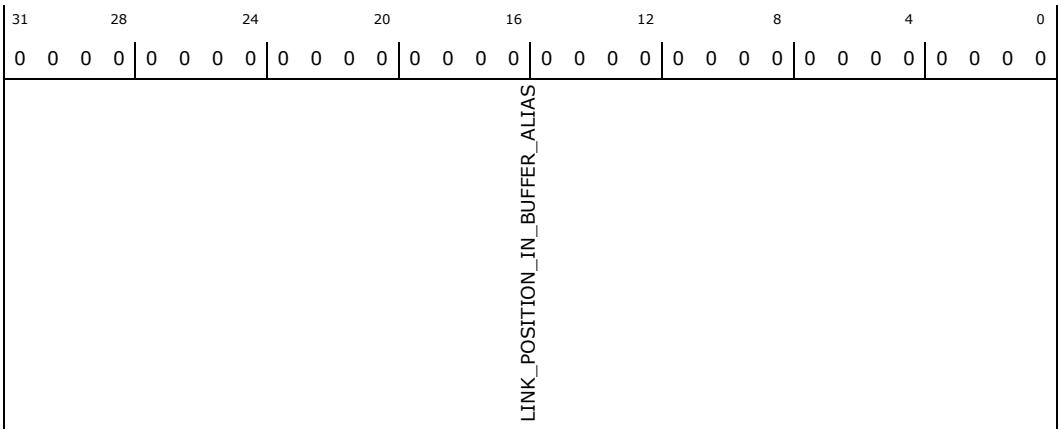
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **LINK_POSITION_IN_BUFFER_ALIAS:** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0. |

## 20.6.112 OSD0LPIBA—Offset 2104h

Output Stream Descriptor 0 Link Position in Buffer Alias



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD0LPIBA:** [AZLBAR] + 2104h

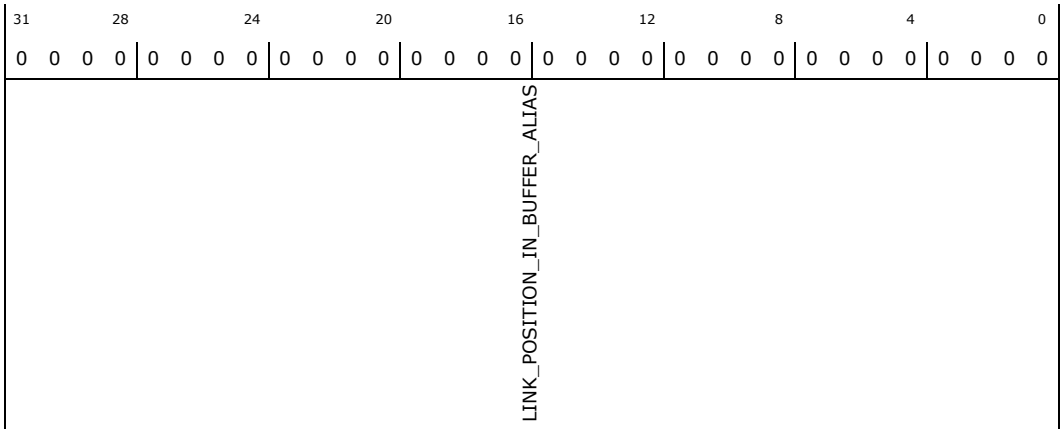
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **LINK_POSITION_IN_BUFFER_ALIAS:** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0. |

## 20.6.113 OSD1LPIBA—Offset 2124h

Output Stream Descriptor 1 Link Position in Buffer Alias



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD1LPIBA:** [AZLBAR] + 2124h

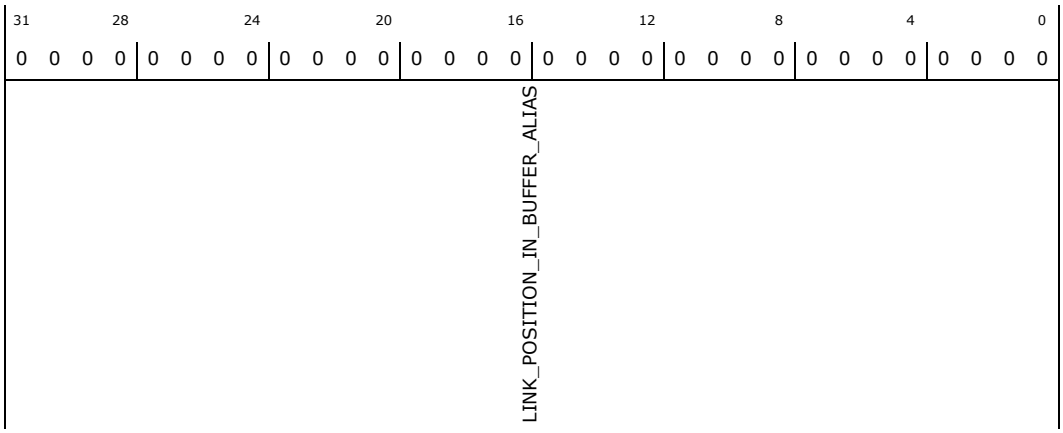
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **LINK_POSITION_IN_BUFFER_ALIAS:** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0. |

## 20.6.114 OSD2LPIBA—Offset 2144h

Output Stream Descriptor 2 Link Position in Buffer Alias



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**OSD2LPIBA:** [AZLBAR] + 2144h

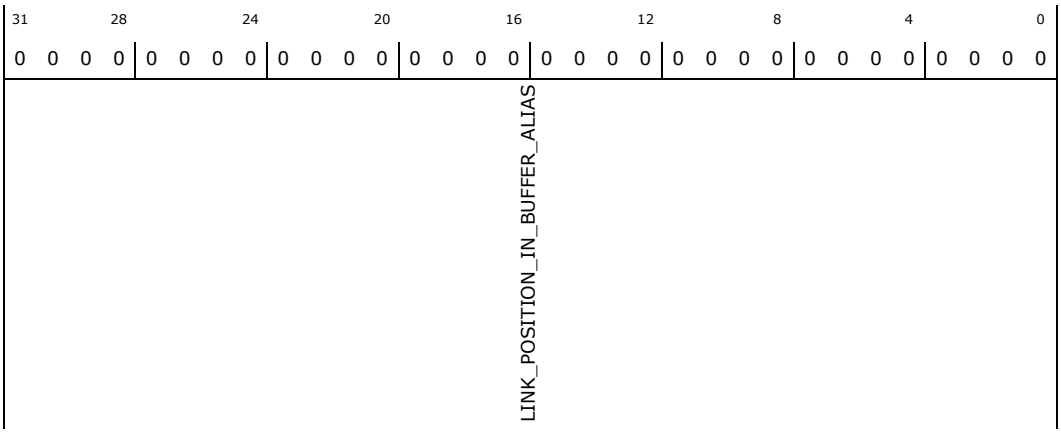
**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **LINK_POSITION_IN_BUFFER_ALIAS:** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0. |

## 20.6.115 OSD3LPIBA—Offset 2164h

Output Stream Descriptor 3 Link Position in Buffer Alias



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

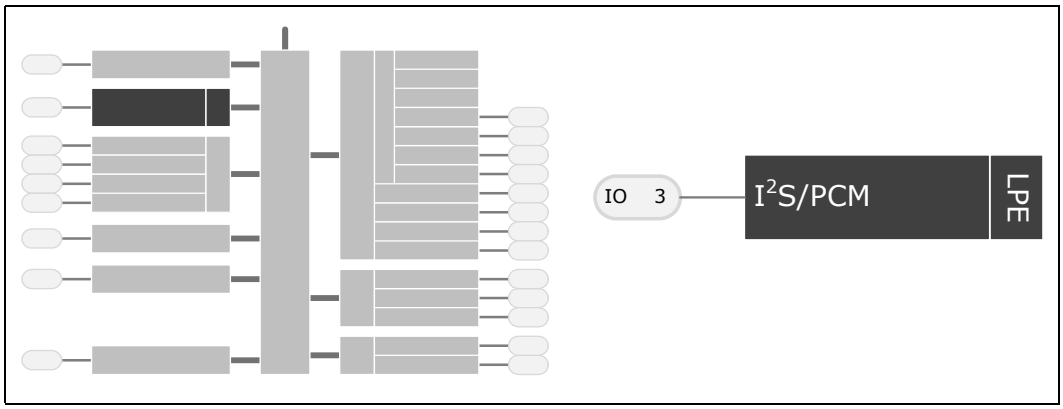
**OSD3LPIBA:** [AZLBAR] + 2164h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)
**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RO | **LINK_POSITION_IN_BUFFER_ALIAS:** This is an alias of the corresponding LPIB register. Indicates the number of bytes that have been received off the link. This register will count from 0 to the value in the Cyclic Buffer Length register and then wrap to 0. |

# 21 Low Power Engine (LPE) for Audio ($I^2S$)



The Low Power Engine for Audio provides acceleration for common audio and voice functions. The voice and audio engine provides a mechanism for rendering audio and voice streams and tones from the operating system, applications to an audio or voice codec, and ultimately to the speaker, headphones, or Bluetooth headsets.

Audio streams in the SoC can be encoded and decoded by the Low Power Engine (LPE) in the Audio subsystem.

LPE Audio provides three external $I^2S$ audio interfaces.

***Note:*** LPE_I2S[1:0] are multiplexed on the same balls as High Definition Audio.

***Note:*** When LPE is active, the High Definition Audio functionality is disabled.

## 21.1 Signal Descriptions

See Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

**Table 226. LPE Signals**

| Signal Name | Direction Plat. Power | Description |
|---|---|---|
| **LPE_I2S2[0:2]_CLK** | I/O V1P8S | Clock signal for $I^2S$ |
| **LPE_I2S2[0:2]_FRM** | I/O V1P8S | Frame select signal for $I^2S$ |
| **LPE_I2S2[0:2]_DATAIN** | I V1P8S | RX data for $I^2S$ |
| **LPE_I2S2[0:2]_DATAOUT** | O V1P8S | TX data for $I^2S$ |

† All LPE signals are muxed and may be used by other functions.

## 21.2 Features

The LPE Audio Subsystem consists of the following:

- Integrated, power-efficient 32-bit architecture core with 24-bit audio processing instructions
- Core processing speeds up to 343 MHz
- Closely Coupled Memories (CCMs)
  - 80KB Instruction RAM
  - 160KB Data RAM
  - 48KB Instruction Cache
  - 96KB Data Cache
- Very low-power consumption coupled with high-fidelity 24-bit audio
- Dual-issue, static, super-scalar VLIW processing engine
- Mode-less switching between 16-, 24-, and 64-bit dual-issue instructions
- Dual MACs which can operate with 32 x 16-bit and/or 24 x 24-bit operands
- Inter-Process Communication (IPC) mechanism to communicate with the SoC Processor Core including 4KB mailbox memory
- Flexible audio interfaces include three SSPs with $I^2S$ port functionality for I-directional audio transfers
  - $I^2S$ mode supports PCM payloads
  - Frame counters for all $I^2S$ ports
- High Performance DMA
  - DMA IP to support multiple outstanding transactions
  - Interleaved scatter-gather support for Audio DMA transfers
- Clock switching logic including new frequency increments

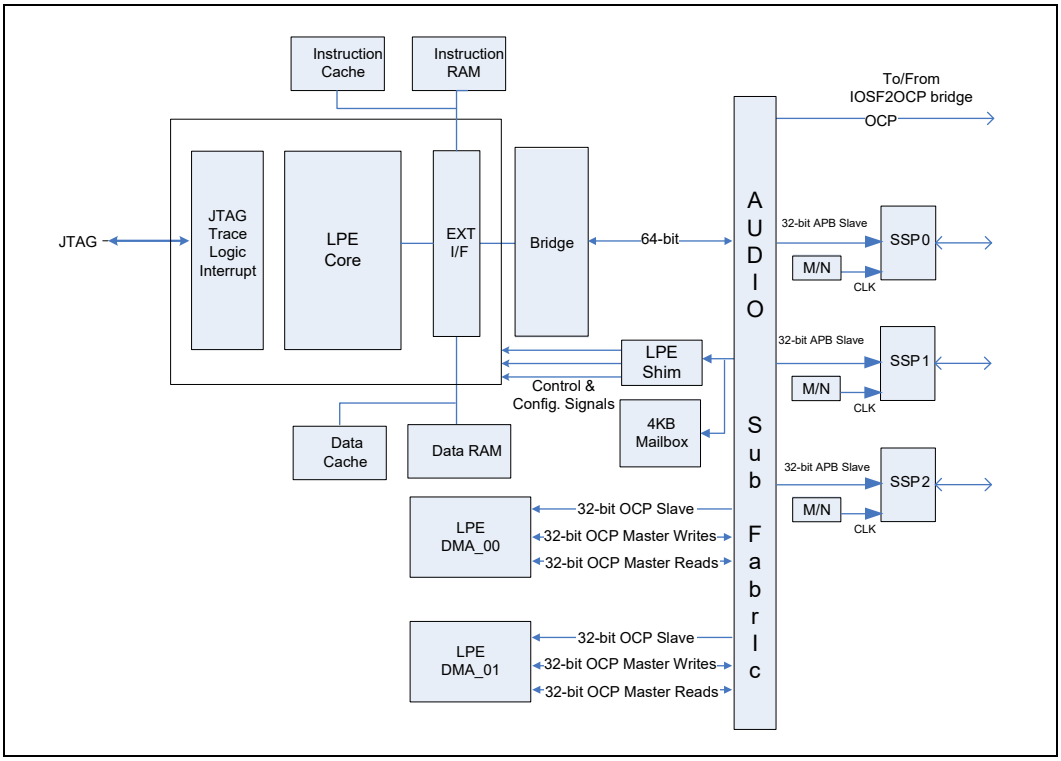
- External timer function with an always running clock.

The LPE core runs at a peak clock frequency of 343 MHz and has dedicated on-chip program and data memories and caches. The LPE core can access shared SRAM blocks, and external DRAM through OCP fabric. It communicates with audio peripherals using the audio sub-fabric, and employs Inter-Processor Communication (IPC) mechanism to communicate with the SoC Processor Core.

The Audio subsystem includes two OCP-based DMA engines. These DMA engines support single and multi-block transfers. They can be configured to transfer data between DRAM and audio CCMs or transfer data between CCMs and the audio peripheral interfaces

All these interfaces are peripherals in the Audio subsystem. LPE, LPE DMA, or the SoC processor core may access the peripherals during normal operation. The PMC may access all peripherals during specific tasks such as at boot time or during power state changes.A complete audio solution based on an internal audio processing engine which includes several $I^2S$-based output ports.

The audio core used is a dedicated audio DSP core designed specifically for audio processing (decoding, post-processing, mixing, etc.)



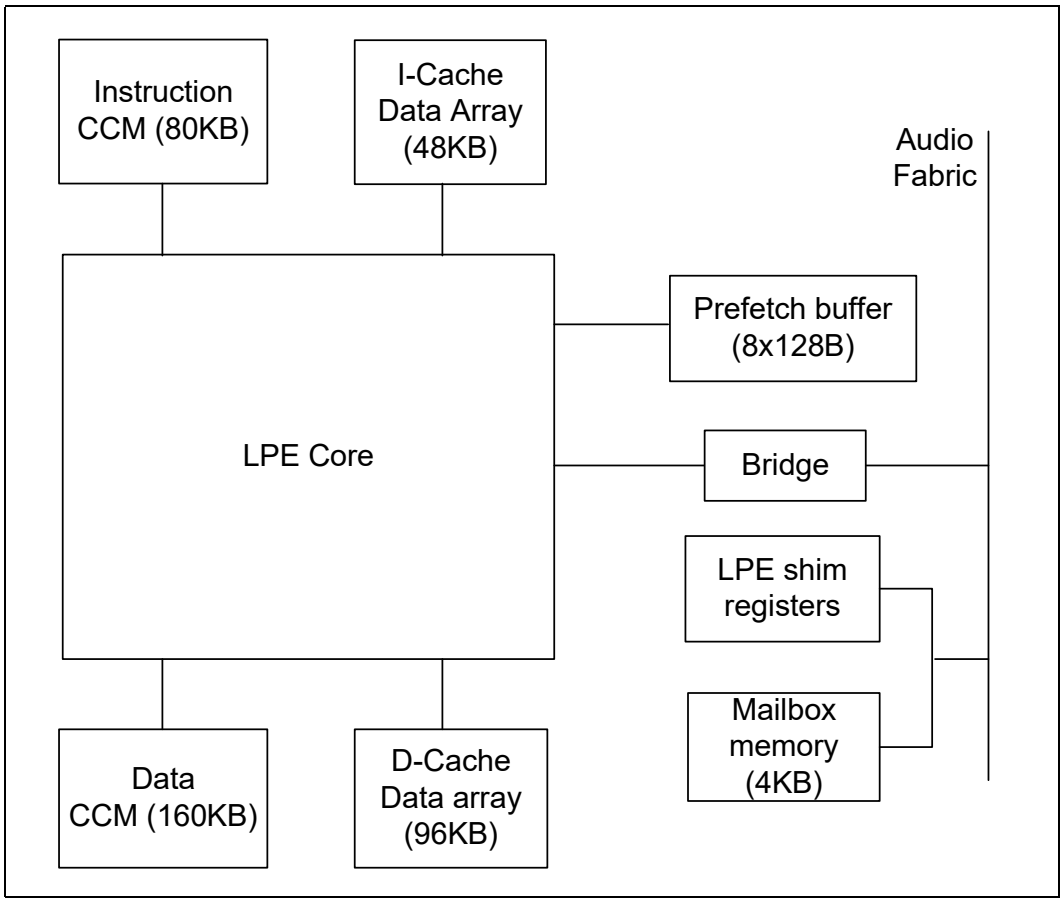
***Note:*** LPE requires systems with more than 512MB memory. This is required since the LPE firmware must reside at a stolen memory location on 512MB boundaries below 3 GiB. The LPE firmware itself is ~1MB, and is reserved by BIOS for LPE use.

## 21.3 Detailed Block Level Description

### 21.3.1 LPE Core

The LPE core in the SoC runs at maximum frequency of 343 MHz and interfaces with the rest of the SoC system through the OCP bus. It is one of the masters on the Audio Sub-Fabric The SoC Processor Core and LPE DMA engines are the other masters on the fabric. The following figure shows the LPE core and its interfaces.

**Figure 106.Audio Cluster Block Diagram**



The main DSP hardware is a two-multiplier, multiply/accumulate unit, a register file LPE_PR to hold pairs of 24-bit data items, a register file LPE-OR to hold 56-bit accumulator values, an arithmetic/logic unit to operate on the LPE_PR and LPE_OR values, and a shift unit to operate on the LPE_PR and LPE_OR values. The multiply/accumulate unit also supports multiplication of 32-bit values from LPE_OR registers by 16-bit values from LPE_PR registers, with the 48-bit result written or accumulated in the LPE_OR register. The instructions for the DSP subsystems are built from operations that are divided into two sets: the slot 0 set and the slot 1 set. In each execution cycle, zero or one operations from each set can be executed independently according to the static bundling expressed in the machine code.

## 21.3.2 Memory Architecture

The LPE core is configured to use local memory and local caches. It has 80KB of Instruction Closely Coupled Memory (CCM), 160KB of Data CCM, 48KB of Instruction Cache and 96KB of Data Cache. The LPE core also has access to 4KB of mailbox memory and external DRAM.

**Figure 107. Memory Connections for LPE**

### 21.3.3 Instruction Closely Coupled Memory (CCM)

Instruction CCM for the core is used for loading commonly used routines as well as time-critical processing. Examples of time critical processing are acoustic echo cancellation and noise cancellation during voice calls.

Instruction CCM is initialized after reset by an external DMA controller. Runtime update of instruction CCM can be done either using explicit instructions or using an external DMA controller with inbound access.

### 21.3.4 Data Closely Coupled Memory (CCM)

Data CCM can be initialized after reset by an external DMA controller using inbound access. Runtime update of data CCM can be done either using stores to Data CCM or using an external DMA controller with inbound access.

### 21.3.5 Mailbox Memory and Data Exchange

The mailbox memory is a shared memory region in LPE address space that is accessible by the SOC Processor Core, PMC, and LPE. It is used when Doorbell registers cannot hold all the information that one processor wishes to communicate to the other. A typical example of such data blocks are audio stream related parameters when starting a new stream. The structures of data communicated through the mailbox are not defined in hardware so that software may partition the mailbox memory in any desired way and create any meaningful structures required.

## 21.4 Software Implementation Considerations

### 21.4.1 SoC Processor Core Cache Coherence

Traffic generated by the LPE core is considered non-cacheable and non-coherent with respect to the SoC Processor Core cache. DMA traffic is considered cacheable and checked for coherency with the SoC Processor Core cache.

Implications of this implementation are as follows:

- All code and tables for the LPE core need to be explicitly flushed from the SoC Processor Core cache if they are ever accessed.
- If the LPE core directly accesses data buffers in system DDR, the driver must explicitly flush the buffer from the SoC Processor Core cache
- If DMA accesses data buffers from system DRAM, the driver need not flush the data buffer from the SoC Processor Core cache.

## 21.4.2 Interrupts

### 21.4.2.1 LPE Peripheral Interrupts

Each of the LPE peripherals generates its own interrupts. SSP0, SSP1, and SSP2 have one interrupt each. Each of the DMA channels have individual interrupt lines. These interrupts are connected to the LPE core through the PISR register. The same interrupts are routed to IOAPIC through the ISRX register. The LPE core and SoC Processor Core have individual masks to enable these interrupts.

### 21.4.2.2 Interrupts Between SoC Processor Core and the LPE

The interrupts between the SoC Processor Core and the LPE are handled through the inter-processor communication registers. Whenever the SoC Processor Core writes to the IPCX communication register an interrupt is generated to the LPE. The LPE firmware sees there is a message waiting from the SoC Processor Core, and reads the IPCX register for the data. This data is a pre-configured message, where the message structure has been decided beforehand between the SoC Processor Core and the LPE. Similarly we have the IPCD register for the communication between the LPE and SoC Processor Core. Once the LPE writes to the IPCD register, an interrupt should be generated for the SoC Processor Core and the SoC Processor Core should read the message from the IPCD register and act accordingly. From a software viewpoint, the mechanism remains the same as before. From a hardware view point, the interrupt to IA-32 gets routed by means of the IOAPIC block. The IPC from Audio to SoC Processor Core gets a dedicated interrupt line to the IOAPIC.

### 21.4.2.3 Interrupts between PMC and LPE

The interrupts between PMC and LPE are also handled using Inter Process Communication registers.

## 21.4.3 Power Management Options for the LPE Core

- WAITI
  - — Allows the LPE core to suspend operation until an interrupt occurs by executing the optional WAITI instruction.
- External Run/Stall Control Signal
  - — This processor input allows external logic to stall large portions of the LPE pipeline by shutting off the clock to much of the processor's logic to reduce operating power when the LPE computational capabilities are not immediately needed by the system.

***Note:*** Using the WAITI instruction to power down the processor will save more power than use of the external run/stall signal because the WAITI instruction disables more of the LPE's internal clocks.

### 21.4.4 External Timer

This timer always runs from SSP clock (before M/N divider) at 19.2/25MHz. The timer starts running once the run bit (refer to the External timer register definition for details) is set and the clear bit is cleared.

The timer generates an Interrupt pulse when the counter value matches the "match" value. The interrupt does not get generated if the match value is set to "0". The timer runs in free running mode and rolls over after all 32 bits have become all 1's.

The timer continues to run as long as the run bit is set. Once the run bit is cleared the timer holds the current value. The clear bit needs to be set to restart the timer from "0".

## 21.5 Clocks

### 21.5.1 Clock Frequencies

Table 227 shows the clock frequency options for the Audio functional blocks.

**Table 227. Clock Frequencies**

| Clock | Frequency | Notes |
|---|---|---|
| Audio core | 25/50/100/200/267/343 MHz | Audio input clock trunk. CCU drives one of several frequencies as noted. |
| DMA 0 | 25/50 MHz | DMA clock |
| DMA1 | 25/50 MHz | DMA clock |
| Audio fabric clock | 25/50 MHz | Fabric clock derived from audio core clock |
| SSP0 Clock | Fabric side: 25/50 MHz<br>Link side: Up to 19.2/25 MHz | SSP0 clock domains |
| SSP1 Clock | Fabric side: 25/50 MHz<br>Link side: Up to 19.2/25 MHz | SSP1 clock domains |
| SSP2 Clock | Fabric side: 25/50 MHz<br>Link side: Up to 19.2/25 MHz | SSP2 clock domains |

### 21.5.2 50 MHz Clock for LPE

50 MHz, the 2X OSC clock, is added to increase MIPS for low power MP3 mode. This frequency will be supplied by the clock doubler internal to the SoC's Clock Control Unit.

### 21.5.3 Cache and CCM Clocking

Data CCM, Data cache, Instruction CCM, and Instruction Cache run off of the LPE clock. These memories are in a single clock domain.

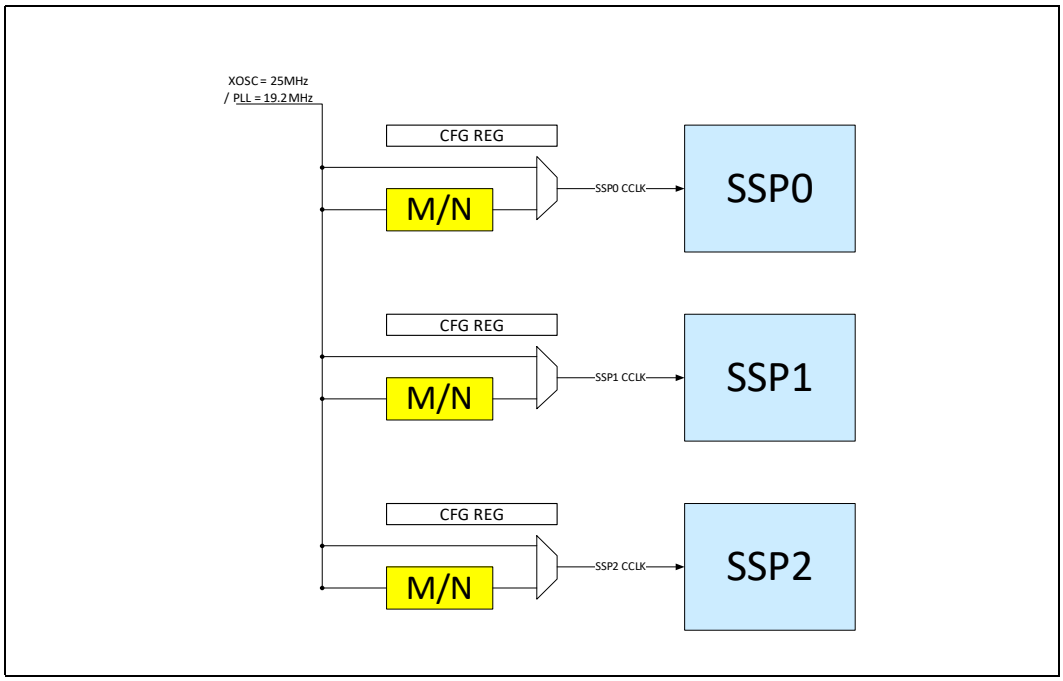
***Note:*** All Data CCM and Instruction CCM run in the same clock domain.

### 21.5.4 SSP Clocking

SSP could be used as either clock masters or clock slaves. Consequently, theses IP have dual clock domains.

The first clock domain is clocked from an internal clock (e.g., fabric clock) and is used for generic logic like interrupt generation and register access.

The second clock domain drives the serial shift register (either driven internally or externally). When driven internally, this clock can be sourced from XTAL clock 25 MHz or PLL 19.2 MHz. These clocks are then divided down within the serial interface IP to generate the final bit clock for the interface.



After power on, if the SSP input IO clock is in high state, first transition of the clock from high to low may be missing due to the Soc clock gating logic.

***Note:*** "Frame Master" mode cannot be used when operating as clock slave and "Frame Slave" mode cannot be used when operating as clock master.

### 21.5.5 M/N Divider

LPE SSP in master mode uses the SSP CCLK to drive the serial clock. It has very limited option to divide CCLK. An M/N divider is added between the 19.2/25 MHz clock (XOSC) from CCU to each SSP CCLK input as shown in following diagram:

**Figure 108.SSP CCLK Structure**

***Note:*** The maximum SSP CCLK frequency is listed in Table 132.

The LPE M/N divider is designed to produce a clock signal for the SSP block used in master mode. The divider is based on a generic NOM/DENOM divider. The supplied Master clock is 25 MHz (XTAL) or 19.2 MHz (LPPLL), but usually be used by the 25 MHz clock.

This mechanism is good for a wide spectrum of generated clocks. Two registers must be configured to get the target SSP clock. The values for the Nominator and Denominator registers are the smallest divider of:

$$\frac{Nominator}{Denominator} = \frac{Source_clock}{Target_clock}$$

### 21.5.5.1 Example

If we want to generate 17.64 MHz (=400x44.1 KHz) output clock out of 25 MHz clock, we need to program "NOM = 441" and "DENOM = 625":

17.64 MHz = (441/625) x 25 MHz

In general the M over N can generate fractional devisor that could be used for generating the required clocks for Audio codec. Table 228 describes some configuration options of this generic divider:

**Table 228. M/N Values, Examples**

| Source Clock Frequency | Requested Clock | M/N Value |
|---|---|---|
| 25 MHz | 48 KHz | 6/3125 |
| | 48K x 24 = 1.152 MHz | 1152/25000 |
| | 48K x32 = 1.536 MHz | 1536/25000 |
| | 48K x 64 = 3.072 MHz | 3072/25000 |
| | 44.1 KHz | 441/250000 |
| | 48K x 400 = 19.2 MHz | 96/125 |
| | 44.1K x 400 = 17.64 MHz | 441/625 |

### 21.5.5.2 Accuracy and Jitter

The output of the M/N is equal to the desired clock in average with Jitter of 20nTXE for 25 MHz input clock.

### 21.5.5.3 Configuration

Following configurable fields per M/N divider/SSP are in LPE shim registers:

**Table 229. M/N Configurable Fields**

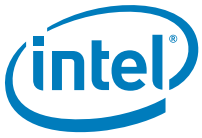
| Field | Width | Description |
|---|---|---|
| Bypass | 1 bit | When set M/N divider is bypass. Clock from CCU is connected directly to SSP CCLK |
| EN | 1 bit | Enable the divider |
| Update | 1 bit | Update divider parameters |
| M Value | 20 bits | Nominator value |
| N Value | 20 bits | Denominator value |

## 21.6 SSP ($I^2S$)

The SoC audio subsystem consists of the LPE Audio Engine and three Synchronous Serial Protocol (SSP) ports. These ports are used in PCM mode and enable simultaneous support of voice and audio streams over $I^2S$. The SoC audio subsystem also includes two DMA controllers dedicated to the LPE. The LPE DMA controllers are used for transferring data between external memory and CCMs, between CCMs and the SSP ports, and between CCMs. All peripheral ports can operate simultaneously.

### 21.6.1 Introduction

The Enhanced SSP Serial Ports are full-duplex synchronous serial interfaces. They can connect to a variety of external analog-to-digital (A/D) converters, audio, and telecommunication codecs, and many other devices which use serial protocols for transferring data. Formats supported include National* Microwire, Texas Instruments* Synchronous Serial Protocol (SSP), Motorola* Serial Peripheral Interface (SPI) protocol and a flexible Programmable Serial Port protocol (PSP).



The Enhanced SSPs operate in master mode (the attached peripheral functions as a slave) or slave mode (the attached peripheral functions as a master), and support serial bit rates from 0 to 25 Mbps, dependent on the input clock. Serial data formats range from 4 to 32-bits in length. Two on-chip register blocks function as independent FIFOs for transmit and receive data.

FIFOs may be loaded or emptied by the system processor using single transfers or DMA burst transfers of up to the FIFO depth. Each 32-bit word from the bus fills one entry in a FIFO using the lower significant bits of a 32-bit word.

### 21.6.2 SSP Features

The SSP port features are:

- Inter-IC Sound ($I^2S$) protocols, are supported by programming the Programmable Serial Protocol (PSP).
- One FIFO for transmit data (TXFIFO) and a second, independent, FIFO for receive data (RXFIFO), where each FIFO is 16 samples deep x 32 bits wide
- Data sample sizes from 8, 16, 18 and 24bits

- 12.5 Mbps maximum serial bit-rate in both modes: master and slave.
- Clock master or slave mode operations
- Receive-without-transmit operation
- Network mode with up to eight time slots for PSP formats, and independent transmit/receive in any/all/none of the time slots.
- After updating SSP configuration, for example active slot count, the SSP will need to be disabled and enabled again. In other words, a SSP will not function correctly if a user changes the configuration setting on the fly.

## 21.6.3 Operation

Serial data is transferred between the LPE core or the SoC Processor Core and an external peripheral through FIFOs in one of the SSP ports. Data transfers between an SSP port and memory are initiated by either the LPE core or the SoC Processor Core using programmed I/O, or by DMA bursts. Although it is possible to initiate transfers directly from the SoC Processor Core, current driver design uses LPE for all PCM operations. Separate transmit and receive FIFOs and serial data paths permit simultaneous transfers in both directions to and from the external peripheral, depending on the protocols chosen.

Programmed I/O can transfer data between:

- The LPE core and the FIFO Data register for the TXFIFO
- The SoC Processor Core and the FIFO Data register for the TXFIFO
- The LPE core and the FIFO Data register for the RXFIFO
- The SoC Processor Core and the FIFO Data register for the RXFIFO
- The SoC Processor Core and the control or status registers
- The LPE core and the control or status registers

DMA bursts can transfer data between:

- Universal memory and the FIFO Data register for the TXFIFO
- Universal memory and the FIFO Data register for the RXFIFO
- Universal memory and the sequentially addressed control or status registers

## 21.6.4 LPE and DMA FIFO Access

The LPE or DMA access data through the Enhanced SSP Port's Transmit and Receive FIFOs. An LPE access takes the form of programmed I/O, transferring one FIFO entry per access. LPE accesses would normally be triggered off of an SSSR Interrupt and must always be 32 bits wide. LPE Writes to the FIFOs are 32 bits wide, but the serializing logic will ignore all bits beyond the programmed FIFO data size (EDSS/DSS value). LPE Reads to the FIFOs are also 32 bits wide, but the Receive data written into the RX FIFO (from the RXD line) is stored with zeroes in the MSBs down to the programmed data size. The FIFOs can also be accessed by DMA bursts, which must be

in multiples of 1, 2 or 4 bytes, depending upon the EDSS value, and must also transfer one FIFO entry per access. When the SSCR0.EDSS bit is set, DMA bursts must be in multiples of 4 bytes (the DMA must have the Enhanced SSP configured as a 32-bit peripheral).The DMA's width register must be at least the SSP data size programmed into the SSP control registers EDSS and DSS. The FIFO is seen as one 32-bit location by the processor. For Writes, the Enhanced SSP port takes the data from the Transmit FIFO, serializes it, and sends it over the serial wire (I2S[2:0]_DATAOUT) to the external peripheral. Receive data from the external peripheral (on I2S[2:0]_DATAIN) is converted to parallel words and stored in the Receive FIFO.

A programmable FIFO trigger threshold, when exceeded, generates an Interrupt or DMA service request that, if enabled, signals the CPU or DMA respectively to empty the Receive FIFO or to refill the Transmit FIFO.

The Transmit and Receive FIFOs are differentiated by whether the access is a Read or a Write transfer. Reads automatically target the Receive FIFO, while Writes will write data to the Transmit FIFO. From a memory-map perspective, they are at the same address. FIFOs are 16 samples deep by 32 bits wide. Each read or write is to 1 SSP sample.

### 21.6.5 Supported Formats

The SSP consists of four pins that are used to transfer data between the SoC and external Audio codecs, modems, or other peripherals. Although four serial-data formats exist, each has the same basic structure, and in all cases the following pins are used in the following manner:

- I2Sx_CLK—Defines the bit rate at which serial data is driven onto and sampled from the port
- I2Sx_FRM—Defines the boundaries of a basic data "unit," comprised of multiple serial bits
- I2Sx_DATAIN—The serial data path for transmitted data, from system to peripheral
- I2Sx_DATAOUT—The serial data path for received data, from peripheral to system

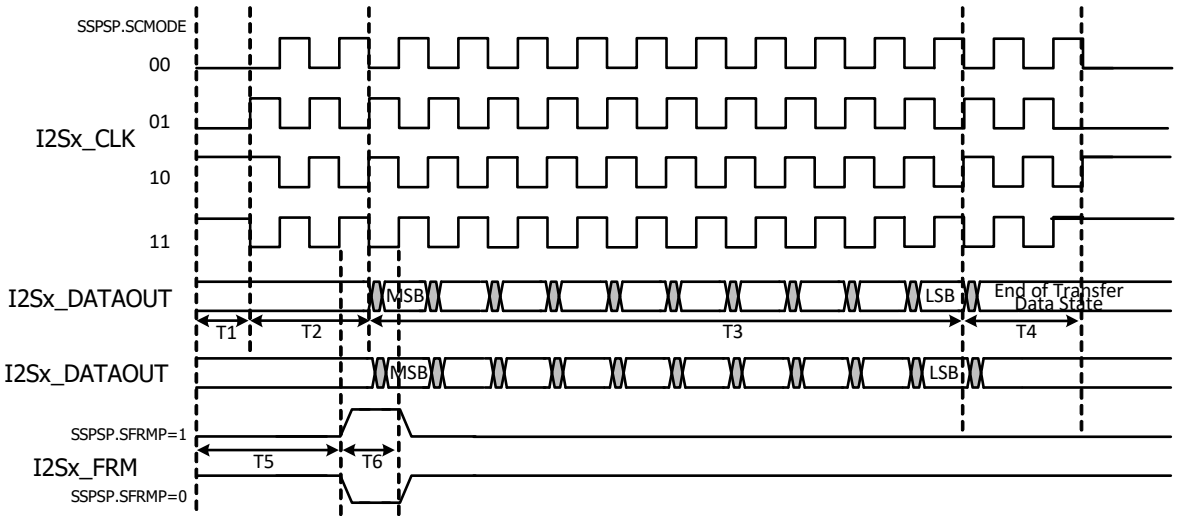
A data frame can contain from 4 to 32 bits, depending on the selected format. Serial data is transmitted most significant bit first. The Programmable Serial Protocol (PSP) format is used to implement $I^2S$.

Master and Slave modes are supported. When driven by the Enhanced SSP, the I2Sx_CLK only toggles during active transfers (not continuously) unless ECRA/ECRB functions are used. When the I2Sx_CLK is driven by another device, it is allowed to be either continuous or only driven during transfers, but certain restrictions on PSP parameters apply.

Normally, the serial clock (I2Sx_CLK), if driven by the Enhanced SSP Port, only toggles while an active data transfer is underway. There are several conditions, however, that may cause the clock to run continuously. If the Receive With Out Transmit mode is enabled by setting the SSCR1.RWOT bit to 1, the I2Sx_CLK will toggle regardless of whether Transmit data exists within the Transmit FIFO. The I2Sx_CLK will also toggle continuously if the Enhanced SSP is in Network mode, or if ECRA, or ECRB is enabled. At other times, I2Sx_CLK will be held in an inactiveI2Sx_FRM or idle state, as defined by the specified protocol under which it operates.

#### 21.6.5.1 Programmable Serial Protocol (PSP)

There are many variations of the frame behavior for different codecs and protocol formats. To allow flexibility the PSP format allows I2Sx_FRM to be programmable in direction, delay, polarity, and width. Master and Slave modes are supported. PSP can be programmed to be either full or half duplex.



The I2Sx_CLK function behavior varies between each format. PSP lets programmers choose which edge of I2Sx_CLK to use for switching Transmit data, and for sampling Receive data. In addition, programmers can control the idle state for I2Sx_CLK and the number of active clocks that precede and follow the data transmission.

The PSP format provides programmability for several parameters that determine the transfer timings between data samples. There are four possible serial clock sub-modes, depending on the I2Sx_CLK edges selected for driving data and sampling received data, and the selection of idle state of the clock.

For the PSP format, the Idle and Disable modes of the I2Sx_DATAOUT, I2Sx_CLK, and I2Sx_FRM are programmable by means of the SSPSP.ETDS, SSPSP.SCMODE and SSPSP.SFRMP bits. When Transmit data is ready, the I2Sx_CLK will remain in its Idle state for the number of serial clock (I2Sx_CLK) clock periods programmed within the Start Delay (SSPSP.STRTDLY) field. I2Sx_CLK will then start toggling, I2Sx_DATAOUT will remain in the idle state for the number of cycles programmed within the Dummy Start (SSPSP.DMYSTRT) field. The I2Sx_FRM signal will be asserted after the number of half-clocks programmed in the SSPSP.SFRDLY field. The I2Sx_FRM signal will remain asserted for the number of clocks programmed within the SSPSP.SFRMWDTH then de-assert. Four to 32 bits can be transferred per frame. Once the last bit (LSB) is transferred, the I2Sx_CLK will continue toggling based off the Dummy Stop (SSPSP.DMYSTOP) field. I2Sx_DATAOUT either retains the last value transmitted or is forced to zero, depending on the value programmed within the End of Transfer Data State (SSPSP.ETDS) field, when the controller goes into Idle mode, unless the Enhanced SSP port is disabled or reset (which forces I2Sx_DATAOUT to zero).

With the assertion of I2Sx_FRM, Receive data is simultaneously driven from the peripheral on I2Sx_DATAIN, most significant bit first. Data transitions on I2Sx_CLK based on the Serial Clock Mode selected and is sampled by the controller on the opposite edge. When the Enhanced SSP is a master to the frame synch (I2Sx_FRM) and a slave to the clock (I2Sx_CLK), then at least three extra clocks (I2Sx_CLKs) will be needed at the beginning and end of each block of transfers to synchronize control signals from the APB clock domain into the SSP clock domain (a block of transfers is a group of back-to-back continuous transfers).

**Figure 109.Programmable Serial Protocol Format**

**NOTE:** When in PSP format, if the SSP is the master of the clock (I2Sx_CLK is an output) and the SSPSP.ETDS bit is cleared, the End of Transfer Data State for the I2Sx_DATAOUT line is 0. If the SSP is the master of the clock, and the SSPSP.ETDS bit is set, the I2Sx_DATAOUT line remains at the last bit transmitted (LSB). If the SSP is a slave to the clock (I2Sx_CLK is an input), and modes 1 or 3 are used, the ETDS can only change from the LSB if more clocks (I2Sx_CLK) are sent to the SSP (i.e., dummy stop clocks or slave clock is free running.

**Figure 110.Programmable Serial Protocol Format (Consecutive Transfers)**

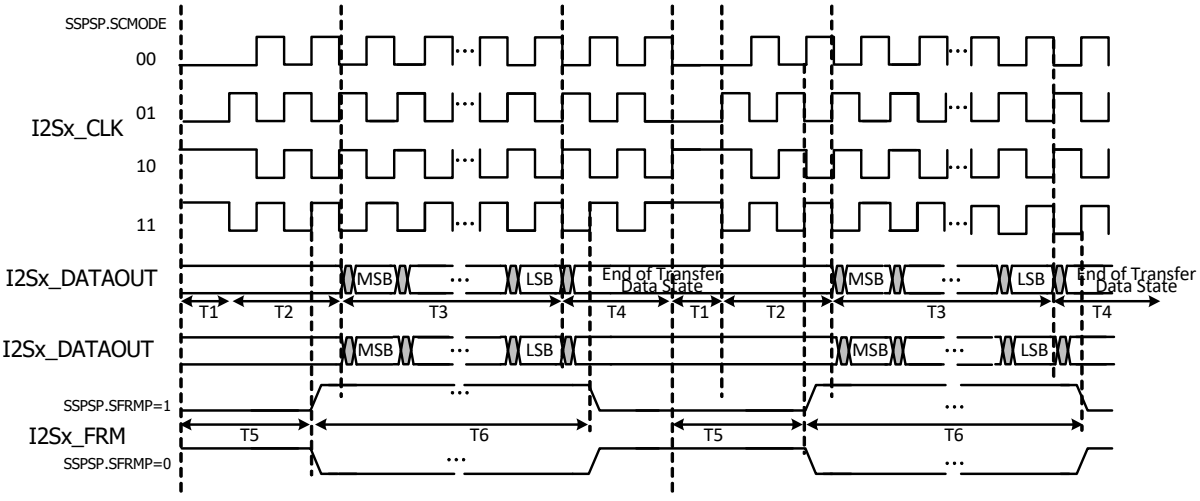


**Table 230. Programmable Protocol Parameters**

| Symbol | Definition (Register.Bit Field) | Range | Units |
|---|---|---|---|
| | Serial Clock Mode (SSPSP.SCMODE) | (Drive, Sample, I2Sx_CLK Idle)<br>0 = Fall, Rise, Low<br>1 = Rise, Fall, Low<br>2 = Rise, Fall, High<br>3 = Fall, Rise, High | |
| | Serial Frame Polarity (SSPSP.SFRMP) | High or Low | |
| T1 | Start Delay (SSPSP.STRTDLY) | 0–7 | Clock Period |
| T2 | Dummy Start (SSPSP.DMYSTRT) | 0–3 | Clock Period |
| T3 | Data Size (SSCRO.EDSS AND SSCRO.DSS) | 4–32 | Clock Period |
| T4 | Dummy Stop (SSPSP.DMYSTOP) | 0–3 | Clock Period |
| T5 | I2Sx_FRM Delay (SPSP.SFRMDLY) | 0–88 | Half Clock Period |
| T6 | I2Sx_FRM Width (SSPSP.SFRMWDTH) | 1–44 | Clock Period |
| | End of Transfer Data State (SSPSP.ETDS) | Low or [bit 0] | |

***Note:*** The I2Sx_FRM Delay must not extend beyond the end of T4. I2Sx_FRM Width must be asserted for at least 1 I2Sx_CLK, and should be de-asserted before the end of the T4 cycle (for example, in terms of time, not bit values, (T5 + T6) <= (T1 + T2 + T3 + T4), 1<= T6 < (T2 + T3 + T4), and (T5 + T6) >= (T1 + 1) to ensure that I2Sx_FRM is asserted for at least 2 edges of the I2Sx_CLK). The T1 Start Delay value should be programmed to 0 when the I2Sx_CLK is enabled by either of the SSCR1.ECRA or SSCR1.ECRB bits. While the PSP can be programmed to generate the assertion of I2Sx_FRM during the middle of the data transfer (after the MSB was sent), the Enhanced SSP will not be able to receive data in Frame slave mode (SSCR1SFRMDIR = 1) if the assertion of Frame is not before the MSB is sent (i.e. T5 <= T2 if SSCR1.SFRMDIR =1). Transmit Data will transition from the "End of Transfer Data State" to the next MSB value upon the assertion of Frame. The Start Delay field should be programmed to 0 whenever I2Sx_CLK or I2Sx_FRM is configured as an input. Clock state is not defined between two active frame periods. Clock can be active or inactive between two active frame periods.

## 21.7 Programming Model

The CPU or DMA access data through the Enhanced SSP Port's Transmit and Receive FIFOs. A CPU access takes the form of programmed I/O, transferring one FIFO entry per access. CPU accesses would normally be triggered off of an SSSR Interrupt and

must always be 32 bits wide. The CPU Writes to the FIFOs are 32 bits wide, but the serializing logic will ignore all bits beyond the programmed FIFO data size (EDSS/DSS value). CPU Reads to the FIFOs are also 32 bits wide, but the Receive data written into the RX FIFO (from the RXD line) is stored with zeroes in the MSBs down to the programmed data size. The FIFOs can also be accessed by DMA bursts, which must be in multiples of 1, 2, or 4 bytes, depending upon the EDSS value, and must also transfer one FIFO entry per access. When the SSCR0.EDSS bit is set, DMA bursts must be in multiples of 4 bytes (the DMA must have the Enhanced SSP configured as a 32-bit peripheral). The DMA DCMD.width register must be at least the SSP data size programmed into the SSP control registers EDSS and DSS. The FIFO is seen as one 32-bit location by the processor. For Writes, the Enhanced SSP port takes the data from the Transmit FIFO, serializes it, and sends it over the serial wire (I2Sx_DATAOUT) to the external peripheral. Receive data from the external peripheral (on I2Sx_DATAIN) is converted to parallel words and stored in the Receive FIFO.

A programmable FIFO trigger threshold, when exceeded, generates an Interrupt or DMA service request that, if enabled, signals the IA-32 CPU or DMA respectively to empty the Receive FIFO or to refill the Transmit FIFO. The Transmit and Receive FIFOs are differentiated by whether the access is a Read or a Write transfer. Reads automatically target the Receive FIFO, while Writes will write data to the Transmit FIFO. From a memory-map perspective, they are at the same address. Each read or write is 1 SSP sample.

## 21.7.1 PIO and DMA Programming Considerations

All CPU and DMA accesses transfer one FIFO entry per access. Data in the FIFOs is always stored with one 32-bit value per data sample, regardless of the format data word length. Within each 32-bit field, the stored data sample is right-justified, with the least significant bit of the word in bit 0. In the Receive FIFO, unused bits are packed as zeroes above the most significant bit. In the Transmit FIFO, unused don’t-care bits are above the most significant bit (i.e., DMA and CPU access do not have to write to the unused bit locations). Logic in the Enhanced SSP automatically formats data in the Transmit FIFO so that the sample is properly transmitted on I2Sx_DATAOUT in the selected frame format.

Two separate and independent FIFOs are present for Transmit (to peripheral) and Receive (from peripheral) serial data. FIFOs are filled or emptied by programmed I/O or DMA bursts.

### 21.7.1.1 Programmed IO Considerations

FIFO filling and emptying can be performed by the processor in response to an Interrupt from the FIFO logic. Each FIFO has a programmable FIFO trigger threshold at which an Interrupt is triggered. When the number of entries in the Receive FIFO exceeds the SSCR1.RFT value, an interrupt is generated (if enabled), which signals the CPU to empty the Receive FIFO. When the number of entries in the Transmit FIFO is less than or equal to the SSCR1.TFT value plus 1, an Interrupt is generated (if enabled), which signals the CPU to refill the Transmit FIFO.

Users can also poll the Enhanced SSP Status register to determine how many samples are in a FIFO, and whether the FIFO is full or empty. Software is responsible for ensuring that the proper RFT and TFT values are chosen to prevent ROR and TUR error conditions.

***Note:*** If the software attempts to read from an empty Receive FIFO, it will receive a duplicate of the previously read value.

### 21.7.1.2 DMA Considerations

The DMA controller can also be programmed to transfer data to and from the Enhanced SSP FIFOs. To prevent over-runs of the Transmit FIFO or under-runs of the Receive FIFO when using the DMA, be careful when setting the Transmit and Receive FIFO trigger threshold levels.

There are restrictions on how the DMA can be programmed when used with the SSP Controller.

- The DMA Transfer Width must be greater than or equal to the SSP data size. For example if the SSP Data Size is 16b then the DMA Transfer Width should be 16b.
- The DMA may not support the DMA Transfer Width of the SSP Data Size and therefore the DMA Transfer Width must be larger than the SSP Data Size. If this is the case then software must manage any extra data bits.
- The DMA Burst Transaction Length for RX must be less than or equal to the RX Threshold.
- The DMA Burst Transaction Length for TX must be less than or equal to the number of empty locations in the TX FIFO. A safe value is the Total TX FIFO Size - TX Threshold.
- DMA must be in Fixed Address mode to read or write the SSP Data Register.

In full-duplex formats where the Enhanced SSP always receives the same number of data samples as it transmits, the DMA should be set up to transmit and receive the same number of bytes.

***Note:*** A TFT value of 0 means that there is one sample left in the TX FIFO.

Because the Enhanced SSP is not flow controlled, software must program the TX FIFO Threshold (TFT), RX FIFO Threshold (RFT), and the DMA burst size to ensure that a TX FIFO overflow or RX FIFO underflow does not occur. Software must also ensure that the Enhanced SSP DMA requests are properly prioritized in the system to prevent fatal overruns and under-runs.

The programming model for using the DMA is as follows:

- Program the total number of Transmit/Receive byte lengths, DMA burst, and DMA Width in the DMA.
- Set the preferred values in the Enhanced SSP Control registers.
- Enable the Enhanced SSP by setting SSCR0.SSE.
- Set the run bit in DMA Command Register.

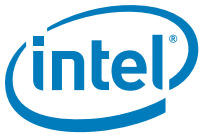
- The DMA will wait for either the Transmit or Receive Service requests.
- If the Transmit/Receive byte length is not an even multiple of the transfer burst size, a trailing byte condition may occur.

## 21.7.2 Trailing Bytes in the Receive FIFO

When the number of samples in the Receive FIFO is less than its FIFO trigger threshold level, and no additional data is received, the remaining bytes are called trailing bytes. Trailing bytes can be handled by either the DMA or the processor, as indicated by the SSCR1.TRAIL bit. Trailing bytes are identified by means of a timeout mechanism and the existence of data within the Receive FIFO.

### 21.7.2.1 Timeout

A timeout condition exists when the Receive FIFO has been idle for a period of time (in APB clocks) defined by the value programmed within the Timeout register (SSTO). When a timeout occurs, the receiver timeout interrupt SSSR.TINT bit will be set to a 1, and if the Timeout Interrupt is enabled SSCR1.TINTE=1, a Timeout Interrupt will occur to signal the processor that a timeout condition has occurred. The timeout timer is reset after a new sample is received. Once the SSSR.TINT bit is set it must be cleared by software by writing a 1 to it. Clearing this bit also causes the Timeout Interrupt, if enabled, to be de-asserted.



### 21.7.2.2 Peripheral Trailing Byte Interrupt

It is possible for the DMA to reach the end of its Descriptor chain while removing Receive FIFO data. When this happens, the processor is forced to take over because the DMA can no longer service the Enhanced SSP request until a new chain is linked. When the DMA has reached the end of its Descriptor chain, and there is data in the receive FIFO, the Enhanced SSP will do the following:

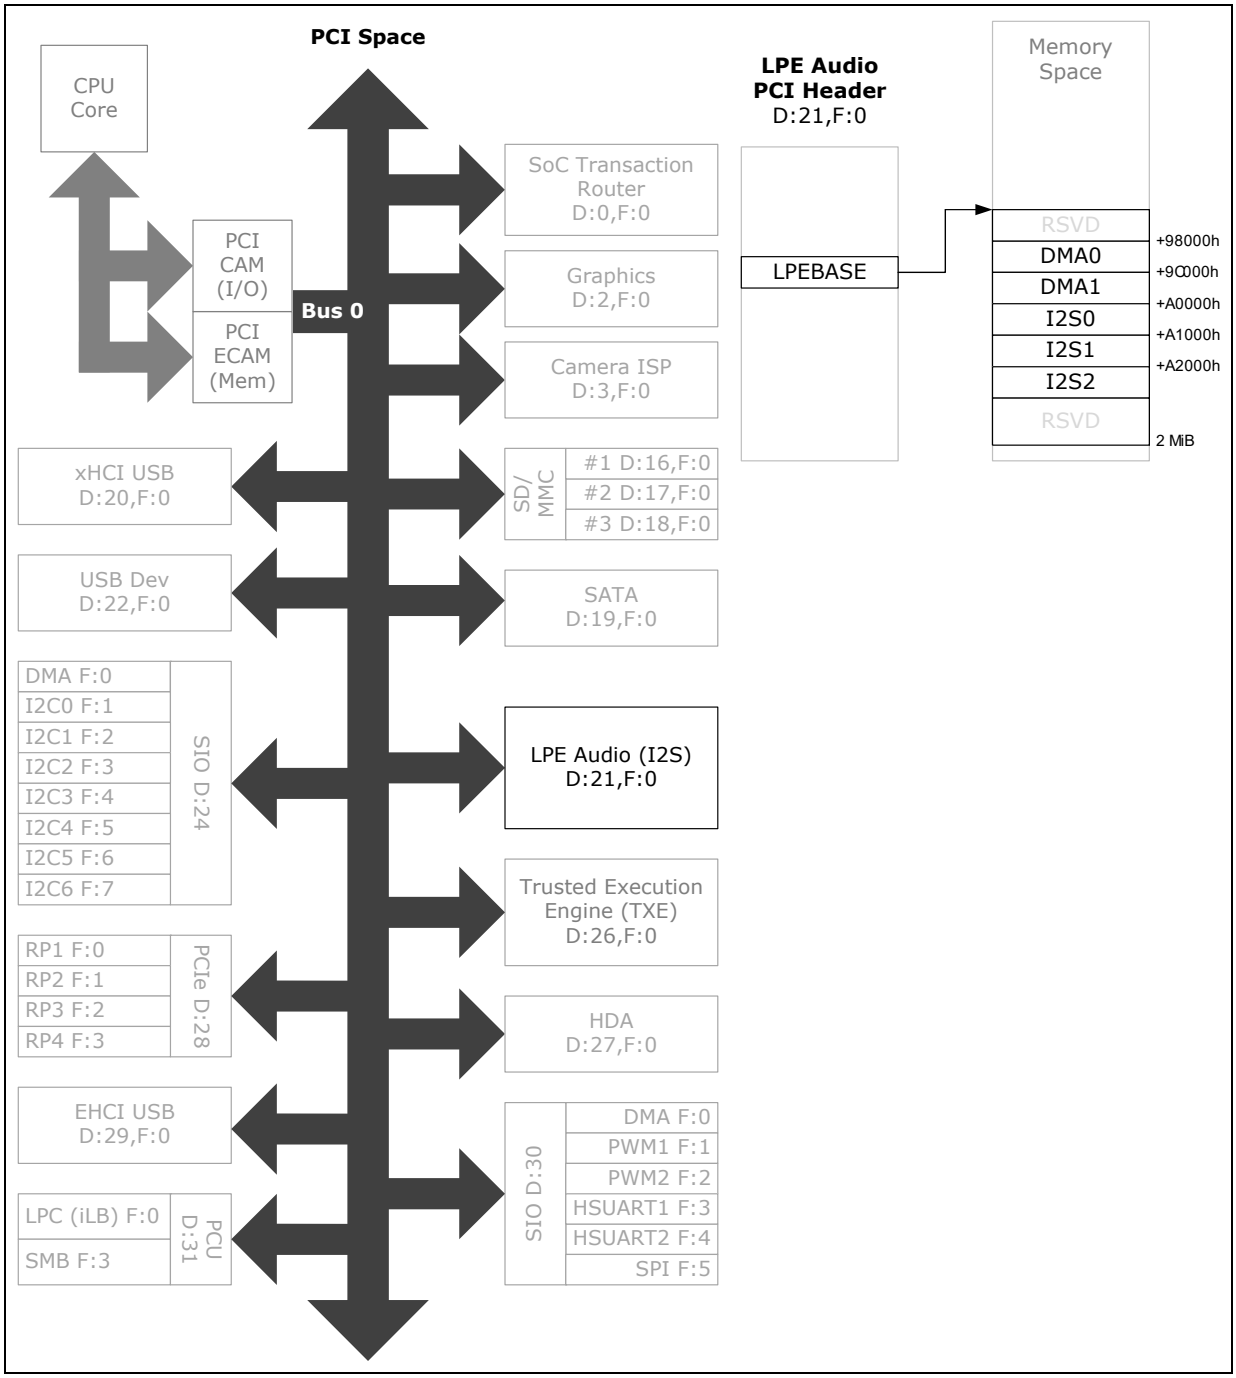
- Sets the peripheral trailing byte interrupt SSSR.PINT bit to 1
- Asserts the Enhanced SSP Interrupt to signal to the processor that a Peripheral Trailing Byte Interrupt condition has occurred (if SSCR1.PINTE=1 to enable the interrupt).
- Sets the SSSR.EOC status bit which must be cleared by software. If more data is received after the EOC bit was set (and EOC bit is still set), then the SSSR.PINT bit will be set to a 1.

Once the SSSR.PINT bit is set, it must be cleared by software by writing a 1 to it. Clearing the SSSR.PINT bit also de-asserts the Peripheral Interrupt if it has been enabled (SSCR1.PINTE=1).

The remaining bytes must then be removed by means of a processor I/O as described in the processor-based method below, or by reprogramming a new Descriptor chain and restarting the DMA. Programmers need to be aware of this possibility. Refer to the DMA chapter for details on Descriptor programming and “end of chain” events.

### 21.7.2.3 Removing Trailing Bytes (Processor Based SSCR1.TRAIL=0)

This is the default method indicated by a zero in the SSCR1.TRAIL bit. In this case, no Receive DMA service request is generated. To read out the trailing bytes, software should wait for the timeout Interrupt and then read all remaining entries as indicated by the SSSR.RFL and SSSR.RNE bits within the Enhanced SSP Status register (SSSR).



***Note:*** To use the Trailing bytes feature through the CPU, the Timeout Interrupt must be enabled by setting SSCR1.TINTE=1 (to enable the interrupt).

### 21.7.2.4 Removing Trailing Bytes (DMA Based SSCR1.TRAIL=1)

When the DMA is to handle trailing bytes (SSCR1.TRAIL = 1) a DMA service request is automatically issued for the remaining number of samples left in the Receive buffer. The DMA will then empty the contents of the Receive buffer unless the DMA reaches the end of its Descriptor chain. If a timeout occurs, the processor is only interrupted by means of a Timeout Interrupt if it has been enabled by setting SSCR1.TINTE=1. When handling trailing bytes by means of the DMA, if a timeout occurs and the receive FIFO is empty, an End-of-Receive (EOR) will be sent to the DMA Controller. If an EOC occurs at the time that the last sample is read out of the FIFO (the DMA descriptor chain was just exactly long enough), and the timeout counter is still running (that is, a time out has not occurred and the SSTO register is non-zero), then, when the time out does occur, the Enhanced SSP will generate a DMA request which will create an RAS interrupt from the DMA. When this occurs, software must re-program the DMA registers and re-enable the channel for the Enhanced SSP to send its EOR to the DMA controller.

## 21.8 Register Map

**Figure 111.Low Power Engine for Audio Register Map**

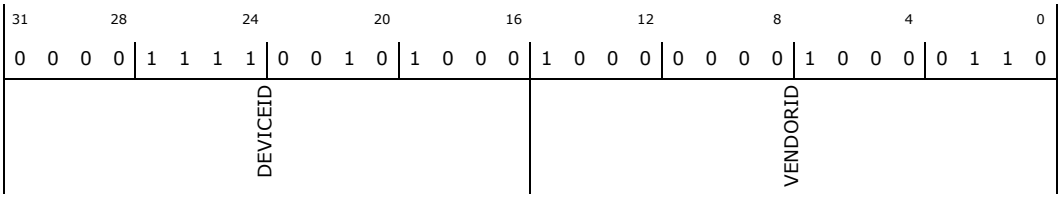
### 21.9.1 reg_DEVVENDID_type (DEVVENDID)—Offset 0h



DEVICEVENDORID - Device ID and Vendor ID Register

**Access Method**

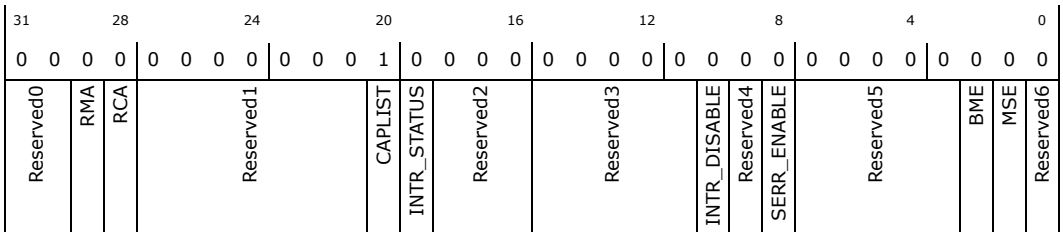
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DEVVENDID:** [0/21/0] + 0h

**Default:** 0F288086h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0F28h RO | **DEVICEID:** Device ID |
| 15:0 | 8086h RO | **VENDORID:** Vendor ID |

### 21.9.2 reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h



STATUSCOMMAND- Status and Command

**Access Method**

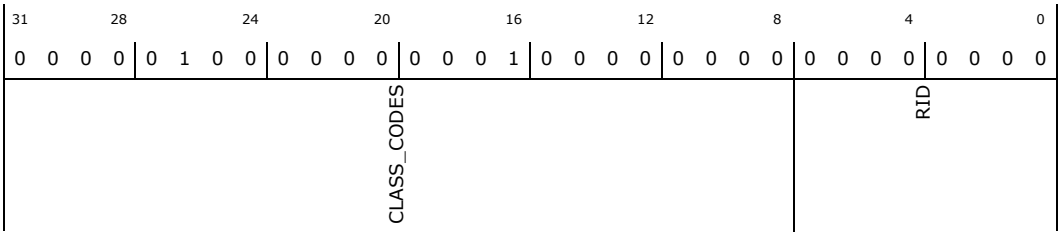
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**STATUSCOMMAND:** [0/21/0] + 4h

**Default:** 00100000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RO | **Reserved0:** reserved |
| 29 | 0h<br>RW/1C | **RMA:** Received Master Abort: Not Implemented |
| 28 | 0h<br>RW/1C | **RCA:** Received Target Abort: Not Implemented |
| 27:21 | 00h<br>RO | **Reserved1:** reserved |
| 20 | 1h<br>RO | **CAPLIST:** Capabilities List: Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at the configuration offset 34h. |
| 19 | 0h<br>RO | **INTR_STATUS:** Interrupt Status: This bit reflects state of interrupt in the device Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, is the device/function interrupt message sent. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. This bit reflects Legacy interrupt status. |
| 18:16 | 0h<br>RO | **Reserved2:** reserved |
| 15:11 | 00h<br>RO | **Reserved3:** reserved |
| 10 | 0h<br>RW | **INTR_DISABLE:** Setting this bit disables INTx assertion from Bridge. The interrupt disabled is legacy INTx# interrupt, which is the Bridge does not send Interrupt Assert message through the IOSF Sideband Channel. Reset value of this bit is 0. This bit has no connection with the interrupt status bit |
| 9 | 0h<br>RO | **Reserved4:** reserved |
| 8 | 0h<br>RW | **SERR_ENABLE:** not implemented |
| 7:3 | 00h<br>RO | **Reserved5:** reserved |
| 2 | 0h<br>RW | **BME:** If this bit is 0,the Bridge does not generate any new upstream transaction on IOSF as a master. Reset value of this bit is 0. |
| 1 | 0h<br>RW | **MSE:** Memory Space Enable: This bit controls Bridge response to downstream memory accesses. When set, accesses to memory space of the device is enabled. Reset value of this bit is 0. |
| 0 | 0h<br>RO | **Reserved6:** reserved |

## 21.9.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h



REVCLASSCODE - Revision ID and Class Code

### Access Method

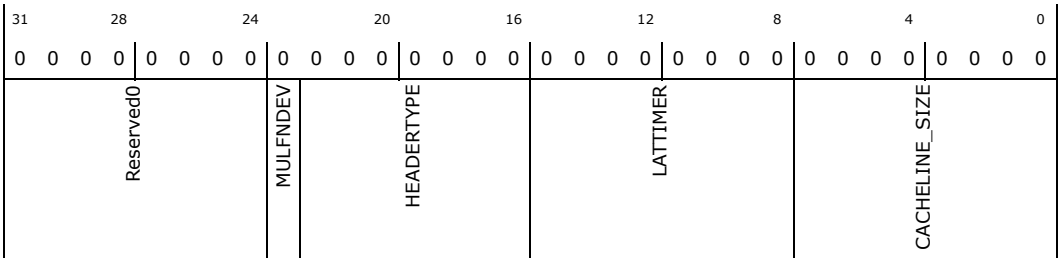
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**REVCLASSCODE:** [0/21/0] + 8h

**Default:** 04010000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 040100h RO | **CLASS_CODES:** Class Code |
| 7:0 | 00h RO | **RID:** Revision ID |

## 21.9.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch



CLLATHEADERBIST - Cache Line Latency Header and BIST

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

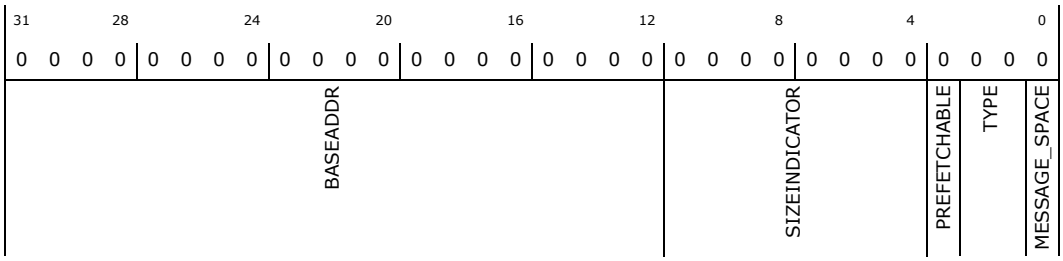
**CLLATHEADERBIST:** [0/21/0] + Ch

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 00h RO | **Reserved0:** Reserved |
| 23 | 0h RO | **MULFNDEV:** MULFNDEV |
| 22:16 | 00h RO | **HEADERTYPE:** Header Type: Implements Type 0 Configuration header. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 00h<br>RO | **LATTIMER:** Latency Timer:. This register is implemented as R/W with default as 0. Similar to other Intel IPs. |
| 7:0 | 00h<br>RW | **CACHELINE_SIZE:** Cacheline Size: This register is implemented as R/W with default as 0. Similar to other Intel IPs. |

## 21.9.5 reg_BAR_type (BAR)—Offset 10h



BAR -Base Address Register

### Access Method

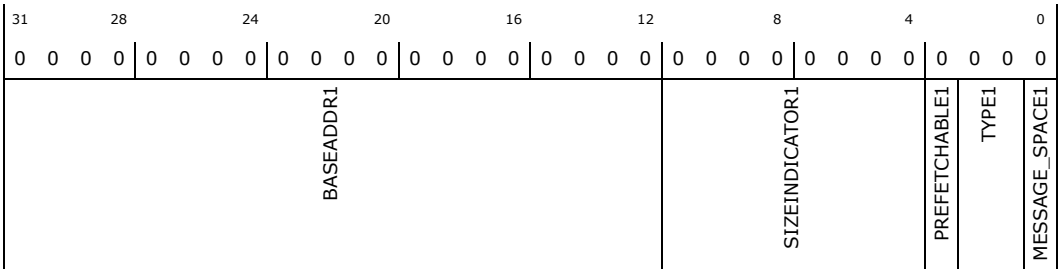
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR:** [0/21/0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:12 | 00000h<br>RW | **BASEADDR:** Base Address register |
| 11:4 | 00h<br>RO | **SIZEINDICATOR:** Size indicator |
| 3 | 0h<br>RO | **PREFETCHABLE:** Indicates that this BAR is not prefetchable. |
| 2:1 | 0h<br>RO | **TYPE:** 00 indicates BAR lies in 32bit address range |
| 0 | 0h<br>RO | **MESSAGE_SPACE:** message space |

## 21.9.6 reg_BAR1_type (BAR1)—Offset 14h



BAR1 -Base Address Register1

### Access Method

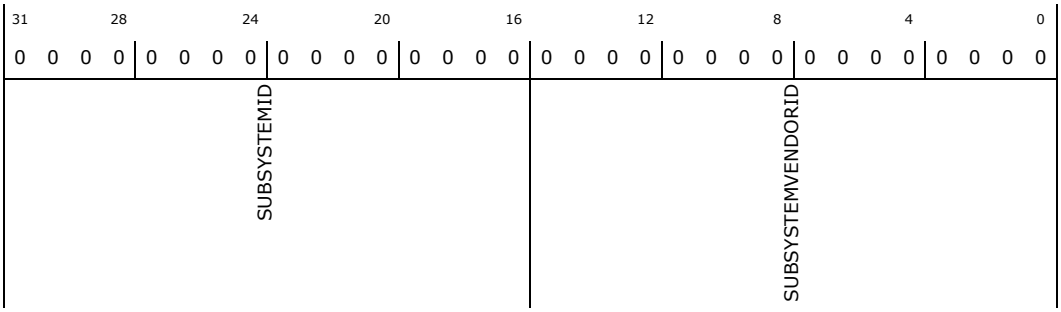
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR1:** [0/21/0] + 14h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:12 | 00000h RW | **BASEADDR1:** This field is present if BAR1 is enabled through private configuration space. Memory accesses to BAR1 region are aliased to the PCI configuration space. The BAR1 region is always 4K. |
| 11:4 | 00h RO | **SIZEINDICATOR1:** Always is 0 as minimum size is 4K |
| 3 | 0h RO | **PREFETCHABLE1:** Indicates that this BAR is not prefetchable |
| 2:1 | 0h RO | **TYPE1:** 00 indicates BAR lies in 32bit address range |
| 0 | 0h RO | **MESSAGE_SPACE1:** message space |

## 21.9.7 reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch



SUBSYSTEMID -Subsystem Vendor and Subsystem ID

### Access Method

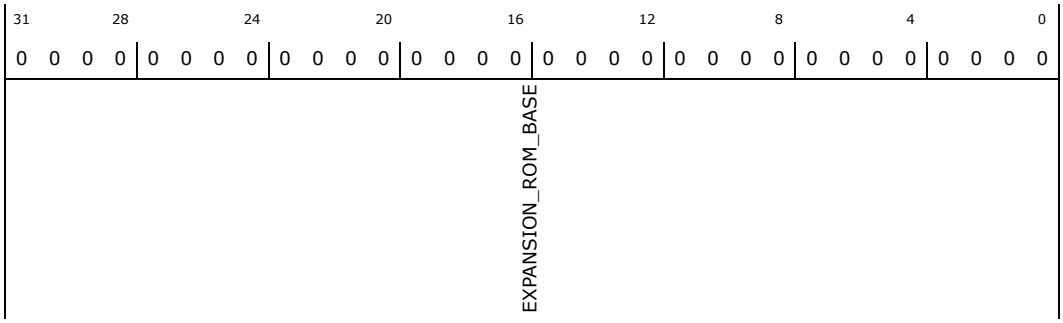
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SUBSYSTEMID:** [0/21/0] + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h RW/O | **SUBSYSTEMID:** Subsystem ID |
| 15:0 | 0000h RW/O | **SUBSYSTEMVENDORID:** Subsystem Vendor |

## 21.9.8 reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h



EXPANSION ROM base address

### Access Method

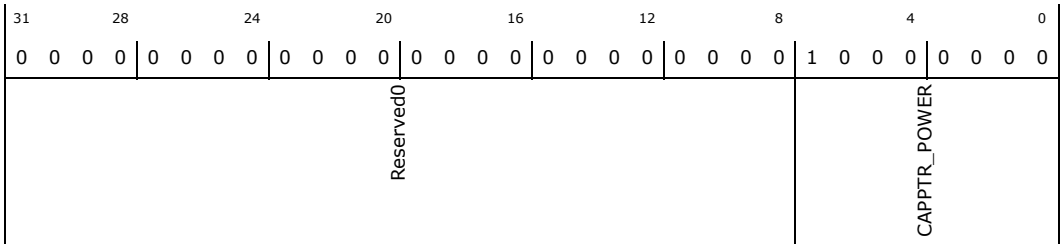
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**EXPANSION_ROM_BASEADDR:** [0/21/0] + 30h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 00000000h RO | **EXPANSION_ROM_BASE:** Value of all zeros indicates no support for Expansion ROM |

## 21.9.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h



CAPABILITYPTR - Capabilities Pointer

### Access Method

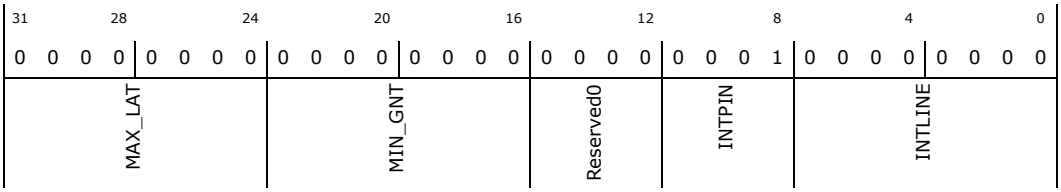
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CAPABILITYPTR:** [0/21/0] + 34h

**Default:** 00000080h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 000000h RO | **Reserved0:** reserved |
| 7:0 | 80h RO | **CAPPTR_POWER:** Indicates what the next capability is. This capability points to the PM Capability, 0x80, structure. |

## 21.9.10 reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch



INTERRUPTREG - Interrupt Register

### Access Method

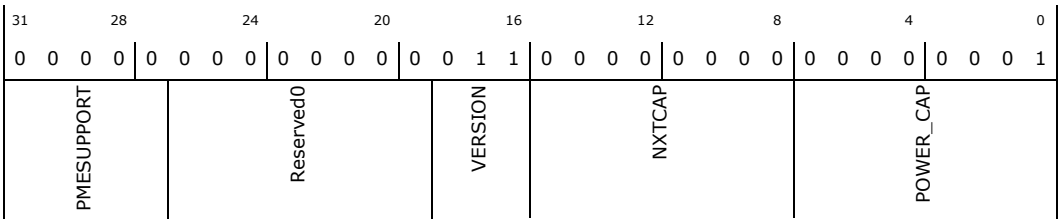
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**INTERRUPTREG:** [0/21/0] + 3Ch

**Default:** 00000100h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 00h<br>RO | **MAX_LAT:** Value of 0 indicates device has no major requirements for the settings of latency timers |
| 23:16 | 00h<br>RO | **MIN_GNT:** Value of 0 indicates device has no major requirements for the settings of latency timers |
| 15:12 | 0h<br>RO | **Reserved0:** reserved |
| 11:8 | 1h<br>RO | **INTPIN:** Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space. For a single function device, this ideally is INTA |
| 7:0 | 00h<br>RW | **INTLINE:** Bridge does not use this field directly. It is used to communicate to software, the interrupt line to which the interrupt pin is connected. |

## 21.9.11 reg_POWERCAPID_type (POWERCAPID)—Offset 80h



POWERCAPID - PowerManagement Capability ID

### Access Method

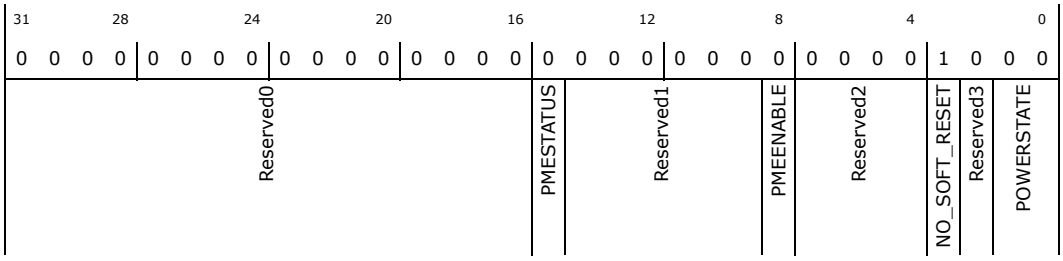
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**POWERCAPID:** [0/21/0] + 80h

**Default:** 00030001h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:27 | 00h RO | **PMESUPPORT:** This 5-bit field indicates the power states in which the function can assert the PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal at the same time in that power state. bit 11 X XXX1b: PME# can be asserted from D0 bit 12 X XX1Xb: PME# can be asserted from D1. Bridge does not support this state. bit 13 X X1XXb: PME# can be asserted from D2. Bridge does not support this state. bit 14 X 1XXXb:PME# can be asserted from D3hot bit 15 1 XXXXb:PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the private configuration space PME_Support XORed with the PME_Support strap. |
| 26:19 | 00h RO | **Reserved0:** reserved |
| 18:16 | 3h RO | **VERSION:** Indicates support for Revision 1.2 of the PCI Power Management Specification. |
| 15:8 | 00h RO | **NXTCAP:** Points to the next capability structure. This points to NULL |
| 7:0 | 01h RO | **POWER_CAP:** Indicates this is power management capability. |

## 21.9.12 reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h



reserved

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

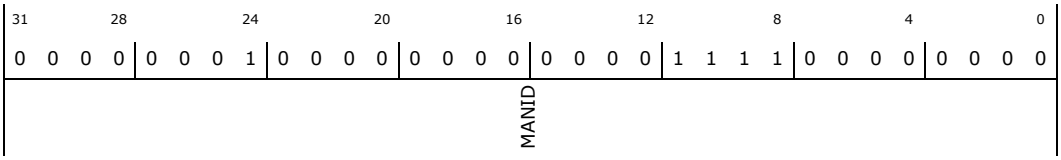
**PMECTRLSTATUS:** [0/21/0] + 84h

**Default:** 00000008h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h RO | **Reserved0:** reserved |
| 15 | 0h RW/1C | **PMESTATUS:** 0 Software clears the bit by writing a 1 to it. 1 This bit is set when the PME# signal is asserted independent of the state of the PME Enable bit |
| 14:9 | 00h RO | **Reserved1:** reserved |
| 8 | 0h RW | **PMEENABLE:** pme enable |
| 7:4 | 0h RO | **Reserved2:** reserved |
| 3 | 1h RO | **NO_SOFT_RESET:** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset.Configuration Context is preserved. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 2 | 0h<br>RO | **Reserved3:** reserved |
| 1:0 | 0h<br>RW | **POWERSTATE:** This field is used both to determine the current power state and to set a new power state.[BR]The values are: 00 D0 state 11 D3HOT state Others Reserved<br>Note: If the software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally. The data is discarded and no state change occurs.<br>Note: When in the D3HOT states, interrupts are blocked. D3Hot cannot be used for downstream decode on fabric ports. |

### 21.9.13 reg_MANID_type (MANID)—Offset F8h



Manufacturers ID

#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**MANID:** [0/21/0] + F8h

**Default:** 01000F00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 01000f00h<br>RO | **MANID:** Manufacturing ID |

## 21.10 pci_mem Address Map

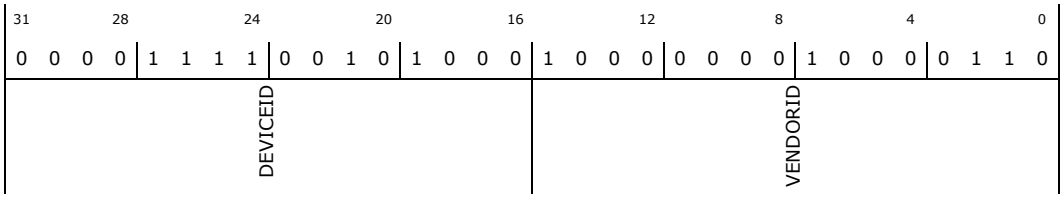
### Table 232. Summary of Memory Mapped I/O Registers—0/21/0

| Offset | Size | Register ID—Description | Default Value |
|---|---|---|---|
| 0h | 4 | "reg_DEVVENDID_type (DEVVENDID)—Offset 0h" on page 2840 | 0F288086h |
| 4h | 4 | "reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h" on page 2840 | 00100000h |
| 8h | 4 | "reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h" on page 2841 | 04010000h |
| Ch | 4 | "reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch" on page 2842 | 00000000h |
| 10h | 4 | "reg_BAR_type (BAR)—Offset 10h" on page 2842 | 00000000h |
| 14h | 4 | "reg_BAR1_type (BAR1)—Offset 14h" on page 2843 | 00000000h |
| 2Ch | 4 | "reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch" on page 2844 | 00000000h |
| 30h | 4 | "reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h" on page 2844 | 00000000h |
| 34h | 4 | "reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h" on page 2845 | 00000080h |
| 3Ch | 4 | "reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch" on page 2845 | 00000100h |

**Table 232. Summary of Memory Mapped I/O Registers—0/21/0 (Continued)**

| Offset | Size | Register ID—Description | Default Value |
|---|---|---|---|
| 80h | 4 | "reg_POWERCAPID_type (POWERCAPID)—Offset 80h" on page 2846 | 00030001h |
| 84h | 4 | "reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h" on page 2847 | 00000008h |
| F8h | 4 | "reg_MANID_type (MANID)—Offset F8h" on page 2848 | 01000F00h |

## 21.10.1 reg_DEVVENDID_type (DEVVENDID)—Offset 0h



DEVICEVENDORID - Device ID and Vendor ID Register

### Access Method

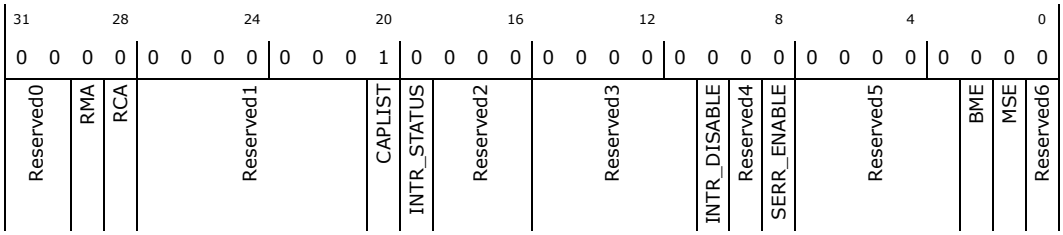
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DEVVENDID:** [0/21/0] + 0h

**Default:** 0F288086h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0F28h RO | **DEVICEID:** Device ID |
| 15:0 | 8086h RO | **VENDORID:** Vendor ID |

## 21.10.2 reg_STATUSCOMMAND_type (STATUSCOMMAND)—Offset 4h



STATUSCOMMAND- Status and Command

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

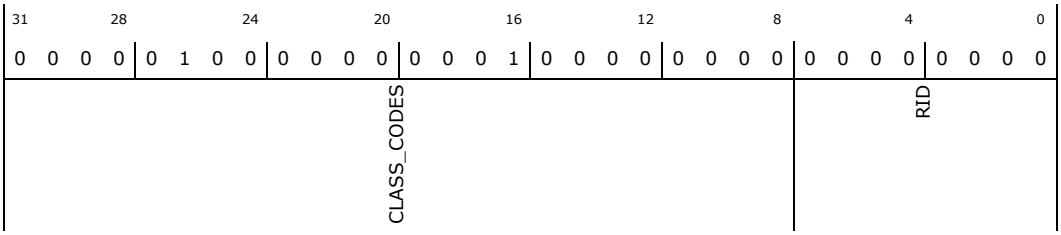
**STATUSCOMMAND:** [0/21/0] + 4h

**Default:** 00100000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h RO | **Reserved0:** reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 29 | 0h RW/1C | **RMA:** Received Master Abort: Not Implemented |
| 28 | 0h RW/1C | **RCA:** Received Target Abort: Not Implemented |
| 27:21 | 00h RO | **Reserved1:** reserved |
| 20 | 1h RO | **CAPLIST:** Capabilities List: Indicates that the controller contains a capabilities pointer list. The first item is pointed to by looking at the configuration offset 34h. |
| 19 | 0h RO | **INTR_STATUS:** Interrupt Status: This bit reflects state of interrupt in the device Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, is the device/function interrupt message sent. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. This bit reflects Legacy interrupt status. |
| 18:16 | 0h RO | **Reserved2:** reserved |
| 15:11 | 00h RO | **Reserved3:** reserved |
| 10 | 0h RW | **INTR_DISABLE:** Setting this bit disables INTx assertion from Bridge. The interrupt disabled is legacy INTx# interrupt, which is the Bridge does not send Interrupt Assert message through the IOSF Sideband Channel. Reset value of this bit is 0. This bit has no connection with the interrupt status bit |
| 9 | 0h RO | **Reserved4:** reserved |
| 8 | 0h RW | **SERR_ENABLE:** not implemented |
| 7:3 | 00h RO | **Reserved5:** reserved |
| 2 | 0h RW | **BME:** If this bit is 0,the Bridge does not generate any new upstream transaction on IOSF as a master. Reset value of this bit is 0. |
| 1 | 0h RW | **MSE:** Memory Space Enable: This bit controls Bridge response to downstream memory accesses. When set, accesses to memory space of the device is enabled. Reset value of this bit is 0. |
| 0 | 0h RO | **Reserved6:** reserved |

## 21.10.3 reg_REVCLASSCODE_type (REVCLASSCODE)—Offset 8h



REVCLASSCODE - Revision ID and Class Code

### Access Method

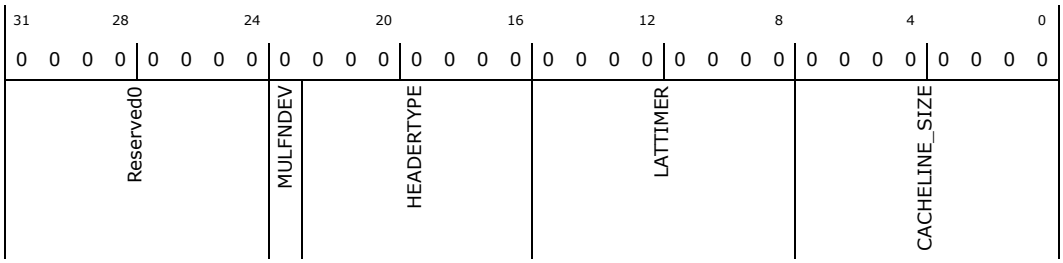
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**REVCLASSCODE:** [0/21/0] + 8h

**Default:** 04010000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 040100h RO | **CLASS_CODES:** Class Code |
| 7:0 | 00h RO | **RID:** Revision ID |

## 21.10.4 reg_CLLATHEADERBIST_type (CLLATHEADERBIST)—Offset Ch



CLLATHEADERBIST - Cache Line Latency Header and BIST

### Access Method

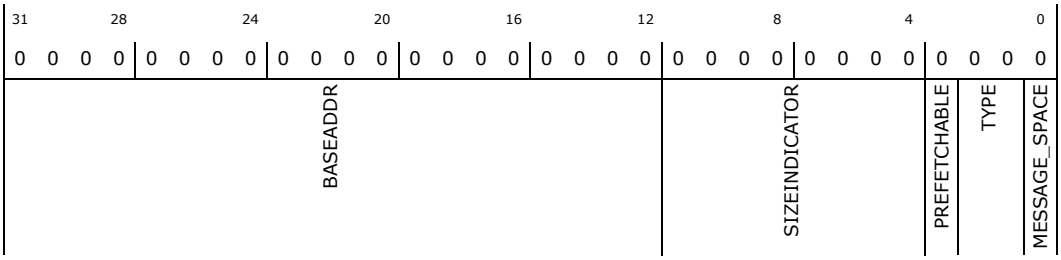
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CLLATHEADERBIST:** [0/21/0] + Ch

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 00h RO | **Reserved0:** Reserved |
| 23 | 0h RO | **MULFNDEV:** MULFNDEV |
| 22:16 | 00h RO | **HEADERTYPE:** Header Type: Implements Type 0 Configuration header. |
| 15:8 | 00h RO | **LATTIMER:** Latency Timer:. This register is implemented as R/W with default as 0. Similar to other Intel IPs. |
| 7:0 | 00h RW | **CACHELINE_SIZE:** Cacheline Size: This register is implemented as R/W with default as 0. Similar to other Intel IPs. |

## 21.10.5 reg_BAR_type (BAR)—Offset 10h



BAR -Base Address Register

### Access Method

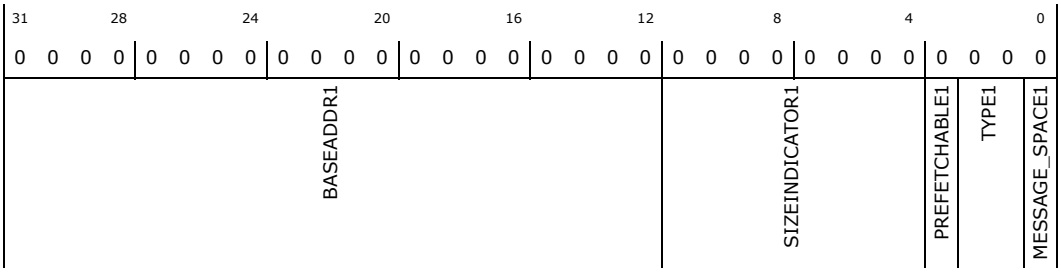
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR:** [0/21/0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:12 | 00000h RW | **BASEADDR:** Base Address register |
| 11:4 | 00h RO | **SIZEINDICATOR:** Size indicator |
| 3 | 0h RO | **PREFETCHABLE:** Indicates that this BAR is not prefetchable. |
| 2:1 | 0h RO | **TYPE:** 00 indicates BAR lies in 32bit address range |
| 0 | 0h RO | **MESSAGE_SPACE:** message space |

## 21.10.6 reg_BAR1_type (BAR1)—Offset 14h



BAR1 -Base Address Register1

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

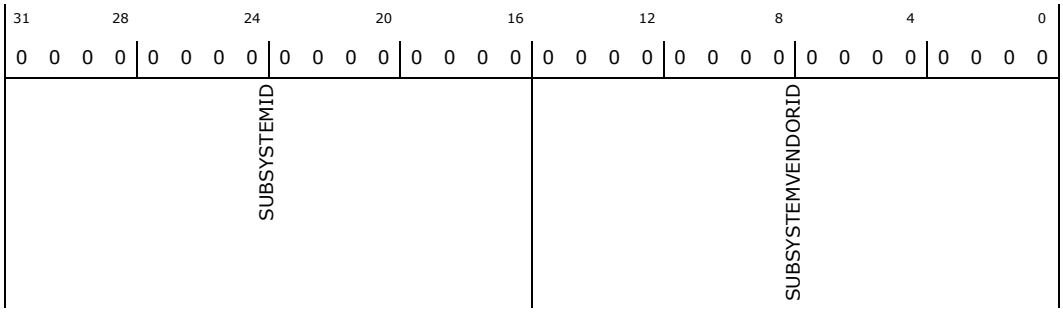
**BAR1:** [0/21/0] + 14h

### Default: 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:12 | 00000h RW | **BASEADDR1:** This field is present if BAR1 is enabled through private configuration space. Memory accesses to BAR1 region are aliased to the PCI configuration space. The BAR1 region is always 4K. |
| 11:4 | 00h RO | **SIZEINDICATOR1:** Always is 0 as minimum size is 4K |
| 3 | 0h RO | **PREFETCHABLE1:** Indicates that this BAR is not prefetchable |

| Bit Range | Default & Access | Description |
|---|---|---|
| 2:1 | 0h<br>RO | **TYPE1:** 00 indicates BAR lies in 32bit address range |
| 0 | 0h<br>RO | **MESSAGE_SPACE1:** message space |

## 21.10.7 reg_SUBSYSTEMID_type (SUBSYSTEMID)—Offset 2Ch



SUBSYSTEMID -Subsystem Vendor and Subsystem ID

### Access Method

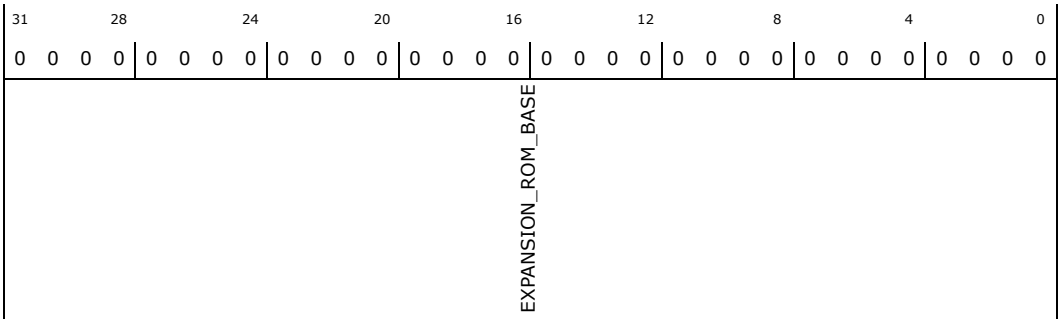
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SUBSYSTEMID:** [0/21/0] + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h<br>RW/O | **SUBSYSTEMID:** Subsystem ID |
| 15:0 | 0000h<br>RW/O | **SUBSYSTEMVENDORID:** Subsystem Vendor |

## 21.10.8 reg_EXPANSION_ROM_BASEADDR_type (EXPANSION_ROM_BASEADDR)—Offset 30h



EXPANSION ROM base address

### Access Method

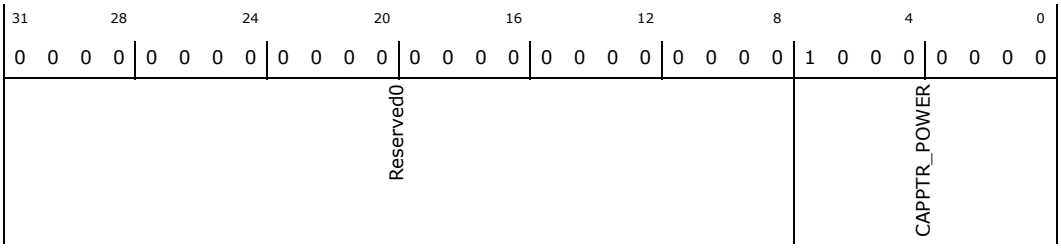
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**EXPANSION_ROM_BASEADDR:** [0/21/0] + 30h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 00000000h RO | **EXPANSION_ROM_BASE:** Value of all zeros indicates no support for Expansion ROM |

## 21.10.9 reg_CAPABILITYPTR_type (CAPABILITYPTR)—Offset 34h



CAPABILITYPTR - Capabilities Pointer

### Access Method

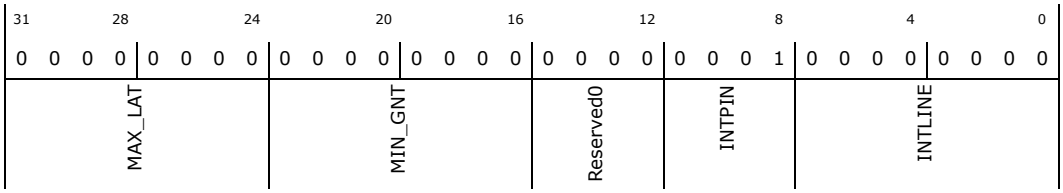
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CAPABILITYPTR:** [0/21/0] + 34h

**Default:** 00000080h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 000000h RO | **Reserved0:** reserved |
| 7:0 | 80h RO | **CAPPTR_POWER:** Indicates what the next capability is. This capability points to the PM Capability, 0x80, structure. |

## 21.10.10 reg_INTERRUPTREG_type (INTERRUPTREG)—Offset 3Ch



INTERRUPTREG - Interrupt Register

### Access Method

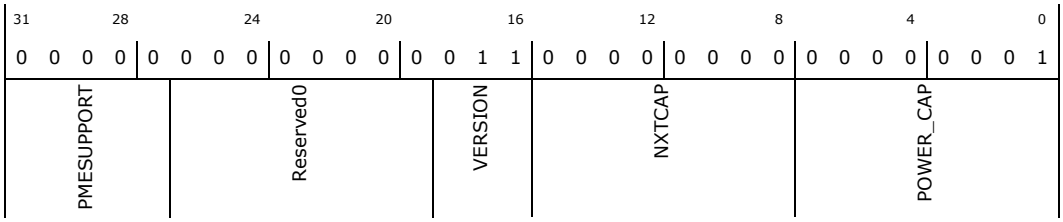
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**INTERRUPTREG:** [0/21/0] + 3Ch

**Default:** 00000100h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 00h<br>RO | **MAX_LAT:** Value of 0 indicates device has no major requirements for the settings of latency timers |
| 23:16 | 00h<br>RO | **MIN_GNT:** Value of 0 indicates device has no major requirements for the settings of latency timers |
| 15:12 | 0h<br>RO | **Reserved0:** reserved |
| 11:8 | 1h<br>RO | **INTPIN:** Interrupt Pin Value in this register is reflected from the IPIN value in the private configuration space. For a single function device, this ideally is INTA |
| 7:0 | 00h<br>RW | **INTLINE:** Bridge does not use this field directly. It is used to communicate to software, the interrupt line to which the interrupt pin is connected. |

## 21.10.11 reg_POWERCAPID_type (POWERCAPID)—Offset 80h



POWERCAPID - PowerManagement Capability ID

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

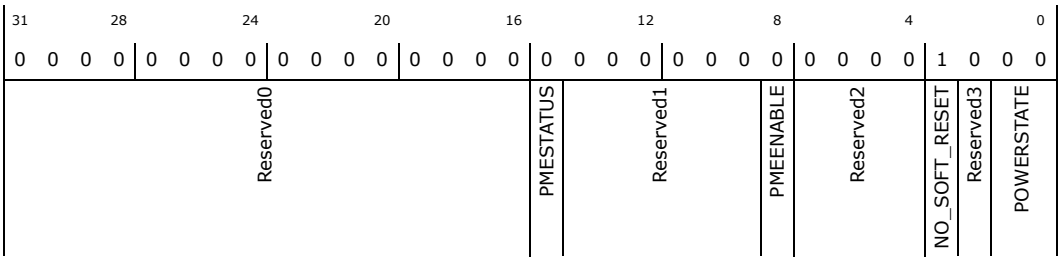
**POWERCAPID:** [0/21/0] + 80h

**Default:** 00030001h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:27 | 00h<br>RO | **PMESUPPORT:** This 5-bit field indicates the power states in which the function can assert the PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal at the same time in that power state. bit 11 X XXX1b: PME# can be asserted from D0 bit 12 X XX1Xb: PME# can be asserted from D1. Bridge does not support this state. bit 13 X X1XXb: PME# can be asserted from D2. Bridge does not support this state. bit 14 X 1XXXb:PME# can be asserted from D3hot bit 15 1 XXXXb:PME# can be asserted from D3cold. Bridge does not support this state. This field is taken from the private configuration space PME_Support XORed with the PME_Support strap. |
| 26:19 | 00h<br>RO | **Reserved0:** reserved |
| 18:16 | 3h<br>RO | **VERSION:** Indicates support for Revision 1.2 of the PCI Power Management Specification. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 15:8 | 00h<br>RO | **NXTCAP:** Points to the next capability structure. This points to NULL |
| 7:0 | 01h<br>RO | **POWER_CAP:** Indicates this is power management capability. |

## 21.10.12 reg_PMECTRLSTATUS_type (PMECTRLSTATUS)—Offset 84h



reserved

### Access Method

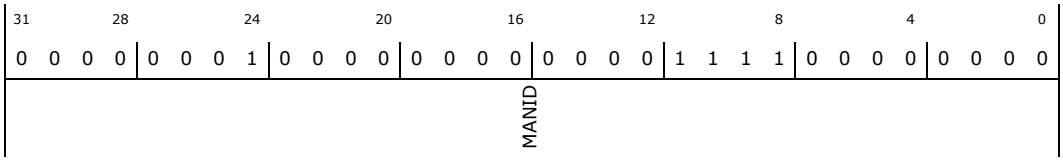
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**PMECTRLSTATUS:** [0/21/0] + 84h

**Default:** 00000008h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h<br>RO | **Reserved0:** reserved |
| 15 | 0h<br>RW/1C | **PMESTATUS:** 0 Software clears the bit by writing a 1 to it. 1 This bit is set when the PME# signal is asserted independent of the state of the PME Enable bit |
| 14:9 | 00h<br>RO | **Reserved1:** reserved |
| 8 | 0h<br>RW | **PMEENABLE:** pme enable |
| 7:4 | 0h<br>RO | **Reserved2:** reserved |
| 3 | 1h<br>RO | **NO_SOFT_RESET:** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset.Configuration Context is preserved. |
| 2 | 0h<br>RO | **Reserved3:** reserved |
| 1:0 | 0h<br>RW | **POWERSTATE:** This field is used both to determine the current power state and to set a new power state.[BR]The values are: 00 D0 state 11 D3HOT state Others Reserved Note: If the software attempts to write a value of 01b or 10b in to this field, the write operation must complete normally. The data is discarded and no state change occurs. Note: When in the D3HOT states, interrupts are blocked. D3Hot cannot be used for downstream decode on fabric ports. |

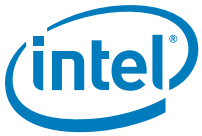
## 21.10.13 reg_MANID_type (MANID)—Offset F8h



Manufacturers ID

### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)



**MANID:** [0/21/0] + F8h

**Default:** 01000F00h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 01000f00h RO | **MANID:** Manufacturing ID |

§ §

## 21.11 Memory Mapped Shim Registers

### Table 233. Summary of LPE Shim Memory Mapped I/O Registers—BAR

| Offset | Size | Register ID—Description | Default Value |
|---|---|---|---|
| 0h | 8 | "reg_CSR_type (CSR)—Offset 0h" on page 2850 | 0000000001E40001h |
| 8h | 8 | "reg_XT_PISR_type (PISR)—Offset 8h" on page 2851 | 0000000000000000h |
| 10h | 8 | "reg_XT_PIMR_type (PIMR)—Offset 10h" on page 2852 | 0000000000000000h |
| 18h | 8 | "reg_IA_PISR_type (ISRX)—Offset 18h" on page 2853 | 0000000000000000h |
| 20h | 8 | "reg_ISRD_type (ISRD)—Offset 20h" on page 2854 | 0000000000000000h |
| 28h | 8 | "reg_IA_PIMR_type (IMRX)—Offset 28h" on page 2855 | 0000000000000000h |
| 30h | 8 | "reg_IMRD_type (IMRD)—Offset 30h" on page 2856 | 0000000000000000h |
| 38h | 8 | "reg_IPCX_type (IPCX)—Offset 38h" on page 2857 | 0000000000000000h |
| 40h | 8 | "reg_IPCD_type (IPCD)—Offset 40h" on page 2858 | 0000000000000000h |
| 48h | 8 | "reg_ISRSC_type (ISRSC)—Offset 48h" on page 2858 | 0000000000000000h |
| 50h | 8 | "reg_ISRLPESC_type (ISRLPESC)—Offset 50h" on page 2859 | 0000000000000000h |
| 58h | 8 | "reg_IMRSC_type (IMRSC)—Offset 58h" on page 2860 | 0000000000000000h |
| 60h | 8 | "reg_IMRLPESC_type (IMRLPESC)—Offset 60h" on page 2861 | 0000000000000000h |

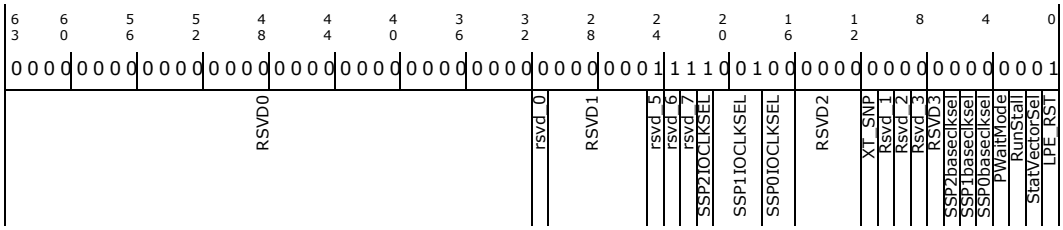
## 21.11.1 reg_CSR_type (CSR)—Offset 0h

This register controls clock and reset of the block, various configurations of the block and reflects general status of the block.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**CSR:** [BAR + 140000h] + 0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000001E40001h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:32 | 0b<br>RO | **RSVD0:** Reserved |
| 31 | 0b<br>RW | **rsvd_0:** Reserved |

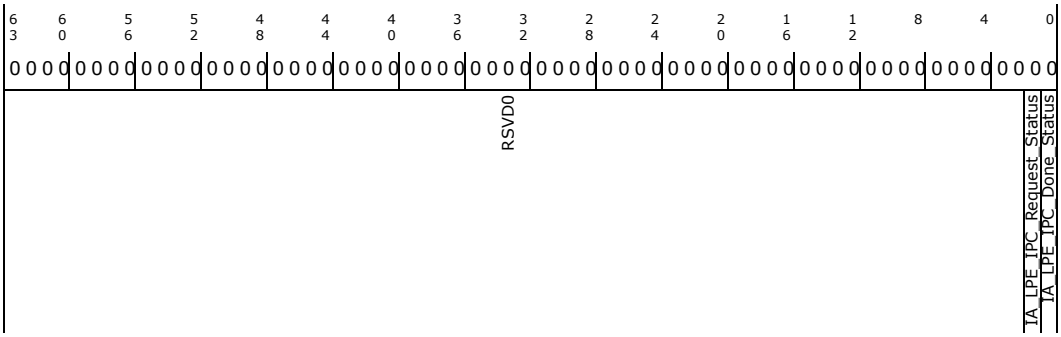
| 0 | 0b<br>RO | **LPE_IA_IPC_Done_Status:** IPCX Interrupt Request 1: interrupt when LPE writes a message into IPCX register with bit 62 set is asserted 0: Deasserted. |

## 21.11.5 reg_ISRD_type (ISRD)—Offset 20h

ISRD



**Access Method**

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**ISRD:** [BAR + 140000h] + 20h

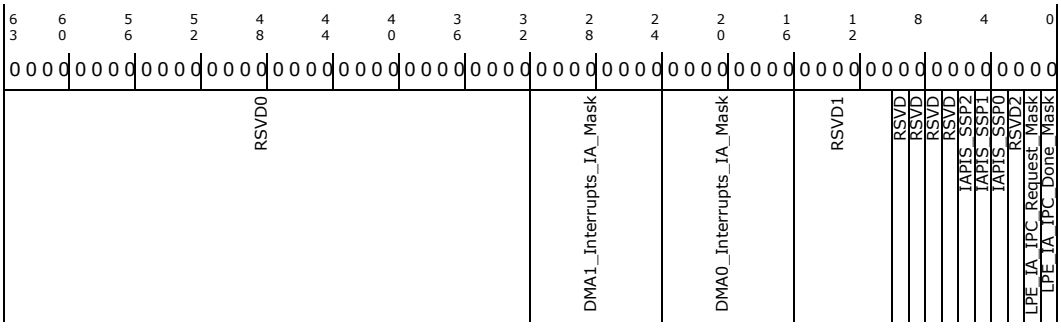
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:2 | 0b<br>RO | **RSVD0:** Reserved |
| 1 | 0b<br>RO | **IA_LPE_IPC_Request_Status:** IPCIA Interrupt Request to LPE 1: interrupt when IA-32 CPU writes a message into IPCIA register with bit 63 set. 0: Deasserted |
| 0 | 0b<br>RO | **IA_LPE_IPC_Done_Status:** IPCLPEIA Interrupt Request to LPE 1: interrupt when IA-32 CPU writes a message into IPCLPEIA register with bit 62 set is asserted 0: Deasserted. |

## 21.11.6 reg_IA_PIMR_type (IMRX)—Offset 28h

PIMR



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**IMRX:** [BAR + 140000h] + 28h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:32 | 0b<br>RO | **RSVD0:** Reserved |

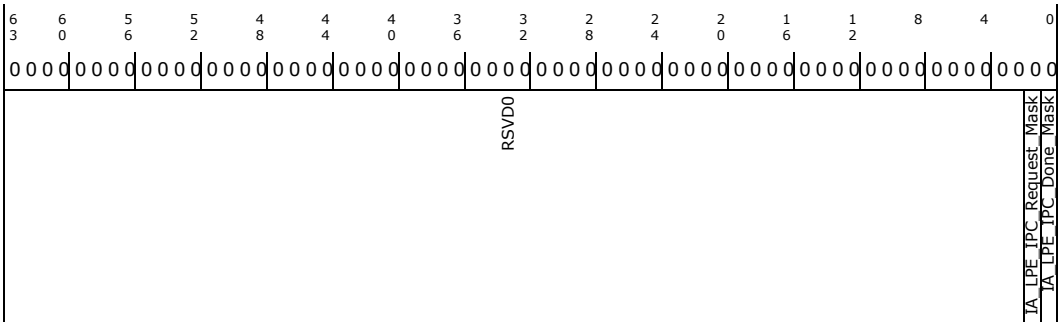
| 8 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 7 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 6 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 5 | 0b<br>RW | **IAPIS_SSP2:** SSP2 Interrupt Mask for IA 1: Interrupt is masked 0: Interrupt is unmasked |
| 4 | 0b<br>RW | **IAPIS_SSP1:** SSP1 Interrupt Mask for IA 1: Interrupt is masked 0: Interrupt is unmasked |
| 3 | 0b<br>RW | **IAPIS_SSP0:** SSP0 Interrupt Mask for IA 1: Interrupt is masked 0: Interrupt is unmasked |
| 2 | 0b<br>RO | **RSVD2:** Reserved |
| 1 | 0b<br>RW | **LPE_IA_IPC_Request_Mask:** LPE to IA IPC Request Mask 1: Interrupt is masked 0: Interrupt is unmasked |
| 0 | 0b<br>RW | **LPE_IA_IPC_Done_Mask:** LPE to IA IPC Done Mask 1: Interrupt is masked 0: Interrupt is unmasked |

### 21.11.7 reg_IMRD_type (IMRD)—Offset 30h

IMRD



#### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**IMRD:** [BAR + 140000h] + 30h

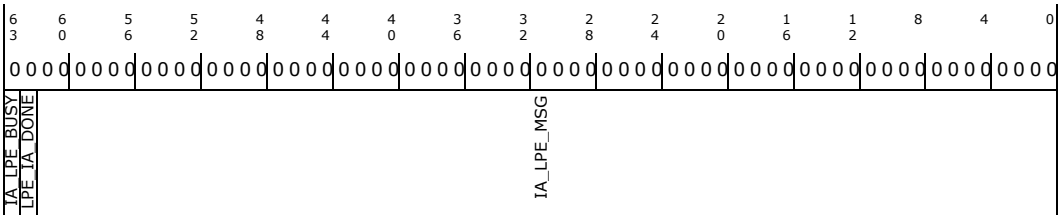
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:2 | 0b<br>RO | **RSVD0:** Reserved |
| 1 | 0b<br>RW | **IA_LPE_IPC_Request_Mask:** IPCIA interrupt Enable to LPE |
| 0 | 0b<br>RW | **IA_LPE_IPC_Done_Mask:** IPCLPEIA interrupt Enable to LPE |

## 21.11.8 reg_IPCX_type (IPCX)—Offset 38h

The Inter-process Status and Message register for IA-32 contains a message sent from the IA-32 CPU to LPE. The format of the CPU message bits (61:0) is not defined in the HW specs. It is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When the message is written in this register, the software must set bit 63 to indicate that the IPCIA is not empty. Setting Busy also asserts interrupt request to LPE if the interrupt is enabled in the IMRLPEIA. After LPE reads the message code from the register, it must perform a write with bit 63 cleared. The IA-32 CPU must not attempt to write into IPCIA if bit 63 is set.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**IPCX:** [BAR + 140000h] + 38h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

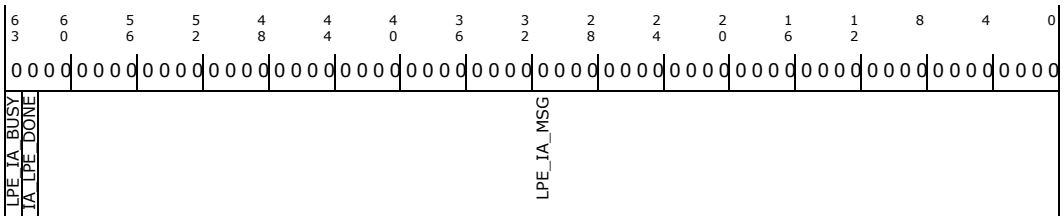
**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63 | 0b<br>RW | **IA_LPE_BUSY:** Busy. When this bit is cleared, the LPE Ready to accept a message |

| Bit Range | Default & Access | Description |
|---|---|---|
| 62 | 0b<br>RW | **LPE_IA_DONE:** Done. When the bit is set, the LPE completed the operation and requests attention |
| 61:0 | 0000000000000000h<br>RW | **IA_LPE_MSG:** IA-32 to LPE Message |

## 21.11.9 reg_IPCD_type (IPCD)—Offset 40h

Inter-process Status and Message register for LPE contains a message sent from LPE to IA-32 CPU. The format of the CPU message bits 29:0 is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When software writes the message is in this register, it should set bit 63 to indicate that the new data is written. When IA-32 CPU reads the message code from the register, and writes back with the bit 63 cleared. When the IA-32 CPU processes the message sent by LPE, it may set bit 63 in IPCD to assert interrupt request to LPE. The LPE must not attempt to write into IPCLPEIA if bit 63 is set.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**IPCD:** [BAR + 140000h] + 40h

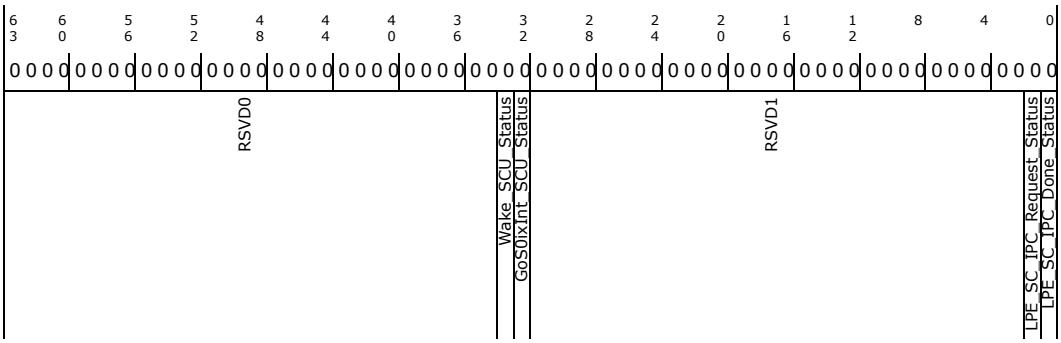
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63 | 0b<br>RW | **LPE_IA_BUSY:** Busy. When this bit is cleared, the IA CPU is Ready to accept a new message |
| 62 | 0b<br>RW | **IA_LPE_DONE:** Done. When the bit is set, the IA CPU completed operation and requests attention from LPE |
| 61:0 | 0000000000000000h<br>RW | **LPE_IA_MSG:** LPE to IA CPU Message |

## 21.11.10 reg_ISRSC_type (ISRSC)—Offset 48h

ISRSC



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**ISRSC:** [BAR + 140000h] + 48h

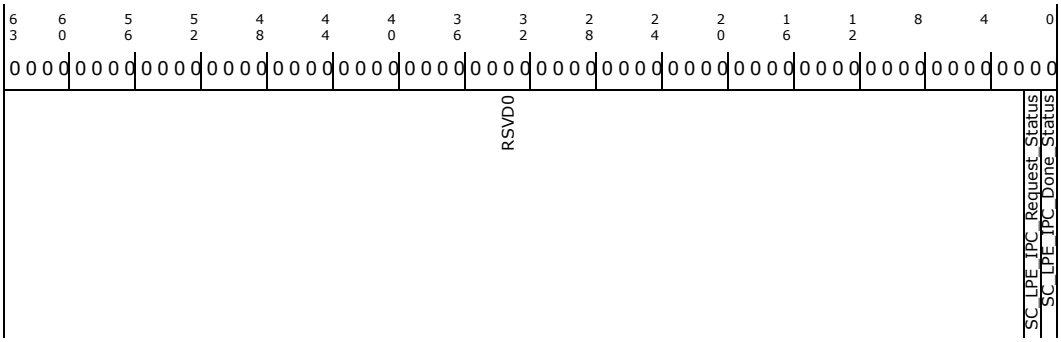
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:34 | 0b<br>RO | **RSVD0:** Reserved |
| 33 | 0b<br>RW/1C | **Wake_SCU_Status:** This bit is set by hardware when a blocked transaction is detected. It generates a wake to the SCU |
| 32 | 0b<br>RW/1C | **GoS0ixInt_SCU_Status:** This bit is set by expiry of the Re-entry timer. The bit gets set only if GoS0ixInt_En bit is set and this interrupt is unmasked. |
| 31:2 | 0b<br>RO | **RSVD1:** Reserved |
| 1 | 0b<br>RO | **LPE_SC_IPC_Request_Status:** IPCLPESC Interrupt Request 1: interrupt when LPE writes a message into IPCLPESC register with bit 63 set 0: Deasserted |
| 0 | 0b<br>RW/1C | **LPE_SC_IPC_Done_Status:** IPCSC Interrupt Request 1: interrupt when LPE writes a message into IPCSC register with bit 62 set is asserted 0: Deasserted. |

## 21.11.11 reg_ISRLPESC_type (ISRLPESC)—Offset 50h

ISRLPESC



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**ISRLPESC:** [BAR + 140000h] + 50h

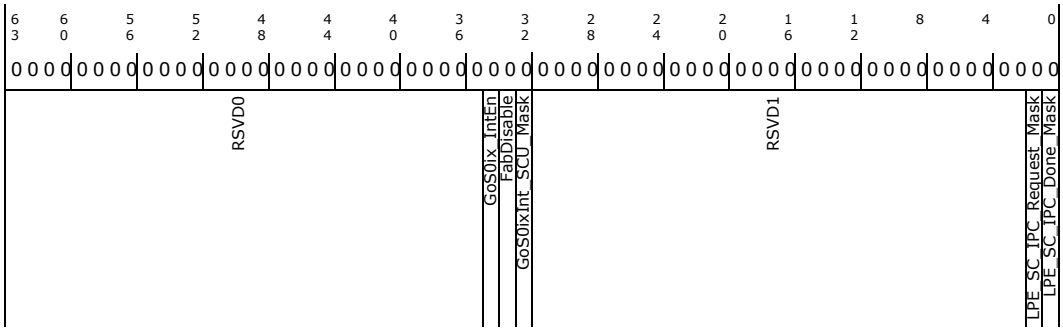
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:2 | 0b<br>RO | **RSVD0:** Reserved |
| 1 | 0b<br>RO | **SC_LPE_IPC_Request_Status:** IPCSC Interrupt Request to LPE 1: interrupt when SC writes a message into IPCSC register with bit 63 set. 0: Deasserted |
| 0 | 0b<br>RO | **SC_LPE_IPC_Done_Status:** IPCLPESC Interrupt Request to LPE 1: interrupt when SC CPU writes a message into IPCLPEIA register with bit 62 set is asserted 0: Deasserted. |

## 21.11.12 reg_IMRSC_type (IMRSC)—Offset 58h

IMRSC



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**IMRSC:** [BAR + 140000h] + 58h

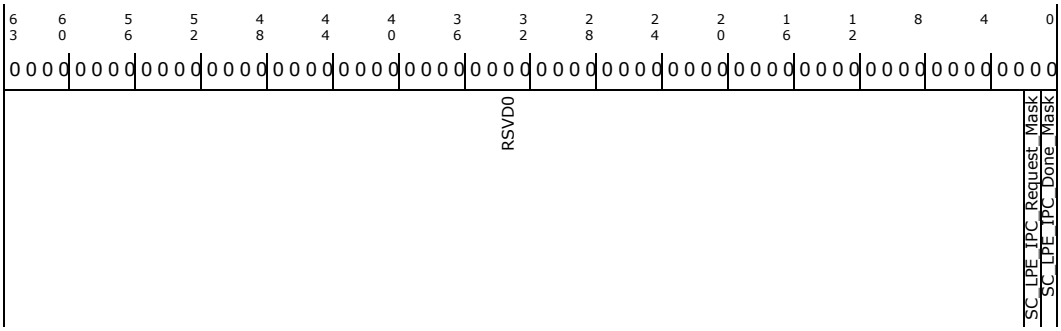
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:35 | 0b<br>RO | **RSVD0:** Reserved |
| 34 | 0b<br>RW/1C | **GoS0ix_IntEn:** This bit indicates that Reentry to S0iX interrupts to SCU are enabled. The bit is set by hardware when a transaction is blocked at the Audio to Secondary interface due to the secondary fabric being gated and the fabdisable bit being set. Software is expected to clear this bit along with the Secondary Fabric Reject bit. This disables the interrupts. |
| 33 | 0b<br>RW | **FabDisable:** This bit is used to generate the wake interrupt to SCU. When set the interrupt generation is enabled. When cleared the interrupt generation is disabled |
| 32 | 0b<br>RW | **GoS0ixInt_SCU_Mask:** Mask bit for S0ix Reentry interrupt to SCU |
| 31:2 | 0b<br>RO | **RSVD1:** Reserved |
| 1 | 0b<br>RW | **LPE_SC_IPC_Request_Mask:** IPCLPESC Interrupt Enable to SC CPU |
| 0 | 0b<br>RW | **LPE_SC_IPC_Done_Mask:** IPCSC Interrupt Enable to SC CPU |

## 21.11.13 reg_IMRLPESC_type (IMRLPESC)—Offset 60h

IMRLPRESC



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**IMRLPESC:** [BAR + 140000h] + 60h

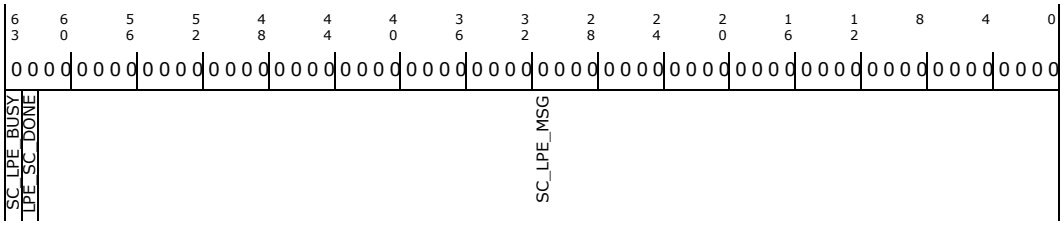
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:2 | 0b<br>RO | **RSVD0:** Reserved |
| 1 | 0b<br>RW | **SC_LPE_IPC_Request_Mask:** IPCSC interrupt Enable to LPE |
| 0 | 0b<br>RW | **SC_LPE_IPC_Done_Mask:** IPCLPESC interrupt Enable to LPE |

## 21.11.14 reg_IPCSC_type (IPCSC)—Offset 68h

The Inter-process Status and Message register for SC contains a message sent from the SC CPU to LPE. The format of the CPU message bits (29:0) is not defined in the HW specs. It is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When the message is written in this register, the software must set bit 63 to indicate that the IPCSC is not empty. Setting Busy also asserts interrupt request to LPE if the interrupt is enabled in the IMRLPESC. After LPE reads the message code from the register, it must perform a write with bit 63 cleared. The SC CPU must not attempt to write into IPCIA if bit 63 is set.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**IPCSC:** [BAR + 140000h] + 68h

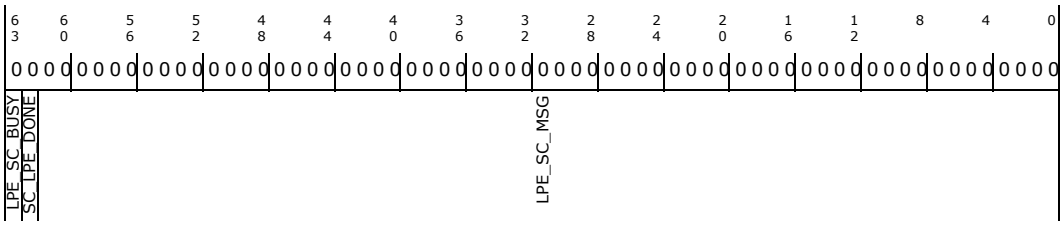
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63 | 0b<br>RW | **SC_LPE_BUSY:** Busy. When this bit is cleared, the LPE Ready to accept a message |
| 62 | 0b<br>RW | **LPE_SC_DONE:** Done. When the bit is set, the LPE completed the operation and requests attention |
| 61:0 | 0000000000000000h<br>RW | **SC_LPE_MSG:** SC to LPE Message |

## 21.11.15 reg_IPCLPESC_type (IPCLPESC)—Offset 70h

Inter-process Status and Message register for LPE contains a message sent from LPE to SC. The format of the CPU message bits 29:0 is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When software writes the message is in this register, it should set bit 63 to indicate that the new data is written. When SC reads the message code from the register, and writes back with the bit 63 cleared. When the SC CPU processes the message sent by LPE, it may set bit 62 in IPCLPESC to assert interrupt request to LPE. The LPE must not attempt to write into IPCD if bit 63 is set.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**IPCLPESC:** [BAR + 140000h] + 70h

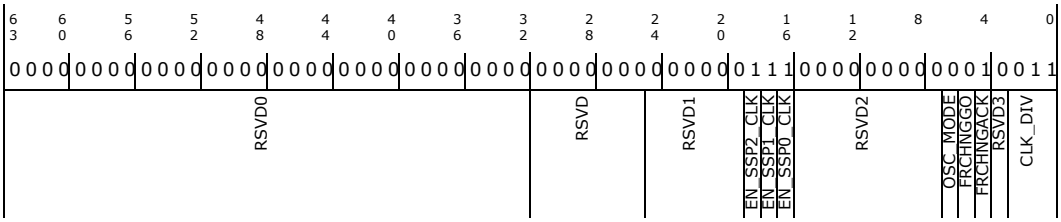
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63 | 0b<br>RW | **LPE_SC_BUSY:** Busy. When this bit is cleared, the SC CPU is Ready to accept a new message |
| 62 | 0b<br>RW | **SC_LPE_DONE:** Done. When the bit is set, the SC CPU completed operation and requests attention from LPE |
| 61:0 | 0h<br>RW | **LPE_SC_MSG:** LPE to SC CPU Message |

## 21.11.16 reg_CLKCTL_type (CLKCTL)—Offset 78h

LPE Clock Control Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**CLKCTL:** [BAR + 140000h] + 78h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000070013h

| Bit Range | Default & Access | Description |
|---|---|---|

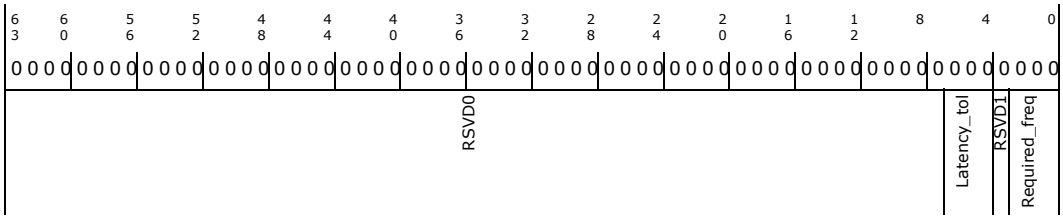
## 21.11.17 reg_FR_LAT_REQ_type (FR_LAT_REQ)—Offset 80h

LPE



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**FR_LAT_REQ:** [BAR + 140000h] + 80h

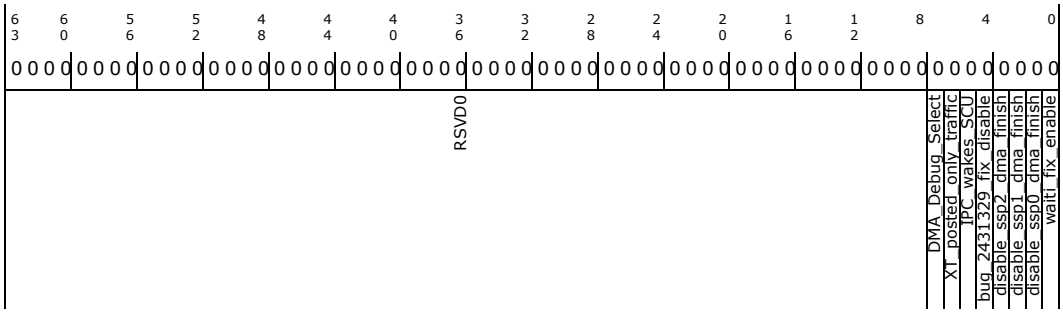
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:7 | 0b<br>RO | **RSVD0:** Reserved |
| 6:4 | 0b<br>RW | **Latency_tol:** Latency tolerance for Cache Misses is listed here. SCU firmware is required to read this register and make a decision on whether it can enter a lower power state and still meet the latency tolerance. |
| 3 | 0b<br>RO | **RSVD1:** Reserved |
| 2:0 | 0b<br>RW | **Required_freq:** The following encoding specifies the frequency that the Audio Cluster requires for current operations. 000: 25 MHz(XTAL) 001: 25 Mhz(XTAL) 010: 50 Mhz(2xXTAL) 011: 50 Mhz(default) 100: 100 Mhz 101: 200 Mhz 110: 267 Mhz 111: 343 Mhz Please note, that this does not guarantee that this frequency will be generated from the CCU. The SCU firmware is required to read this register before making a decision on entering lower power states. |

## 21.11.18 reg_CHICKEN_BITS_type (CHICKEN_BITS)—Offset 88h

LPE



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**CHICKEN_BITS:** [BAR + 140000h] + 88h

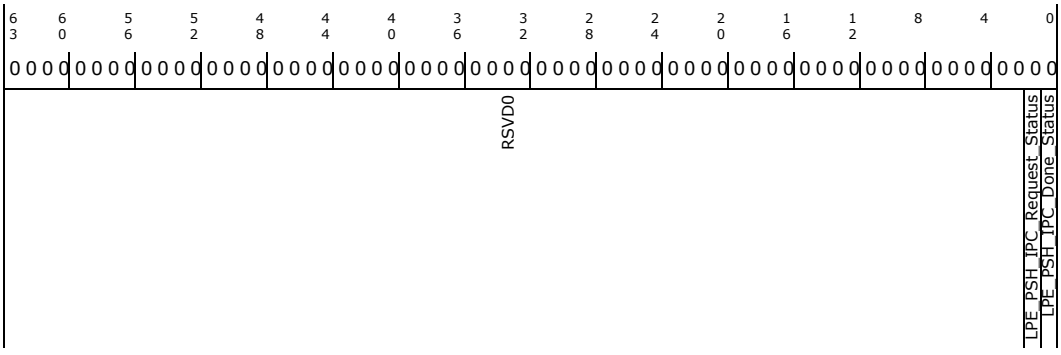
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:8 | 0b<br>RO | **RSVD0:** Reserved |
| 7 | 0b<br>RW | **DMA_Debug_Select:** Setting this bit will select DMA 1 debug signals to be routed to the VISA Mux. |
| 6 | 0b<br>RW | **XT_posted_only_traffic:** Setting this bit will select make all the traffic from Tensilica to be posted. |
| 5 | 0b<br>RW | **IPC_wakes_SCU:** Setting this to 1 will cause the IPC to be fed into the wake cone for SCU. |
| 4 | 0b<br>RW | **bug_2431329_fix_disable:** Setting this to 1 will disable the synopsys compatible hardware handshake mechanism. Keep this set to 0 for regular hardware handshake operation. |
| 3 | 0b<br>RW | **disable_ssp2_dma_finish:** Setting this to 1 will cause the SSP Unit to ignore the dma_finish signal. Set this to 1 for MultiBlock transfers. |
| 2 | 0b<br>RW | **disable_ssp1_dma_finish:** Setting this to 1 will cause the SSP Unit to ignore the dma_finish signal. Set this to 1 for MultiBlock transfers. |
| 1 | 0b<br>RW | **disable_ssp0_dma_finish:** Setting this to 1 will cause the SSP Unit to ignore the dma_finish signal. Set this to 1 for MultiBlock transfers. |
| 0 | 0b<br>RW | **waiti_fix_enable:** Setting this bit to 1 makes the frequency change request to be valid only if the core is in WAITI. |

## 21.11.19 reg_ISRPSH_type (ISRPSH)—Offset 90h

ISRPSH



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**ISRPSH:** [BAR + 140000h] + 90h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

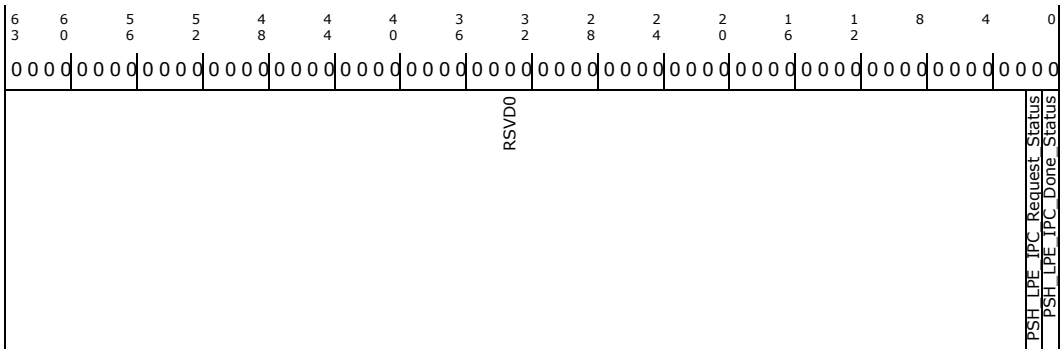
**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:2 | 0b<br>RO | **RSVD0:** Reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 1 | 0b<br>RO | **LPE_PSH_IPC_Request_Status:** IPCLPEPSH Interrupt Request 1: interrupt when LPE writes a message into IPCLPEPSH register with bit 63 set 0: Deasserted |
| 0 | 0b<br>RW/1C | **LPE_PSH_IPC_Done_Status:** IPCPSH Interrupt Request 1: interrupt when LPE writes a message into IPCPSH register with bit 62 set is asserted 0: Deasserted. |

## 21.11.20 reg_ISRLPEPSH_type (ISRLPEPSH)—Offset 98h

ISRLPEPSH



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**ISRLPEPSH:** [BAR + 140000h] + 98h

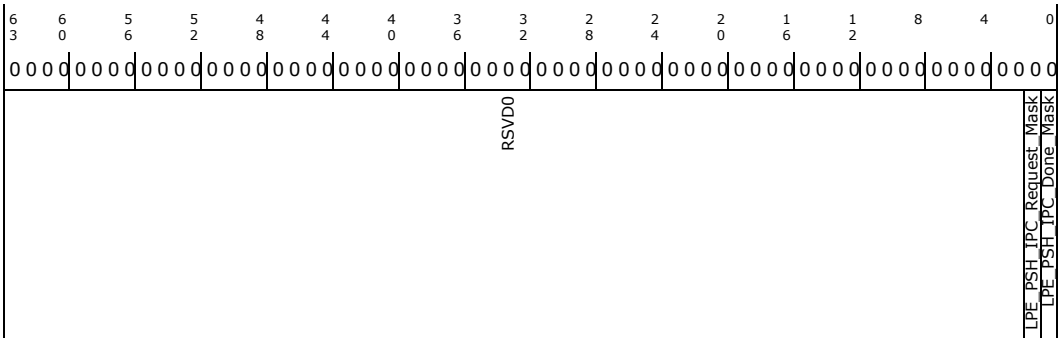
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:2 | 0b<br>RO | **RSVD0:** Reserved |
| 1 | 0b<br>RO | **PSH_LPE_IPC_Request_Status:** IPCPSH Interrupt Request to LPE 1: interrupt when PSH writes a message into IPCPSH register with bit 63 set. 0: Deasserted |
| 0 | 0b<br>RO | **PSH_LPE_IPC_Done_Status:** IPCLPEPSH Interrupt Request to LPE 1: interrupt when PSH CPU writes a message into IPCLPEIA register with bit 62 set is asserted 0: Deasserted. |

## 21.11.21 reg_IMRPSH_type (IMRPSH)—Offset A0h

IMRPSH



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**IMRPSH:** [BAR + 140000h] + A0h

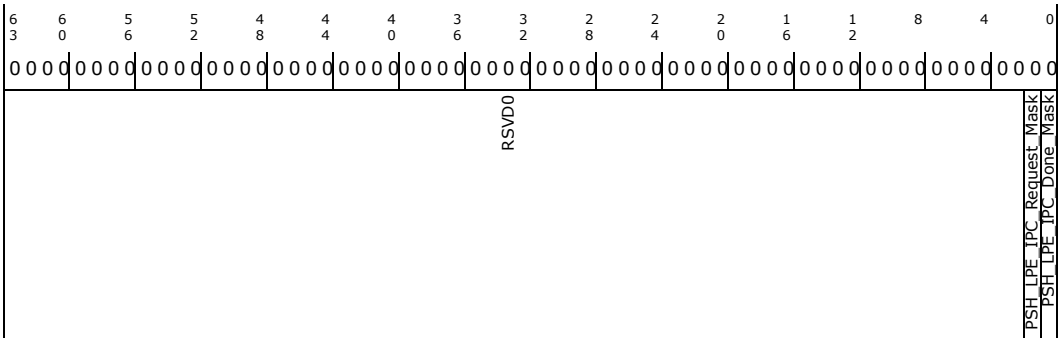
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:2 | 0b<br>RO | **RSVD0:** Reserved |
| 1 | 0b<br>RW | **LPE_PSH_IPC_Request_Mask:** IPCLPEPSH Interrupt Enable to PSH CPU |
| 0 | 0b<br>RW | **LPE_PSH_IPC_Done_Mask:** IPCPSH Interrupt Enable to PSH CPU |

## 21.11.22 reg_IMRLPEPSH_type (IMRLPEPSH)—Offset A8h

IMRLPEPSH



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**IMRLPEPSH:** [BAR + 140000h] + A8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

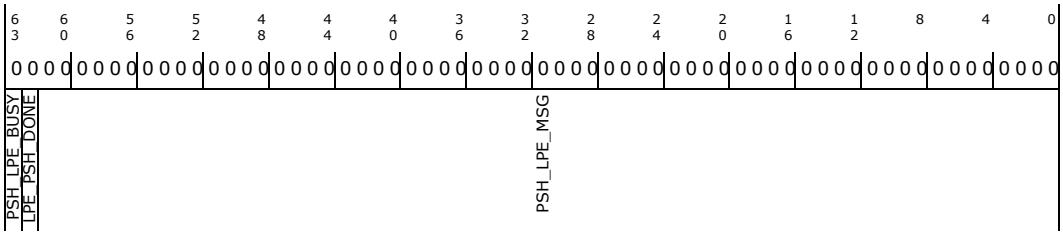
**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:2 | 0b<br>RO | **RSVD0:** Reserved |
| 1 | 0b<br>RW | **PSH_LPE_IPC_Request_Mask:** IPCPSH interrupt Enable to LPE |

| Bit Range | Default & Access | Description |
|---|---|---|
| 0 | 0b<br>RW | **PSH_LPE_IPC_Done_Mask:** IPCLPEPSH interrupt Enable to LPE |

## 21.11.23 reg_IPCPSH_type (IPCPSH)—Offset B0h

The Inter-process Status and Message register for PSH contains a message sent from the PSH CPU to LPE. The format of the CPU message bits (29:0) is not defined in the HW specs. It is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When the message is written in this register, the software must set bit 63 to indicate that the IPCPSH is not empty. Setting Busy also asserts interrupt request to LPE if the interrupt is enabled in the IMRLPEPSH. After LPE reads the message code from the register, it must perform a write with bit 63 cleared. The PSH CPU must not attempt to write into IPCIA if bit 63 is set.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**IPCPSH:** [BAR + 140000h] + B0h

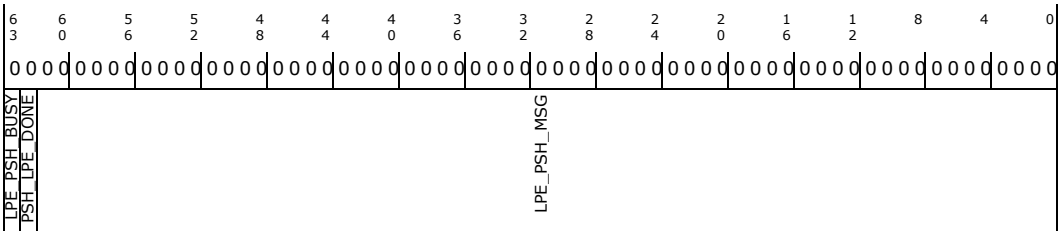
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63 | 0b<br>RW | **PSH_LPE_BUSY:** Busy. When this bit is cleared, the LPE Ready to accept a message |
| 62 | 0b<br>RW | **LPE_PSH_DONE:** Done. When the bit is set, the LPE completed the operation and requests attention |
| 61:0 | 00000000 0000000h<br>RW | **PSH_LPE_MSG:** PSH to LPE Message |

## 21.11.24 reg_IPCLPEPSH_type (IPCLPEPSH)—Offset B8h

Inter-process Status and Message register for LPE contains a message sent from LPE to PSH. The format of the CPU message bits 29:0 is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When software writes the message is in this register, it should set bit 63 to indicate that the new data is written. When PSH reads the message code from the register, and writes back with the bit 63 cleared. When the PSH CPU processes the message sent by LPE, it may set bit 62 in IPCLPEPSH to assert interrupt request to LPE. The LPE must not attempt to write into IPCD if bit 63 is set.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**IPCLPEPSH:** [BAR + 140000h] + B8h

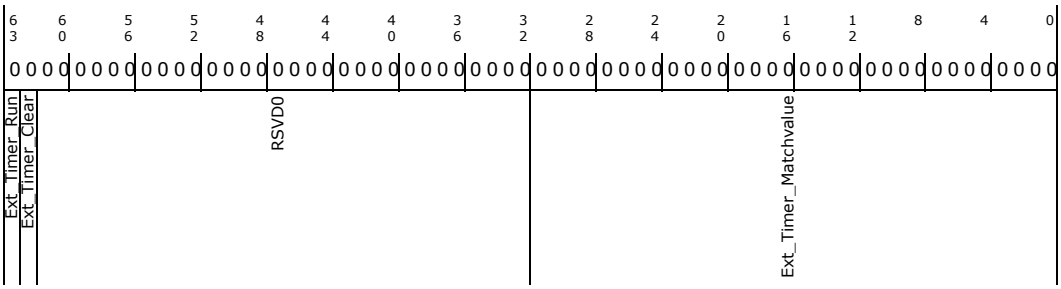
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63 | 0b<br>RW | **LPE_PSH_BUSY:** Busy. When this bit is cleared, the PSH CPU is Ready to accept a new message |
| 62 | 0b<br>RW | **PSH_LPE_DONE:** Done. When the bit is set, the PSH CPU completed operation and requests attention from LPE |
| 61:0 | 0h<br>RW | **LPE_PSH_MSG:** LPE to PSH CPU Message |

## 21.11.25 reg_EXT_TIMER_CNTL_type (EXT_TIMER_CNTL)—Offset C0h

External Timer Control Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**EXT_TIMER_CNTL:** [BAR + 140000h] + C0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

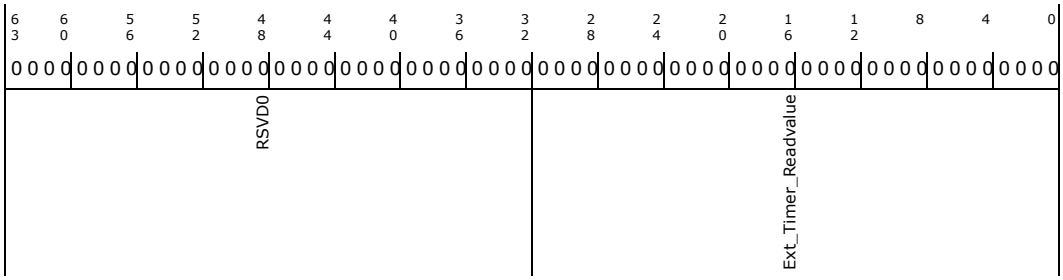
**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63 | 0b<br>RW | **Ext_Timer_Run:** Timer Run bit. The timer runs only when this bit is set. It resumes running from the current value in the readvalue bits. Clearing the bit pauses the timer. |
| 62 | 0b<br>RW/S | **Ext_Timer_Clear:** Timer Clear bit. Clears the timer and sets the value back to zero. This should also be reflected in the readvalue bits |

| Bit Range | Default & Access | Description |
|---|---|---|
| 61:32 | 0b<br>RO | **RSVD0:** Reserved |
| 31:0 | 0b<br>RW | **Ext_Timer_Matchvalue:** The timer will generate a pulse when the Readvalue reaches Matchvalue. The pulse causes a level interrupt to get set in the PISR register. The PISR interrupt needs to be cleared before the next pulse is generated. The timer keeps counting beyond the Readvalue. Setting the Matchvalue to zero makes this a free running timer and no interrupt will be generated in this case. For correct operation, the ISR should either set a new Matchvalue or set it to zero. If nothing is done, the timer will roll over and trigger an interrupt again when it reaches the Matchvalue. |

## 21.11.26 reg_EXT_TIMER_STAT_type (EXT_TIMER_STAT)—Offset C8h

External Timer Control Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**EXT_TIMER_STAT:** [BAR + 140000h] + C8h

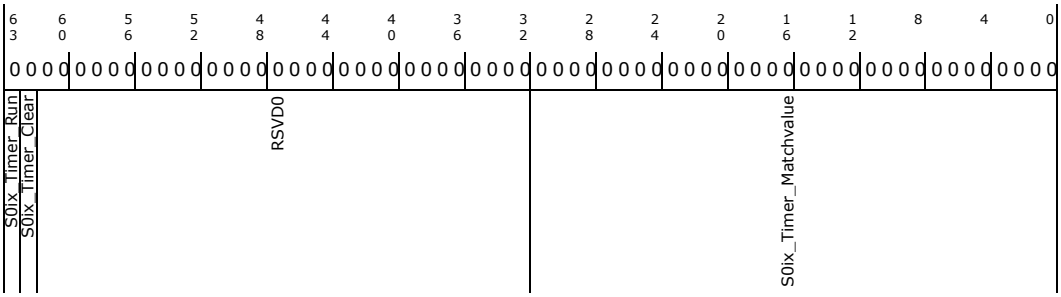
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:32 | 0b<br>RO | **RSVD0:** Reserved |
| 31:0 | 0b<br>RO | **Ext_Timer_Readvalue:** Shows the current count value of the timer |

## 21.11.27 reg_S0ix_TIMER_CNTL_type (S0ix_TIMER_CNTL)—Offset D0h

External Timer Control Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**S0ix_TIMER_CNTL:** [BAR + 140000h] + D0h

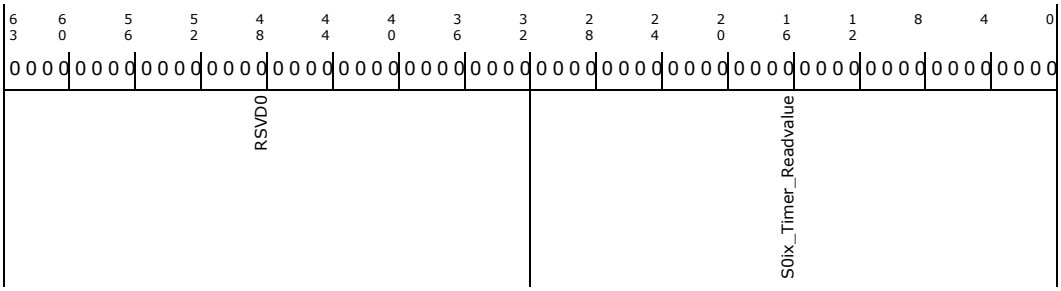
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63 | 0b<br>RW | **S0ix_Timer_Run:** Timer Run bit. The timer runs only when this bit is set. It resumes running from the current value in the readvalue bits. Clearing the bit pauses the timer. |
| 62 | 0b<br>RW/S | **S0ix_Timer_Clear:** Timer Clear bit. Clears the timer and sets the value back to zero. This should also be reflected in the readvalue bits |
| 61:32 | 0b<br>RO | **RSVD0:** Reserved |
| 31:0 | 0b<br>RW | **S0ix_Timer_Matchvalue:** The timer will generate a pulse when the Readvalue reaches Matchvalue. The pulse causes a level interrupt to get set in the PISR register. The PISR interrupt needs to be cleared before the next pulse is generated. The timer keeps counting beyond the Readvalue. Setting the Matchvalue to zero makes this a free running timer and no interrupt will be generated in this case. For correct operation, the ISR should either set a new Matchvalue or set it to zero. If nothing is done, the timer will roll over and trigger an interrupt again when it reaches the Matchvalue. |

## 21.11.28 reg_S0ix_TIMER_STAT_type (S0ix_TIMER_STAT)—Offset D8h

External Timer Control Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**S0ix_TIMER_STAT:** [BAR + 140000h] + D8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

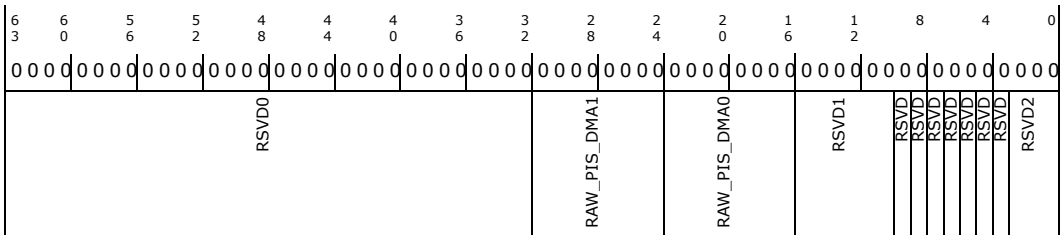
**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:32 | 0b<br>RO | **RSVD0:** Reserved |

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0b<br>RO | **S0ix_Timer_Readvalue:** Shows the current count value of the timer |

## 21.11.29 reg_RAW_PISR_type (XT_RAW_PISR)—Offset E0h

RAW PISR



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**XT_RAW_PISR:** [BAR + 140000h] + E0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63:32 | 0b<br>RO | **RSVD0:** Reserved |
| 31:24 | 00000000b<br>RO | **RAW_PIS_DMA1:** DMA 1 interrupts |

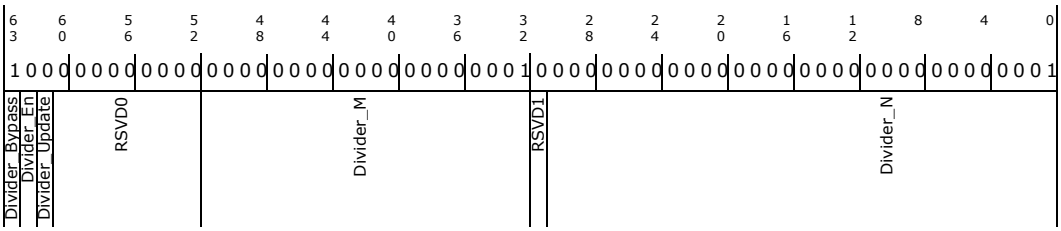
| 5 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 4 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 3 | 0b<br>RO | **Reserved (RSVD):** Reserved. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 2:0 | 0b<br>RO | **RSVD2:** Reserved |

## 21.11.30 reg_SSP0_DIV_CTRL_type (SSP0_DIV_CTRL)—Offset E8h

SSP0 M/N Clock Divider control - Add for VLV



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**SSP0_DIV_CTRL:** [BAR + 140000h] + E8h

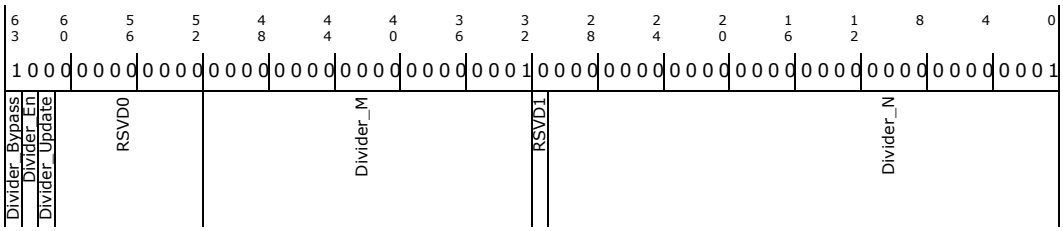
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 8000000100000001h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63 | 1b<br>RW | **Divider_Bypass:** SSP0 Bypass divider |
| 62 | 0b<br>RW | **Divider_En:** SSP0 Enable divider |
| 61 | 0b<br>RW | **Divider_Update:** SSP0 Update divider |
| 60:52 | 0b<br>RO | **RSVD0:** Reserved |
| 51:32 | 1b<br>RW | **Divider_M:** SSP0 Nominator value |
| 31:20 | 0b<br>RO | **RSVD1:** Reserved |
| 19:0 | 1b<br>RW | **Divider_N:** SSP0 Denominator value |

## 21.11.31 reg_SSP1_DIV_CTRL_type (SSP1_DIV_CTRL)—Offset F0h

SSP1 M/N Clock Divider control - Add for VLV



### Access Method

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**SSP1_DIV_CTRL:** [BAR + 140000h] + F0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 8000000100000001h

| Bit Range | Default & Access | Description |
|---|---|---|
| 63 | 1b<br>RW | **Divider_Bypass:** SSP1 Bypass divider |
| 62 | 0b<br>RW | **Divider_En:** SSP1 Enable divider |

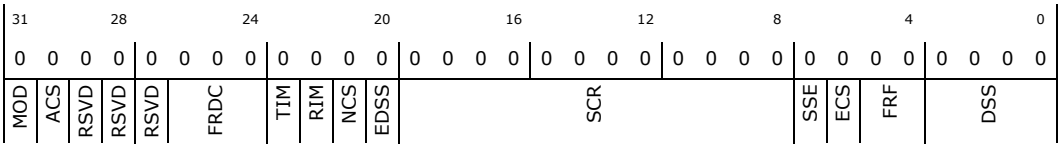
### 21.12.1 SSP Control 0 Register (SSCR0)—Offset 0h

The Enhanced SSP Control 0 registers contain twelve different bit fields that control various functions within the Enhanced SSP. All bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits must be zeroes, and Read values of these bits is undetermined.



#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR0:** [BAR + 0A0000h] + 0h

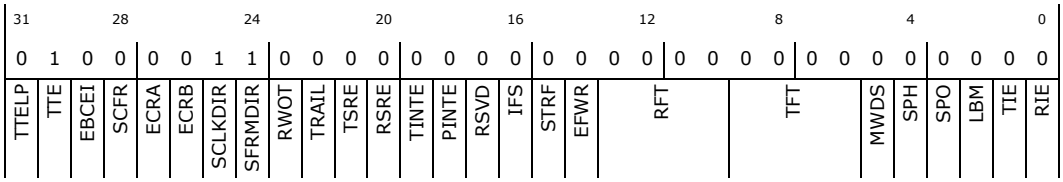
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0b RW | **Mode Select (MOD):** 0 = Normal SSP Mode 1 = Network Mode |
| 30 | 0b RW | **Audio Clock Select (ACS):** 0 = Clock selection is determined by the NCS and ECS bits 1 = Audio Clock (and Audio Clock Divider) are used to clock the SSP's serial clock (SSPSCLK) |
| 29 | 0b RO | **Reserved (RSVD):** Reserved. |
| 28 | 0b RO | **Reserved (RSVD):** Reserved. |
| 27 | 0b RO | **Reserved (RSVD):** Reserved. |
| 26:24 | 000b RW | **Frame Rate Divider Control (FRDC):** Value 0-7 indicates the number of time slots per frame when in network mode (the actual number of time slots is FRDC+1, so 1 to 8 time slots). |
| 23 | 0b RW | **Transmit FIFO Under Run Interrupt Mask (TIM):** 0 = TUR events will generate an SSP interrupt 1 = TUR events will not generate an SSP interrupt |
| 22 | 0b RW | **Receive FIFO Over Run Interrupt Mask (RIM):** 0 = ROR events will generate an SSP interrupt 1 = ROR events will not generate an SSP interrupt |
| 21 | 0b RW | **Network Clock Select (NCS):** 0 = Clock selection is determined by ECS bit 1 = Network clock is used to create the SSP's serial clock (SSPSCLK) |
| 20 | 0b RW | **Extended Data Size Select (EDSS):** 0 = A zero is preappended to the DSS value which sets the DSS range from 4-16 bits 1 = A one is pre-appended to the DSS value which sets the DSS range from 17-32 bits |
| 19:8 | 000h RW | **Serial Clock Rate (SCR):** Value (0 to 4095) used to generate transmission rate of SSP. Serial bit rate = SSP clock/(SCR+1), where SCR is decimal integer. |
| 7 | 0b RW | **Synchronous Serial Port Enable (SSE):** 0 = SSP operation disabled and FIFOs are cleared 1 = SSP operation enabled |
| 6 | 0b RW | **External Clock Select (ECS):** 0 = On-chip clock used to produce the SSP's serial clock (SSPSCLK) 1 = SSPEXTCLK/GPIO pin is used to create the SSP's SSPCLK |
| 5:4 | 00b RW | **Frame Format (FRF):** 00 = Motorola Serial Peripheral Interface (SPI) 01 = Texas Instruments Synchronous Serial Protocol (SSP) 10 = National Semiconductor Microwire 11 = Programmable Serial Protocol (PSP) |
| 3:0 | 0000b RW | **Data Size Select (DSS):** With EDSS as MSB, value+1 gives data size. Values 4 to 32 allowed. |

## 21.12.2 SSP Control 1 Register (SSCR1)—Offset 4h

The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.



**Access Method**

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR1:** [BAR + 0A0000h] + 4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

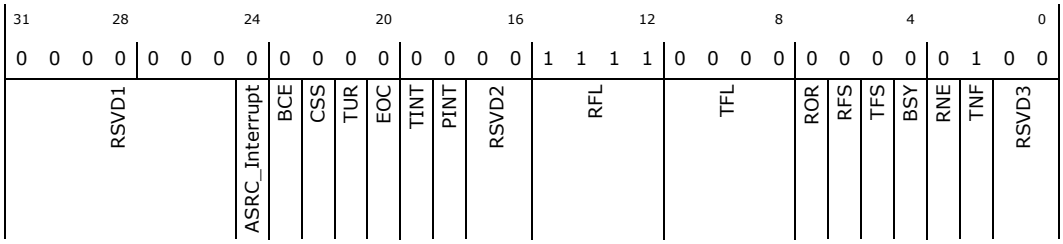
**Default:** 43000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0b RW | **TXD Tristate Enable on Last Phase (TTELP):** 0 = TXD line will be tristated on same clock edge as TXD is to be flopped 1 = TXD line will be tristated 1/2 clock edge after TXD is to be flopped |
| 30 | 1b RW | **TXD Tristate Enable (TTE):** 0 = TXD line will not be tristated 1 = TXD line will be tristated when no transmitting data |
| 29 | 0b RW | **Enable Bit Count Error Interrupt (EBCEI):** 0 = Interrupt due to a bit count error is disabled 1 = Interrupt due to a bit count error is enabled |
| 28 | 0b RW | **Slave Clock Free Running (SCFR):** 0 = clock input to SSPSCLK is continuously running 1 = clock input to SSPSCLK is only active durring transfers |
| 27 | 0b RW | **Enable Clock Request A (ECRA):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled |
| 26 | 0b RW | **Enable Clock Request B (ECRB):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled |
| 25 | 1b RW | **SSP Serial Bit Rate Clock (SSPSCLK) Direction (SCLKDIR):** 0 = Master mode, SSP drives SSPSCLK 1 = Slave mode, SSP recieves SSPSCLK |
| 24 | 1b RW | **SSP Frame (SSPSFRM) Direction (SFRMDIR):** 0 = Master mode, SSP drives SSPSFRM 1 = Slave mode, SSP receives SSPSFRM |
| 23 | 0b RW | **Receive With Out Transmit (RWOT):** 0 = Transmit/Receive mode 1 = Receive without transmit mode |
| 22 | 0b RW | **Trailing Byte (TRAIL):** 0 = Processor based, trailing bytes are handled by processor 1 = DMA based, trailing bytes are handled by DMA |
| 21 | 0b RW | **Transmit Service Request Enable (TSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled |
| 20 | 0b RW | **Receive Service Request Enable (RSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled |
| 19 | 0b RW | **Receiver Time-out Interrupt Enable (TINTE):** 0 = Receiver Time-out interrupts are disabled 1 = Receiver Time-out interrupts are enabled |
| 18 | 0b RW | **Peripheral Trailing Byte Interrupts Enable (PINTE):** 0 = Peripheral Trailing Byte Interrupts are disabled 1 = Peripheral Trailing Byte Interrupts are enabled |
| 17 | 0b RW | **RSVD:** Reserved |
| 16 | 0b RW | **Invert Frame Signal (IFS):** 0 = Frame polarity is determined by SSP format and PSP polarity bits 1 = Frame signal will be inverted from the normal SSP frame signal (as defined by the SSP format nad PSP polarity bits) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 15 | 0b<br>RW | **Select FIFO for EFWR (test mode bit) (when EFWR=1) (STRF):** 0 = Transmit FIFO is selected for both writes and reads through the SSP Data Register (SSDR) 1 = Receive FIFO is selected for both writes and reads through the SSP Data Register (SSDR) |
| 14 | 0b<br>RW | **Enable FIFO Write/Read (test mode bit) (EFWR):** 0 = FIFO write/read special function is disabled (normal SSP operational mode) 1 = FIFO write/read special function is enabled |
| 13:10 | 0000b<br>RW | **Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting. |
| 9:6 | 0000b<br>RW | **Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting. |
| 5 | 0b<br>RW | **Microwire Transmit Data Size (MWDS):** 0 = 8-bit command words are transmitted 1 = 16-bit command words are transmitted |
| 4 | 0b<br>RW | **Motorola SPI SSPSCLK Phase Setting (SPH):** 0 = SSPSCLK is inactive one sycle at the start of a fram and 1/2 cycle at the end of a frame 1 = SSPSCLK is inactive 1/2 cycle at the start of a frame and one cycle at the end of a frame |
| 3 | 0b<br>RW | **Motorola SPI SSPSCLK polarity setting (SPO):** 0 = The inactive or idle state of SSPSCLK is low 1 = The inactive or idle state of SSPSCLK is high |
| 2 | 0b<br>RW | **Loop-Back Mode (test mode bit) (LBM):** 0 = Normal serial port operation enabled 1 = Output of transmit serial shifter connected to input of receive serial shifter, internally |
| 1 | 0b<br>RW | **Transmit FIFO Interrupt Enable (TIE):** 0 = Transmit FIFO level interrupt is disabled 1 = Transmit FIFO level interrupt is enabled |
| 0 | 0b<br>RW | **Receive FIFO Interrupt Enable (RIE):** 0 = Receive FIFO level interrupt is disabled 1 = Receive FIFO level interrupt is enabled |

### 21.12.3 SSP Status Register (SSSR)—Offset 8h

The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request.



#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSSR:** [BAR + 0A0000h] + 8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

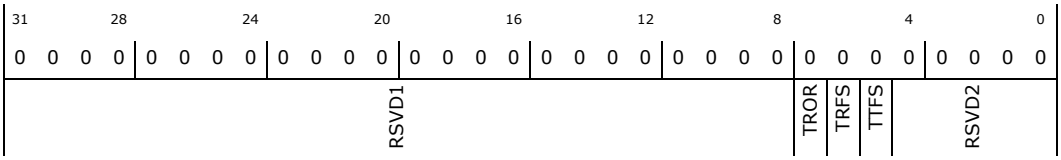
**Default:** 0000F004h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:25 | 00h RO | **RSVD1:** Reserved |
| 24 | 0b RW/1C | **ASRC Interrupt (ASRC_Interrupt):** The interrupt bit is set to 1 when the frame count matches the frame threshold. This is Write 1 to clear register bit. |
| 23 | 0b RW/1C | **Bit Count Error (BCE):** 0 = SSP has not experienced a bit count error 1 = SSPSFRM signal has been asserted when the bit counter was not 0 |
| 22 | 0b RO | **Clock Synchronization Status (CSS):** 0 = SSP is ready for slave clock operations 1 = SSP is currently busy synchronizing slave mode signals |
| 21 | 0b RW/1C | **Transmit FIFO Under Run (TUR):** 0 = Transmit FIFO has not experienced an under run 1 = Attempted read from the transmit FIFO when the FIFO was empty, request interrupt |
| 20 | 0b RW/1C | **End of Chain (EOC):** 0 = DMA has not signaled an end of chain condition 1 = DMA has signaled an end of chain condition |
| 19 | 0b RW/1C | **Receiver Time-out Interrupt (TINT):** 0 = No receiver time-out pending 1 = Receiver time-out pending |
| 18 | 0b RW/1C | **Peripheral Trailing Byte Interrupt (PINT):** 0 = No peripheral trailing byte interrupt pending 1 = Peripheral trailing byte interrupt pending |
| 17:16 | 00b RO | **RSVD2:** Reserved |
| 15:12 | 1111b RO | **Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value 0xF is read, the FIFO is either empty or full and the programmer should refer to the RNE bit. This is a legacy register and only represents the lower 4b of the FIFO Level. The SFIFOL register contains the full FIFO level status. |
| 11:8 | 0000b RO | **Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the TNF bit. This is a legacy register and only represents the lower 4b of the FIFO Level. The SFIFOL register contains the full FIFO level status. |
| 7 | 0b RW/1C | **Receive FIFO Overrun (ROR):** 0 = Receive FIFO has not experienced an overrun 1 = Attempted data write to full receive FIFO, request interrupt |
| 6 | 0b RO | **Receive FIFO Service Request (RFS):** 0 = Receive FIFO level is at or below RFT threshold (RFT), or SSP disabled 1 = Receive FIFO level exceeds RFT threshold (RFT), request interrupt |
| 5 | 0b RO | **Transmit FIFO Service Request (TFS):** 0 = Transmit FIFO level exceeds the TFT threshold (TFT+1), or SSP disabled 1 = Transmit FIFO level is at or below TFT threshold (TFT+1), request interrupt |
| 4 | 0b RO | **SSP Busy (BSY):** 0 = SSP is idle or disabled 1 = SSP currently transmitting or receiving a frame |
| 3 | 0b RO | **Receive FIOF Not Empty (RNE):** 0 = Receive FIFO is empty 1 = Receive FIFO is not empty |
| 2 | 1b RO | **Transmit FIFO Not Full (TNF):** 0 = Transmit FIFO is full 1 = Transmit FIFO is not full |

| Bit Range | Default & Access | Description |
|---|---|---|
| 1:0 | 00b<br>RO | **RSVD3:** Reserved |

## 21.12.4 SSP Interupt Test Register (SSITR)—Offset Ch

The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSITR:** [BAR + 0A0000h] + Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

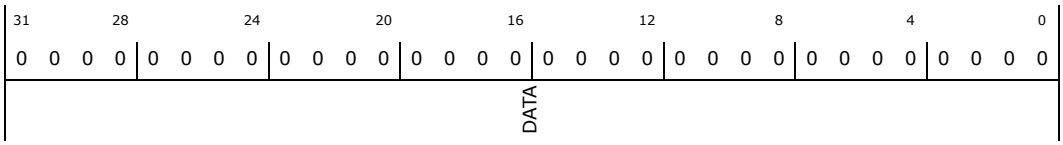
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 000000h<br>RO | **RSVD1:** Reserved |
| 7 | 0b<br>RW | **Test Receive FIFO overrun (TROR):** 0 = No receive FIFO overrun service request 1 = Generates non-maskable interrupt to CPU. No DMA request is generated |
| 6 | 0b<br>RW | **Test Receive FIFO service request (TRFS):** 0 = No receive FIFO service request 1 = Generates non-maskable interrupt to CPU and a DMA request for receive FIFO |
| 5 | 0b<br>RW | **Test Transmit FIFO service request (TTFS):** 0 = No transmit FIFO service request pending 1 = Generates non-maskable interrupt to CPU and a DMA request for transmit FIFO |
| 4:0 | 00000b<br>RO | **RSVD2:** Reserved |

## 21.12.5 SSP Data Register (SSDR)—Offset 10h

The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the

register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.TFL, SSSR.RFL, SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32-bits is automatically right-justified in the Receive FIFO. When the Enhanced SSP is programmed for National Semiconductor Microwire* frame format and if the size for Transmit data is 8-bits as selected by SSCR1.MWDS=0, then the most significant 24-bits are ignored. Similarly, if the size for the Transmit data is 16-bit as selected by SSCR1.MWDS=1, then most significant 16-bits are ignored. The SSCR0.DSS field controls the Receive data size.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSDR:** [BAR + 0A0000h] + 10h

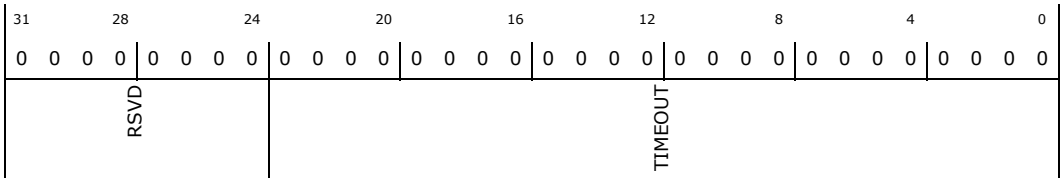
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 00000000h RO | **Data (DATA):** Data word to be written to/read from transmit/receive FIFO. When reading from this register when the SSP is disabled (SSE=0) then this will return indeterminate data. |

## 21.12.6 SSP Time-Out Regsiter (SSTO)—Offset 28h

The Enhanced SSP Time-Out registers have single bit fields that specify the time-out value used to signal a period of inactivity within the Receive FIFO. Note that Writes to reserved bits must be zeroes and reads are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTO:** [BAR + 0A0000h] + 28h

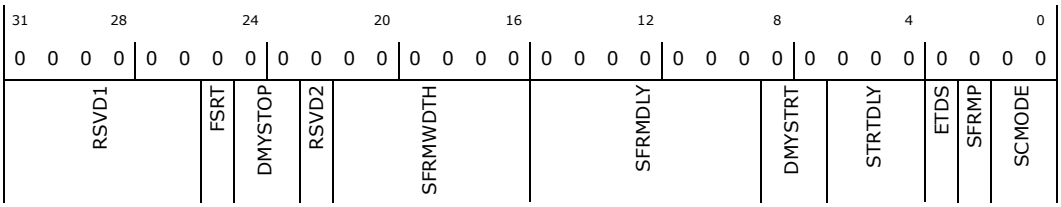
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 00h<br>RO | **RSVD:** Reserved |
| 23:0 | 000000h<br>RW | **Timeout Value (TIMEOUT):** Is the value that defines the timeout interval, given by TIMEOUT/Peripheral Clock Frequency |

## 21.12.7 SSP Programmable Protocol Register (SSPSP)—Offset 2Ch

The Enhanced SSP Programmable Protocol registers are read-write registers that contain eight fields that are used to program the various programmable serial-protocol parameters. When using PSP format in Network mode, the parameters SFRMDLY, STRTDLY, DMYSTP, DMYSTRT must be set to 0. Other parameters (such as FRMPOL, SCMODE, FSRT, SFRMDWDTH) are programmable. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSPSP:** [BAR + 0A0000h] + 2Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

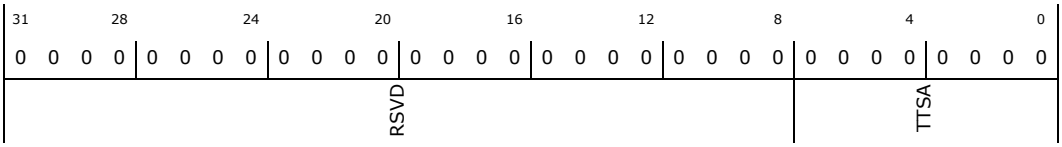
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:26 | 000000b<br>RO | **RSVD1:** Reserved |
| 25 | 0b<br>RW | **Frame Sync Relative Timing Bit (FSRT):** 0 = Next frame is asserted after the end of the T4 timing 1 = Next frame is asserted with the LSB of the previous frame |
| 24:23 | 00b<br>RW | **Dummy Stop (DMYSTOP):** Programmed value sets the number of SSPSCLK cycles that follow the transmitted data |
| 22 | 0b<br>RW | **RSVD2:** Reserved |
| 21:16 | 000000b<br>RW | **Serial Frame Width (SFRMWDTH):** Programmed value sets frame width (1-38) |
| 15:9 | 0000000b<br>RW | **Serial Frame Delay (SFRMDLY):** Programmed value sets the number of half SSPSCLK cycles from TXD/RXD being driven to SSPSFRM being asserted (0-74) |
| 8:7 | 00b<br>RW | **Dummy Start (DMYSTRT):** Programmed value sets the number of SSPSCLKs after STRTDLY is complete that precede the transmit/receive data |
| 6:4 | 000b<br>RW | **Start Delay (STRTDLY):** Programmed value sets start delay that is used to set the idle time of SSPSCLK between transfers (0-7 SSPSCLK periods) |
| 3 | 0b<br>RW | **End of Transfer Data State (ETDS):** 0 = Low 1 = Last value (bit 0) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 2 | 0b<br>RW | **Serial Frame Polarity (SFRMP):** 0 = SSPSFRM is active low 1 = SSPSFRM is active high |
| 1:0 | 00b<br>RW | **Serial bit-rate Clock Mode (SCMODE):** 00 = Data driven (falling), Data sampled (rising), Idle state (low) 01 = Data driven (rising), Data sampled (falling), Idle state (low) 10 = Data driven (rising), Data sampled (falling), Idle state (high) 11 = Data driven (falling), Data sampled (rising), Idle state (high) |

## 21.12.8 SSM TX Time Slot Active Register (SSTSA)—Offset 30h

The Enhanced SSP TX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will transmit data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTSA:** [BAR + 0A0000h] + 30h

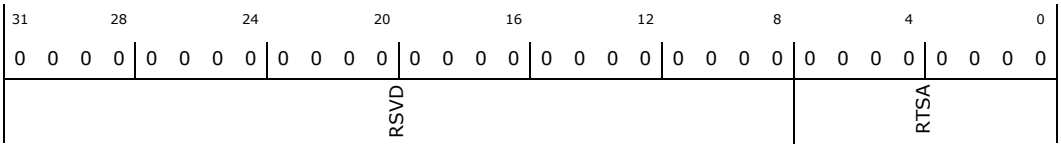
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 000000h<br>RO | **RSVD:** Reserved |
| 7:0 | 00h<br>RW | **TX Time Slot Active (TTSA):** 0 = SSP will not transmit data in this time slot 1 = SSP will transmit data in this time slot |

## 21.12.9 SSP RX Time Slot Active Register (SSRSA)—Offset 34h

The Enhanced SSP RX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will receive data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSRSA:** [BAR + 0A0000h] + 34h

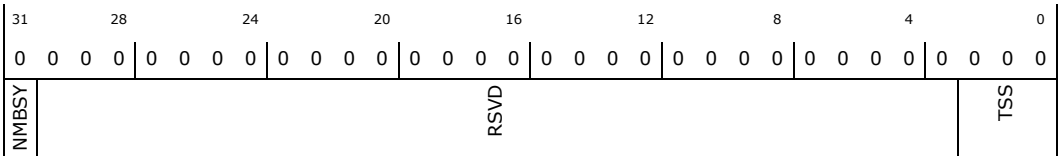
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 000000h RO | **RSVD:** Reserved |
| 7:0 | 00h RW | **RX Time Slot Active (RTSA):** 0 = SSP will not receive data in this time slot 1 = SSP will receive data in this time slot |

## 21.12.10 SSP Time Slot Status Register (SSTSS)—Offset 38h

The Enhanced SSP Time Slot Status registers are read only registers that indicate which Time Slot the Enhanced SSP is currently in when the Enhanced SSP is in Network Mode (SSCR0.MOD = 1). This register is not valid when the Enhanced SSP is not in Network Mode. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTSS:** [BAR + 0A0000h] + 38h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

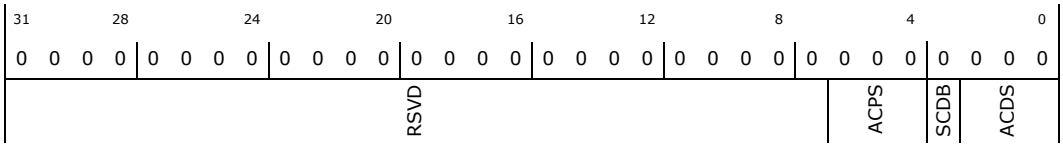
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0b RO | **Network Mode Busy (NMBSY):** 0 = No frame is currently active (in network mode only) 1 = SSP is in network mode and a frame is currently active |
| 30:3 | 0000000h RO | **RSVD:** Reserved |
| 2:0 | 000b RO | **Time Slot Status (TSS):** Value indicates which time slot is currently active |

## 21.12.11 SSP Audio Clock Divider (SSACD)—Offset 3Ch

The Enhanced SSP Audio Clock Divider registers are read-write registers that indicate which clock frequency is sent to the Enhanced SSP and to the SYSCLK pin. If SSCR0.SCR is not 0, then there is no guaranteed phase relationship between SYSCLK and SSPSCLK. The SSPSFRM Frame Synch Sampling Frequency is calculated by dividing the chosen PLL output clock frequency (SSACD.ACPS) by the chosen divider (SSACD.ACDS) which gives the SYSCLK frequency. The SYSCLK is then divided by 4 (or by 1) to get the SSPSCLK. The SSPSCLK is divided by the data size (EDSS, DSS values) and by the number of time slots being used (SSCR0.FRDC value), if any, to give the

SSPSFRM frequency. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined. It's important to note that this feature is only available if implemented by the project instantiation. A clock source and mux must be instantiated outside of the SSP controller for this feature to work. Only this register is designed into the SSP Controller.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSACD:** [BAR + 0A0000h] + 3Ch

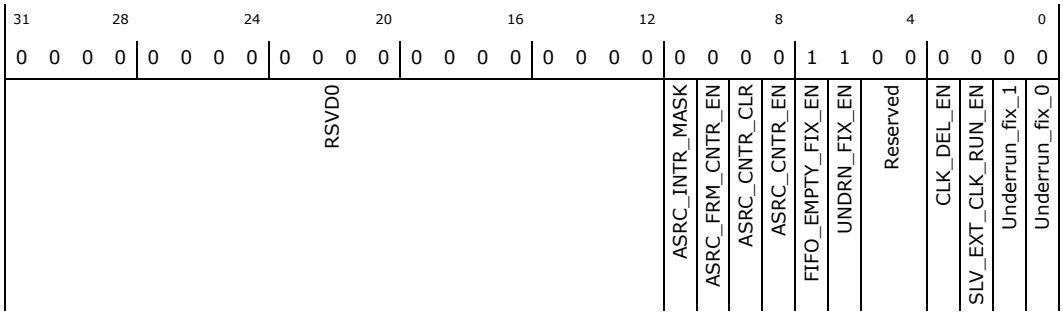
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:7 | 0000000h RO | **RSVD:** Reserved |
| 6:4 | 000b RW | **Audio Clock PLL Select (ACPS):** Value indicates which PLL output clock is sent to the clock divider in the clock unit 000: 5.622MHz, 001: 11.345MHz, 010: 12.235MHz, 011: 14.857MHz, 100: 32.842MHz, 101: 48.000MHz, 110, 111: Reserved |
| 3 | 0b RW | **SYSCLK Divider Bypass (SCDB):** 0 = SYSCLK is divided by 4 before being sent to SSP 1 = SYSCLK is not divided before being sent to SSP |
| 2:0 | 000b RW | **Audio Clock Divider Select (ACDS):** Value indicates which divider will be used by the clock unit to create the SYSCLK output pin. Clock divider value will be 2^ACDS, max ACDS = 5. |

## 21.12.12 SSP Control 2 Register (SSCR2)—Offset 40h

The command status register 2 is extension of command status register and contains various feature enable and disables.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR2:** [BAR + 0A0000h] + 40h

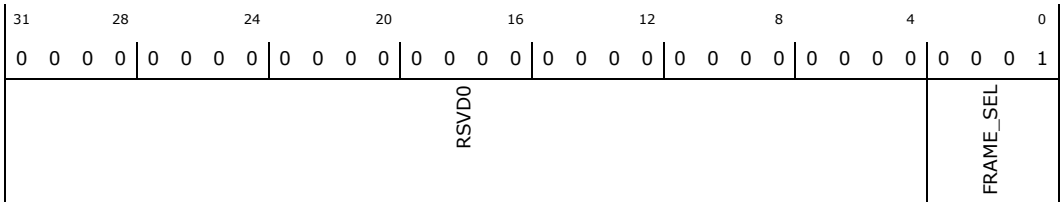
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 000000C0h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:12 | 0b<br>RO | **RSVD0:** Reserved |
| 11 | 0b<br>RW | **ASRC Interrupt Mask (ASRC_INTR_MASK):** Setting this bit to 1 masks the ASRC interrupt that is generated every time the frame count matches the frame threshold. Software should override this bit, since it have no reset value |
| 10 | 0b<br>RW | **ASRC frame count enable (ASRC_FRM_CNTR_EN):** Setting this bit enables the frame counter to start running. Clearing this bit will make the frame counter go back to zero immediately. |
| 9 | 0b<br>RW/AC | **ASRC Counter Clear (ASRC_CNTR_CLR):** Setting this to 1 will clear the ASRC Free running counter. This bit will self clear after the counter is cleared. |
| 8 | 0b<br>RW | **ASRC Counter enable (ASRC_CNTR_EN):** Setting this bit makes the Free running ASRC counter to start running. Clearing this bit will make it pause and hold it's current value. |
| 7 | 1b<br>RW | **Fifo empty fix enable (FIFO_EMPTY_FIX_EN):** Corner cases between the FIFO empty and APB writes happening to the TX FIFO around the time the new data needs to be sent out on the TXD are fixed with this bit. |
| 6 | 1b<br>RW | **Underrun fix enable (UNDRN_FIX_EN):** OSC to PLL switch along with underrun was causing unexpected behavior. This bit enables the fix for that bug. |
| 5:4 | 00b<br>RW | **Reserved:** This is a RW bit with no effect on IP behavior |
| 3 | 0b<br>RW | **Clock Delay Enable (CLK_DEL_EN):** When CLK_DEL_EN = 0, delay logic for capturing data from device is disabled. When CLK_DEL_EN = 1, delay logic for capturing data from device is delayed by half a period of the IO clock |
| 2 | 0b<br>RW | **Slave Mode External Clock Run Enable (SLV_EXT_CLK_RUN_EN):** When in Slave mode the receive state machine requires several clock edges (around 6) to properly sample incoming data. This bit enables a free running clock to the receive state machine before any data is received to properly sample the incoming data. 0 = Disable 1 = Enable |
| 1 | 0b<br>RW | **Mode 1 Underrun Fix (Underrun_fix_1):** Mode 1 of transmit underrun fix. In this mode, new data will start on the underrun slot. This function is only appled to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1 If both underrun modes are enable, mode 1 has higher priority. |
| 0 | 0b<br>RW | **Mode 0 Underrun Fix (Underrun_fix_0):** Mode 0 of transmit underrun fix. In this mode, new data will always start at slot 0. This function is only applied to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1 |

## 21.12.13 SSP Frame Select Register (SSFS)—Offset 44h

The SSP Frame select register is used to choose which frame signal to assert when accessing a slave device. SW drivers should set this register to assert the correct frame select to the targetted device.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSFS:** [BAR + 0A0000h] + 44h

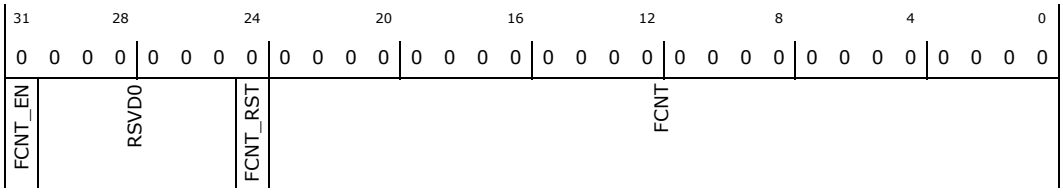
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000001h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:4 | 0b<br>RO | **RSVD0:** Reserved |
| 3:0 | 0001b<br>RW | **Frame Select Enable (FRAME_SEL):** Each bit in this field corresponds to a frame signal of the SSP Controller. Not all SSP controllers have all frame selects pinned out so consult the pin list for indication of which SSP controllers support how many frame signals. [Bit 0] Frame Select 0 Master and Slave Supported [Bit 1] Frame Select 1 Master Only [Bit 2] Frame Select 2 Master Only [Bit 3] Frame Select 3 Master Only 0 = Frame Select Disabled 1 = Frame Select Enabled |

## 21.12.14 SSP Slot Frame Counter Register[0-7] (FRAME_CNT[0-7])—Offset 48h, Count 8, Stride 4h

The slot frame counter is typically used in Audio modes and increments the counter every two SSPSCLKs. This allows the OS to check the progress of a transfer. Since the SSP can support upto 8 slots in network mode there are 8 slot frame counters.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**FRAME_CNT[0-7]:** [BAR + 0A0000h] + 48h + [0-7]*4h

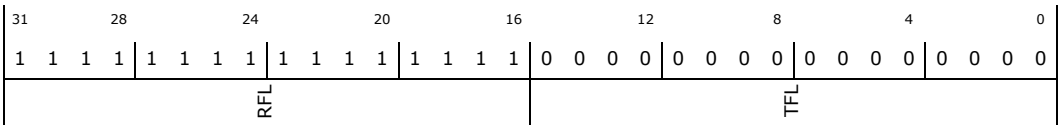
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0b<br>RW | **Slot Frame Count Enable (FCNT_EN):** 0 = Disable frame counter. 1 = Enable frame counter. |
| 30:25 | 0b<br>RO | **RSVD0:** Reserved |
| 24 | 0b<br>WO | **Slot Frame Count Reset (FCNT_RST):** SSP frame counter reset. Writing a 1 to this bit clears the frame counter. |
| 23:0 | 000000h<br>RO | **Slot Frame Count (FCNT):** SSP frame count. |

## 21.12.15 SSP FIFO Level Register (SFIFOL)—Offset 68h

The SFIFOL register describes the current state of the RX and TX FIFOs. Not all bits of the TFL and RFL fields are used and depends on the actual hardware FIFO depth used in the instantiation of the SSP controller. This FIFO level register is meant to replace the SSSR.TFL and SSR.RFL fields.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SFIFOL:** [BAR + 0A0000h] + 68h

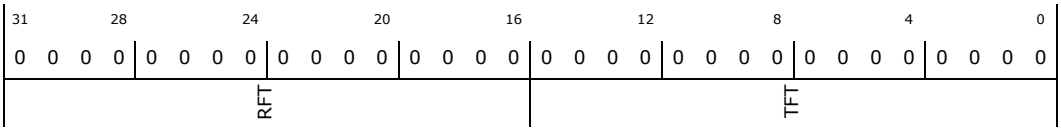
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** FFFF0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | FFFFh RO | **Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value of all 0xF's are read, the FIFO is either empty or full and the programmer should refer to the SSSR.RNE bit. |
| 15:0 | 0000h RO | **Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the SSSR.TNF bit. |

## 21.12.16 SSP FIFO Trigger Threshold Register (SFIFOTT)—Offset 6Ch

The SFIFOTT is a register that determines when the the FIFOs will assert an interrupt for FIFO full indication. This is meant to replace the SSCR1.RFT and SSCR1.TFT legacy registers. The max size of these registers is based on the actualy FIFO depth in hardware and not the actual size of the bit field.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SFIFOTT:** [BAR + 0A0000h] + 6Ch

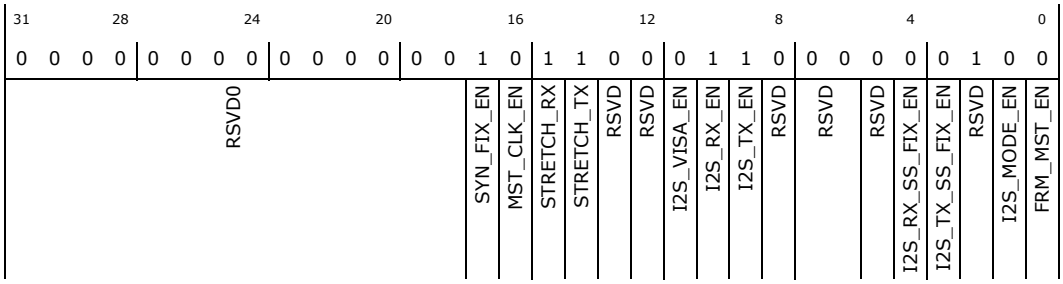
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. Notes on setting the RFT value. This applies to cases where SSP is receiving data from a device and is interfaced with a DMA channel via the hardware handshake mechanism. Please follow the following recommendations: 1. Number of bits denoted by the (DSS, EDSS) parameters in the SSP should match the SRC_TR_WIDTH programmed in the DMA channel. 2. (RFT+1) should be equal to (SRC_MSIZE). 3. Another option to 2 is to keep the BLOCK_TS in the DMA to be a multiple of (RFT+1) |
| 15:0 | 0000h<br>RW | **Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. |

## 21.12.17 SSP Control 3 Register (SSCR3)—Offset 70h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR3:** [BAR + 0A0000h] + 70h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

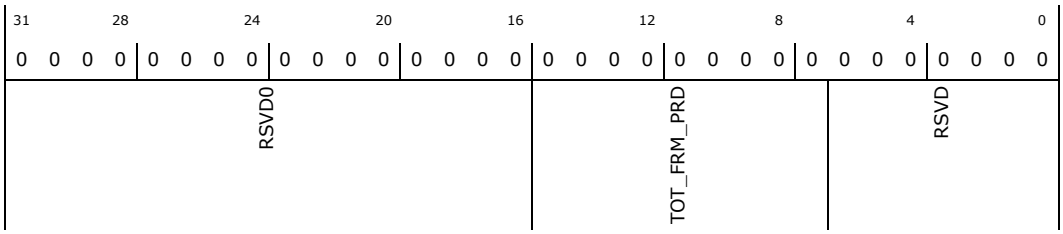
**Default:** 0002C604h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:18 | 0b<br>RO | **RSVD0:** Reserved |
| 17 | 1b<br>RW | **Sync Fix Enable (SYN_FIX_EN):** This is a chicken bit for enabling the synchronizer fix for clr_underrun_ssp signal. SW should preserve this bit at its default value. |
| 16 | 0b<br>RW | **Master Mode Clock Enable (MST_CLK_EN):** When in single slot master mode (which is the mode used for emulating I2S or LJ master mode), the SSP core can stop the clock on a Tx underflow condition, preventing the Rx side from receiving data. This bit, when set, forces the clock to run when a Tx underflow happens, thereby allowing Rx side to continue functioning while Tx side is in underflow. SW should set this bit when I2S or LJ master mode is enabled i.e. bits 0 and 1 in this register are both set or when using 1-slot PCM (SFS or LFS) master mode operation. Otherwise, SW should leave this at 0. |
| 15 | 1b<br>RW | **Stretch RX Pulse (STRETCH_RX):** HW uses this as a chicken bit to stretch the RX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value. |
| 14 | 1b<br>RW | **Stretch TX Pulse (STRETCH_TX):** HW uses this as a chicken bit to stretch the TX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 13 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 12 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 11 | 0b<br>RW | **I2S VISA Enable (I2S_VISA_EN):** Enables newly added I2S and PCM wrapper logic debug signals sent out on the VISA bus instead of the core SSP debug signals. 0 = Core SSP Debug Signals 1 = New I2S and PCM Debug Signals |
| 10 | 1b<br>RW | **I2S Receive Enable (I2S_RX_EN):** When set, this bit enables data to be received on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational. |
| 9 | 1b<br>RW | **I2S Transmit Enable (I2S_TX_EN):** When set, this bit enables data to be transmitted on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational. |
| 8 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 7:6 | 00b<br>RO | **Reserved (RSVD):** Reserved. |
| 5 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 4 | 0b<br>RW | **I2S RX Slot Swap Fix Enable (I2S_RX_SS_FIX_EN):** This bit enables the Rx overrun fix in I2S or LJ modes and prevents channel swapping when Rx overrun happens. Note that this bit does not apply to any PCM modes. PCM modes still have the Rx overflow channel aliasing issue, similar to PNW/CLV. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable |
| 3 | 0b<br>RW | **I2S TX Slot Swap Fix Enable (I2S_TX_SS_FIX_EN):** This bit enables the TX underflow fix in I2S or LJ modes and prevents channel swapping when TX underflow happens. Note that this bit does not apply to any PCM modes. PCM modes still have the TX underflow channel aliasing issue, similar to PNW/CLV. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable |
| 2 | 1b<br>RO | **Reserved (RSVD):** Reserved. |
| 1 | 0b<br>RW | **I2S Mode Enable (I2S_MODE_EN):** This bit enables I2S Mode. In I2S mode, slave or master mode operation is selected by appropriately clearing/setting bit 0 in this register. SW should select I2S mode operation before enabling the SSP controller. 0 = Disabled 1 = Enabled |
| 0 | 0b<br>RW | **Frame Master Enable (FRM_MST_EN):** When set, this bit enables the internal frame generator logic that allows accurate frame rate generation. This bit should be set for I2S and PCM master mode operations and cleared for all other modes. SW should select the proper value in this bit before enabling SSP controller. 0 = Disabled 1 = Enabled |

## 21.12.18 SSP Control 4 Register (SSCR4)—Offset 74h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR4:** [BAR + 0A0000h] + 74h

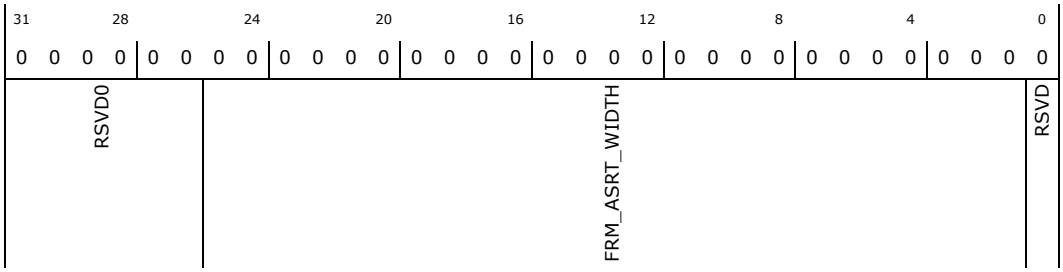
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0b<br>RO | **RSVD0:** Reserved |
| 15:7 | 000h<br>RW | **Total Frame Period (TOT_FRM_PRD):** The total frame period (both asserted and de-asserted time of frame), measured in bit clocks, that is driven in I2S, LJ and PCM master modes. This can be controlled to get the desired accuracy on frame rate. A value of 0 and a value smaller than the value programmed in SSCR5.FrameAssertedWidth are illegal |
| 6:0 | 00h<br>RO | **Reserved (RSVD):** Reserved. |

## 21.12.19 SSP Control 5 Register (SSCR5)—Offset 78h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR5:** [BAR + 0A0000h] + 78h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

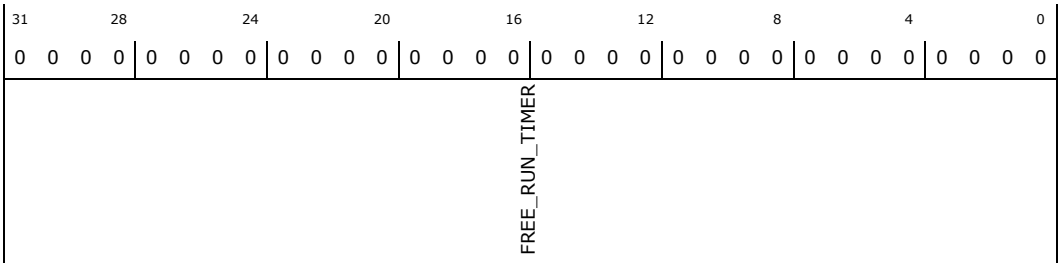
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:26 | 0b<br>RO | **RSVD0:** Reserved |
| 25:1 | 0000000h<br>RW | **Frame Assert Width (FRM_ASRT_WIDTH):** This field controls the width of the asserted period of frame in I2S, LJ and PCM master modes. A value of 1 indicates a width of 2 bit clock period, 2 indicates a width of 3 bit clock periods, etc. The frame width is Frame Assert Width + 1. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 0 | 0b<br>RO | **Reserved (RSVD):** Reserved. |

## 21.12.20 ASRC Free Running Timer (ASRC_FRT)—Offset 7Ch

This is a 32 bit free running counter that can be enabled, paused or cleared using bits in the SSCR2_XR register. The value reflected here will be noted down in the timer snapshot register when the frame count matches the frame threshold



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ASRC_FRT:** [BAR + 0A0000h] + 7Ch

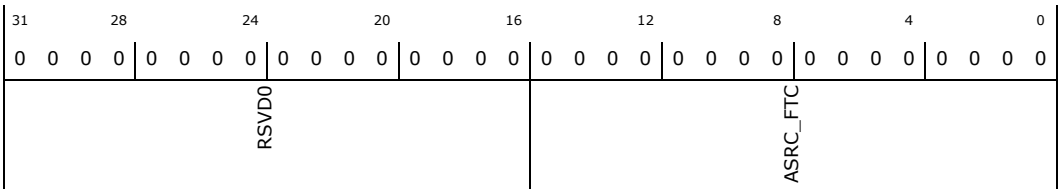
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 00000000h<br>RO/V | **ASRC free running timer (FREE_RUN_TIMER):** This field reflects the value of the free running timer. |

## 21.12.21 Frame Threshold for ASRC Frame Count (ASRC_FTC)—Offset 80h

The frame threshold value at which the timer snapshot will be taken is written here.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ASRC_FTC:** [BAR + 0A0000h] + 80h

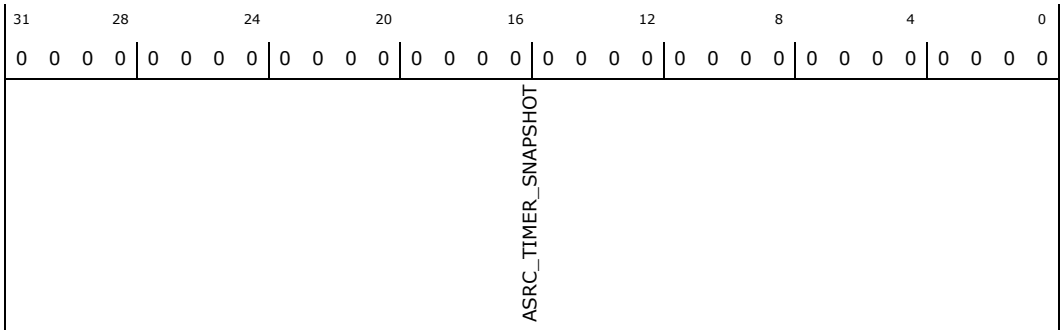
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0b<br>RO | **RSVD0:** Reserved |
| 15:0 | 0000h<br>RW | **ASRC Frame Threshold (ASRC_FTC):** The 16 bit frame threshold value needs to be written here. Every time the frame count matches the frame threshold a snapshot of the free running timer will be taken and stored in the snapshot register. An interrupt will be generated as well. If the frame threshold is changed on the fly during operation then the following behavior is expected. Previous value = A, New value value = B If B ) A : The frame counter keeps counting up to the new value. Nothing happens when the frame counter reaches the old value of A. If B ( A : The frame counter resets to zero on the next frame. No interrupt or snapshot is generated in this case. |

## 21.12.22 ASRC Timer Snapshot (ASRC_SNPSHT)—Offset 84h

Frame Snapshot Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ASRC_SNPSHT:** [BAR + 0A0000h] + 84h

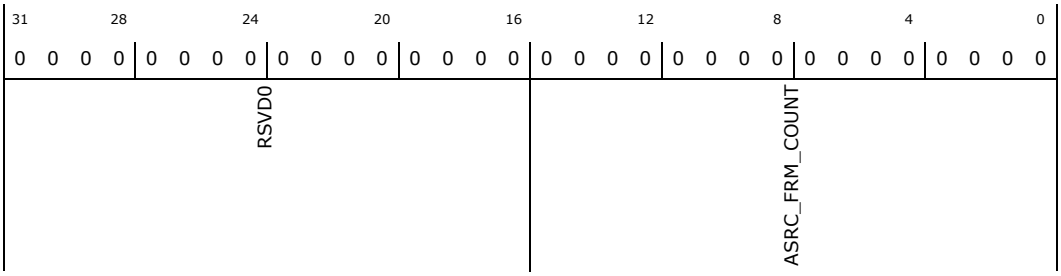
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 00000000h<br>RO | **ASRC Frame Snapshot (ASRC_TIMER_SNAPSHOT):** This field holds the 32 bit snapshot value. The value is noted on the clock cycle when the frame threshold matches the frame count. |

## 21.12.23 ASRC Frame Count (ASRC_FRMCNT)—Offset 88h

Frame Count Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ASRC_FRMCNT:** [BAR + 0A0000h] + 88h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0b<br>RO | **RSVD0:** Reserved |
| 15:0 | 0000h<br>RO | **ASRC Frame Count (ASRC_FRM_COUNT):** This is the current frame count. This is a debug register and the value is noted in this register only when the LSB of the frame counter flips. If the counter is cleared when it was at an even value, the cleared value is not reflected here. |

## 21.13 Low Power Audio I2S0 Address Map

**Table 235. Summary of Low Power Audio I2S0 Memory Mapped I/O Registers—BAR**

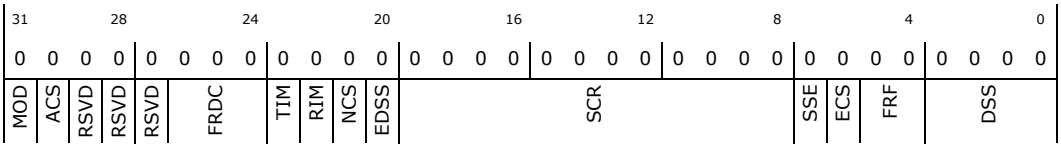
### 21.13.1 SSP Control 0 Register (SSCR0)—Offset 0h

The Enhanced SSP Control 0 registers contain twelve different bit fields that control various functions within the Enhanced SSP. All bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits must be zeroes, and Read values of these bits is undetermined.



**Access Method**

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR0:** [BAR + 0A1000h] + 0h

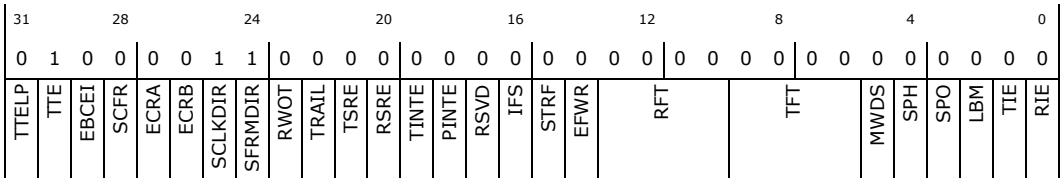
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0b RW | **Mode Select (MOD):** 0 = Normal SSP Mode 1 = Network Mode |
| 30 | 0b RW | **Audio Clock Select (ACS):** 0 = Clock selection is determined by the NCS and ECS bits 1 = Audio Clock (and Audio Clock Divider) are used to clock the SSP's serial clock (SSPSCLK) |
| 29 | 0b RO | **Reserved (RSVD):** Reserved. |
| 28 | 0b RO | **Reserved (RSVD):** Reserved. |
| 27 | 0b RO | **Reserved (RSVD):** Reserved. |
| 26:24 | 000b RW | **Frame Rate Divider Control (FRDC):** Value 0-7 indicates the number of time slots per frame when in network mode (the actual number of time slots is FRDC+1, so 1 to 8 time slots). |
| 23 | 0b RW | **Transmit FIFO Under Run Interrupt Mask (TIM):** 0 = TUR events will generate an SSP interrupt 1 = TUR events will not generate an SSP interrupt |
| 22 | 0b RW | **Receive FIFO Over Run Interrupt Mask (RIM):** 0 = ROR events will generate an SSP interrupt 1 = ROR events will not generate an SSP interrupt |
| 21 | 0b RW | **Network Clock Select (NCS):** 0 = Clock selection is determined by ECS bit 1 = Network clock is used to create the SSP's serial clock (SSPSCLK) |
| 20 | 0b RW | **Extended Data Size Select (EDSS):** 0 = A zero is preappended to the DSS value which sets the DSS range from 4-16 bits 1 = A one is pre-appended to the DSS value which sets the DSS range from 17-32 bits |
| 19:8 | 000h RW | **Serial Clock Rate (SCR):** Value (0 to 4095) used to generate transmission rate of SSP. Serial bit rate = SSP clock/(SCR+1), where SCR is decimal integer. |
| 7 | 0b RW | **Synchronous Serial Port Enable (SSE):** 0 = SSP operation disabled and FIFOs are cleared 1 = SSP operation enabled |
| 6 | 0b RW | **External Clock Select (ECS):** 0 = On-chip clock used to produce the SSP's serial clock (SSPSCLK) 1 = SSPEXTCLK/GPIO pin is used to create the SSP's SSPCLK |
| 5:4 | 00b RW | **Frame Format (FRF):** 00 = Motorola Serial Peripheral Interface (SPI) 01 = Texas Instruments Synchronous Serial Protocol (SSP) 10 = National Semiconductor Microwire 11 = Programmable Serial Protocol (PSP) |
| 3:0 | 0000b RW | **Data Size Select (DSS):** With EDSS as MSB, value+1 gives data size. Values 4 to 32 allowed. |

## 21.13.2 SSP Control 1 Register (SSCR1)—Offset 4h

The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.



**Access Method**

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR1:** [BAR + 0A1000h] + 4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 43000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0b RW | **TXD Tristate Enable on Last Phase (TTELP):** 0 = TXD line will be tristated on same clock edge as TXD is to be flopped 1 = TXD line will be tristated 1/2 clock edge after TXD is to be flopped |
| 30 | 1b RW | **TXD Tristate Enable (TTE):** 0 = TXD line will not be tristated 1 = TXD line will be tristated when no transmitting data |
| 29 | 0b RW | **Enable Bit Count Error Interrupt (EBCEI):** 0 = Interrupt due to a bit count error is disabled 1 = Interrupt due to a bit count error is enabled |
| 28 | 0b RW | **Slave Clock Free Running (SCFR):** 0 = clock input to SSPSCLK is continuously running 1 = clock input to SSPSCLK is only active durring transfers |
| 27 | 0b RW | **Enable Clock Request A (ECRA):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled |
| 26 | 0b RW | **Enable Clock Request B (ECRB):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled |
| 25 | 1b RW | **SSP Serial Bit Rate Clock (SSPSCLK) Direction (SCLKDIR):** 0 = Master mode, SSP drives SSPSCLK 1 = Slave mode, SSP recieves SSPSCLK |
| 24 | 1b RW | **SSP Frame (SSPSFRM) Direction (SFRMDIR):** 0 = Master mode, SSP drives SSPSFRM 1 = Slave mode, SSP receives SSPSFRM |
| 23 | 0b RW | **Receive With Out Transmit (RWOT):** 0 = Transmit/Receive mode 1 = Receive without transmit mode |
| 22 | 0b RW | **Trailing Byte (TRAIL):** 0 = Processor based, trailing bytes are handled by processor 1 = DMA based, trailing bytes are handled by DMA |
| 21 | 0b RW | **Transmit Service Request Enable (TSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled |
| 20 | 0b RW | **Receive Service Request Enable (RSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled |
| 19 | 0b RW | **Receiver Time-out Interrupt Enable (TINTE):** 0 = Receiver Time-out interrupts are disabled 1 = Receiver Time-out interrupts are enabled |
| 18 | 0b RW | **Peripheral Trailing Byte Interrupts Enable (PINTE):** 0 = Peripheral Trailing Byte Interrupts are disabled 1 = Peripheral Trailing Byte Interrupts are enabled |
| 17 | 0b RW | **RSVD:** Reserved |
| 16 | 0b RW | **Invert Frame Signal (IFS):** 0 = Frame polarity is determined by SSP format and PSP polarity bits 1 = Frame signal will be inverted from the normal SSP frame signal (as defined by the SSP format nad PSP polarity bits) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 15 | 0b<br>RW | **Select FIFO for EFWR (test mode bit) (when EFWR=1) (STRF):** 0 = Transmit FIFO is selected for both writes and reads through the SSP Data Register (SSDR) 1 = Receive FIFO is selected for both writes and reads through the SSP Data Register (SSDR) |

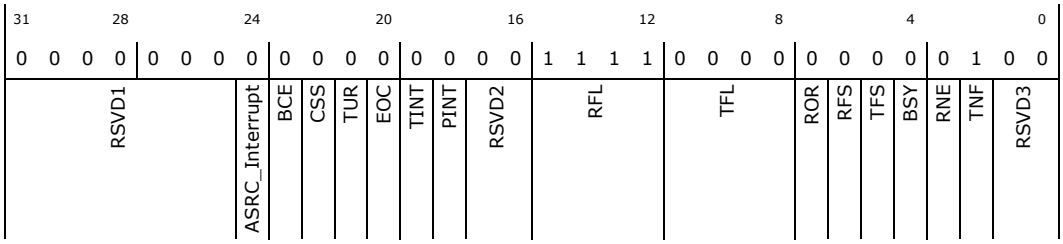
### 21.13.3 SSP Status Register (SSSR)—Offset 8h

The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request.



#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSSR:** [BAR + 0A1000h] + 8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000F004h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:25 | 00h RO | **RSVD1:** Reserved |
| 24 | 0b RW/1C | **ASRC Interrupt (ASRC_Interrupt):** The interrupt bit is set to 1 when the frame count matches the frame threshold. This is Write 1 to clear register bit. |
| 23 | 0b RW/1C | **Bit Count Error (BCE):** 0 = SSP has not experienced a bit count error 1 = SSPSFRM signal has been asserted when the bit counter was not 0 |
| 22 | 0b RO | **Clock Synchronization Status (CSS):** 0 = SSP is ready for slave clock operations 1 = SSP is currently busy synchronizing slave mode signals |
| 21 | 0b RW/1C | **Transmit FIFO Under Run (TUR):** 0 = Transmit FIFO has not experienced an under run 1 = Attempted read from the transmit FIFO when the FIFO was empty, request interrupt |
| 20 | 0b RW/1C | **End of Chain (EOC):** 0 = DMA has not signaled an end of chain condition 1 = DMA has signaled an end of chain condition |

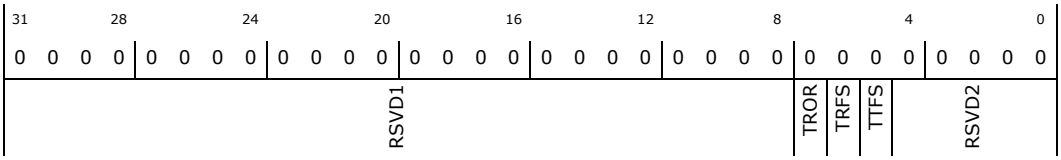
| 4 | 0b RO | **SSP Busy (BSY):** 0 = SSP is idle or disabled 1 = SSP currently transmitting or receiving a frame |
| 3 | 0b RO | **Receive FIOF Not Empty (RNE):** 0 = Receive FIFO is empty 1 = Receive FIFO is not empty |
| 2 | 1b RO | **Transmit FIFO Not Full (TNF):** 0 = Transmit FIFO is full 1 = Transmit FIFO is not full |

| Bit Range | Default & Access | Description |
|---|---|---|
| 1:0 | 00b<br>RO | **RSVD3:** Reserved |

## 21.13.4 SSP Interupt Test Register (SSITR)—Offset Ch

The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSITR:** [BAR + 0A1000h] + Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |

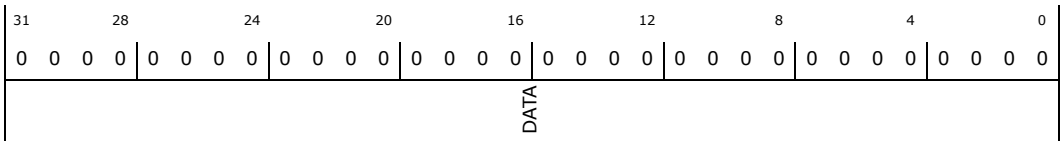
| 4:0 | 00000b<br>RO | **RSVD2:** Reserved |

## 21.13.5 SSP Data Register (SSDR)—Offset 10h

The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the

register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.TFL, SSSR.RFL, SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32-bits is automatically right-justified in the Receive FIFO. When the Enhanced SSP is programmed for National Semiconductor Microwire* frame format and if the size for Transmit data is 8-bits as selected by SSCR1.MWDS=0, then the most significant 24-bits are ignored. Similarly, if the size for the Transmit data is 16-bit as selected by SSCR1.MWDS=1, then most significant 16-bits are ignored. The SSCR0.DSS field controls the Receive data size.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSDR:** [BAR + 0A1000h] + 10h

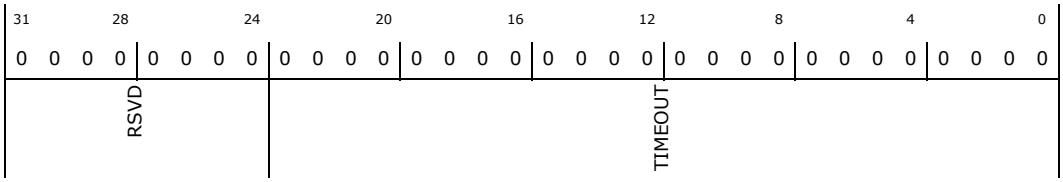
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 00000000h RO | **Data (DATA):** Data word to be written to/read from transmit/receive FIFO. When reading from this register when the SSP is disabled (SSE=0) then this will return indeterminate data. |

## 21.13.6 SSP Time-Out Regsiter (SSTO)—Offset 28h

The Enhanced SSP Time-Out registers have single bit fields that specify the time-out value used to signal a period of inactivity within the Receive FIFO. Note that Writes to reserved bits must be zeroes and reads are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTO:** [BAR + 0A1000h] + 28h

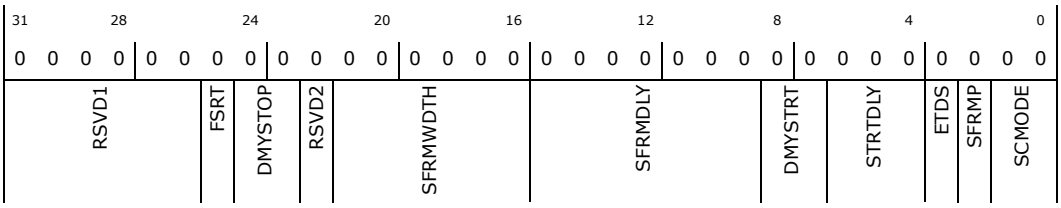
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 00h<br>RO | **RSVD:** Reserved |
| 23:0 | 000000h<br>RW | **Timeout Value (TIMEOUT):** Is the value that defines the timeout interval, given by TIMEOUT/Peripheral Clock Frequency |

## 21.13.7 SSP Programmable Protocol Register (SSPSP)—Offset 2Ch

The Enhanced SSP Programmable Protocol registers are read-write registers that contain eight fields that are used to program the various programmable serial-protocol parameters. When using PSP format in Network mode, the parameters SFRMDLY, STRTDLY, DMYSTP, DMYSTRT must be set to 0. Other parameters (such as FRMPOL, SCMODE, FSRT, SFRMDWDTH) are programmable. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSPSP:** [BAR + 0A1000h] + 2Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |

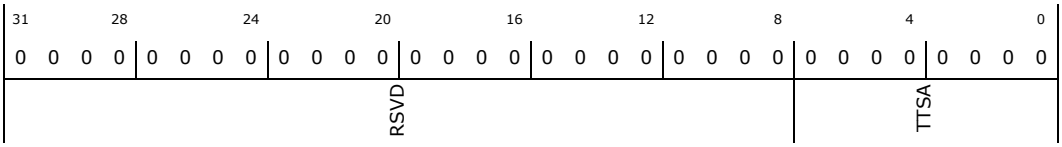
| 1:0 | 00b<br>RW | **Serial bit-rate Clock Mode (SCMODE):** 00 = Data driven (falling), Data sampled (rising), Idle state (low) 01 = Data driven (rising), Data sampled (falling), Idle state (low) 10 = Data driven (rising), Data sampled (falling), Idle state (high) 11 = Data driven (falling), Data sampled (rising), Idle state (high) |

## 21.13.8 SSM TX Time Slot Active Register (SSTSA)—Offset 30h

The Enhanced SSP TX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will transmit data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTSA:** [BAR + 0A1000h] + 30h

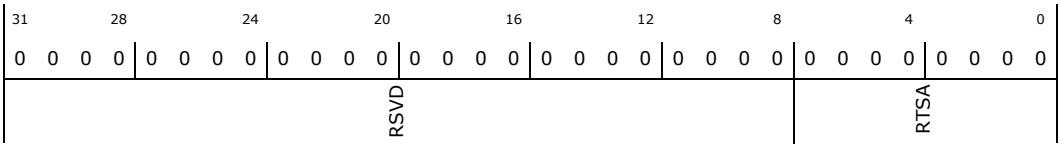
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 000000h<br>RO | **RSVD:** Reserved |
| 7:0 | 00h<br>RW | **TX Time Slot Active (TTSA):** 0 = SSP will not transmit data in this time slot 1 = SSP will transmit data in this time slot |

## 21.13.9 SSP RX Time Slot Active Register (SSRSA)—Offset 34h

The Enhanced SSP RX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will receive data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSRSA:** [BAR + 0A1000h] + 34h

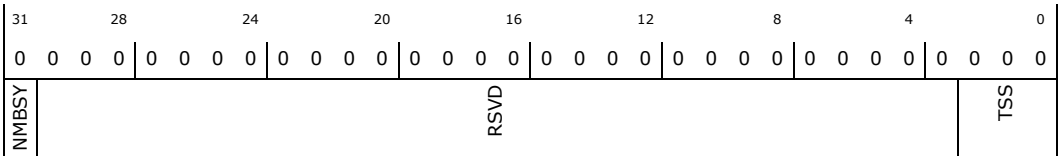
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 000000h RO | **RSVD:** Reserved |
| 7:0 | 00h RW | **RX Time Slot Active (RTSA):** 0 = SSP will not receive data in this time slot 1 = SSP will receive data in this time slot |

## 21.13.10 SSP Time Slot Status Register (SSTSS)—Offset 38h

The Enhanced SSP Time Slot Status registers are read only registers that indicate which Time Slot the Enhanced SSP is currently in when the Enhanced SSP is in Network Mode (SSCR0.MOD = 1). This register is not valid when the Enhanced SSP is not in Network Mode. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTSS:** [BAR + 0A1000h] + 38h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

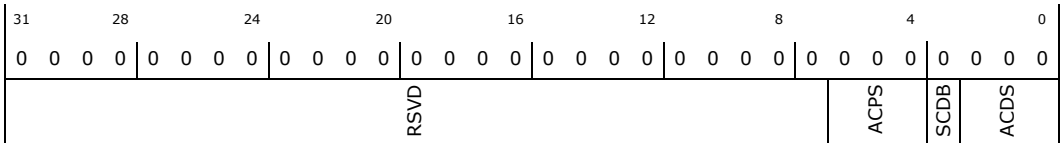
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0b RO | **Network Mode Busy (NMBSY):** 0 = No frame is currently active (in network mode only) 1 = SSP is in network mode and a frame is currently active |
| 30:3 | 0000000h RO | **RSVD:** Reserved |
| 2:0 | 000b RO | **Time Slot Status (TSS):** Value indicates which time slot is currently active |

## 21.13.11 SSP Audio Clock Divider (SSACD)—Offset 3Ch

The Enhanced SSP Audio Clock Divider registers are read-write registers that indicate which clock frequency is sent to the Enhanced SSP and to the SYSCLK pin. If SSCR0.SCR is not 0, then there is no guaranteed phase relationship between SYSCLK and SSPSCLK. The SSPSFRM Frame Synch Sampling Frequency is calculated by dividing the chosen PLL output clock frequency (SSACD.ACPS) by the chosen divider (SSACD.ACDS) which gives the SYSCLK frequency. The SYSCLK is then divided by 4 (or by 1) to get the SSPSCLK. The SSPSCLK is divided by the data size (EDSS, DSS values) and by the number of time slots being used (SSCR0.FRDC value), if any, to give the

SSPSFRM frequency. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined. It's important to note that this feature is only available if implemented by the project instantiation. A clock source and mux must be instantiated outside of the SSP controller for this feature to work. Only this register is designed into the SSP Controller.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSACD:** [BAR + 0A1000h] + 3Ch

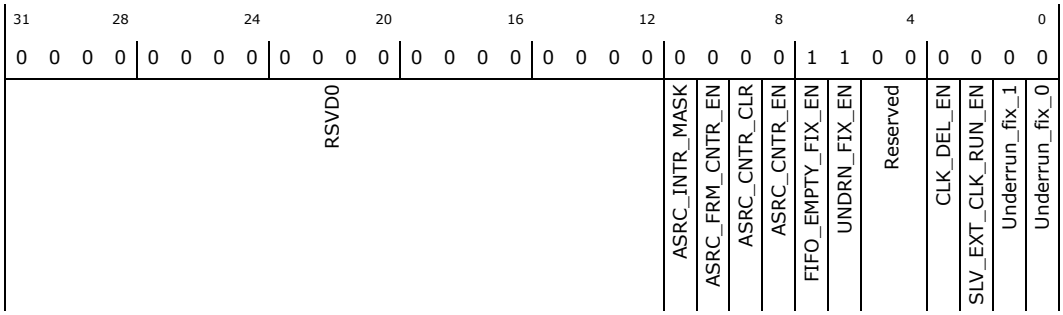
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:7 | 0000000h RO | **RSVD:** Reserved |
| 6:4 | 000b RW | **Audio Clock PLL Select (ACPS):** Value indicates which PLL output clock is sent to the clock divider in the clock unit 000: 5.622MHz, 001: 11.345MHz, 010: 12.235MHz, 011: 14.857MHz, 100: 32.842MHz, 101: 48.000MHz, 110, 111: Reserved |
| 3 | 0b RW | **SYSCLK Divider Bypass (SCDB):** 0 = SYSCLK is divided by 4 before being sent to SSP 1 = SYSCLK is not divided before being sent to SSP |
| 2:0 | 000b RW | **Audio Clock Divider Select (ACDS):** Value indicates which divider will be used by the clock unit to create the SYSCLK output pin. Clock divider value will be 2^ACDS, max ACDS = 5. |

## 21.13.12 SSP Control 2 Register (SSCR2)—Offset 40h

The command status register 2 is extension of command status register and contains various feature enable and disables.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR2:** [BAR + 0A1000h] + 40h

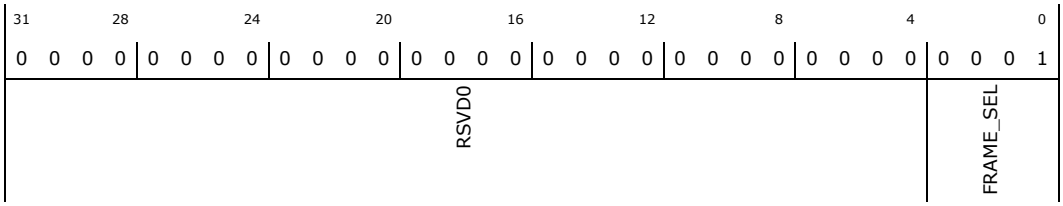
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 000000C0h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:12 | 0b<br>RO | **RSVD0:** Reserved |
| 11 | 0b<br>RW | **ASRC Interrupt Mask (ASRC_INTR_MASK):** Setting this bit to 1 masks the ASRC interrupt that is generated every time the frame count matches the frame threshold. Software should override this bit, since it have no reset value |
| 10 | 0b<br>RW | **ASRC frame count enable (ASRC_FRM_CNTR_EN):** Setting this bit enables the frame counter to start running. Clearing this bit will make the frame counter go back to zero immediately. |
| 9 | 0b<br>RW/AC | **ASRC Counter Clear (ASRC_CNTR_CLR):** Setting this to 1 will clear the ASRC Free running counter. This bit will self clear after the counter is cleared. |
| 8 | 0b<br>RW | **ASRC Counter enable (ASRC_CNTR_EN):** Setting this bit makes the Free running ASRC counter to start running. Clearing this bit will make it pause and hold it's current value. |
| 7 | 1b<br>RW | **Fifo empty fix enable (FIFO_EMPTY_FIX_EN):** Corner cases between the FIFO empty and APB writes happening to the TX FIFO around the time the new data needs to be sent out on the TXD are fixed with this bit. |
| 6 | 1b<br>RW | **Underrun fix enable (UNDRN_FIX_EN):** OSC to PLL switch along with underrun was causing unexpected behavior. This bit enables the fix for that bug. |
| 5:4 | 00b<br>RW | **Reserved:** This is a RW bit with no effect on IP behavior |
| 3 | 0b<br>RW | **Clock Delay Enable (CLK_DEL_EN):** When CLK_DEL_EN = 0, delay logic for capturing data from device is disabled. When CLK_DEL_EN = 1, delay logic for capturing data from device is delayed by half a period of the IO clock |
| 2 | 0b<br>RW | **Slave Mode External Clock Run Enable (SLV_EXT_CLK_RUN_EN):** When in Slave mode the receive state machine requires several clock edges (around 6) to properly sample incoming data. This bit enables a free running clock to the receive state machine before any data is received to properly sample the incoming data. 0 = Disable 1 = Enable |
| 1 | 0b<br>RW | **Mode 1 Underrun Fix (Underrun_fix_1):** Mode 1 of transmit underrun fix. In this mode, new data will start on the underrun slot. This function is only appled to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1 If both underrun modes are enable, mode 1 has higher priority. |
| 0 | 0b<br>RW | **Mode 0 Underrun Fix (Underrun_fix_0):** Mode 0 of transmit underrun fix. In this mode, new data will always start at slot 0. This function is only applied to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1 |

## 21.13.13 SSP Frame Select Register (SSFS)—Offset 44h

The SSP Frame select register is used to choose which frame signal to assert when accessing a slave device. SW drivers should set this register to assert the correct frame select to the targetted device.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSFS:** [BAR + 0A1000h] + 44h

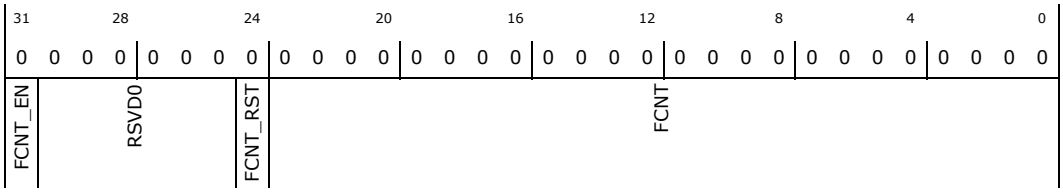
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000001h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:4 | 0b<br>RO | **RSVD0:** Reserved |
| 3:0 | 0001b<br>RW | **Frame Select Enable (FRAME_SEL):** Each bit in this field corresponds to a frame signal of the SSP Controller. Not all SSP controllers have all frame selects pinned out so consult the pin list for indication of which SSP controllers support how many frame signals. [Bit 0] Frame Select 0 Master and Slave Supported [Bit 1] Frame Select 1 Master Only [Bit 2] Frame Select 2 Master Only [Bit 3] Frame Select 3 Master Only 0 = Frame Select Disabled 1 = Frame Select Enabled |

## 21.13.14 SSP Slot Frame Counter Register[0-7] (FRAME_CNT[0-7])—Offset 48h, Count 8, Stride 4h

The slot frame counter is typically used in Audio modes and increments the counter every two SSPSCLKs. This allows the OS to check the progress of a transfer. Since the SSP can support upto 8 slots in network mode there are 8 slot frame counters.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**FRAME_CNT[0-7]:** [BAR + 0A1000h] + 48h + [0-7]*4h

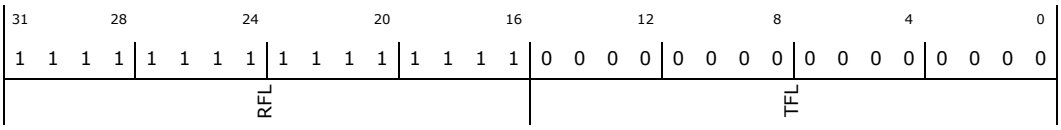
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0b<br>RW | **Slot Frame Count Enable (FCNT_EN):** 0 = Disable frame counter. 1 = Enable frame counter. |
| 30:25 | 0b<br>RO | **RSVD0:** Reserved |
| 24 | 0b<br>WO | **Slot Frame Count Reset (FCNT_RST):** SSP frame counter reset. Writing a 1 to this bit clears the frame counter. |
| 23:0 | 000000h<br>RO | **Slot Frame Count (FCNT):** SSP frame count. |

## 21.13.15 SSP FIFO Level Register (SFIFOL)—Offset 68h

The SFIFOL register describes the current state of the RX and TX FIFOs. Not all bits of the TFL and RFL fields are used and depends on the actual hardware FIFO depth used in the instantiation of the SSP controller. This FIFO level register is meant to replace the SSSR.TFL and SSR.RFL fields.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SFIFOL:** [BAR + 0A1000h] + 68h

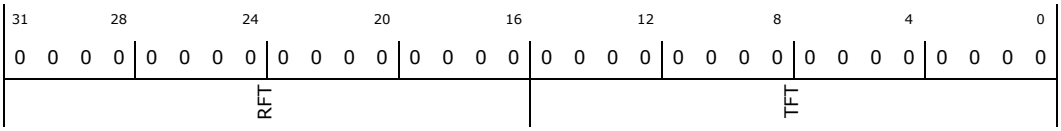
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** FFFF0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | FFFFh RO | **Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value of all 0xF's are read, the FIFO is either empty or full and the programmer should refer to the SSSR.RNE bit. |
| 15:0 | 0000h RO | **Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the SSSR.TNF bit. |

## 21.13.16 SSP FIFO Trigger Threshold Register (SFIFOTT)—Offset 6Ch

The SFIFOTT is a register that determines when the the FIFOs will assert an interrupt for FIFO full indication. This is meant to replace the SSCR1.RFT and SSCR1.TFT legacy registers. The max size of these registers is based on the actualy FIFO depth in hardware and not the actual size of the bit field.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SFIFOTT:** [BAR + 0A1000h] + 6Ch

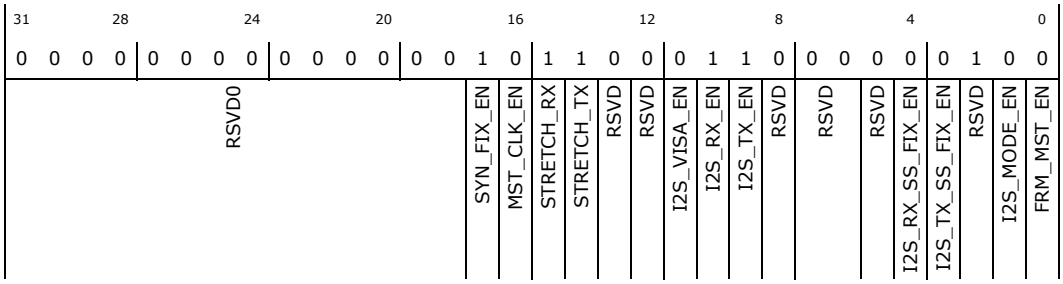
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. Notes on setting the RFT value. This applies to cases where SSP is receiving data from a device and is interfaced with a DMA channel via the hardware handshake mechanism. Please follow the following recommendations: 1. Number of bits denoted by the (DSS, EDSS) parameters in the SSP should match the SRC_TR_WIDTH programmed in the DMA channel. 2. (RFT+1) should be equal to (SRC_MSIZE). 3. Another option to 2 is to keep the BLOCK_TS in the DMA to be a multiple of (RFT+1) |
| 15:0 | 0000h<br>RW | **Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. |

## 21.13.17 SSP Control 3 Register (SSCR3)—Offset 70h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR3:** [BAR + 0A1000h] + 70h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

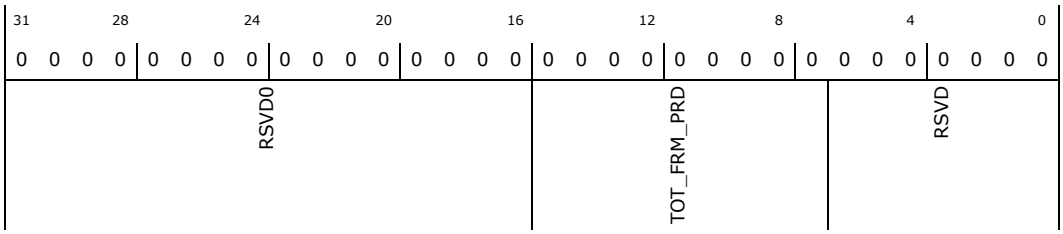
**Default:** 0002C604h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:18 | 0b<br>RO | **RSVD0:** Reserved |
| 17 | 1b<br>RW | **Sync Fix Enable (SYN_FIX_EN):** This is a chicken bit for enabling the synchronizer fix for clr_underrun_ssp signal. SW should preserve this bit at its default value. |
| 16 | 0b<br>RW | **Master Mode Clock Enable (MST_CLK_EN):** When in single slot master mode (which is the mode used for emulating I2S or LJ master mode), the SSP core can stop the clock on a Tx underflow condition, preventing the Rx side from receiving data. This bit, when set, forces the clock to run when a Tx underflow happens, thereby allowing Rx side to continue functioning while Tx side is in underflow. SW should set this bit when I2S or LJ master mode is enabled i.e. bits 0 and 1 in this register are both set or when using 1-slot PCM (SFS or LFS) master mode operation. Otherwise, SW should leave this at 0. |
| 15 | 1b<br>RW | **Stretch RX Pulse (STRETCH_RX):** HW uses this as a chicken bit to stretch the RX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value. |
| 14 | 1b<br>RW | **Stretch TX Pulse (STRETCH_TX):** HW uses this as a chicken bit to stretch the TX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 13 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 12 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 11 | 0b<br>RW | **I2S VISA Enable (I2S_VISA_EN):** Enables newly added I2S and PCM wrapper logic debug signals sent out on the VISA bus instead of the core SSP debug signals. 0 = Core SSP Debug Signals 1 = New I2S and PCM Debug Signals |
| 10 | 1b<br>RW | **I2S Receive Enable (I2S_RX_EN):** When set, this bit enables data to be received on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational. |
| 9 | 1b<br>RW | **I2S Transmit Enable (I2S_TX_EN):** When set, this bit enables data to be transmitted on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational. |
| 8 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 7:6 | 00b<br>RO | **Reserved (RSVD):** Reserved. |
| 5 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 4 | 0b<br>RW | **I2S RX Slot Swap Fix Enable (I2S_RX_SS_FIX_EN):** This bit enables the Rx overrun fix in I2S or LJ modes and prevents channel swapping when Rx overrun happens. Note that this bit does not apply to any PCM modes. PCM modes still have the Rx overflow channel aliasing issue, similar to PNW/CLV. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable |
| 3 | 0b<br>RW | **I2S TX Slot Swap Fix Enable (I2S_TX_SS_FIX_EN):** This bit enables the TX underflow fix in I2S or LJ modes and prevents channel swapping when TX underflow happens. Note that this bit does not apply to any PCM modes. PCM modes still have the TX underflow channel aliasing issue, similar to PNW/CLV. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable |
| 2 | 1b<br>RO | **Reserved (RSVD):** Reserved. |
| 1 | 0b<br>RW | **I2S Mode Enable (I2S_MODE_EN):** This bit enables I2S Mode. In I2S mode, slave or master mode operation is selected by appropriately clearing/setting bit 0 in this register. SW should select I2S mode operation before enabling the SSP controller. 0 = Disabled 1 = Enabled |
| 0 | 0b<br>RW | **Frame Master Enable (FRM_MST_EN):** When set, this bit enables the internal frame generator logic that allows accurate frame rate generation. This bit should be set for I2S and PCM master mode operations and cleared for all other modes. SW should select the proper value in this bit before enabling SSP controller. 0 = Disabled 1 = Enabled |

## 21.13.18 SSP Control 4 Register (SSCR4)—Offset 74h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR4:** [BAR + 0A1000h] + 74h

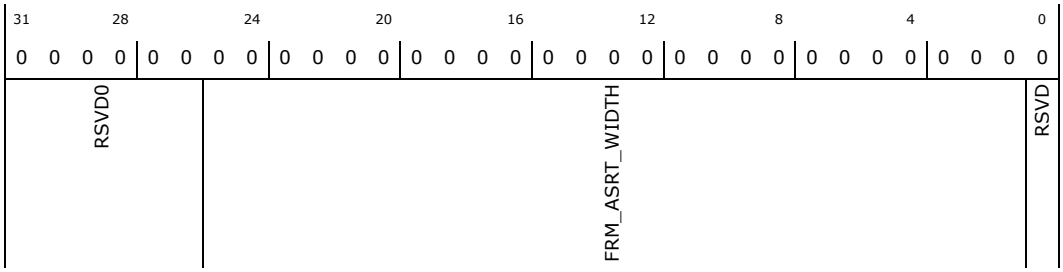
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0b<br>RO | **RSVD0:** Reserved |
| 15:7 | 000h<br>RW | **Total Frame Period (TOT_FRM_PRD):** The total frame period (both asserted and de-asserted time of frame), measured in bit clocks, that is driven in I2S, LJ and PCM master modes. This can be controlled to get the desired accuracy on frame rate. A value of 0 and a value smaller than the value programmed in SSCR5.FrameAssertedWidth are illegal |
| 6:0 | 00h<br>RO | **Reserved (RSVD):** Reserved. |

## 21.13.19 SSP Control 5 Register (SSCR5)—Offset 78h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR5:** [BAR + 0A1000h] + 78h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

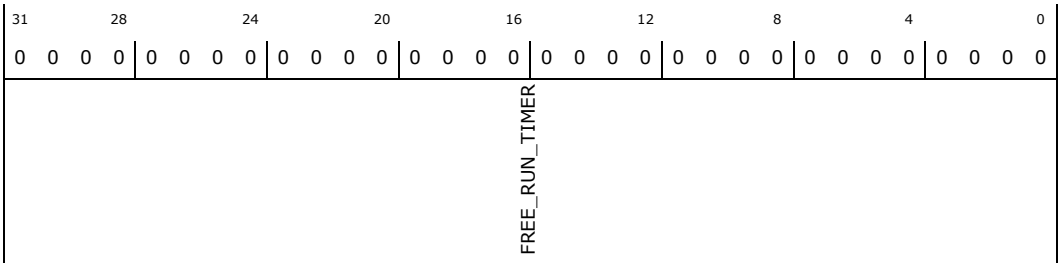
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:26 | 0b<br>RO | **RSVD0:** Reserved |
| 25:1 | 0000000h<br>RW | **Frame Assert Width (FRM_ASRT_WIDTH):** This field controls the width of the asserted period of frame in I2S, LJ and PCM master modes. A value of 1 indicates a width of 2 bit clock period, 2 indicates a width of 3 bit clock periods, etc. The frame width is Frame Assert Width + 1. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 0 | 0b<br>RO | **Reserved (RSVD):** Reserved. |

## 21.13.20 ASRC Free Running Timer (ASRC_FRT)—Offset 7Ch

This is a 32 bit free running counter that can be enabled, paused or cleared using bits in the SSCR2_XR register. The value reflected here will be noted down in the timer snapshot register when the frame count matches the frame threshold



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ASRC_FRT:** [BAR + 0A1000h] + 7Ch

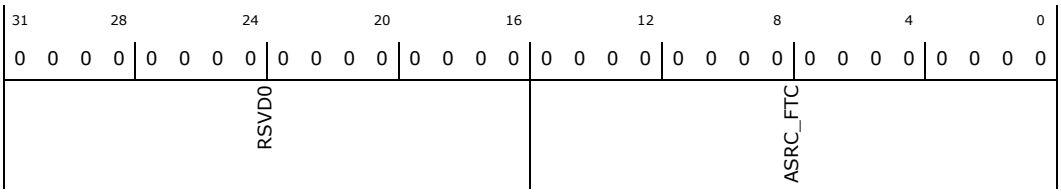
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 00000000h<br>RO/V | **ASRC free running timer (FREE_RUN_TIMER):** This field reflects the value of the free running timer. |

## 21.13.21 Frame Threshold for ASRC Frame Count (ASRC_FTC)—Offset 80h

The frame threshold value at which the timer snapshot will be taken is written here.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ASRC_FTC:** [BAR + 0A1000h] + 80h

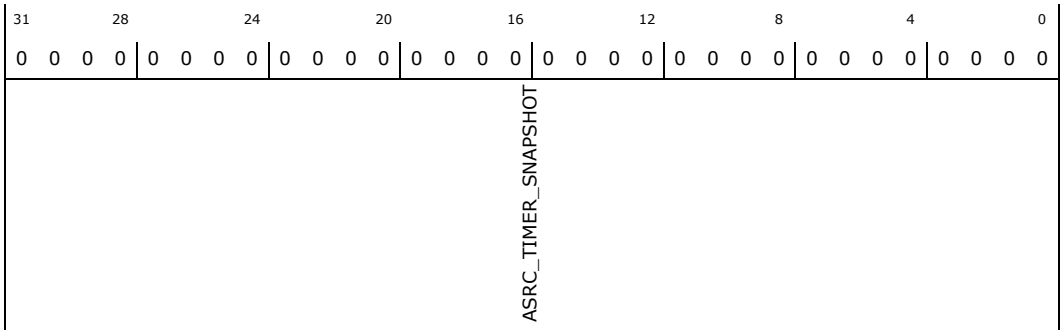
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0b<br>RO | **RSVD0:** Reserved |
| 15:0 | 0000h<br>RW | **ASRC Frame Threshold (ASRC_FTC):** The 16 bit frame threshold value needs to be written here. Every time the frame count matches the frame threshold a snapshot of the free running timer will be taken and stored in the snapshot register. An interrupt will be generated as well. If the frame threshold is changed on the fly during operation then the following behavior is expected. Previous value = A, New value value = B If B ) A : The frame counter keeps counting up to the new value. Nothing happens when the frame counter reaches the old value of A. If B ( A : The frame counter resets to zero on the next frame. No interrupt or snapshot is generated in this case. |

## 21.13.22 ASRC Timer Snapshot (ASRC_SNPSHT)—Offset 84h

Frame Snapshot Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ASRC_SNPSHT:** [BAR + 0A1000h] + 84h

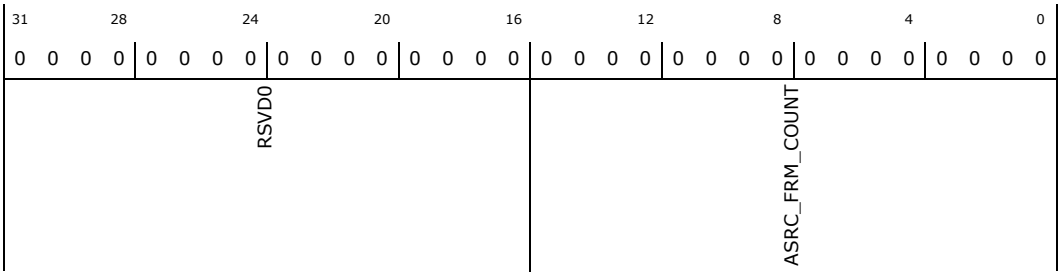
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 00000000h<br>RO | **ASRC Frame Snapshot (ASRC_TIMER_SNAPSHOT):** This field holds the 32 bit snapshot value. The value is noted on the clock cycle when the frame threshold matches the frame count. |

## 21.13.23 ASRC Frame Count (ASRC_FRMCNT)—Offset 88h

Frame Count Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ASRC_FRMCNT:** [BAR + 0A1000h] + 88h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0b<br>RO | **RSVD0:** Reserved |
| 15:0 | 0000h<br>RO | **ASRC Frame Count (ASRC_FRM_COUNT):** This is the current frame count. This is a debug register and the value is noted in this register only when the LSB of the frame counter flips. If the counter is cleared when it was at an even value, the cleared value is not reflected here. |

## 21.14 Low Power Audio I2S0 Address Map

**Table 236. Summary of Low Power Audio I2S0 Memory Mapped I/O Registers—BAR**

| Offset | Size | Register ID—Description | Default Value |

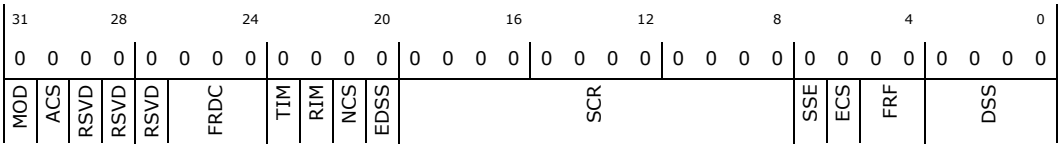
### 21.14.1 SSP Control 0 Register (SSCR0)—Offset 0h

The Enhanced SSP Control 0 registers contain twelve different bit fields that control various functions within the Enhanced SSP. All bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits must be zeroes, and Read values of these bits is undetermined.



**Access Method**

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR0:** [BAR + 0A2000h] + 0h

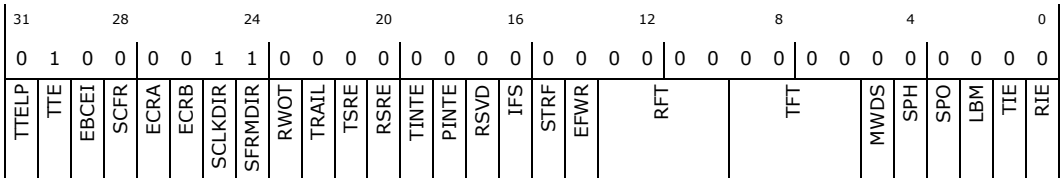
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0b RW | **Mode Select (MOD):** 0 = Normal SSP Mode 1 = Network Mode |
| 30 | 0b RW | **Audio Clock Select (ACS):** 0 = Clock selection is determined by the NCS and ECS bits 1 = Audio Clock (and Audio Clock Divider) are used to clock the SSP's serial clock (SSPSCLK) |
| 29 | 0b RO | **Reserved (RSVD):** Reserved. |
| 28 | 0b RO | **Reserved (RSVD):** Reserved. |
| 27 | 0b RO | **Reserved (RSVD):** Reserved. |
| 26:24 | 000b RW | **Frame Rate Divider Control (FRDC):** Value 0-7 indicates the number of time slots per frame when in network mode (the actual number of time slots is FRDC+1, so 1 to 8 time slots). |
| 23 | 0b RW | **Transmit FIFO Under Run Interrupt Mask (TIM):** 0 = TUR events will generate an SSP interrupt 1 = TUR events will not generate an SSP interrupt |
| 22 | 0b RW | **Receive FIFO Over Run Interrupt Mask (RIM):** 0 = ROR events will generate an SSP interrupt 1 = ROR events will not generate an SSP interrupt |
| 21 | 0b RW | **Network Clock Select (NCS):** 0 = Clock selection is determined by ECS bit 1 = Network clock is used to create the SSP's serial clock (SSPSCLK) |
| 20 | 0b RW | **Extended Data Size Select (EDSS):** 0 = A zero is preappended to the DSS value which sets the DSS range from 4-16 bits 1 = A one is pre-appended to the DSS value which sets the DSS range from 17-32 bits |
| 19:8 | 000h RW | **Serial Clock Rate (SCR):** Value (0 to 4095) used to generate transmission rate of SSP. Serial bit rate = SSP clock/(SCR+1), where SCR is decimal integer. |
| 7 | 0b RW | **Synchronous Serial Port Enable (SSE):** 0 = SSP operation disabled and FIFOs are cleared 1 = SSP operation enabled |
| 6 | 0b RW | **External Clock Select (ECS):** 0 = On-chip clock used to produce the SSP's serial clock (SSPSCLK) 1 = SSPEXTCLK/GPIO pin is used to create the SSP's SSPCLK |
| 5:4 | 00b RW | **Frame Format (FRF):** 00 = Motorola Serial Peripheral Interface (SPI) 01 = Texas Instruments Synchronous Serial Protocol (SSP) 10 = National Semiconductor Microwire 11 = Programmable Serial Protocol (PSP) |
| 3:0 | 0000b RW | **Data Size Select (DSS):** With EDSS as MSB, value+1 gives data size. Values 4 to 32 allowed. |

## 21.14.2 SSP Control 1 Register (SSCR1)—Offset 4h

The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.



**Access Method**

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR1:** [BAR + 0A2000h] + 4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

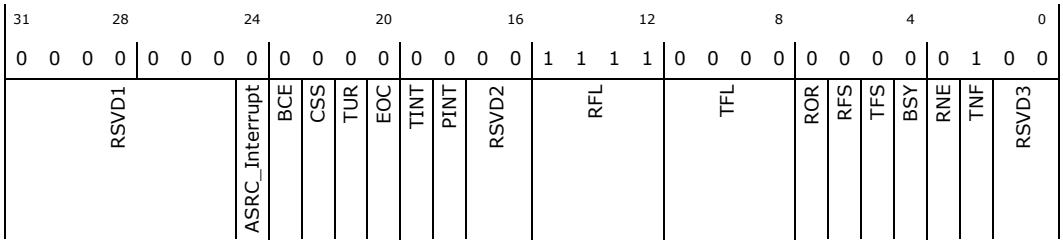
**Default:** 43000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0b RW | **TXD Tristate Enable on Last Phase (TTELP):** 0 = TXD line will be tristated on same clock edge as TXD is to be flopped 1 = TXD line will be tristated 1/2 clock edge after TXD is to be flopped |
| 30 | 1b RW | **TXD Tristate Enable (TTE):** 0 = TXD line will not be tristated 1 = TXD line will be tristated when no transmitting data |
| 29 | 0b RW | **Enable Bit Count Error Interrupt (EBCEI):** 0 = Interrupt due to a bit count error is disabled 1 = Interrupt due to a bit count error is enabled |
| 28 | 0b RW | **Slave Clock Free Running (SCFR):** 0 = clock input to SSPSCLK is continuously running 1 = clock input to SSPSCLK is only active durring transfers |
| 27 | 0b RW | **Enable Clock Request A (ECRA):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled |
| 26 | 0b RW | **Enable Clock Request B (ECRB):** 0 = clock request from other SSP is disabled 1 = clock request from other SSP is enabled |
| 25 | 1b RW | **SSP Serial Bit Rate Clock (SSPSCLK) Direction (SCLKDIR):** 0 = Master mode, SSP drives SSPSCLK 1 = Slave mode, SSP recieves SSPSCLK |
| 24 | 1b RW | **SSP Frame (SSPSFRM) Direction (SFRMDIR):** 0 = Master mode, SSP drives SSPSFRM 1 = Slave mode, SSP receives SSPSFRM |
| 23 | 0b RW | **Receive With Out Transmit (RWOT):** 0 = Transmit/Receive mode 1 = Receive without transmit mode |
| 22 | 0b RW | **Trailing Byte (TRAIL):** 0 = Processor based, trailing bytes are handled by processor 1 = DMA based, trailing bytes are handled by DMA |
| 21 | 0b RW | **Transmit Service Request Enable (TSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled |
| 20 | 0b RW | **Receive Service Request Enable (RSRE):** 0 = DMA Service Request is disabled 1 = DMA Service Request is enabled |
| 19 | 0b RW | **Receiver Time-out Interrupt Enable (TINTE):** 0 = Receiver Time-out interrupts are disabled 1 = Receiver Time-out interrupts are enabled |
| 18 | 0b RW | **Peripheral Trailing Byte Interrupts Enable (PINTE):** 0 = Peripheral Trailing Byte Interrupts are disabled 1 = Peripheral Trailing Byte Interrupts are enabled |
| 17 | 0b RW | **RSVD:** Reserved |
| 16 | 0b RW | **Invert Frame Signal (IFS):** 0 = Frame polarity is determined by SSP format and PSP polarity bits 1 = Frame signal will be inverted from the normal SSP frame signal (as defined by the SSP format nad PSP polarity bits) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 15 | 0b RW | **Select FIFO for EFWR (test mode bit) (when EFWR=1) (STRF):** 0 = Transmit FIFO is selected for both writes and reads through the SSP Data Register (SSDR) 1 = Receive FIFO is selected for both writes and reads through the SSP Data Register (SSDR) |
| 14 | 0b RW | **Enable FIFO Write/Read (test mode bit) (EFWR):** 0 = FIFO write/read special function is disabled (normal SSP operational mode) 1 = FIFO write/read special function is enabled |
| 13:10 | 0000b RW | **Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting. |
| 9:6 | 0000b RW | **Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. This is a legacy field and only represents the lower 4b of the FIFO Trigger Threshold. Please see SFIFOTT register for complete threshold setting. |
| 5 | 0b RW | **Microwire Transmit Data Size (MWDS):** 0 = 8-bit command words are transmitted 1 = 16-bit command words are transmitted |
| 4 | 0b RW | **Motorola SPI SSPSCLK Phase Setting (SPH):** 0 = SSPSCLK is inactive one sycle at the start of a fram and 1/2 cycle at the end of a frame 1 = SSPSCLK is inactive 1/2 cycle at the start of a frame and one cycle at the end of a frame |
| 3 | 0b RW | **Motorola SPI SSPSCLK polarity setting (SPO):** 0 = The inactive or idle state of SSPSCLK is low 1 = The inactive or idle state of SSPSCLK is high |
| 2 | 0b RW | **Loop-Back Mode (test mode bit) (LBM):** 0 = Normal serial port operation enabled 1 = Output of transmit serial shifter connected to input of receive serial shifter, internally |
| 1 | 0b RW | **Transmit FIFO Interrupt Enable (TIE):** 0 = Transmit FIFO level interrupt is disabled 1 = Transmit FIFO level interrupt is enabled |
| 0 | 0b RW | **Receive FIFO Interrupt Enable (RIE):** 0 = Receive FIFO level interrupt is disabled 1 = Receive FIFO level interrupt is enabled |

### 21.14.3 SSP Status Register (SSSR)—Offset 8h

The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request.



#### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSSR:** [BAR + 0A2000h] + 8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

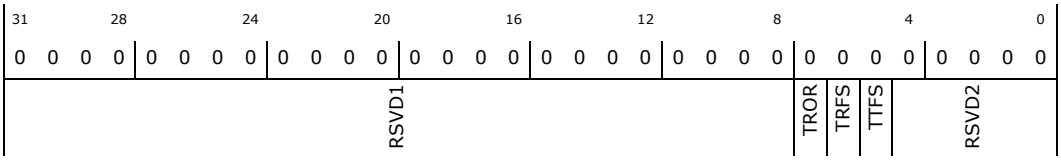
**Default:** 0000F004h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:25 | 00h RO | **RSVD1:** Reserved |
| 24 | 0b RW/1C | **ASRC Interrupt (ASRC_Interrupt):** The interrupt bit is set to 1 when the frame count matches the frame threshold. This is Write 1 to clear register bit. |
| 23 | 0b RW/1C | **Bit Count Error (BCE):** 0 = SSP has not experienced a bit count error 1 = SSPSFRM signal has been asserted when the bit counter was not 0 |
| 22 | 0b RO | **Clock Synchronization Status (CSS):** 0 = SSP is ready for slave clock operations 1 = SSP is currently busy synchronizing slave mode signals |
| 21 | 0b RW/1C | **Transmit FIFO Under Run (TUR):** 0 = Transmit FIFO has not experienced an under run 1 = Attempted read from the transmit FIFO when the FIFO was empty, request interrupt |
| 20 | 0b RW/1C | **End of Chain (EOC):** 0 = DMA has not signaled an end of chain condition 1 = DMA has signaled an end of chain condition |
| 19 | 0b RW/1C | **Receiver Time-out Interrupt (TINT):** 0 = No receiver time-out pending 1 = Receiver time-out pending |
| 18 | 0b RW/1C | **Peripheral Trailing Byte Interrupt (PINT):** 0 = No peripheral trailing byte interrupt pending 1 = Peripheral trailing byte interrupt pending |
| 17:16 | 00b RO | **RSVD2:** Reserved |
| 15:12 | 1111b RO | **Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value 0xF is read, the FIFO is either empty or full and the programmer should refer to the RNE bit. This is a legacy register and only represents the lower 4b of the FIFO Level. The SFIFOL register contains the full FIFO level status. |
| 11:8 | 0000b RO | **Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the TNF bit. This is a legacy register and only represents the lower 4b of the FIFO Level. The SFIFOL register contains the full FIFO level status. |
| 7 | 0b RW/1C | **Receive FIFO Overrun (ROR):** 0 = Receive FIFO has not experienced an overrun 1 = Attempted data write to full receive FIFO, request interrupt |
| 6 | 0b RO | **Receive FIFO Service Request (RFS):** 0 = Receive FIFO level is at or below RFT threshold (RFT), or SSP disabled 1 = Receive FIFO level exceeds RFT threshold (RFT), request interrupt |
| 5 | 0b RO | **Transmit FIFO Service Request (TFS):** 0 = Transmit FIFO level exceeds the TFT threshold (TFT+1), or SSP disabled 1 = Transmit FIFO level is at or below TFT threshold (TFT+1), request interrupt |
| 4 | 0b RO | **SSP Busy (BSY):** 0 = SSP is idle or disabled 1 = SSP currently transmitting or receiving a frame |
| 3 | 0b RO | **Receive FIOF Not Empty (RNE):** 0 = Receive FIFO is empty 1 = Receive FIFO is not empty |
| 2 | 1b RO | **Transmit FIFO Not Full (TNF):** 0 = Transmit FIFO is full 1 = Transmit FIFO is not full |

| Bit Range | Default & Access | Description |
|---|---|---|
| 1:0 | 00b<br>RO | **RSVD3:** Reserved |

## 21.14.4 SSP Interupt Test Register (SSITR)—Offset Ch

The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSITR:** [BAR + 0A2000h] + Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

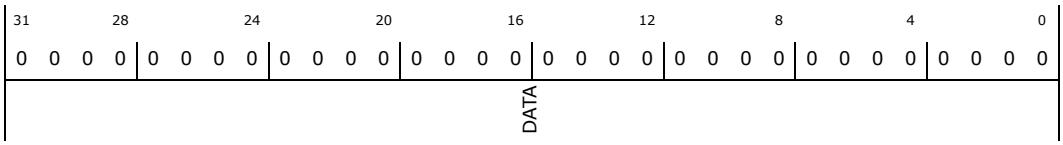
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 000000h<br>RO | **RSVD1:** Reserved |
| 7 | 0b<br>RW | **Test Receive FIFO overrun (TROR):** 0 = No receive FIFO overrun service request 1 = Generates non-maskable interrupt to CPU. No DMA request is generated |
| 6 | 0b<br>RW | **Test Receive FIFO service request (TRFS):** 0 = No receive FIFO service request 1 = Generates non-maskable interrupt to CPU and a DMA request for receive FIFO |
| 5 | 0b<br>RW | **Test Transmit FIFO service request (TTFS):** 0 = No transmit FIFO service request pending 1 = Generates non-maskable interrupt to CPU and a DMA request for transmit FIFO |
| 4:0 | 00000b<br>RO | **RSVD2:** Reserved |

## 21.14.5 SSP Data Register (SSDR)—Offset 10h

The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the

register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.TFL, SSSR.RFL, SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32-bits is automatically right-justified in the Receive FIFO. When the Enhanced SSP is programmed for National Semiconductor Microwire* frame format and if the size for Transmit data is 8-bits as selected by SSCR1.MWDS=0, then the most significant 24-bits are ignored. Similarly, if the size for the Transmit data is 16-bit as selected by SSCR1.MWDS=1, then most significant 16-bits are ignored. The SSCR0.DSS field controls the Receive data size.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSDR:** [BAR + 0A2000h] + 10h

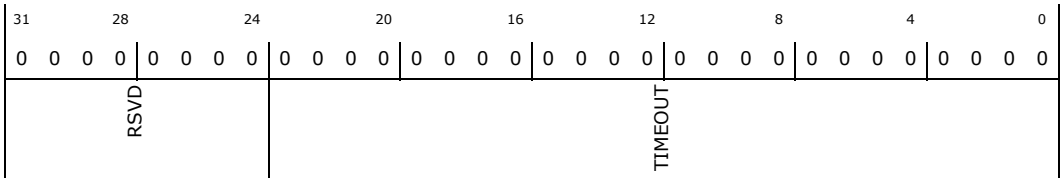
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 00000000h RO | **Data (DATA):** Data word to be written to/read from transmit/receive FIFO. When reading from this register when the SSP is disabled (SSE=0) then this will return indeterminate data. |

## 21.14.6 SSP Time-Out Regsiter (SSTO)—Offset 28h

The Enhanced SSP Time-Out registers have single bit fields that specify the time-out value used to signal a period of inactivity within the Receive FIFO. Note that Writes to reserved bits must be zeroes and reads are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTO:** [BAR + 0A2000h] + 28h

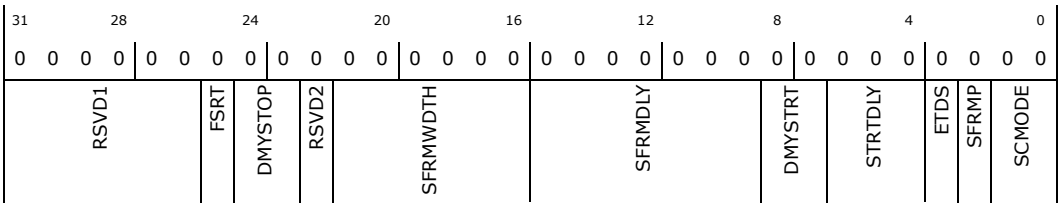
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:24 | 00h<br>RO | **RSVD:** Reserved |
| 23:0 | 000000h<br>RW | **Timeout Value (TIMEOUT):** Is the value that defines the timeout interval, given by TIMEOUT/Peripheral Clock Frequency |

## 21.14.7 SSP Programmable Protocol Register (SSPSP)—Offset 2Ch

The Enhanced SSP Programmable Protocol registers are read-write registers that contain eight fields that are used to program the various programmable serial-protocol parameters. When using PSP format in Network mode, the parameters SFRMDLY, STRTDLY, DMYSTP, DMYSTRT must be set to 0. Other parameters (such as FRMPOL, SCMODE, FSRT, SFRMDWDTH) are programmable. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSPSP:** [BAR + 0A2000h] + 2Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

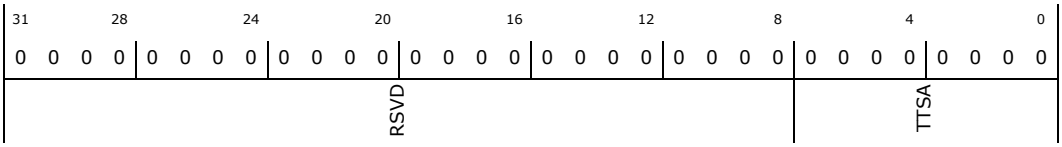
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:26 | 000000b<br>RO | **RSVD1:** Reserved |
| 25 | 0b<br>RW | **Frame Sync Relative Timing Bit (FSRT):** 0 = Next frame is asserted after the end of the T4 timing 1 = Next frame is asserted with the LSB of the previous frame |
| 24:23 | 00b<br>RW | **Dummy Stop (DMYSTOP):** Programmed value sets the number of SSPSCLK cycles that follow the transmitted data |
| 22 | 0b<br>RW | **RSVD2:** Reserved |
| 21:16 | 000000b<br>RW | **Serial Frame Width (SFRMWDTH):** Programmed value sets frame width (1-38) |
| 15:9 | 0000000b<br>RW | **Serial Frame Delay (SFRMDLY):** Programmed value sets the number of half SSPSCLK cycles from TXD/RXD being driven to SSPSFRM being asserted (0-74) |
| 8:7 | 00b<br>RW | **Dummy Start (DMYSTRT):** Programmed value sets the number of SSPSCLKs after STRTDLY is complete that precede the transmit/receive data |
| 6:4 | 000b<br>RW | **Start Delay (STRTDLY):** Programmed value sets start delay that is used to set the idle time of SSPSCLK between transfers (0-7 SSPSCLK periods) |
| 3 | 0b<br>RW | **End of Transfer Data State (ETDS):** 0 = Low 1 = Last value (bit 0) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 2 | 0b<br>RW | **Serial Frame Polarity (SFRMP):** 0 = SSPSFRM is active low 1 = SSPSFRM is active high |
| 1:0 | 00b<br>RW | **Serial bit-rate Clock Mode (SCMODE):** 00 = Data driven (falling), Data sampled (rising), Idle state (low) 01 = Data driven (rising), Data sampled (falling), Idle state (low) 10 = Data driven (rising), Data sampled (falling), Idle state (high) 11 = Data driven (falling), Data sampled (rising), Idle state (high) |

## 21.14.8 SSM TX Time Slot Active Register (SSTSA)—Offset 30h

The Enhanced SSP TX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will transmit data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTSA:** [BAR + 0A2000h] + 30h

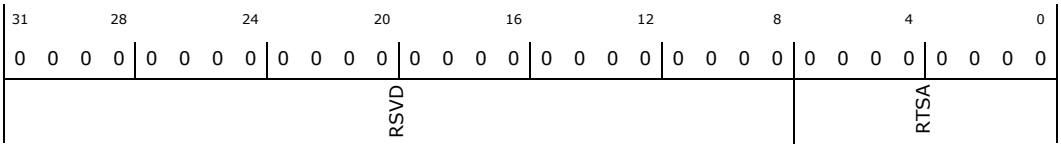
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 000000h<br>RO | **RSVD:** Reserved |
| 7:0 | 00h<br>RW | **TX Time Slot Active (TTSA):** 0 = SSP will not transmit data in this time slot 1 = SSP will transmit data in this time slot |

## 21.14.9 SSP RX Time Slot Active Register (SSRSA)—Offset 34h

The Enhanced SSP RX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will receive data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSRSA:** [BAR + 0A2000h] + 34h

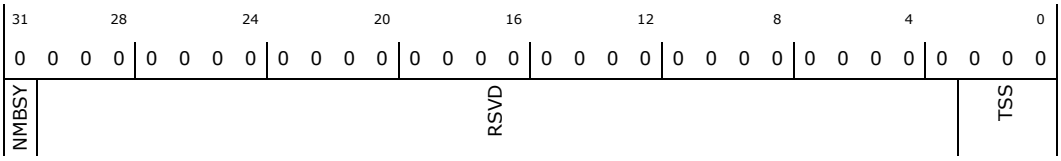
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 000000h RO | **RSVD:** Reserved |
| 7:0 | 00h RW | **RX Time Slot Active (RTSA):** 0 = SSP will not receive data in this time slot 1 = SSP will receive data in this time slot |

## 21.14.10 SSP Time Slot Status Register (SSTSS)—Offset 38h

The Enhanced SSP Time Slot Status registers are read only registers that indicate which Time Slot the Enhanced SSP is currently in when the Enhanced SSP is in Network Mode (SSCR0.MOD = 1). This register is not valid when the Enhanced SSP is not in Network Mode. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTSS:** [BAR + 0A2000h] + 38h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

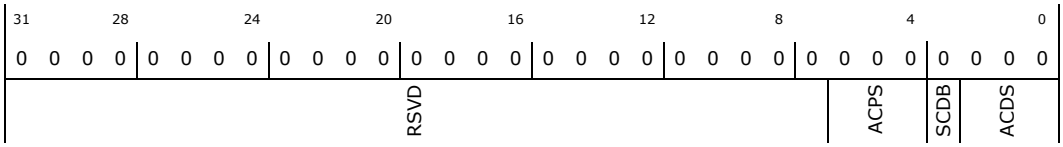
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0b RO | **Network Mode Busy (NMBSY):** 0 = No frame is currently active (in network mode only) 1 = SSP is in network mode and a frame is currently active |
| 30:3 | 0000000h RO | **RSVD:** Reserved |
| 2:0 | 000b RO | **Time Slot Status (TSS):** Value indicates which time slot is currently active |

## 21.14.11 SSP Audio Clock Divider (SSACD)—Offset 3Ch

The Enhanced SSP Audio Clock Divider registers are read-write registers that indicate which clock frequency is sent to the Enhanced SSP and to the SYSCLK pin. If SSCR0.SCR is not 0, then there is no guaranteed phase relationship between SYSCLK and SSPSCLK. The SSPSFRM Frame Synch Sampling Frequency is calculated by dividing the chosen PLL output clock frequency (SSACD.ACPS) by the chosen divider (SSACD.ACDS) which gives the SYSCLK frequency. The SYSCLK is then divided by 4 (or by 1) to get the SSPSCLK. The SSPSCLK is divided by the data size (EDSS, DSS values) and by the number of time slots being used (SSCR0.FRDC value), if any, to give the

SSPSFRM frequency. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined. It's important to note that this feature is only available if implemented by the project instantiation. A clock source and mux must be instantiated outside of the SSP controller for this feature to work. Only this register is designed into the SSP Controller.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSACD:** [BAR + 0A2000h] + 3Ch

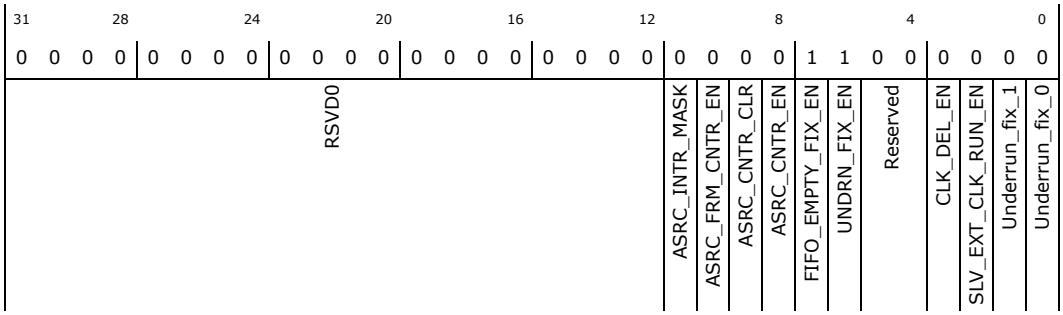
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:7 | 0000000h RO | **RSVD:** Reserved |
| 6:4 | 000b RW | **Audio Clock PLL Select (ACPS):** Value indicates which PLL output clock is sent to the clock divider in the clock unit 000: 5.622MHz, 001: 11.345MHz, 010: 12.235MHz, 011: 14.857MHz, 100: 32.842MHz, 101: 48.000MHz, 110, 111: Reserved |
| 3 | 0b RW | **SYSCLK Divider Bypass (SCDB):** 0 = SYSCLK is divided by 4 before being sent to SSP 1 = SYSCLK is not divided before being sent to SSP |
| 2:0 | 000b RW | **Audio Clock Divider Select (ACDS):** Value indicates which divider will be used by the clock unit to create the SYSCLK output pin. Clock divider value will be 2^ACDS, max ACDS = 5. |

## 21.14.12 SSP Control 2 Register (SSCR2)—Offset 40h

The command status register 2 is extension of command status register and contains various feature enable and disables.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR2:** [BAR + 0A2000h] + 40h

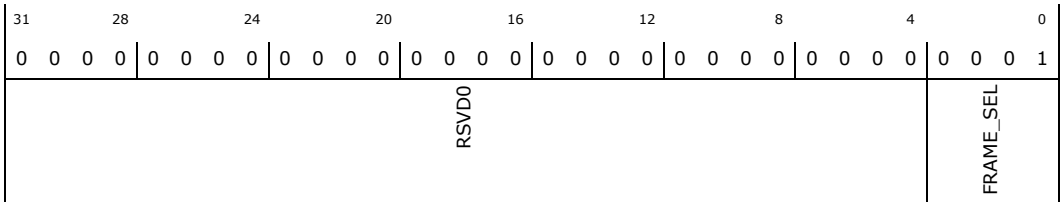
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 000000C0h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:12 | 0b<br>RO | **RSVD0:** Reserved |
| 11 | 0b<br>RW | **ASRC Interrupt Mask (ASRC_INTR_MASK):** Setting this bit to 1 masks the ASRC interrupt that is generated every time the frame count matches the frame threshold. Software should override this bit, since it have no reset value |
| 10 | 0b<br>RW | **ASRC frame count enable (ASRC_FRM_CNTR_EN):** Setting this bit enables the frame counter to start running. Clearing this bit will make the frame counter go back to zero immediately. |
| 9 | 0b<br>RW/AC | **ASRC Counter Clear (ASRC_CNTR_CLR):** Setting this to 1 will clear the ASRC Free running counter. This bit will self clear after the counter is cleared. |
| 8 | 0b<br>RW | **ASRC Counter enable (ASRC_CNTR_EN):** Setting this bit makes the Free running ASRC counter to start running. Clearing this bit will make it pause and hold it's current value. |
| 7 | 1b<br>RW | **Fifo empty fix enable (FIFO_EMPTY_FIX_EN):** Corner cases between the FIFO empty and APB writes happening to the TX FIFO around the time the new data needs to be sent out on the TXD are fixed with this bit. |
| 6 | 1b<br>RW | **Underrun fix enable (UNDRN_FIX_EN):** OSC to PLL switch along with underrun was causing unexpected behavior. This bit enables the fix for that bug. |
| 5:4 | 00b<br>RW | **Reserved:** This is a RW bit with no effect on IP behavior |
| 3 | 0b<br>RW | **Clock Delay Enable (CLK_DEL_EN):** When CLK_DEL_EN = 0, delay logic for capturing data from device is disabled. When CLK_DEL_EN = 1, delay logic for capturing data from device is delayed by half a period of the IO clock |
| 2 | 0b<br>RW | **Slave Mode External Clock Run Enable (SLV_EXT_CLK_RUN_EN):** When in Slave mode the receive state machine requires several clock edges (around 6) to properly sample incoming data. This bit enables a free running clock to the receive state machine before any data is received to properly sample the incoming data. 0 = Disable 1 = Enable |
| 1 | 0b<br>RW | **Mode 1 Underrun Fix (Underrun_fix_1):** Mode 1 of transmit underrun fix. In this mode, new data will start on the underrun slot. This function is only appled to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1 If both underrun modes are enable, mode 1 has higher priority. |
| 0 | 0b<br>RW | **Mode 0 Underrun Fix (Underrun_fix_0):** Mode 0 of transmit underrun fix. In this mode, new data will always start at slot 0. This function is only applied to TI and PSP modes. 0 = disable mode 1 1 = enable mode 1 |

## 21.14.13 SSP Frame Select Register (SSFS)—Offset 44h

The SSP Frame select register is used to choose which frame signal to assert when accessing a slave device. SW drivers should set this register to assert the correct frame select to the targetted device.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSFS:** [BAR + 0A2000h] + 44h

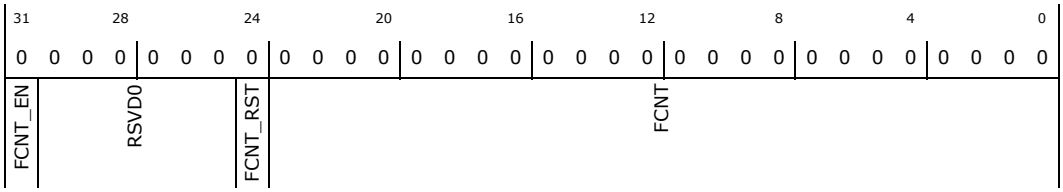
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000001h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:4 | 0b<br>RO | **RSVD0:** Reserved |
| 3:0 | 0001b<br>RW | **Frame Select Enable (FRAME_SEL):** Each bit in this field corresponds to a frame signal of the SSP Controller. Not all SSP controllers have all frame selects pinned out so consult the pin list for indication of which SSP controllers support how many frame signals. [Bit 0] Frame Select 0 Master and Slave Supported [Bit 1] Frame Select 1 Master Only [Bit 2] Frame Select 2 Master Only [Bit 3] Frame Select 3 Master Only 0 = Frame Select Disabled 1 = Frame Select Enabled |

## 21.14.14 SSP Slot Frame Counter Register[0-7] (FRAME_CNT[0-7])—Offset 48h, Count 8, Stride 4h

The slot frame counter is typically used in Audio modes and increments the counter every two SSPSCLKs. This allows the OS to check the progress of a transfer. Since the SSP can support upto 8 slots in network mode there are 8 slot frame counters.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**FRAME_CNT[0-7]:** [BAR + 0A2000h] + 48h + [0-7]*4h

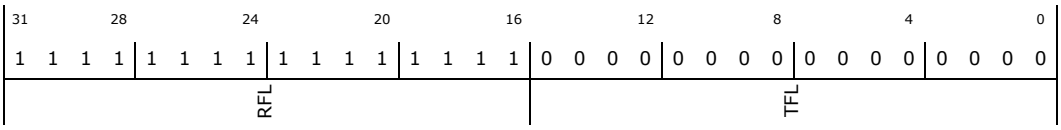
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0b<br>RW | **Slot Frame Count Enable (FCNT_EN):** 0 = Disable frame counter. 1 = Enable frame counter. |
| 30:25 | 0b<br>RO | **RSVD0:** Reserved |
| 24 | 0b<br>WO | **Slot Frame Count Reset (FCNT_RST):** SSP frame counter reset. Writing a 1 to this bit clears the frame counter. |
| 23:0 | 000000h<br>RO | **Slot Frame Count (FCNT):** SSP frame count. |

## 21.14.15 SSP FIFO Level Register (SFIFOL)—Offset 68h

The SFIFOL register describes the current state of the RX and TX FIFOs. Not all bits of the TFL and RFL fields are used and depends on the actual hardware FIFO depth used in the instantiation of the SSP controller. This FIFO level register is meant to replace the SSSR.TFL and SSR.RFL fields.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SFIFOL:** [BAR + 0A2000h] + 68h

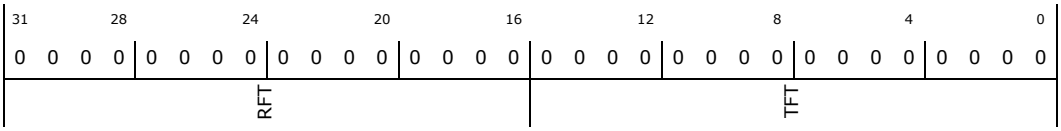
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** FFFF0000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | FFFFh RO | **Receive FIFO Level (RFL):** Number of entries minus one in Receive FIFO. Note: When the value of all 0xF's are read, the FIFO is either empty or full and the programmer should refer to the SSSR.RNE bit. |
| 15:0 | 0000h RO | **Transmit FIFO Level (TFL):** Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the SSSR.TNF bit. |

## 21.14.16 SSP FIFO Trigger Threshold Register (SFIFOTT)—Offset 6Ch

The SFIFOTT is a register that determines when the the FIFOs will assert an interrupt for FIFO full indication. This is meant to replace the SSCR1.RFT and SSCR1.TFT legacy registers. The max size of these registers is based on the actualy FIFO depth in hardware and not the actual size of the bit field.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SFIFOTT:** [BAR + 0A2000h] + 6Ch

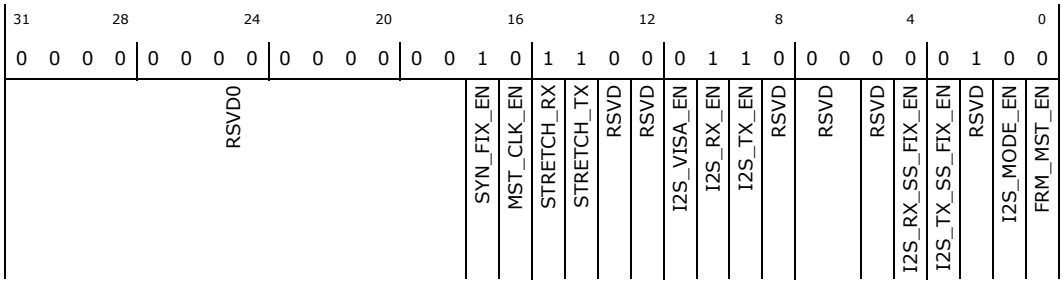
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0000h<br>RW | **Receive FIFO Trigger Threshold (RFT):** Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. Notes on setting the RFT value. This applies to cases where SSP is receiving data from a device and is interfaced with a DMA channel via the hardware handshake mechanism. Please follow the following recommendations: 1. Number of bits denoted by the (DSS, EDSS) parameters in the SSP should match the SRC_TR_WIDTH programmed in the DMA channel. 2. (RFT+1) should be equal to (SRC_MSIZE). 3. Another option to 2 is to keep the BLOCK_TS in the DMA to be a multiple of (RFT+1) |
| 15:0 | 0000h<br>RW | **Transmit FIFO Trigger Threshold (TFT):** Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. |

## 21.14.17 SSP Control 3 Register (SSCR3)—Offset 70h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR3:** [BAR + 0A2000h] + 70h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

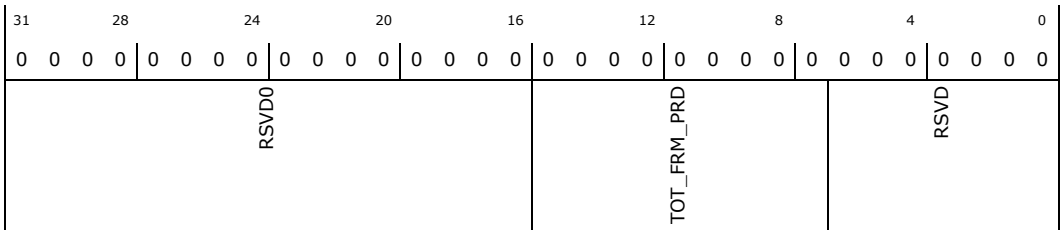
**Default:** 0002C604h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:18 | 0b<br>RO | **RSVD0:** Reserved |
| 17 | 1b<br>RW | **Sync Fix Enable (SYN_FIX_EN):** This is a chicken bit for enabling the synchronizer fix for clr_underrun_ssp signal. SW should preserve this bit at its default value. |
| 16 | 0b<br>RW | **Master Mode Clock Enable (MST_CLK_EN):** When in single slot master mode (which is the mode used for emulating I2S or LJ master mode), the SSP core can stop the clock on a Tx underflow condition, preventing the Rx side from receiving data. This bit, when set, forces the clock to run when a Tx underflow happens, thereby allowing Rx side to continue functioning while Tx side is in underflow. SW should set this bit when I2S or LJ master mode is enabled i.e. bits 0 and 1 in this register are both set or when using 1-slot PCM (SFS or LFS) master mode operation. Otherwise, SW should leave this at 0. |
| 15 | 1b<br>RW | **Stretch RX Pulse (STRETCH_RX):** HW uses this as a chicken bit to stretch the RX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value. |
| 14 | 1b<br>RW | **Stretch TX Pulse (STRETCH_TX):** HW uses this as a chicken bit to stretch the TX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 13 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 12 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 11 | 0b<br>RW | **I2S VISA Enable (I2S_VISA_EN):** Enables newly added I2S and PCM wrapper logic debug signals sent out on the VISA bus instead of the core SSP debug signals. 0 = Core SSP Debug Signals 1 = New I2S and PCM Debug Signals |
| 10 | 1b<br>RW | **I2S Receive Enable (I2S_RX_EN):** When set, this bit enables data to be received on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational. |
| 9 | 1b<br>RW | **I2S Transmit Enable (I2S_TX_EN):** When set, this bit enables data to be transmitted on both the left and right slots of I2S. Otherwise, data on the slots are ignored. HW does not signal FIFO full condition when this bit is cleared. SW can set/clear this bit dynamically when I2S mode is operational. |
| 8 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 7:6 | 00b<br>RO | **Reserved (RSVD):** Reserved. |
| 5 | 0b<br>RO | **Reserved (RSVD):** Reserved. |
| 4 | 0b<br>RW | **I2S RX Slot Swap Fix Enable (I2S_RX_SS_FIX_EN):** This bit enables the Rx overrun fix in I2S or LJ modes and prevents channel swapping when Rx overrun happens. Note that this bit does not apply to any PCM modes. PCM modes still have the Rx overflow channel aliasing issue, similar to PNW/CLV. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable |
| 3 | 0b<br>RW | **I2S TX Slot Swap Fix Enable (I2S_TX_SS_FIX_EN):** This bit enables the TX underflow fix in I2S or LJ modes and prevents channel swapping when TX underflow happens. Note that this bit does not apply to any PCM modes. PCM modes still have the TX underflow channel aliasing issue, similar to PNW/CLV. SW should set this bit only when I2S or LJ mode (slave or master) is enabled. 0 = Disable 1 = Enable |
| 2 | 1b<br>RO | **Reserved (RSVD):** Reserved. |
| 1 | 0b<br>RW | **I2S Mode Enable (I2S_MODE_EN):** This bit enables I2S Mode. In I2S mode, slave or master mode operation is selected by appropriately clearing/setting bit 0 in this register. SW should select I2S mode operation before enabling the SSP controller. 0 = Disabled 1 = Enabled |
| 0 | 0b<br>RW | **Frame Master Enable (FRM_MST_EN):** When set, this bit enables the internal frame generator logic that allows accurate frame rate generation. This bit should be set for I2S and PCM master mode operations and cleared for all other modes. SW should select the proper value in this bit before enabling SSP controller. 0 = Disabled 1 = Enabled |

## 21.14.18 SSP Control 4 Register (SSCR4)—Offset 74h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR4:** [BAR + 0A2000h] + 74h

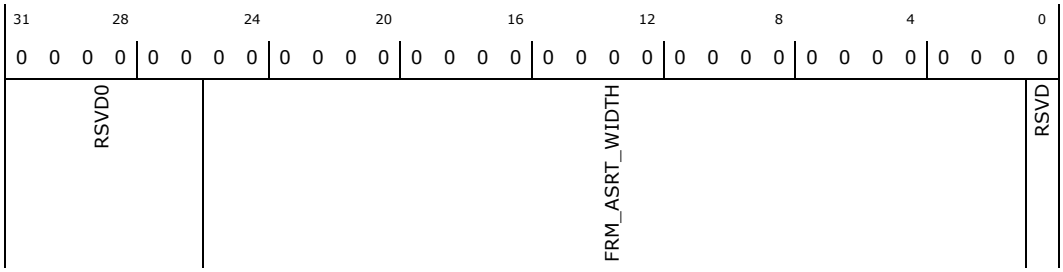
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0b<br>RO | **RSVD0:** Reserved |
| 15:7 | 000h<br>RW | **Total Frame Period (TOT_FRM_PRD):** The total frame period (both asserted and de-asserted time of frame), measured in bit clocks, that is driven in I2S, LJ and PCM master modes. This can be controlled to get the desired accuracy on frame rate. A value of 0 and a value smaller than the value programmed in SSCR5.FrameAssertedWidth are illegal |
| 6:0 | 00h<br>RO | **Reserved (RSVD):** Reserved. |

## 21.14.19 SSP Control 5 Register (SSCR5)—Offset 78h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSCR5:** [BAR + 0A2000h] + 78h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

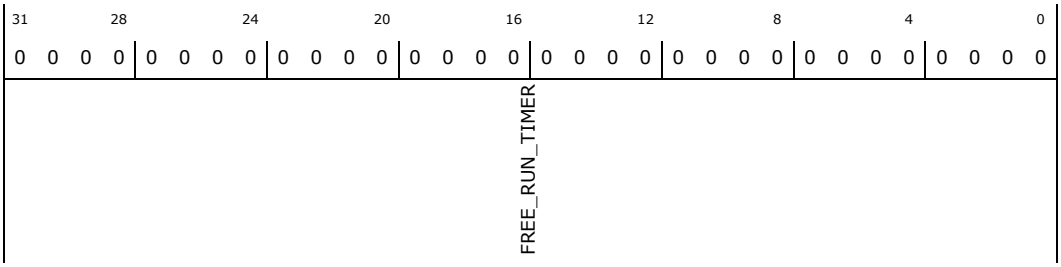
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:26 | 0b<br>RO | **RSVD0:** Reserved |
| 25:1 | 0000000h<br>RW | **Frame Assert Width (FRM_ASRT_WIDTH):** This field controls the width of the asserted period of frame in I2S, LJ and PCM master modes. A value of 1 indicates a width of 2 bit clock period, 2 indicates a width of 3 bit clock periods, etc. The frame width is Frame Assert Width + 1. |

| Bit Range | Default & Access | Description |
|---|---|---|
| 0 | 0b<br>RO | **Reserved (RSVD):** Reserved. |

## 21.14.20 ASRC Free Running Timer (ASRC_FRT)—Offset 7Ch

This is a 32 bit free running counter that can be enabled, paused or cleared using bits in the SSCR2_XR register. The value reflected here will be noted down in the timer snapshot register when the frame count matches the frame threshold



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ASRC_FRT:** [BAR + 0A2000h] + 7Ch

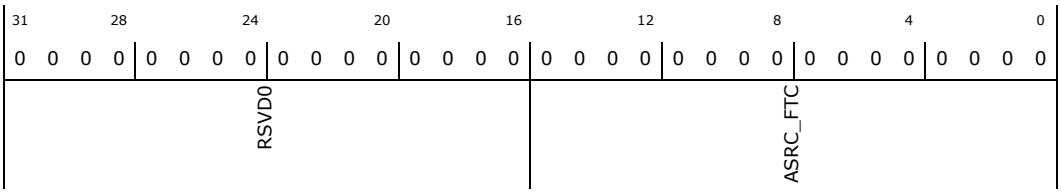
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 00000000h<br>RO/V | **ASRC free running timer (FREE_RUN_TIMER):** This field reflects the value of the free running timer. |

## 21.14.21 Frame Threshold for ASRC Frame Count (ASRC_FTC)—Offset 80h

The frame threshold value at which the timer snapshot will be taken is written here.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ASRC_FTC:** [BAR + 0A2000h] + 80h

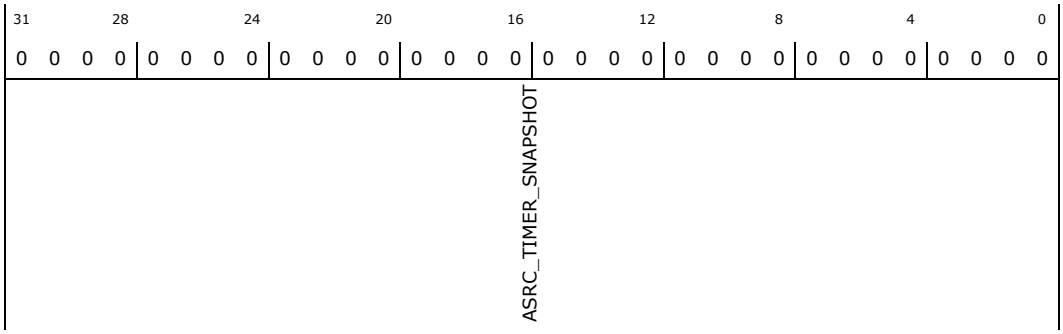
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0b<br>RO | **RSVD0:** Reserved |
| 15:0 | 0000h<br>RW | **ASRC Frame Threshold (ASRC_FTC):** The 16 bit frame threshold value needs to be written here. Every time the frame count matches the frame threshold a snapshot of the free running timer will be taken and stored in the snapshot register. An interrupt will be generated as well. If the frame threshold is changed on the fly during operation then the following behavior is expected. Previous value = A, New value value = B If B ) A : The frame counter keeps counting up to the new value. Nothing happens when the frame counter reaches the old value of A. If B ( A : The frame counter resets to zero on the next frame. No interrupt or snapshot is generated in this case. |

## 21.14.22 ASRC Timer Snapshot (ASRC_SNPSHT)—Offset 84h

Frame Snapshot Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ASRC_SNPSHT:** [BAR + 0A2000h] + 84h

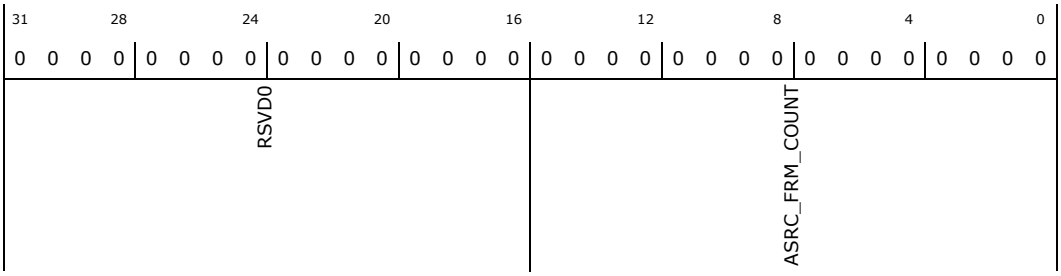
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 00000000h<br>RO | **ASRC Frame Snapshot (ASRC_TIMER_SNAPSHOT):** This field holds the 32 bit snapshot value. The value is noted on the clock cycle when the frame threshold matches the frame count. |

## 21.14.23 ASRC Frame Count (ASRC_FRMCNT)—Offset 88h

Frame Count Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ASRC_FRMCNT:** [BAR + 0A2000h] + 88h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0b<br>RO | **RSVD0:** Reserved |
| 15:0 | 0000h<br>RO | **ASRC Frame Count (ASRC_FRM_COUNT):** This is the current frame count. This is a debug register and the value is noted in this register only when the LSB of the frame counter flips. If the counter is cleared when it was at an even value, the cleared value is not reflected here. |

## 21.15 Low Power Audio DMA0 Memory Mapped IO Registers

### Table 237. Summary of Low Power Audio DMA0 Memory Mapped I/O Registers—lpe_bridge.BAR

| Offset | Size | Register ID—Description | Default Value |
|---|---|---|---|
| 0h | 4 | "reg_SAR_type (SAR0)—Offset 0h" on page 2939 | 00000000h |
| 8h | 4 | "reg_DAR_type (DAR0)—Offset 8h" on page 2940 | 00000000h |
| 10h | 4 | "reg_LLP_type (LLP0)—Offset 10h" on page 2941 | 00000000h |
| 18h | 4 | "reg_CTL_LO_type (CTL_LO0)—Offset 18h" on page 2942 | 00000000h |
| 1Ch | 4 | "reg_CTL_HI_type (CTL_HI0)—Offset 1Ch" on page 2943 | 00000000h |
| 20h | 4 | "reg_SSTAT_type (SSTAT0)—Offset 20h" on page 2944 | 00000000h |
| 28h | 4 | "reg_DSTAT_type (DSTAT0)—Offset 28h" on page 2945 | 00000000h |
| 30h | 4 | "reg_SSTATAR_type (SSTATAR0)—Offset 30h" on page 2945 | 00000000h |
| 38h | 4 | "reg_DSTATAR_type (DSTATAR0)—Offset 38h" on page 2946 | 00000000h |

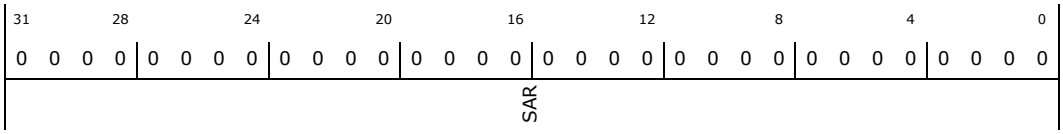
## 21.15.1 reg_SAR_type (SAR0)—Offset 0h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SAR0:** [BAR + 98000h] + 0h

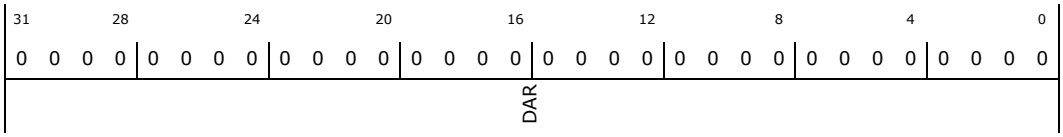
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length ) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.15.2 reg_DAR_type (DAR0)—Offset 8h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DAR0:** [BAR + 98000h] + 8h

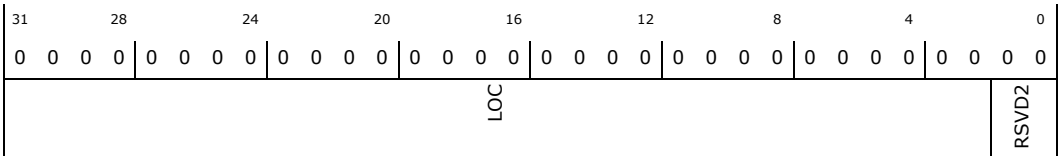
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length ) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.15.3 reg_LLP_type (LLP0)—Offset 10h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**LLP0:** [BAR + 98000h] + 10h

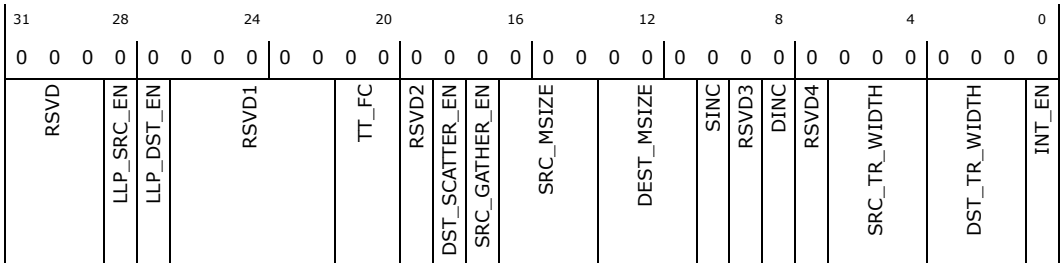
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 00000000h<br>RW | **LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit. |
| 1:0 | 0h<br>RO | **RSVD2:** Reserved |

## 21.15.4 reg_CTL_LO_type (CTL_LO0)—Offset 18h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_LO0:** [BAR + 98000h] + 18h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

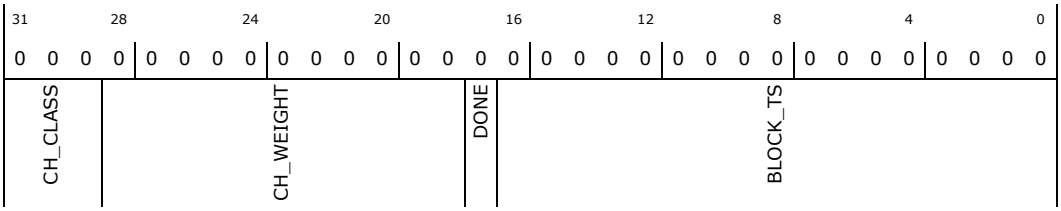
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RO | **RSVD:** Reserved |
| 28 | 0h<br>RW | **LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 27 | 0h<br>RW | **LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 26:22 | 0h<br>RO | **RSVD1:** RSVD |
| 21:20 | 0h<br>RW | **TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA. |
| 19 | 0h<br>RO | **RSVD2:** Reserved |
| 18 | 0h<br>RW | **DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control. |
| 17 | 0h<br>RW | **SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control. |
| 16:14 | 0h<br>RW | **SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field. |
| 13:11 | 0h<br>RW | **DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field. |
| 10 | 0h<br>RW | **SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 9 | 0h<br>RO | **RSVD3:** Reserved |
| 8 | 0h<br>RW | **DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change) |
| 7 | 0h<br>RO | **RSVD4:** Reserved |
| 6:4 | 0h<br>RW | **SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 3:1 | 0h<br>RW | **DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 0 | 0h<br>RW | **INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled. |

## 21.15.5 reg_CTL_HI_type (CTL_HI0)—Offset 1Ch

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_HI0:** [BAR + 98000h] + 1Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

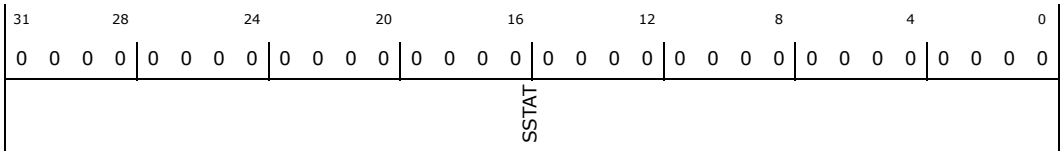
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RW | **CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description |
|---|---|---|
| 28:18 | 0h<br>RW | **CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17 | 0h<br>RW | **DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared. |
| 16:0 | 0h<br>RW | **BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1). |

## 21.15.6 reg_SSTAT_type (SSTAT0)—Offset 20h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTAT0:** [BAR + 98000h] + 20h

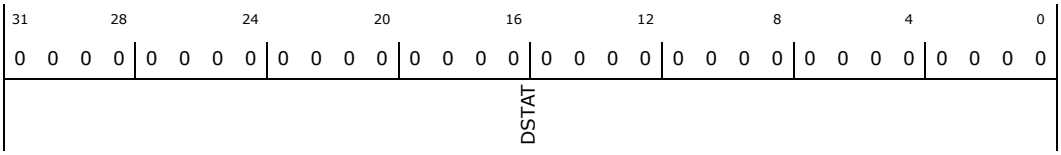
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface. |

## 21.15.7 reg_DSTAT_type (DSTAT0)—Offset 28h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTAT0:** [BAR + 98000h] + 28h

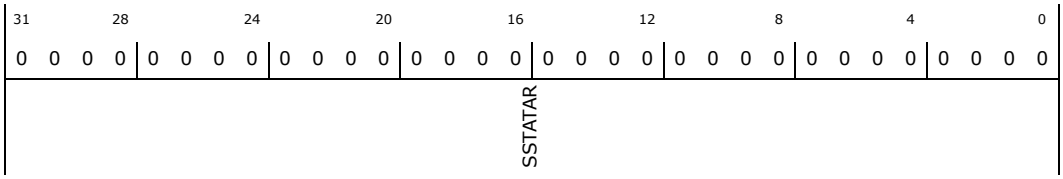
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface. |

## 21.15.8 reg_SSTATAR_type (SSTATAR0)—Offset 30h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTATAR0:** [BAR + 98000h] + 30h

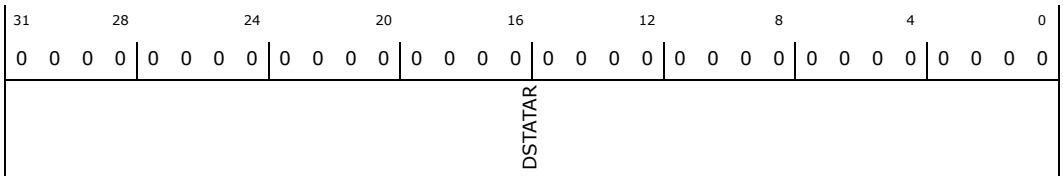
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block. |

## 21.15.9 reg_DSTATAR_type (DSTATAR0)—Offset 38h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTATAR0:** [BAR + 98000h] + 38h

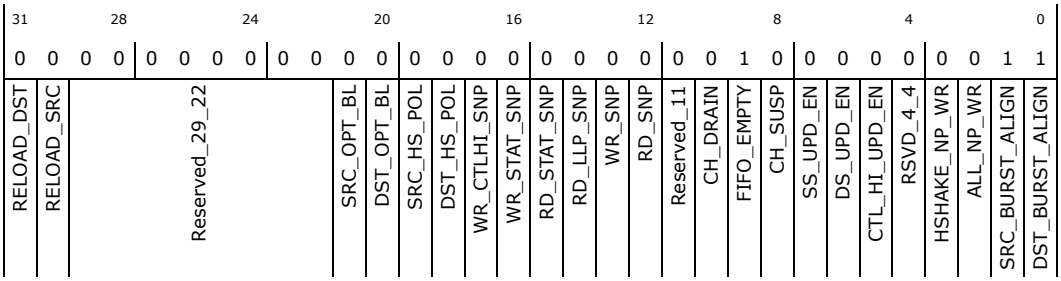
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block. |

## 21.15.10 reg_CFG_LO_type (CFG_LO0)—Offset 40h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_LO0:** [BAR + 98000h] + 40h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

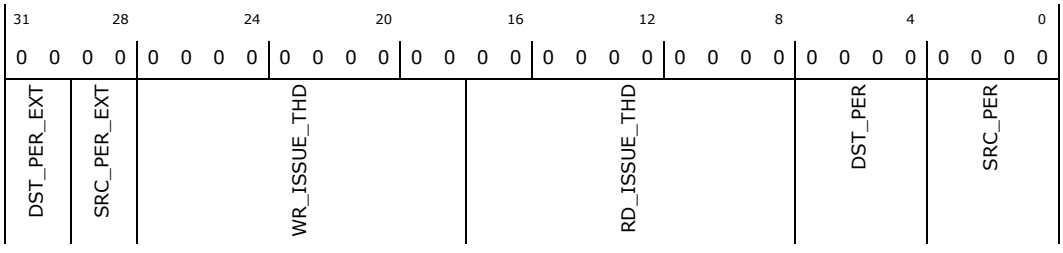
**Default:** 00000203h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h<br>RW | **RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 30 | 0h<br>RW | **RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 29:22 | 00h<br>RO | **Reserved_29_22:** Reserved |
| 21 | 0h<br>RW | **SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled |
| 20 | 0h<br>RW | **DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled |
| 19 | 0h<br>RW | **SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 18 | 0h<br>RW | **DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 17 | 0h<br>RW | **WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values |
| 16 | 0h<br>RW | **WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values |
| 15 | 0h<br>RW | **RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values |
| 14 | 0h<br>RW | **RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors |
| 13 | 0h<br>RW | **WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port |
| 12 | 0h<br>RW | **RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port |
| 11 | 0b<br>RO | **Reserved_11:** Reserved |
| 10 | 0b<br>RW | **CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted |
| 9 | 1b<br>RO | **FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty |

| Bit Range | Default & Access | Description |
|---|---|---|
| 8 | 0h<br>RW | **CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source. |
| 7 | 0h<br>RW | **SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 6 | 0h<br>RW | **DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 5 | 0h<br>RW | **CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 4 | 0h<br>RO | **RSVD_4_4:** Reserved |
| 3 | 0h<br>RW | **HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted) |
| 2 | 0h<br>RW | **ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used. |
| 1 | 1h<br>RW | **SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary |
| 0 | 1h<br>RW | **DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary |

## 21.15.11 reg_CFG_HI_type (CFG_HI0)—Offset 44h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_HI0:** [BAR + 98000h] + 44h

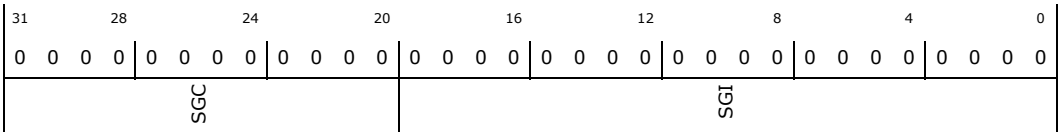
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RW | **DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range. |
| 29:28 | 0h<br>RW | **SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range. |
| 27:18 | 0h<br>RW | **WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW. |
| 17:8 | 0h<br>RW | **RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW. |
| 7:4 | 0h<br>RW | **DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |
| 3:0 | 0h<br>RW | **SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |

## 21.15.12 reg_SGR_type (SGR0)—Offset 48h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SGR0:** [BAR + 98000h] + 48h

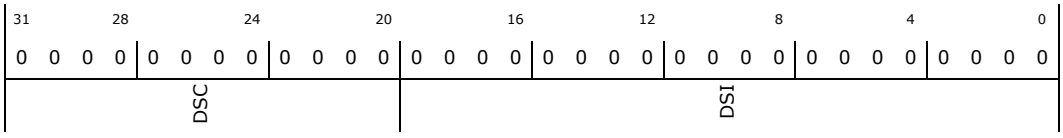
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries. |
| 19:0 | 0h<br>RW | **SGI:** Source gather interval. |

## 21.15.13 reg_DSR_type (DSR0)—Offset 50h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSR0:** [BAR + 98000h] + 50h

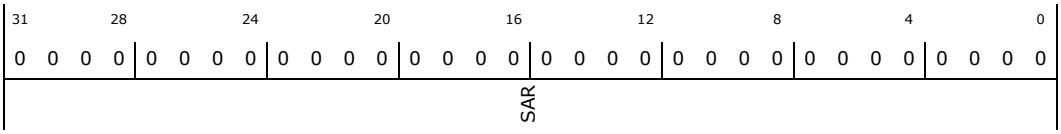
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries. |
| 19:0 | 0h<br>RW | **DSI:** Destination scatter interval. |

## 21.15.14 reg_SAR_type (SAR1)—Offset 58h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SAR1:** [BAR + 98000h] + 58h

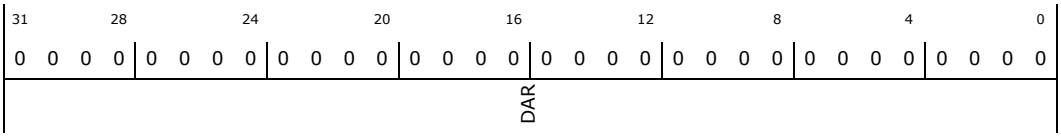
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length ) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.15.15 reg_DAR_type (DAR1)—Offset 60h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DAR1:** [BAR + 98000h] + 60h

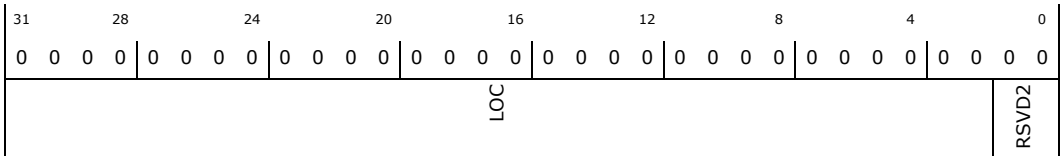
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length ) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.15.16 reg_LLP_type (LLP1)—Offset 68h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**LLP1:** [BAR + 98000h] + 68h

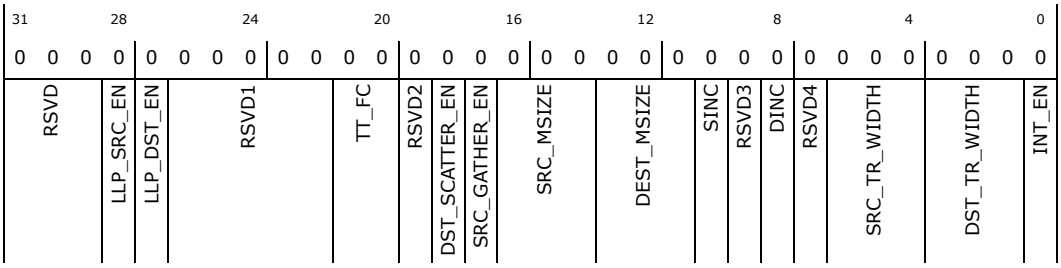
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 00000000h<br>RW | **LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit. |
| 1:0 | 0h<br>RO | **RSVD2:** Reserved |

## 21.15.17 reg_CTL_LO_type (CTL_LO1)—Offset 70h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_LO1:** [BAR + 98000h] + 70h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

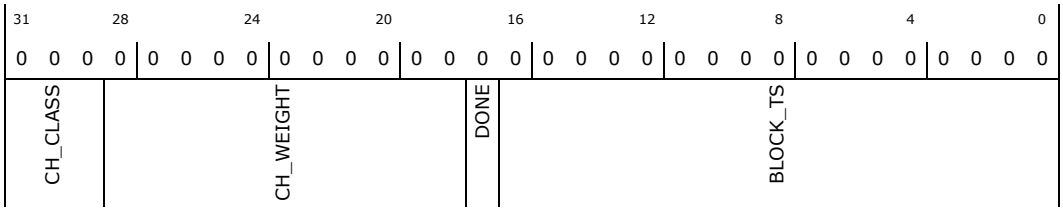
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RO | **RSVD:** Reserved |
| 28 | 0h<br>RW | **LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 27 | 0h<br>RW | **LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 26:22 | 0h<br>RO | **RSVD1:** RSVD |
| 21:20 | 0h<br>RW | **TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA. |
| 19 | 0h<br>RO | **RSVD2:** Reserved |
| 18 | 0h<br>RW | **DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control. |
| 17 | 0h<br>RW | **SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control. |
| 16:14 | 0h<br>RW | **SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field. |
| 13:11 | 0h<br>RW | **DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field. |
| 10 | 0h<br>RW | **SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 9 | 0h<br>RO | **RSVD3:** Reserved |
| 8 | 0h<br>RW | **DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change) |
| 7 | 0h<br>RO | **RSVD4:** Reserved |
| 6:4 | 0h<br>RW | **SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 3:1 | 0h<br>RW | **DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 0 | 0h<br>RW | **INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled. |

## 21.15.18 reg_CTL_HI_type (CTL_HI1)—Offset 74h

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_HI1:** [BAR + 98000h] + 74h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

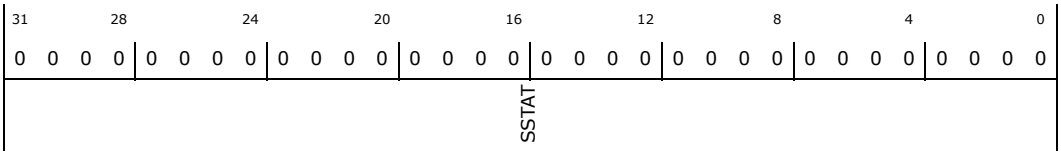
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RW | **CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description |
|---|---|---|
| 28:18 | 0h<br>RW | **CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17 | 0h<br>RW | **DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared. |
| 16:0 | 0h<br>RW | **BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1). |

## 21.15.19 reg_SSTAT_type (SSTAT1)—Offset 78h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTAT1:** [BAR + 98000h] + 78h

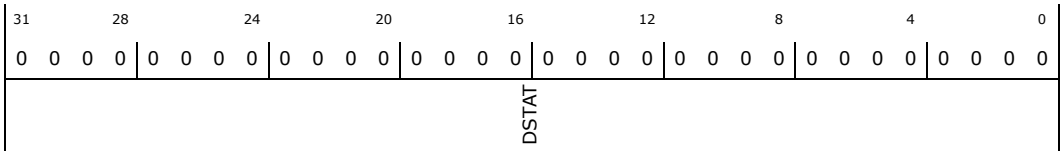
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface. |

## 21.15.20 reg_DSTAT_type (DSTAT1)—Offset 80h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTAT1:** [BAR + 98000h] + 80h

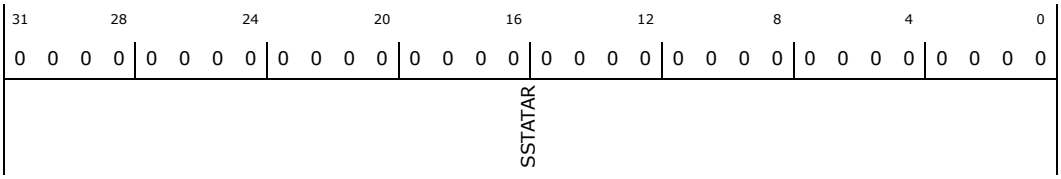
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface. |

## 21.15.21 reg_SSTATAR_type (SSTATAR1)—Offset 88h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTATAR1:** [BAR + 98000h] + 88h

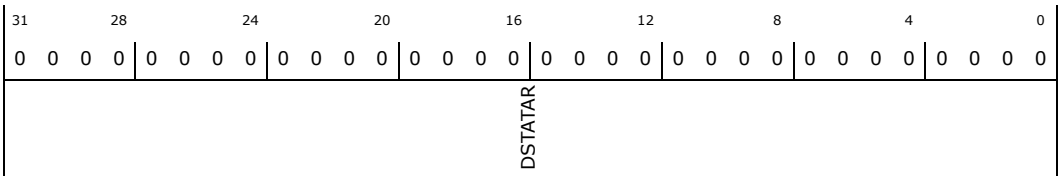
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block. |

## 21.15.22 reg_DSTATAR_type (DSTATAR1)—Offset 90h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTATAR1:** [BAR + 98000h] + 90h

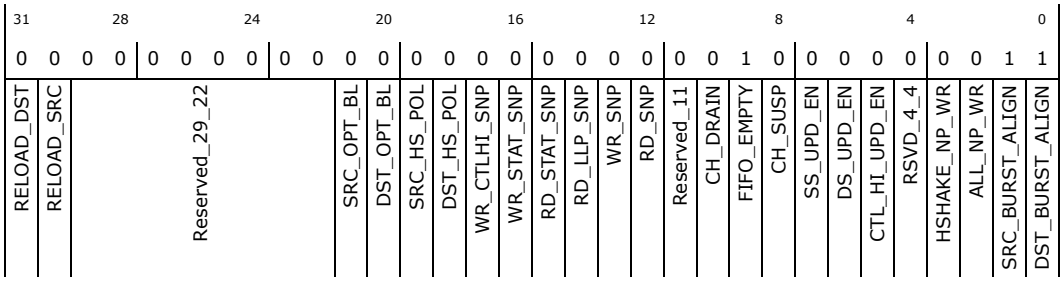
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block. |

## 21.15.23 reg_CFG_LO_type (CFG_LO1)—Offset 98h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_LO1:** [BAR + 98000h] + 98h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

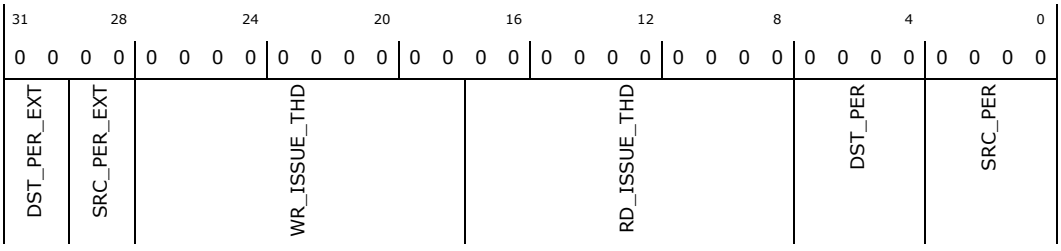
**Default:** 00000203h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h<br>RW | **RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 30 | 0h<br>RW | **RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 29:22 | 00h<br>RO | **Reserved_29_22:** Reserved |
| 21 | 0h<br>RW | **SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled |
| 20 | 0h<br>RW | **DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled |
| 19 | 0h<br>RW | **SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 18 | 0h<br>RW | **DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 17 | 0h<br>RW | **WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values |
| 16 | 0h<br>RW | **WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values |
| 15 | 0h<br>RW | **RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values |
| 14 | 0h<br>RW | **RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors |
| 13 | 0h<br>RW | **WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port |
| 12 | 0h<br>RW | **RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port |
| 11 | 0b<br>RO | **Reserved_11:** Reserved |
| 10 | 0b<br>RW | **CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted |
| 9 | 1b<br>RO | **FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty |

| Bit Range | Default & Access | Description |
|---|---|---|
| 8 | 0h<br>RW | **CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source. |
| 7 | 0h<br>RW | **SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 6 | 0h<br>RW | **DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 5 | 0h<br>RW | **CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 4 | 0h<br>RO | **RSVD_4_4:** Reserved |
| 3 | 0h<br>RW | **HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted) |
| 2 | 0h<br>RW | **ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used. |
| 1 | 1h<br>RW | **SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary |
| 0 | 1h<br>RW | **DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary |

## 21.15.24 reg_CFG_HI_type (CFG_HI1)—Offset 9Ch

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_HI1:** [BAR + 98000h] + 9Ch

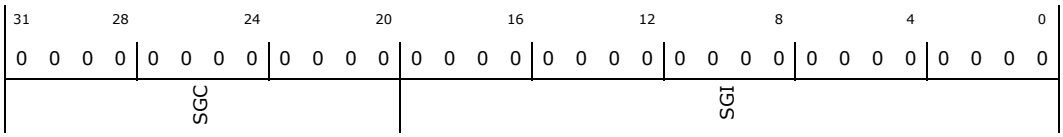
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RW | **DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range. |
| 29:28 | 0h<br>RW | **SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range. |
| 27:18 | 0h<br>RW | **WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW. |
| 17:8 | 0h<br>RW | **RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW. |
| 7:4 | 0h<br>RW | **DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |
| 3:0 | 0h<br>RW | **SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |

## 21.15.25 reg_SGR_type (SGR1)—Offset A0h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SGR1:** [BAR + 98000h] + A0h

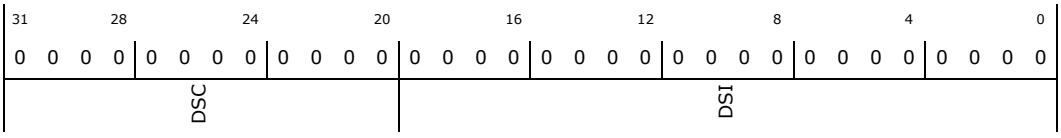
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries. |
| 19:0 | 0h<br>RW | **SGI:** Source gather interval. |

## 21.15.26 reg_DSR_type (DSR1)—Offset A8h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSR1:** [BAR + 98000h] + A8h

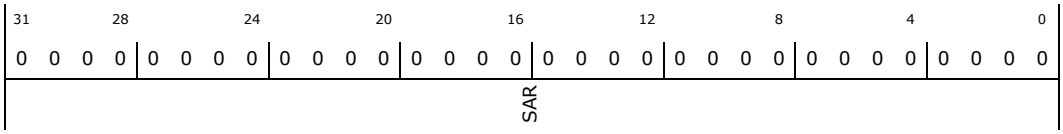
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries. |
| 19:0 | 0h<br>RW | **DSI:** Destination scatter interval. |

## 21.15.27 reg_SAR_type (SAR2)—Offset B0h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SAR2:** [BAR + 98000h] + B0h

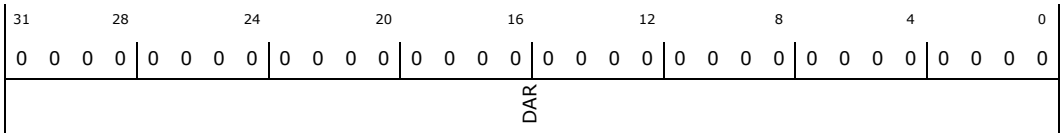
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length ) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.15.28 reg_DAR_type (DAR2)—Offset B8h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DAR2:** [BAR + 98000h] + B8h

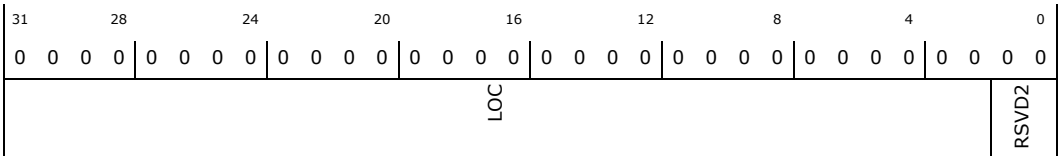
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length ) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.15.29 reg_LLP_type (LLP2)—Offset C0h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**LLP2:** [BAR + 98000h] + C0h

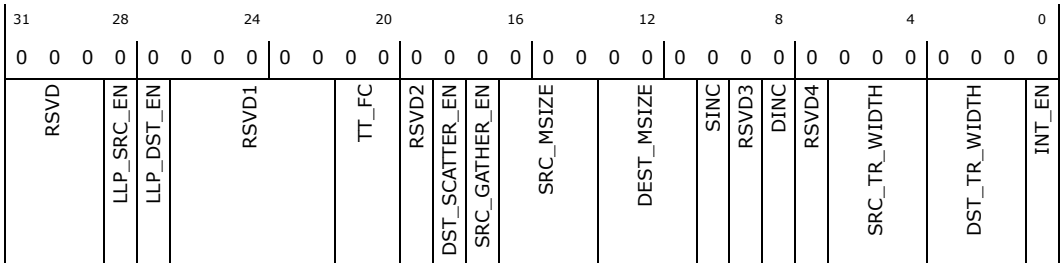
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 00000000h<br>RW | **LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit. |
| 1:0 | 0h<br>RO | **RSVD2:** Reserved |

## 21.15.30 reg_CTL_LO_type (CTL_LO2)—Offset C8h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_LO2:** [BAR + 98000h] + C8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

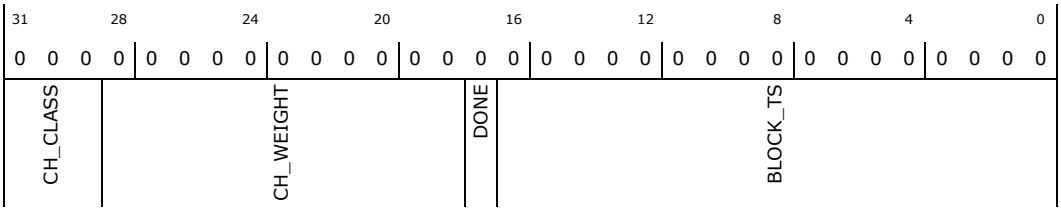
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RO | **RSVD:** Reserved |
| 28 | 0h<br>RW | **LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 27 | 0h<br>RW | **LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 26:22 | 0h<br>RO | **RSVD1:** RSVD |
| 21:20 | 0h<br>RW | **TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA. |
| 19 | 0h<br>RO | **RSVD2:** Reserved |
| 18 | 0h<br>RW | **DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control. |
| 17 | 0h<br>RW | **SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control. |
| 16:14 | 0h<br>RW | **SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field. |
| 13:11 | 0h<br>RW | **DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field. |
| 10 | 0h<br>RW | **SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 9 | 0h<br>RO | **RSVD3:** Reserved |
| 8 | 0h<br>RW | **DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change) |
| 7 | 0h<br>RO | **RSVD4:** Reserved |
| 6:4 | 0h<br>RW | **SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 3:1 | 0h<br>RW | **DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 0 | 0h<br>RW | **INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled. |

## 21.15.31 reg_CTL_HI_type (CTL_HI2)—Offset CCh

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_HI2:** [BAR + 98000h] + CCh

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

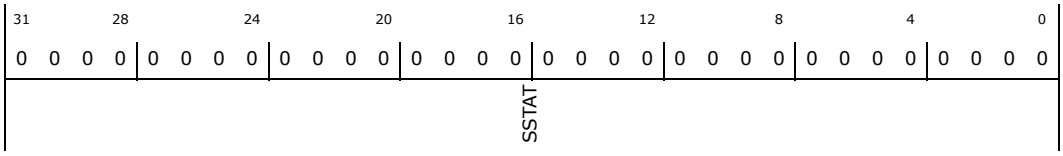
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RW | **CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description |
|---|---|---|
| 28:18 | 0h<br>RW | **CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17 | 0h<br>RW | **DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared. |
| 16:0 | 0h<br>RW | **BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1). |

## 21.15.32 reg_SSTAT_type (SSTAT2)—Offset D0h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTAT2:** [BAR + 98000h] + D0h

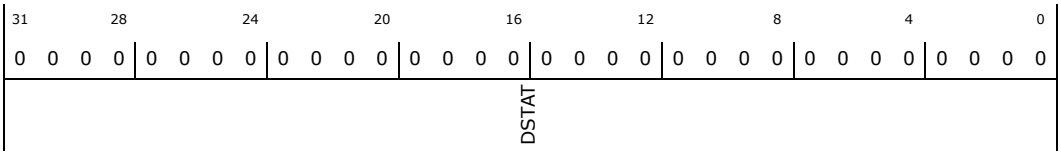
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface. |

## 21.15.33 reg_DSTAT_type (DSTAT2)—Offset D8h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTAT2:** [BAR + 98000h] + D8h

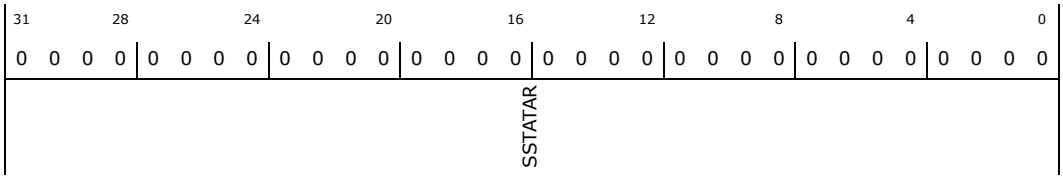
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface. |

## 21.15.34 reg_SSTATAR_type (SSTATAR2)—Offset E0h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTATAR2:** [BAR + 98000h] + E0h

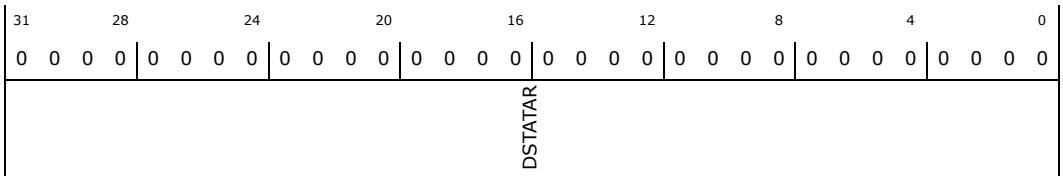
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block. |

## 21.15.35 reg_DSTATAR_type (DSTATAR2)—Offset E8h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTATAR2:** [BAR + 98000h] + E8h

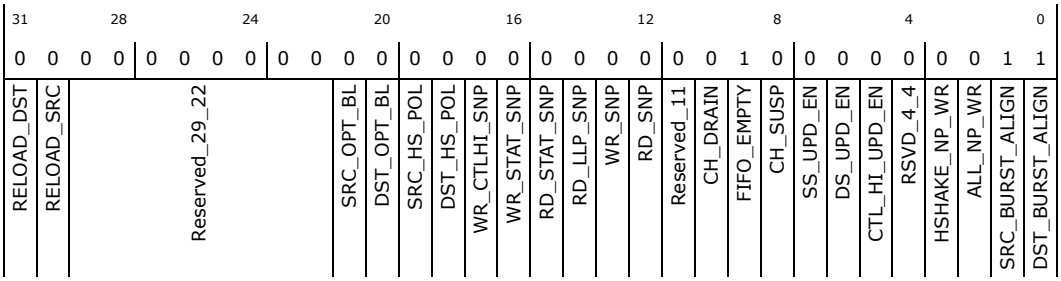
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block. |

## 21.15.36 reg_CFG_LO_type (CFG_LO2)—Offset F0h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_LO2:** [BAR + 98000h] + F0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

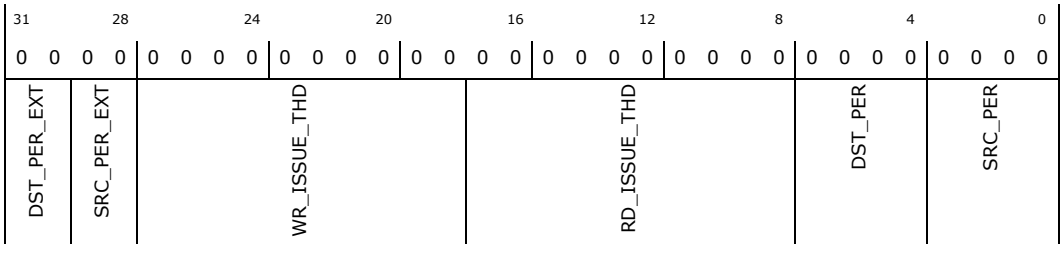
**Default:** 00000203h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h<br>RW | **RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 30 | 0h<br>RW | **RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 29:22 | 00h<br>RO | **Reserved_29_22:** Reserved |
| 21 | 0h<br>RW | **SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled |
| 20 | 0h<br>RW | **DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled |
| 19 | 0h<br>RW | **SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 18 | 0h<br>RW | **DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 17 | 0h<br>RW | **WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values |
| 16 | 0h<br>RW | **WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values |
| 15 | 0h<br>RW | **RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values |
| 14 | 0h<br>RW | **RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors |
| 13 | 0h<br>RW | **WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port |
| 12 | 0h<br>RW | **RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port |
| 11 | 0b<br>RO | **Reserved_11:** Reserved |
| 10 | 0b<br>RW | **CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted |
| 9 | 1b<br>RO | **FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty |

| Bit Range | Default & Access | Description |
|---|---|---|
| 8 | 0h<br>RW | **CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source. |
| 7 | 0h<br>RW | **SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 6 | 0h<br>RW | **DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 5 | 0h<br>RW | **CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 4 | 0h<br>RO | **RSVD_4_4:** Reserved |
| 3 | 0h<br>RW | **HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted) |
| 2 | 0h<br>RW | **ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used. |
| 1 | 1h<br>RW | **SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary |
| 0 | 1h<br>RW | **DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary |

## 21.15.37 reg_CFG_HI_type (CFG_HI2)—Offset F4h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_HI2:** [BAR + 98000h] + F4h

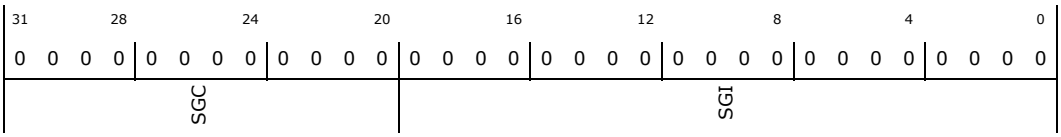
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RW | **DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range. |
| 29:28 | 0h<br>RW | **SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range. |
| 27:18 | 0h<br>RW | **WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW. |
| 17:8 | 0h<br>RW | **RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW. |
| 7:4 | 0h<br>RW | **DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |
| 3:0 | 0h<br>RW | **SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |

## 21.15.38 reg_SGR_type (SGR2)—Offset F8h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SGR2:** [BAR + 98000h] + F8h

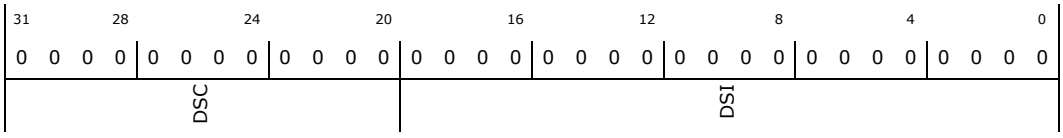
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries. |
| 19:0 | 0h<br>RW | **SGI:** Source gather interval. |

## 21.15.39 reg_DSR_type (DSR2)—Offset 100h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSR2:** [BAR + 98000h] + 100h

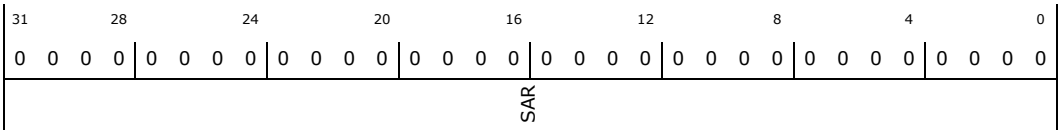
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries. |
| 19:0 | 0h<br>RW | **DSI:** Destination scatter interval. |

## 21.15.40 reg_SAR_type (SAR3)—Offset 108h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SAR3:** [BAR + 98000h] + 108h

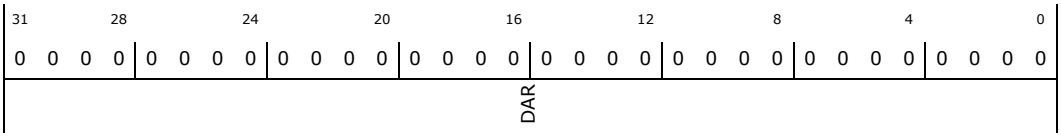
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length ) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.15.41 reg_DAR_type (DAR3)—Offset 110h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DAR3:** [BAR + 98000h] + 110h

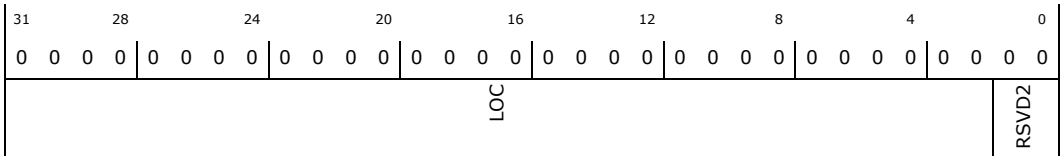
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length ) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.15.42 reg_LLP_type (LLP3)—Offset 118h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**LLP3:** [BAR + 98000h] + 118h

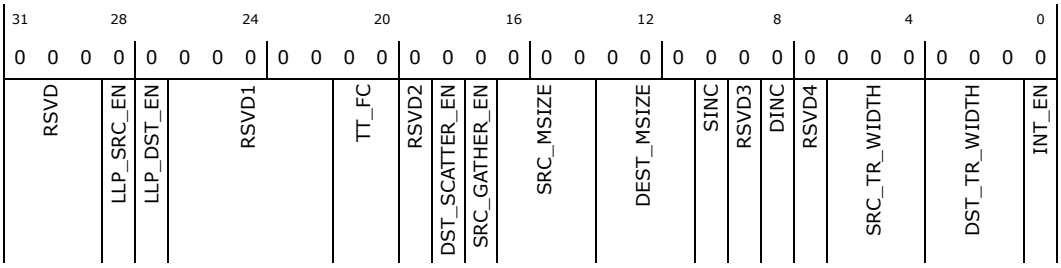
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 00000000h<br>RW | **LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit. |
| 1:0 | 0h<br>RO | **RSVD2:** Reserved |

## 21.15.43 reg_CTL_LO_type (CTL_LO3)—Offset 120h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_LO3:** [BAR + 98000h] + 120h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

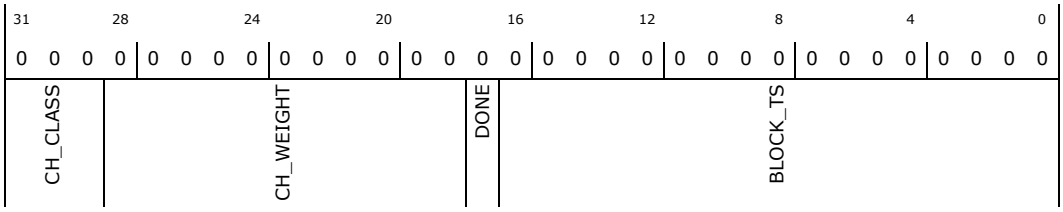
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RO | **RSVD:** Reserved |
| 28 | 0h<br>RW | **LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 27 | 0h<br>RW | **LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 26:22 | 0h<br>RO | **RSVD1:** RSVD |
| 21:20 | 0h<br>RW | **TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA. |
| 19 | 0h<br>RO | **RSVD2:** Reserved |
| 18 | 0h<br>RW | **DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control. |
| 17 | 0h<br>RW | **SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control. |
| 16:14 | 0h<br>RW | **SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field. |
| 13:11 | 0h<br>RW | **DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field. |
| 10 | 0h<br>RW | **SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 9 | 0h<br>RO | **RSVD3:** Reserved |
| 8 | 0h<br>RW | **DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change) |
| 7 | 0h<br>RO | **RSVD4:** Reserved |
| 6:4 | 0h<br>RW | **SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 3:1 | 0h<br>RW | **DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 0 | 0h<br>RW | **INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled. |

## 21.15.44 reg_CTL_HI_type (CTL_HI3)—Offset 124h

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_HI3:** [BAR + 98000h] + 124h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

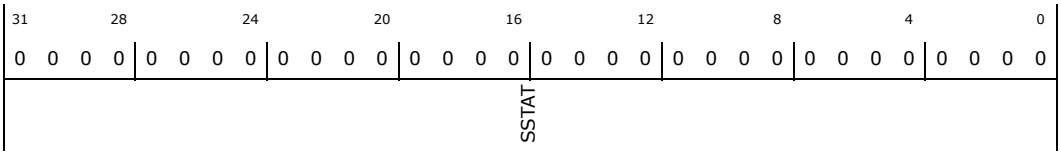
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RW | **CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description |
|---|---|---|
| 28:18 | 0h<br>RW | **CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17 | 0h<br>RW | **DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared. |
| 16:0 | 0h<br>RW | **BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1). |

## 21.15.45 reg_SSTAT_type (SSTAT3)—Offset 128h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTAT3:** [BAR + 98000h] + 128h

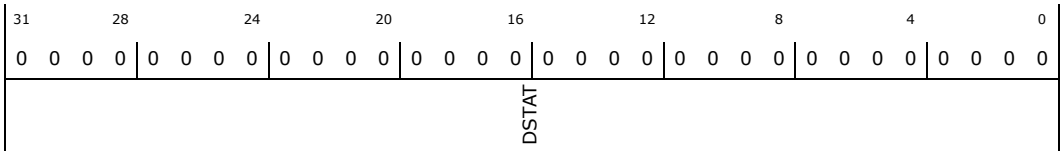
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface. |

## 21.15.46 reg_DSTAT_type (DSTAT3)—Offset 130h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTAT3:** [BAR + 98000h] + 130h

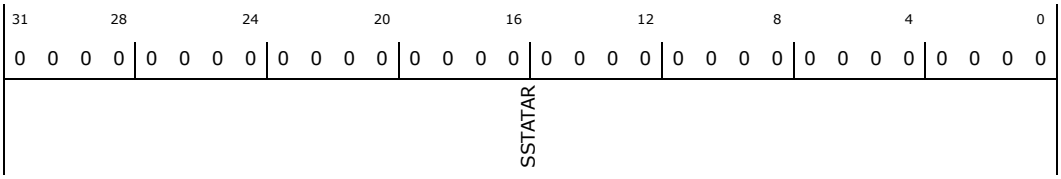
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface. |

## 21.15.47 reg_SSTATAR_type (SSTATAR3)—Offset 138h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTATAR3:** [BAR + 98000h] + 138h

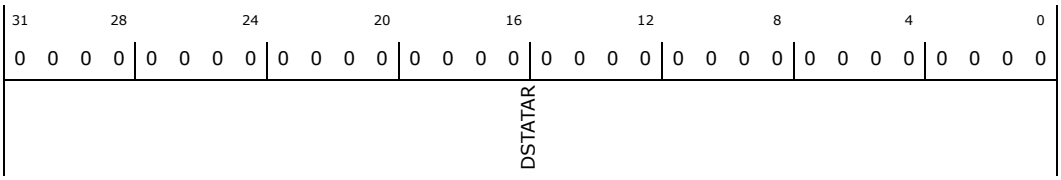
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block. |

## 21.15.48 reg_DSTATAR_type (DSTATAR3)—Offset 140h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTATAR3:** [BAR + 98000h] + 140h

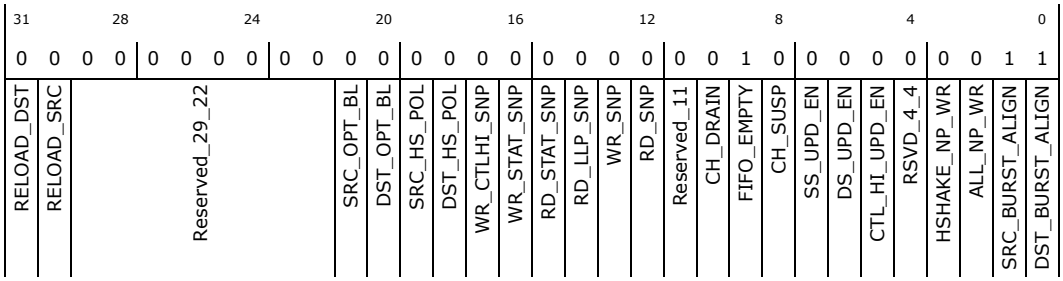
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block. |

## 21.15.49 reg_CFG_LO_type (CFG_LO3)—Offset 148h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_LO3:** [BAR + 98000h] + 148h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

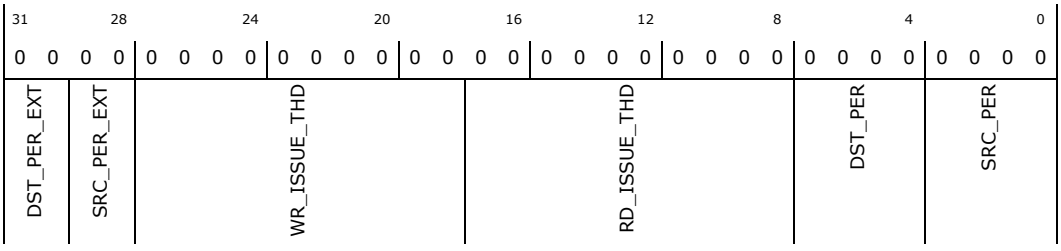
**Default:** 00000203h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h<br>RW | **RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 30 | 0h<br>RW | **RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 29:22 | 00h<br>RO | **Reserved_29_22:** Reserved |
| 21 | 0h<br>RW | **SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled |
| 20 | 0h<br>RW | **DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled |
| 19 | 0h<br>RW | **SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 18 | 0h<br>RW | **DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 17 | 0h<br>RW | **WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values |
| 16 | 0h<br>RW | **WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values |
| 15 | 0h<br>RW | **RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values |
| 14 | 0h<br>RW | **RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors |
| 13 | 0h<br>RW | **WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port |
| 12 | 0h<br>RW | **RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port |
| 11 | 0b<br>RO | **Reserved_11:** Reserved |
| 10 | 0b<br>RW | **CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted |
| 9 | 1b<br>RO | **FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty |

| Bit Range | Default & Access | Description |
|---|---|---|
| 8 | 0h<br>RW | **CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source. |
| 7 | 0h<br>RW | **SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 6 | 0h<br>RW | **DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 5 | 0h<br>RW | **CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 4 | 0h<br>RO | **RSVD_4_4:** Reserved |
| 3 | 0h<br>RW | **HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted) |
| 2 | 0h<br>RW | **ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used. |
| 1 | 1h<br>RW | **SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary |
| 0 | 1h<br>RW | **DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary |

## 21.15.50 reg_CFG_HI_type (CFG_HI3)—Offset 14Ch

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_HI3:** [BAR + 98000h] + 14Ch

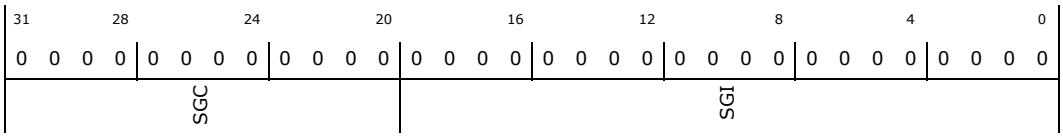
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RW | **DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range. |
| 29:28 | 0h<br>RW | **SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range. |
| 27:18 | 0h<br>RW | **WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW. |
| 17:8 | 0h<br>RW | **RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW. |
| 7:4 | 0h<br>RW | **DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |
| 3:0 | 0h<br>RW | **SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |

## 21.15.51 reg_SGR_type (SGR3)—Offset 150h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SGR3:** [BAR + 98000h] + 150h

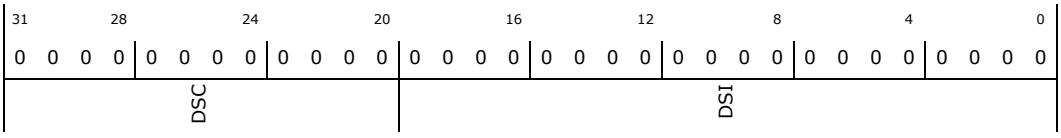
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries. |
| 19:0 | 0h<br>RW | **SGI:** Source gather interval. |

## 21.15.52 reg_DSR_type (DSR3)—Offset 158h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSR3:** [BAR + 98000h] + 158h

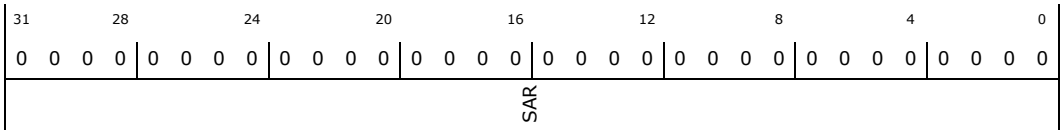
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries. |
| 19:0 | 0h<br>RW | **DSI:** Destination scatter interval. |

## 21.15.53 reg_SAR_type (SAR4)—Offset 160h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SAR4:** [BAR + 98000h] + 160h

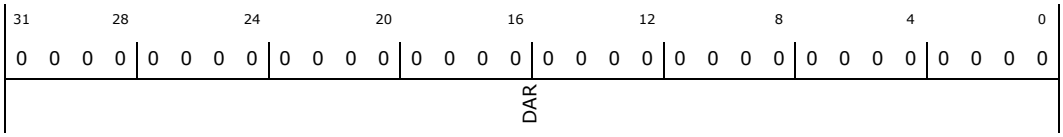
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length ) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.15.54 reg_DAR_type (DAR4)—Offset 168h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DAR4:** [BAR + 98000h] + 168h

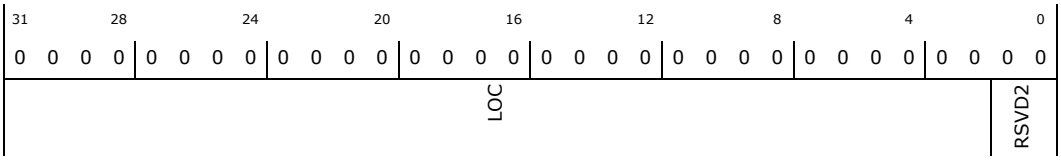
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length ) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.15.55 reg_LLP_type (LLP4)—Offset 170h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**LLP4:** [BAR + 98000h] + 170h

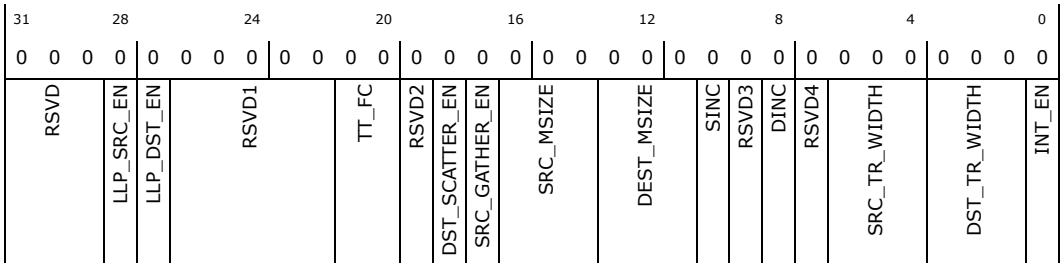
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 00000000h<br>RW | **LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit. |
| 1:0 | 0h<br>RO | **RSVD2:** Reserved |

## 21.15.56 reg_CTL_LO_type (CTL_LO4)—Offset 178h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_LO4:** [BAR + 98000h] + 178h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

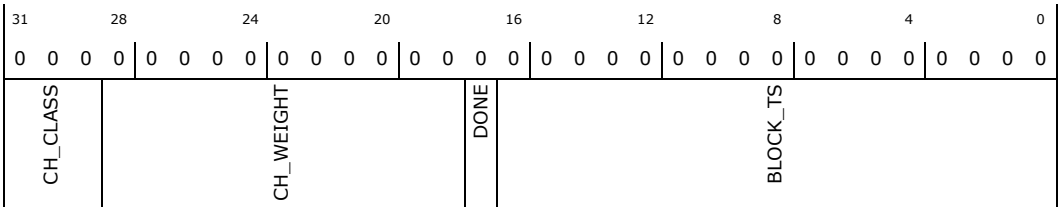
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RO | **RSVD:** Reserved |
| 28 | 0h<br>RW | **LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 27 | 0h<br>RW | **LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 26:22 | 0h<br>RO | **RSVD1:** RSVD |
| 21:20 | 0h<br>RW | **TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA. |
| 19 | 0h<br>RO | **RSVD2:** Reserved |
| 18 | 0h<br>RW | **DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control. |
| 17 | 0h<br>RW | **SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control. |
| 16:14 | 0h<br>RW | **SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field. |
| 13:11 | 0h<br>RW | **DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field. |
| 10 | 0h<br>RW | **SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 9 | 0h<br>RO | **RSVD3:** Reserved |
| 8 | 0h<br>RW | **DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change) |
| 7 | 0h<br>RO | **RSVD4:** Reserved |
| 6:4 | 0h<br>RW | **SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 3:1 | 0h<br>RW | **DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 0 | 0h<br>RW | **INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled. |

## 21.15.57 reg_CTL_HI_type (CTL_HI4)—Offset 17Ch

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_HI4:** [BAR + 98000h] + 17Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

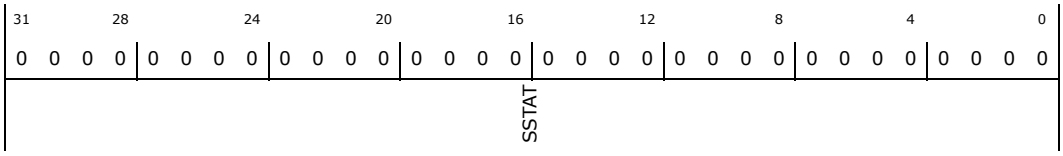
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RW | **CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description |
|---|---|---|
| 28:18 | 0h<br>RW | **CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17 | 0h<br>RW | **DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared. |
| 16:0 | 0h<br>RW | **BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1). |

## 21.15.58 reg_SSTAT_type (SSTAT4)—Offset 180h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTAT4:** [BAR + 98000h] + 180h

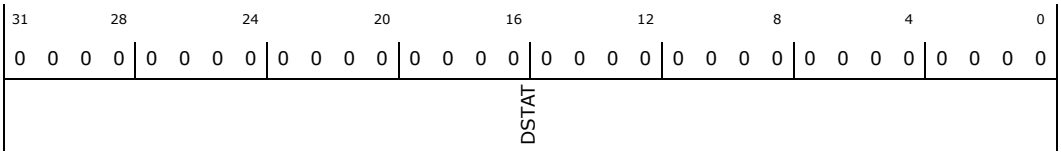
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface. |

## 21.15.59 reg_DSTAT_type (DSTAT4)—Offset 188h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTAT4:** [BAR + 98000h] + 188h

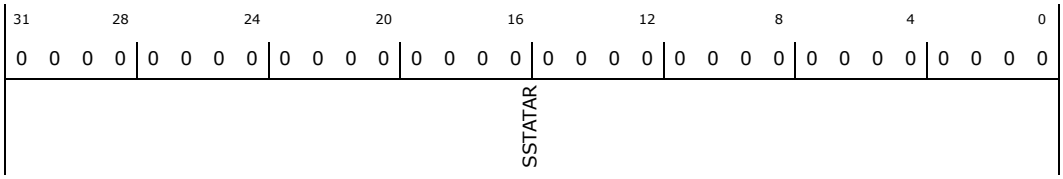
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface. |

## 21.15.60 reg_SSTATAR_type (SSTATAR4)—Offset 190h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTATAR4:** [BAR + 98000h] + 190h

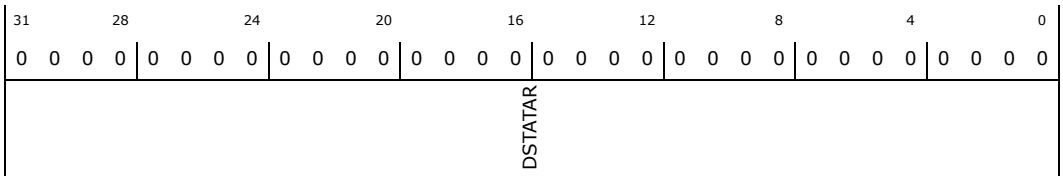
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block. |

## 21.15.61 reg_DSTATAR_type (DSTATAR4)—Offset 198h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTATAR4:** [BAR + 98000h] + 198h

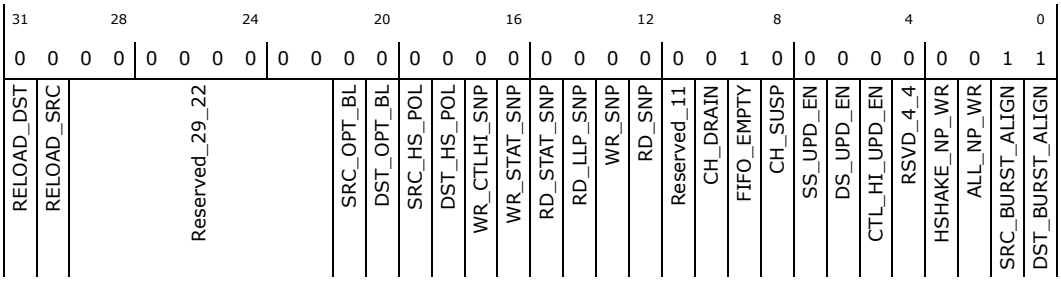
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block. |

## 21.15.62 reg_CFG_LO_type (CFG_LO4)—Offset 1A0h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_LO4:** [BAR + 98000h] + 1A0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

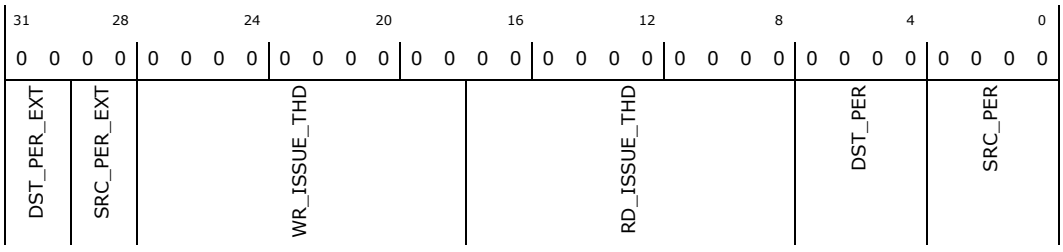
**Default:** 00000203h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h<br>RW | **RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 30 | 0h<br>RW | **RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 29:22 | 00h<br>RO | **Reserved_29_22:** Reserved |
| 21 | 0h<br>RW | **SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled |
| 20 | 0h<br>RW | **DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled |
| 19 | 0h<br>RW | **SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 18 | 0h<br>RW | **DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 17 | 0h<br>RW | **WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values |
| 16 | 0h<br>RW | **WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values |
| 15 | 0h<br>RW | **RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values |
| 14 | 0h<br>RW | **RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors |
| 13 | 0h<br>RW | **WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port |
| 12 | 0h<br>RW | **RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port |
| 11 | 0b<br>RO | **Reserved_11:** Reserved |
| 10 | 0b<br>RW | **CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted |
| 9 | 1b<br>RO | **FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty |

| Bit Range | Default & Access | Description |
|---|---|---|
| 8 | 0h<br>RW | **CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source. |
| 7 | 0h<br>RW | **SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 6 | 0h<br>RW | **DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 5 | 0h<br>RW | **CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 4 | 0h<br>RO | **RSVD_4_4:** Reserved |
| 3 | 0h<br>RW | **HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted) |
| 2 | 0h<br>RW | **ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used. |
| 1 | 1h<br>RW | **SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary |
| 0 | 1h<br>RW | **DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary |

## 21.15.63 reg_CFG_HI_type (CFG_HI4)—Offset 1A4h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_HI4:** [BAR + 98000h] + 1A4h

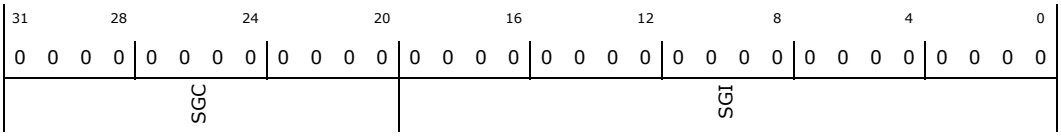
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RW | **DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range. |
| 29:28 | 0h<br>RW | **SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range. |
| 27:18 | 0h<br>RW | **WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW. |
| 17:8 | 0h<br>RW | **RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW. |
| 7:4 | 0h<br>RW | **DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |
| 3:0 | 0h<br>RW | **SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |

## 21.15.64 reg_SGR_type (SGR4)—Offset 1A8h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SGR4:** [BAR + 98000h] + 1A8h

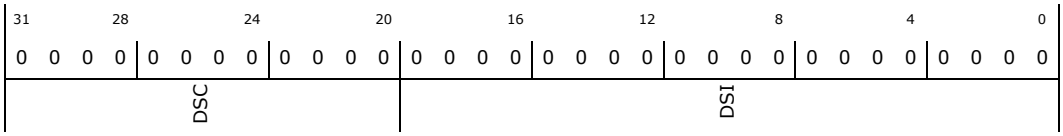
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries. |
| 19:0 | 0h<br>RW | **SGI:** Source gather interval. |

## 21.15.65 reg_DSR_type (DSR4)—Offset 1B0h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSR4:** [BAR + 98000h] + 1B0h

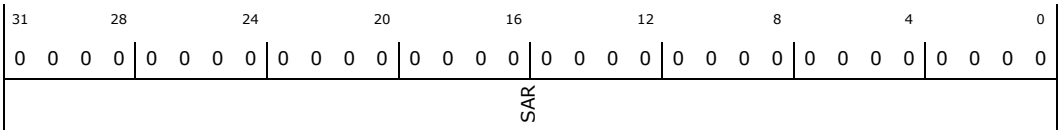
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries. |
| 19:0 | 0h<br>RW | **DSI:** Destination scatter interval. |

## 21.15.66 reg_SAR_type (SAR5)—Offset 1B8h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SAR5:** [BAR + 98000h] + 1B8h

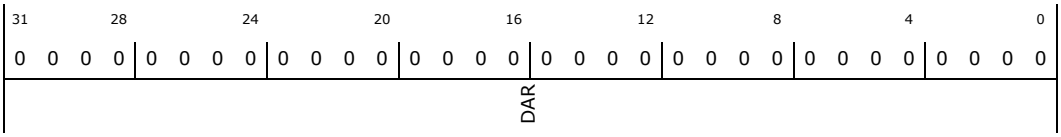
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length ) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.15.67 reg_DAR_type (DAR5)—Offset 1C0h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DAR5:** [BAR + 98000h] + 1C0h

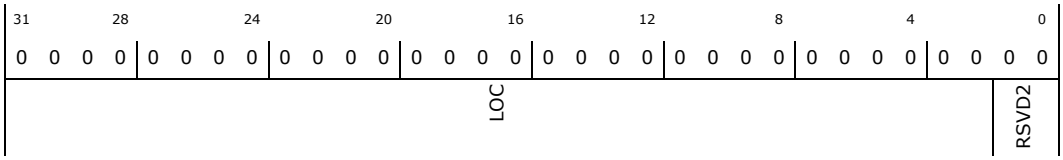
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length ) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.15.68 reg_LLP_type (LLP5)—Offset 1C8h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**LLP5:** [BAR + 98000h] + 1C8h

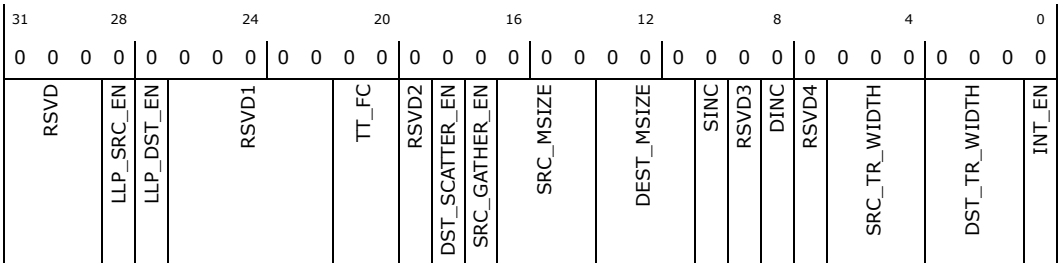
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 00000000h<br>RW | **LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit. |
| 1:0 | 0h<br>RO | **RSVD2:** Reserved |

## 21.15.69 reg_CTL_LO_type (CTL_LO5)—Offset 1D0h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_LO5:** [BAR + 98000h] + 1D0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

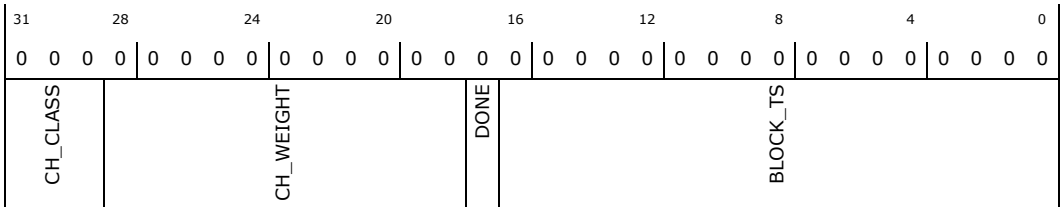
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RO | **RSVD:** Reserved |
| 28 | 0h<br>RW | **LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 27 | 0h<br>RW | **LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 26:22 | 0h<br>RO | **RSVD1:** RSVD |
| 21:20 | 0h<br>RW | **TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA. |
| 19 | 0h<br>RO | **RSVD2:** Reserved |
| 18 | 0h<br>RW | **DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control. |
| 17 | 0h<br>RW | **SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control. |
| 16:14 | 0h<br>RW | **SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field. |
| 13:11 | 0h<br>RW | **DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field. |
| 10 | 0h<br>RW | **SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 9 | 0h<br>RO | **RSVD3:** Reserved |
| 8 | 0h<br>RW | **DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change) |
| 7 | 0h<br>RO | **RSVD4:** Reserved |
| 6:4 | 0h<br>RW | **SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 3:1 | 0h<br>RW | **DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 0 | 0h<br>RW | **INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled. |

## 21.15.70 reg_CTL_HI_type (CTL_HI5)—Offset 1D4h

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_HI5:** [BAR + 98000h] + 1D4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

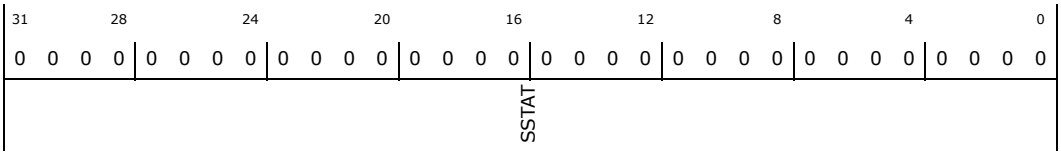
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RW | **CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description |
|---|---|---|
| 28:18 | 0h<br>RW | **CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17 | 0h<br>RW | **DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared. |
| 16:0 | 0h<br>RW | **BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1). |

## 21.15.71 reg_SSTAT_type (SSTAT5)—Offset 1D8h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTAT5:** [BAR + 98000h] + 1D8h

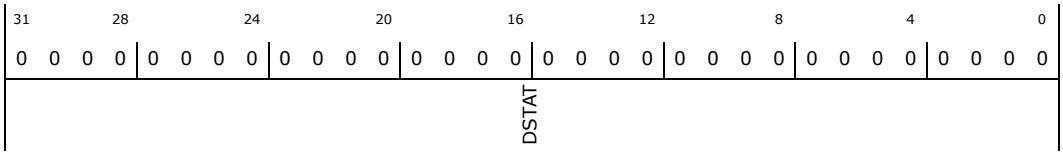
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface. |

## 21.15.72 reg_DSTAT_type (DSTAT5)—Offset 1E0h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTAT5:** [BAR + 98000h] + 1E0h

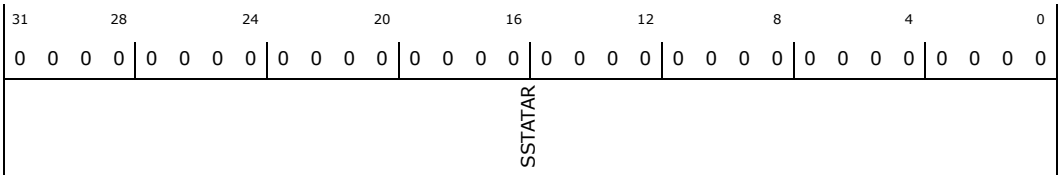
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface. |

## 21.15.73 reg_SSTATAR_type (SSTATAR5)—Offset 1E8h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTATAR5:** [BAR + 98000h] + 1E8h

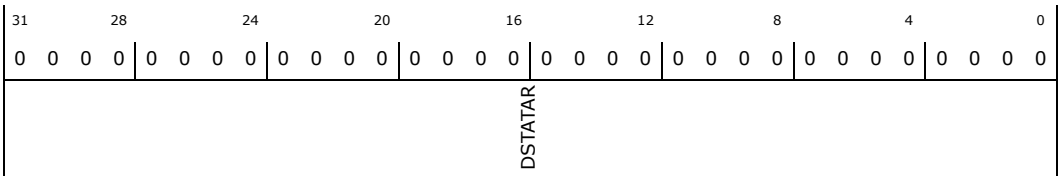
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block. |

## 21.15.74 reg_DSTATAR_type (DSTATAR5)—Offset 1F0h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTATAR5:** [BAR + 98000h] + 1F0h

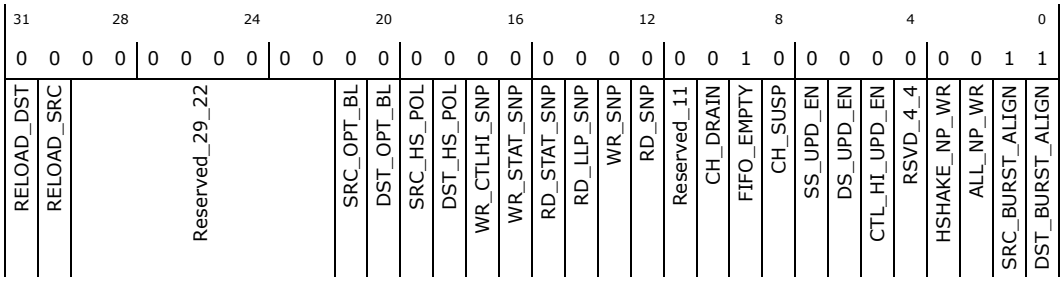
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block. |

## 21.15.75 reg_CFG_LO_type (CFG_LO5)—Offset 1F8h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_LO5:** [BAR + 98000h] + 1F8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000203h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h<br>RW | **RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 30 | 0h<br>RW | **RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 29:22 | 00h<br>RO | **Reserved_29_22:** Reserved |
| 21 | 0h<br>RW | **SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled |
| 20 | 0h<br>RW | **DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled |
| 19 | 0h<br>RW | **SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 18 | 0h<br>RW | **DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 17 | 0h<br>RW | **WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values |
| 16 | 0h<br>RW | **WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values |
| 15 | 0h<br>RW | **RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values |
| 14 | 0h<br>RW | **RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors |
| 13 | 0h<br>RW | **WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port |
| 12 | 0h<br>RW | **RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port |
| 11 | 0b<br>RO | **Reserved_11:** Reserved |
| 10 | 0b<br>RW | **CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted |
| 9 | 1b<br>RO | **FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty |

| Bit Range | Default & Access | Description |
|---|---|---|
| 8 | 0h<br>RW | **CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source. |
| 7 | 0h<br>RW | **SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 6 | 0h<br>RW | **DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 5 | 0h<br>RW | **CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 4 | 0h<br>RO | **RSVD_4_4:** Reserved |
| 3 | 0h<br>RW | **HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted) |

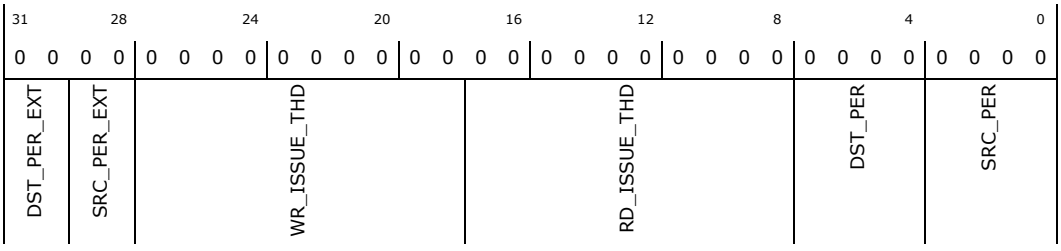
| 1 | 1h<br>RW | **SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary |
| 0 | 1h<br>RW | **DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary |

## 21.15.76 reg_CFG_HI_type (CFG_HI5)—Offset 1FCh

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_HI5:** [BAR + 98000h] + 1FCh

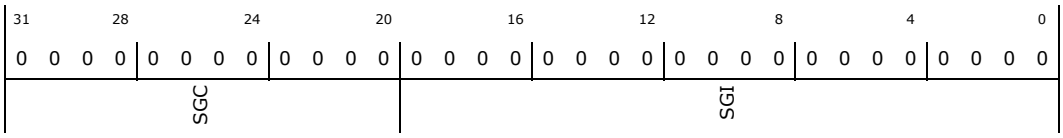
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RW | **DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range. |
| 29:28 | 0h<br>RW | **SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range. |
| 27:18 | 0h<br>RW | **WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW. |
| 17:8 | 0h<br>RW | **RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW. |
| 7:4 | 0h<br>RW | **DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |
| 3:0 | 0h<br>RW | **SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |

## 21.15.77 reg_SGR_type (SGR5)—Offset 200h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SGR5:** [BAR + 98000h] + 200h

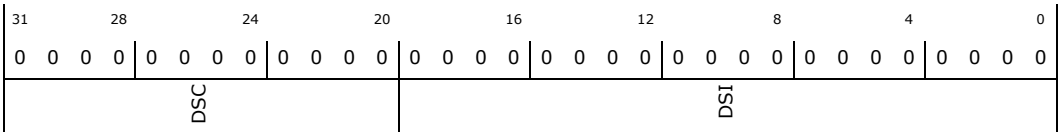
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries. |
| 19:0 | 0h<br>RW | **SGI:** Source gather interval. |

## 21.15.78 reg_DSR_type (DSR5)—Offset 208h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSR5:** [BAR + 98000h] + 208h

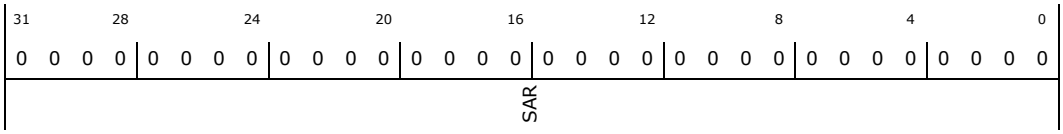
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries. |
| 19:0 | 0h<br>RW | **DSI:** Destination scatter interval. |

## 21.15.79 reg_SAR_type (SAR6)—Offset 210h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SAR6:** [BAR + 98000h] + 210h

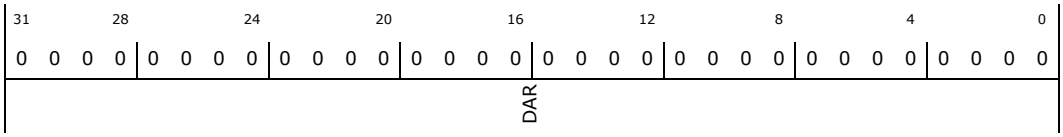
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length ) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.15.80 reg_DAR_type (DAR6)—Offset 218h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DAR6:** [BAR + 98000h] + 218h

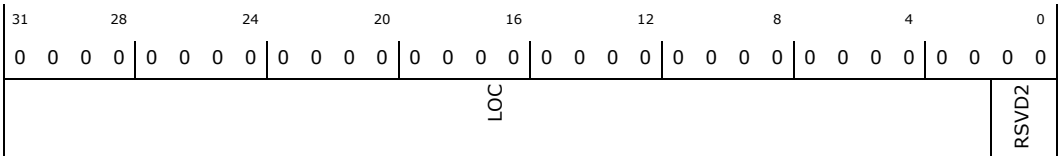
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length ) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.15.81 reg_LLP_type (LLP6)—Offset 220h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**LLP6:** [BAR + 98000h] + 220h

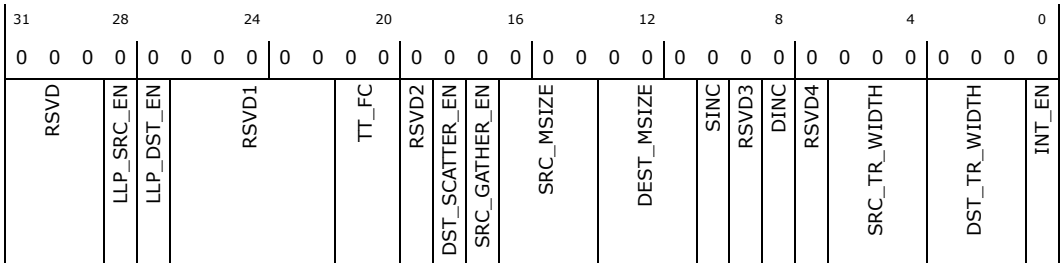
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 00000000h<br>RW | **LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit. |
| 1:0 | 0h<br>RO | **RSVD2:** Reserved |

## 21.15.82 reg_CTL_LO_type (CTL_LO6)—Offset 228h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_LO6:** [BAR + 98000h] + 228h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

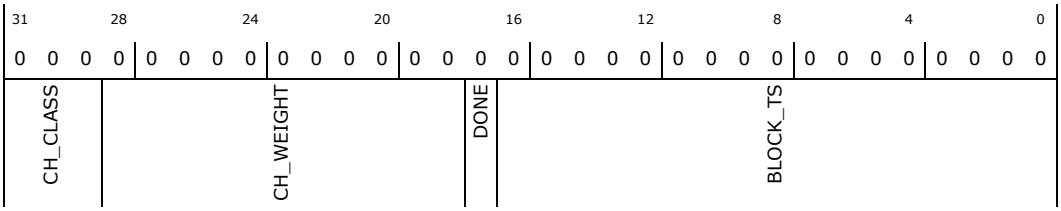
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RO | **RSVD:** Reserved |
| 28 | 0h<br>RW | **LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 27 | 0h<br>RW | **LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 26:22 | 0h<br>RO | **RSVD1:** RSVD |
| 21:20 | 0h<br>RW | **TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA. |
| 19 | 0h<br>RO | **RSVD2:** Reserved |
| 18 | 0h<br>RW | **DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control. |
| 17 | 0h<br>RW | **SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control. |
| 16:14 | 0h<br>RW | **SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field. |
| 13:11 | 0h<br>RW | **DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field. |
| 10 | 0h<br>RW | **SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 9 | 0h<br>RO | **RSVD3:** Reserved |
| 8 | 0h<br>RW | **DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change) |
| 7 | 0h<br>RO | **RSVD4:** Reserved |
| 6:4 | 0h<br>RW | **SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 3:1 | 0h<br>RW | **DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 0 | 0h<br>RW | **INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled. |

## 21.15.83 reg_CTL_HI_type (CTL_HI6)—Offset 22Ch

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_HI6:** [BAR + 98000h] + 22Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

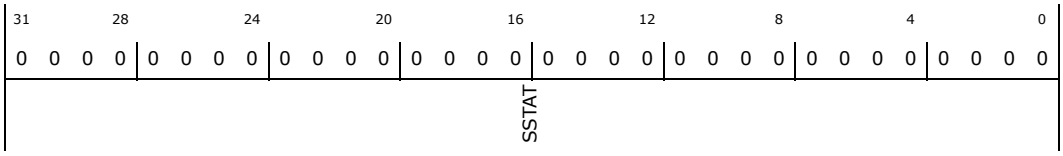
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RW | **CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description |
|---|---|---|
| 28:18 | 0h<br>RW | **CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17 | 0h<br>RW | **DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared. |
| 16:0 | 0h<br>RW | **BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1). |

## 21.15.84 reg_SSTAT_type (SSTAT6)—Offset 230h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTAT6:** [BAR + 98000h] + 230h

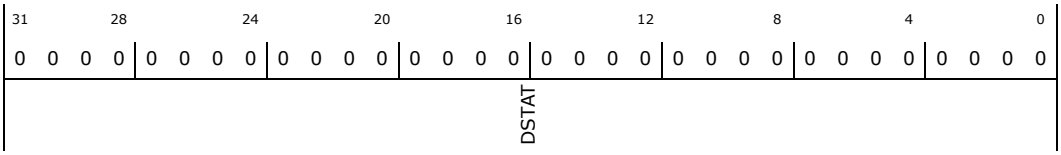
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface. |

## 21.15.85 reg_DSTAT_type (DSTAT6)—Offset 238h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTAT6:** [BAR + 98000h] + 238h

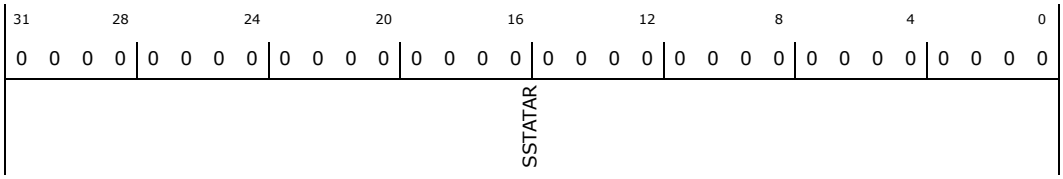
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface. |

## 21.15.86 reg_SSTATAR_type (SSTATAR6)—Offset 240h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTATAR6:** [BAR + 98000h] + 240h

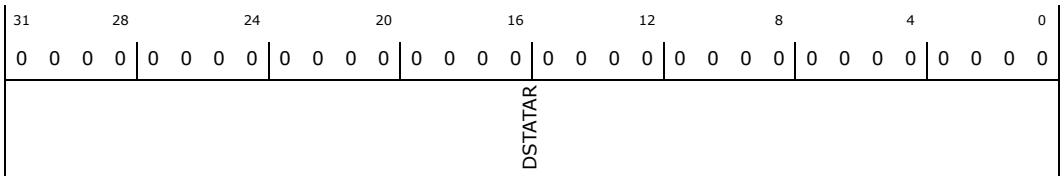
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block. |

## 21.15.87 reg_DSTATAR_type (DSTATAR6)—Offset 248h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTATAR6:** [BAR + 98000h] + 248h

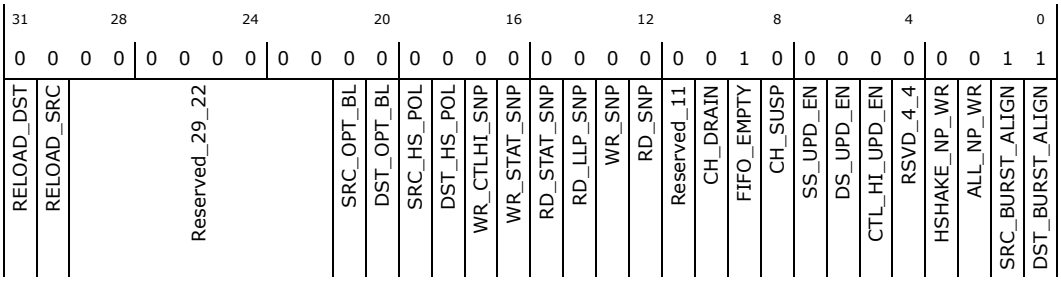
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block. |

## 21.15.88 reg_CFG_LO_type (CFG_LO6)—Offset 250h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_LO6:** [BAR + 98000h] + 250h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

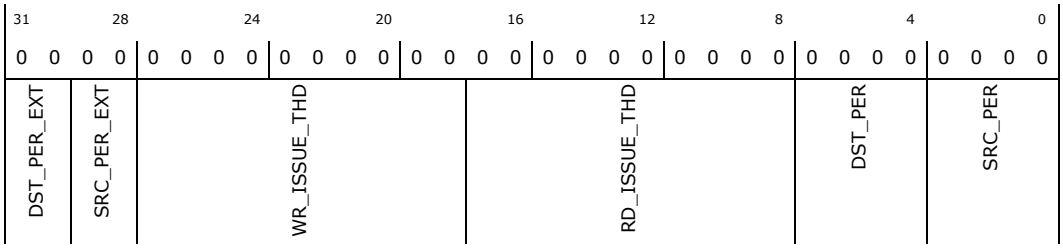
**Default:** 00000203h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h<br>RW | **RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 30 | 0h<br>RW | **RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 29:22 | 00h<br>RO | **Reserved_29_22:** Reserved |
| 21 | 0h<br>RW | **SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled |
| 20 | 0h<br>RW | **DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled |
| 19 | 0h<br>RW | **SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 18 | 0h<br>RW | **DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 17 | 0h<br>RW | **WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values |
| 16 | 0h<br>RW | **WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values |
| 15 | 0h<br>RW | **RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values |
| 14 | 0h<br>RW | **RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors |
| 13 | 0h<br>RW | **WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port |
| 12 | 0h<br>RW | **RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port |
| 11 | 0b<br>RO | **Reserved_11:** Reserved |
| 10 | 0b<br>RW | **CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted |
| 9 | 1b<br>RO | **FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty |

| Bit Range | Default & Access | Description |
|---|---|---|
| 8 | 0h<br>RW | **CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source. |
| 7 | 0h<br>RW | **SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 6 | 0h<br>RW | **DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 5 | 0h<br>RW | **CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 4 | 0h<br>RO | **RSVD_4_4:** Reserved |
| 3 | 0h<br>RW | **HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted) |
| 2 | 0h<br>RW | **ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used. |
| 1 | 1h<br>RW | **SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary |
| 0 | 1h<br>RW | **DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary |

## 21.15.89 reg_CFG_HI_type (CFG_HI6)—Offset 254h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_HI6:** [BAR + 98000h] + 254h

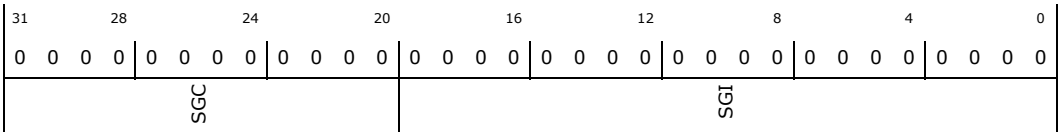
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RW | **DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range. |
| 29:28 | 0h<br>RW | **SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range. |
| 27:18 | 0h<br>RW | **WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW. |
| 17:8 | 0h<br>RW | **RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW. |
| 7:4 | 0h<br>RW | **DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |
| 3:0 | 0h<br>RW | **SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |

## 21.15.90 reg_SGR_type (SGR6)—Offset 258h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SGR6:** [BAR + 98000h] + 258h

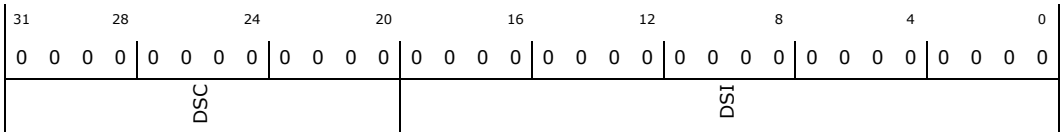
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries. |
| 19:0 | 0h<br>RW | **SGI:** Source gather interval. |

## 21.15.91 reg_DSR_type (DSR6)—Offset 260h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSR6:** [BAR + 98000h] + 260h

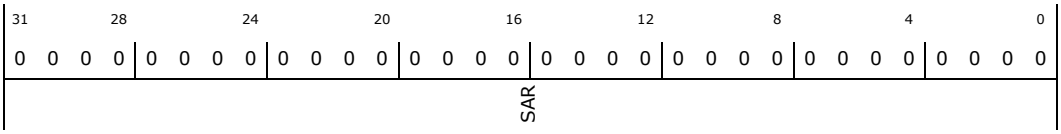
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries. |
| 19:0 | 0h<br>RW | **DSI:** Destination scatter interval. |

## 21.15.92 reg_SAR_type (SAR7)—Offset 268h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SAR7:** [BAR + 98000h] + 268h

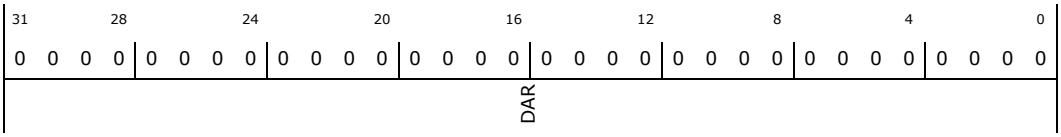
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length ) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.15.93 reg_DAR_type (DAR7)—Offset 270h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DAR7:** [BAR + 98000h] + 270h

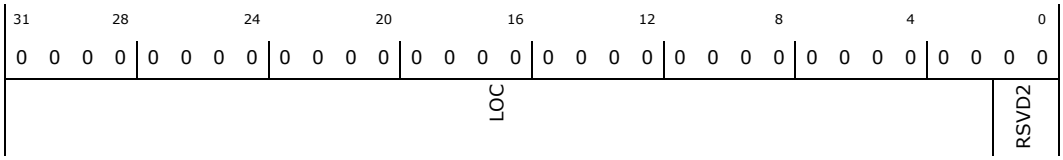
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length ) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.15.94 reg_LLP_type (LLP7)—Offset 278h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**LLP7:** [BAR + 98000h] + 278h

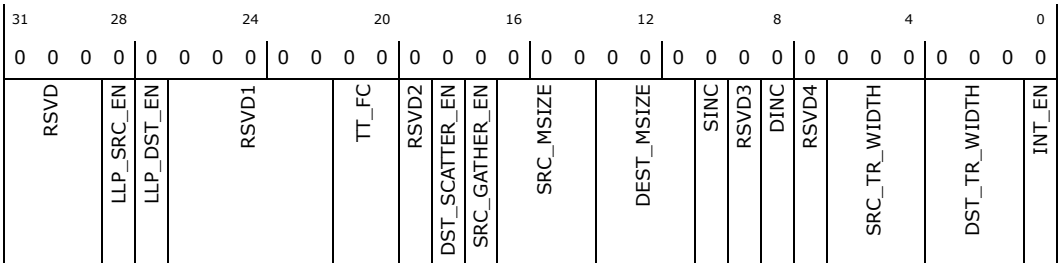
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 00000000h<br>RW | **LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit. |
| 1:0 | 0h<br>RO | **RSVD2:** Reserved |

## 21.15.95 reg_CTL_LO_type (CTL_LO7)—Offset 280h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_LO7:** [BAR + 98000h] + 280h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

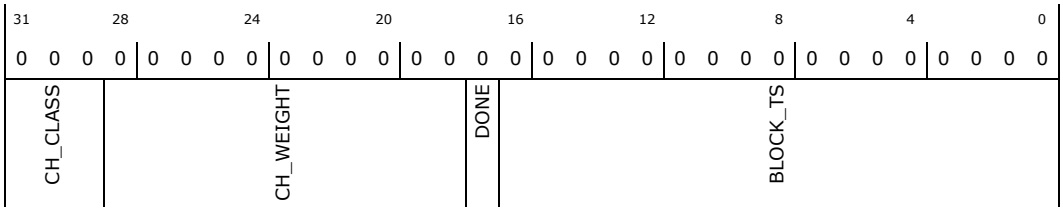
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RO | **RSVD:** Reserved |
| 28 | 0h<br>RW | **LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 27 | 0h<br>RW | **LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 26:22 | 0h<br>RO | **RSVD1:** RSVD |
| 21:20 | 0h<br>RW | **TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA. |
| 19 | 0h<br>RO | **RSVD2:** Reserved |
| 18 | 0h<br>RW | **DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control. |
| 17 | 0h<br>RW | **SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control. |
| 16:14 | 0h<br>RW | **SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field. |
| 13:11 | 0h<br>RW | **DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field. |
| 10 | 0h<br>RW | **SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 9 | 0h<br>RO | **RSVD3:** Reserved |
| 8 | 0h<br>RW | **DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change) |
| 7 | 0h<br>RO | **RSVD4:** Reserved |
| 6:4 | 0h<br>RW | **SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 3:1 | 0h<br>RW | **DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 0 | 0h<br>RW | **INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled. |

## 21.15.96 reg_CTL_HI_type (CTL_HI7)—Offset 284h

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_HI7:** [BAR + 98000h] + 284h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

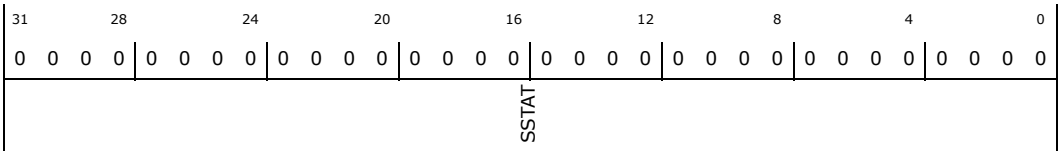
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RW | **CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description |
|---|---|---|
| 28:18 | 0h<br>RW | **CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17 | 0h<br>RW | **DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared. |
| 16:0 | 0h<br>RW | **BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1). |

## 21.15.97 reg_SSTAT_type (SSTAT7)—Offset 288h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTAT7:** [BAR + 98000h] + 288h

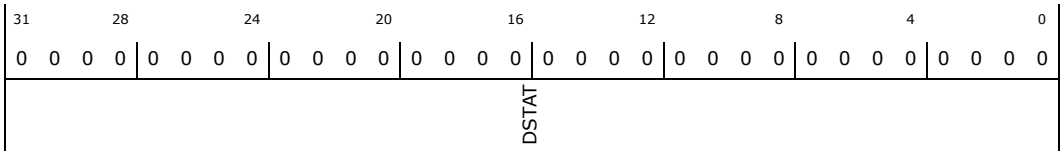
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface. |

## 21.15.98 reg_DSTAT_type (DSTAT7)—Offset 290h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTAT7:** [BAR + 98000h] + 290h

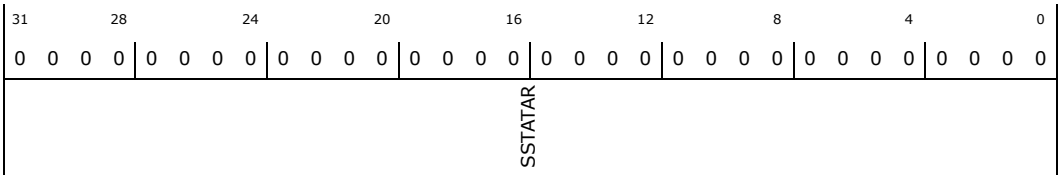
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface. |

## 21.15.99 reg_SSTATAR_type (SSTATAR7)—Offset 298h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTATAR7:** [BAR + 98000h] + 298h

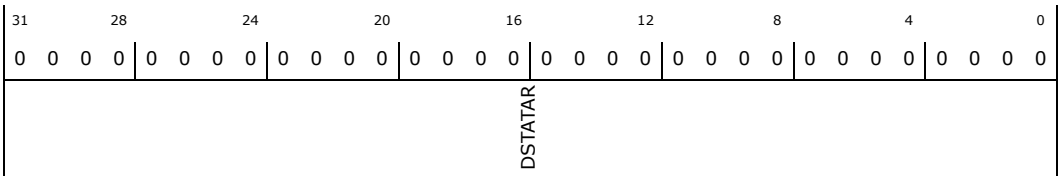
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block. |

## 21.15.100 reg_DSTATAR_type (DSTATAR7)—Offset 2A0h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTATAR7:** [BAR + 98000h] + 2A0h

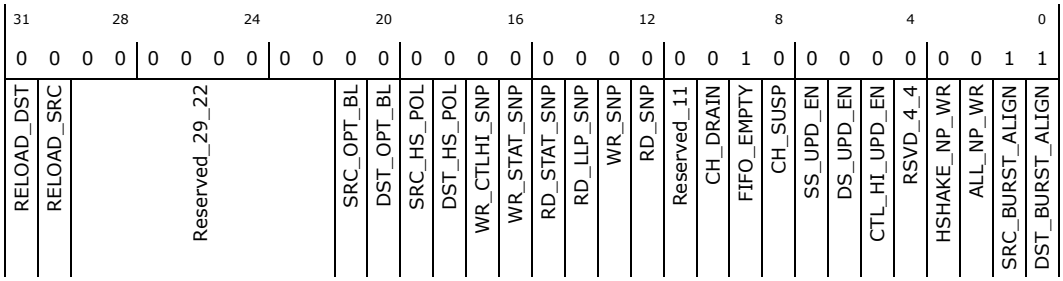
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block. |

## 21.15.101 reg_CFG_LO_type (CFG_LO7)—Offset 2A8h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_LO7:** [BAR + 98000h] + 2A8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

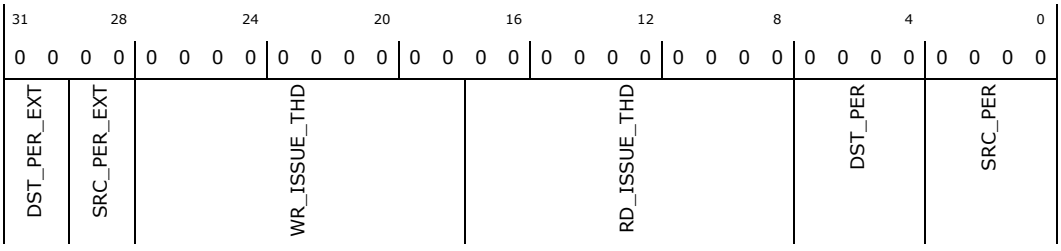
**Default:** 00000203h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h<br>RW | **RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 30 | 0h<br>RW | **RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 29:22 | 00h<br>RO | **Reserved_29_22:** Reserved |
| 21 | 0h<br>RW | **SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled |
| 20 | 0h<br>RW | **DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled |
| 19 | 0h<br>RW | **SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 18 | 0h<br>RW | **DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 17 | 0h<br>RW | **WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values |
| 16 | 0h<br>RW | **WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values |
| 15 | 0h<br>RW | **RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values |
| 14 | 0h<br>RW | **RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors |
| 13 | 0h<br>RW | **WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port |
| 12 | 0h<br>RW | **RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port |
| 11 | 0b<br>RO | **Reserved_11:** Reserved |
| 10 | 0b<br>RW | **CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted |
| 9 | 1b<br>RO | **FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty |

| Bit Range | Default & Access | Description |
|---|---|---|
| 8 | 0h<br>RW | **CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source. |
| 7 | 0h<br>RW | **SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 6 | 0h<br>RW | **DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 5 | 0h<br>RW | **CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 4 | 0h<br>RO | **RSVD_4_4:** Reserved |
| 3 | 0h<br>RW | **HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted) |
| 2 | 0h<br>RW | **ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used. |
| 1 | 1h<br>RW | **SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary |
| 0 | 1h<br>RW | **DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary |

## 21.15.102 reg_CFG_HI_type (CFG_HI7)—Offset 2ACh

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_HI7:** [BAR + 98000h] + 2ACh

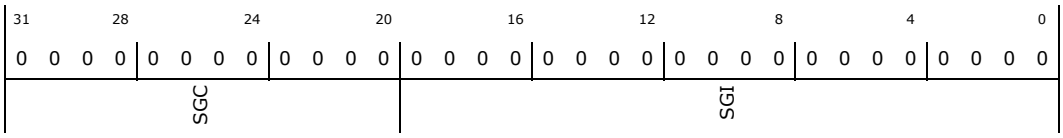
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RW | **DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range. |
| 29:28 | 0h<br>RW | **SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range. |
| 27:18 | 0h<br>RW | **WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW. |
| 17:8 | 0h<br>RW | **RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW. |
| 7:4 | 0h<br>RW | **DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |
| 3:0 | 0h<br>RW | **SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |

## 21.15.103 reg_SGR_type (SGR7)—Offset 2B0h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SGR7:** [BAR + 98000h] + 2B0h

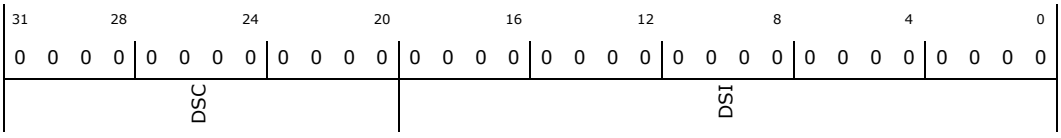
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries. |
| 19:0 | 0h<br>RW | **SGI:** Source gather interval. |

## 21.15.104 reg_DSR_type (DSR7)—Offset 2B8h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSR7:** [BAR + 98000h] + 2B8h

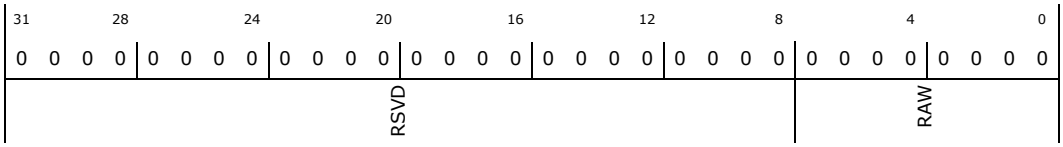
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries. |
| 19:0 | 0h<br>RW | **DSI:** Destination scatter interval. |

## 21.15.105 reg_Raw_type (RawTfr)—Offset 2C0h

Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers The following RAW registers are available in the DMA RawTfr - Raw Status for Transfer Interrupts RawBlock - Raw Status for Block Interrupts Register RawSrcTran - Raw Status for Source Transaction Interrupts Register RawDstTran - Raw Status for Destination Transaction Interrupts Register RawErr - Raw Status for Error Interrupts Register



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**RawTfr:** [BAR + 98000h] + 2C0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

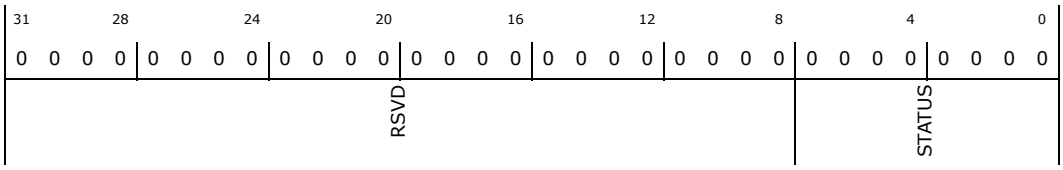
## 21.15.113 reg_Status_type (StatusDstTran)—Offset 300h

All interrupt events from all channels are stored in these Interrupt Status registers after masking: statusBlock, StatusDstTran, StatusErr, StatusSrcTran, and StatusTfr. Each Interrupt Status register has a bit allocated per channel, for example, StatusTfr(2) is the Channel 2 status transfer complete interrupt. The contents of these registers are used to generate the interrupt signals (int or int_n bus, depending on interrupt polarity) leaving the DMA.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**StatusDstTran:** [BAR + 98000h] + 300h

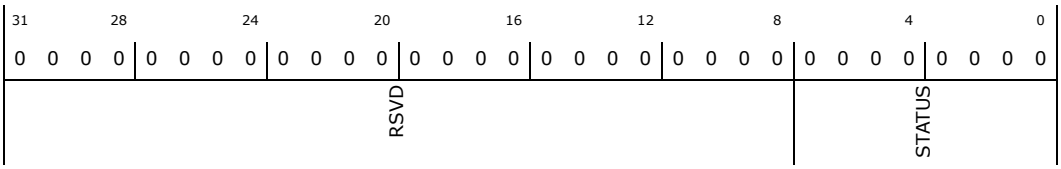
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 0h<br>RO | **RSVD:** Reserved |
| 7:0 | 0h<br>RO | **STATUS:** Interrupt status |

## 21.15.114 reg_Status_type (StatusErr)—Offset 308h

All interrupt events from all channels are stored in these Interrupt Status registers after masking: statusBlock, StatusDstTran, StatusErr, StatusSrcTran, and StatusTfr. Each Interrupt Status register has a bit allocated per channel, for example, StatusTfr(2) is the Channel 2 status transfer complete interrupt. The contents of these registers are used to generate the interrupt signals (int or int_n bus, depending on interrupt polarity) leaving the DMA.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**StatusErr:** [BAR + 98000h] + 308h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

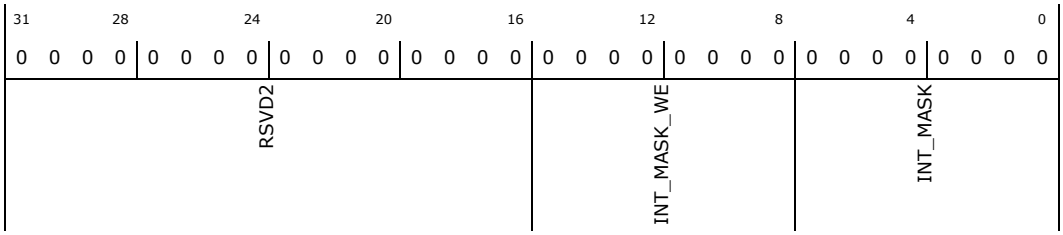
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 0h<br>RO | **RSVD:** Reserved |
| 7:0 | 0h<br>RO | **STATUS:** Interrupt status |

## 21.15.115 reg_Mask_type (MaskTfr)—Offset 310h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged.

Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**MaskTfr:** [BAR + 98000h] + 310h

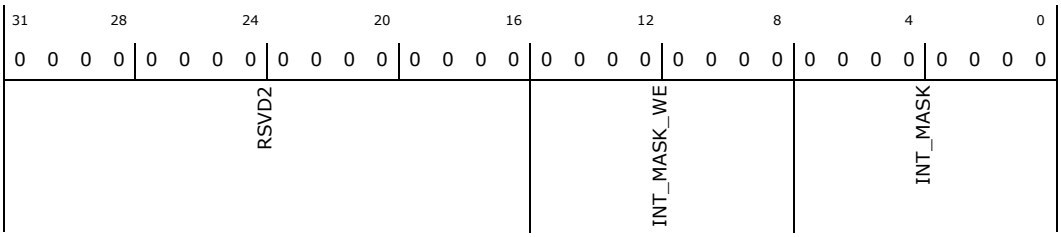
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0h<br>RO | **RSVD2:** Reserved |
| 15:8 | 0h<br>WO | **INT_MASK_WE:** Interrupt Mask Write Enable 0 = write disabled 1 = write enabled |
| 7:0 | 0h<br>RW | **INT_MASK:** Interrupt mask 0-mask 1-unmask |

## 21.15.116 reg_Mask_type (MaskBlock)—Offset 318h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**MaskBlock:** [BAR + 98000h] + 318h

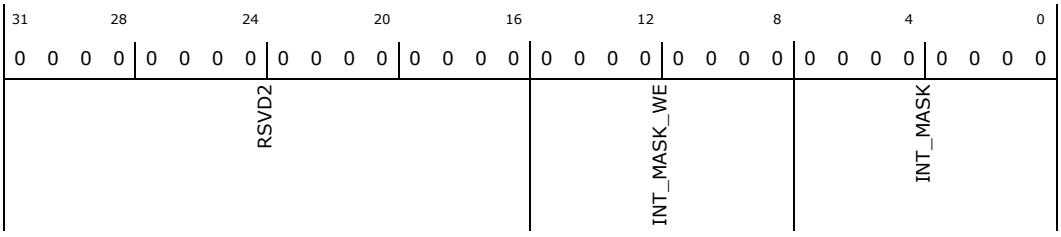
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0h<br>RO | **RSVD2:** Reserved |
| 15:8 | 0h<br>WO | **INT_MASK_WE:** Interrupt Mask Write Enable 0 = write disabled 1 = write enabled |
| 7:0 | 0h<br>RW | **INT_MASK:** Interrupt mask 0-mask 1-unmask |

## 21.15.117 reg_Mask_type (MaskSrcTran)—Offset 320h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.



### Access Method

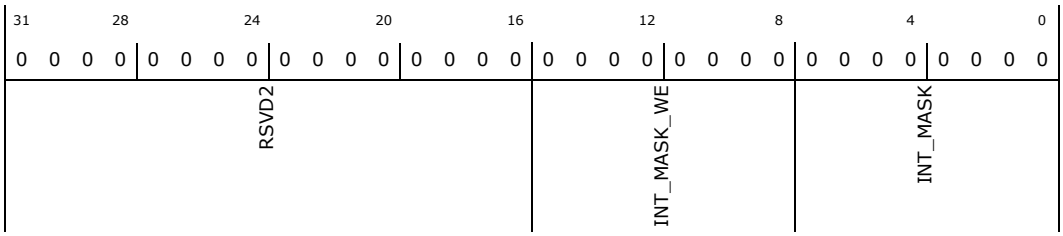
| 15:8 | 0h<br>WO | **INT_MASK_WE:** Interrupt Mask Write Enable 0 = write disabled 1 = write enabled |
| 7:0 | 0h<br>RW | **INT_MASK:** Interrupt mask 0-mask 1-unmask |

## 21.15.118 reg_Mask_type (MaskDstTran)—Offset 328h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**MaskDstTran:** [BAR + 98000h] + 328h

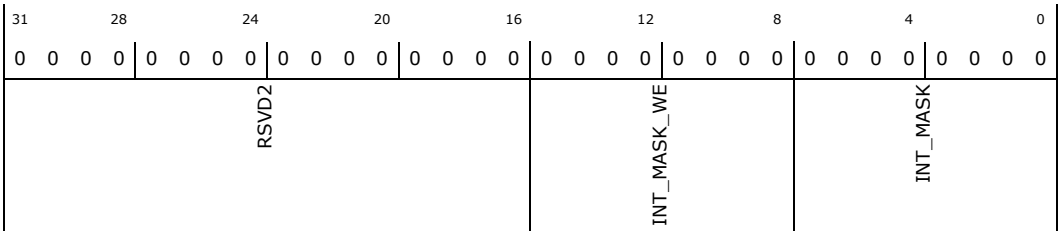
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0h<br>RO | **RSVD2:** Reserved |
| 15:8 | 0h<br>WO | **INT_MASK_WE:** Interrupt Mask Write Enable 0 = write disabled 1 = write enabled |
| 7:0 | 0h<br>RW | **INT_MASK:** Interrupt mask 0-mask 1-unmask |

## 21.15.119 reg_Mask_type (MaskErr)—Offset 330h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int_combined(_n) signal. A channel INT_MASK bit will be written only if the corresponding mask write enable bit in the INT_MASK_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmasks the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int_* port signals.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**MaskErr:** [BAR + 98000h] + 330h

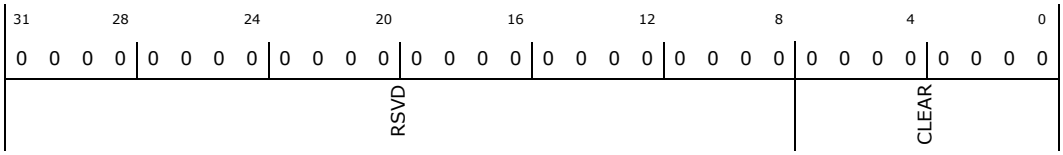
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0h<br>RO | **RSVD2:** Reserved |
| 15:8 | 0h<br>WO | **INT_MASK_WE:** Interrupt Mask Write Enable 0 = write disabled 1 = write enabled |
| 7:0 | 0h<br>RW | **INT_MASK:** Interrupt mask 0-mask 1-unmask |

## 21.15.120 reg_Clear_type (ClearTfr)—Offset 338h

Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ClearTfr:** [BAR + 98000h] + 338h

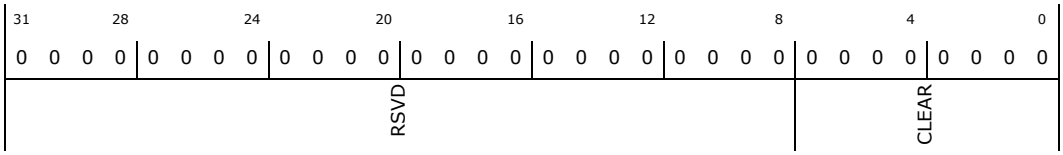
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 0h<br>RO | **RSVD:** Reserved |
| 7:0 | 0h<br>WO | **CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt |

## 21.15.121 reg_Clear_type (ClearBlock)—Offset 340h

Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ClearBlock:** [BAR + 98000h] + 340h

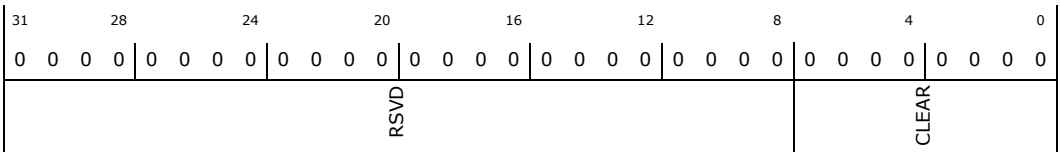
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 0h<br>RO | **RSVD:** Reserved |
| 7:0 | 0h<br>WO | **CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt |

## 21.15.122 reg_Clear_type (ClearSrcTran)—Offset 348h

Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ClearSrcTran:** [BAR + 98000h] + 348h

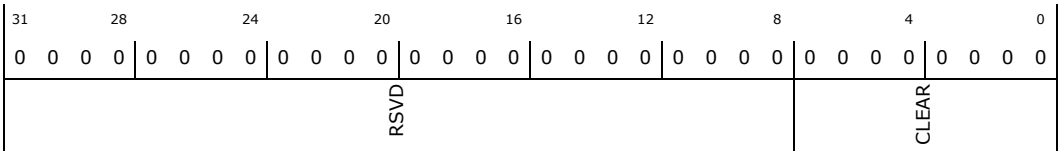
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 0h<br>RO | **RSVD:** Reserved |
| 7:0 | 0h<br>WO | **CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt |

## 21.15.123 reg_Clear_type (ClearDstTran)—Offset 350h

Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ClearDstTran:** [BAR + 98000h] + 350h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

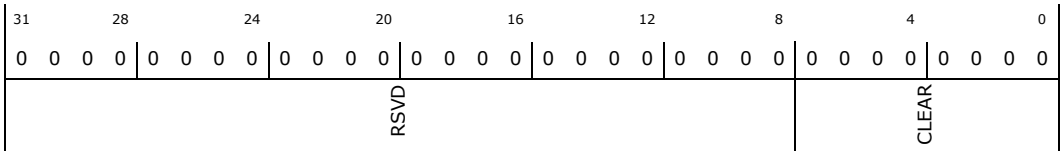
| 7:0 | 0h<br>WO | **CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt |

## 21.15.124 reg_Clear_type (ClearErr)—Offset 358h

Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ClearErr:** [BAR + 98000h] + 358h

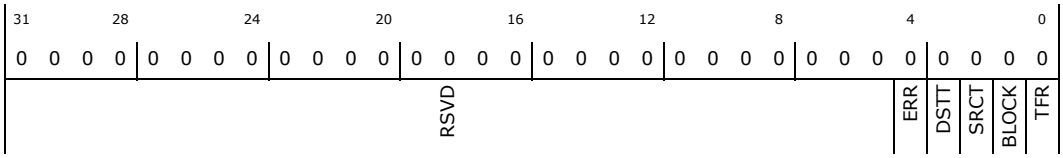
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:8 | 0h<br>RO | **RSVD:** Reserved |
| 7:0 | 0h<br>WO | **CLEAR:** Interrupt clear. 0 = no effect 1 = clear interrupt |

## 21.15.125 reg_StatusInt_type (StatusInt)—Offset 360h

The contents of each of the five Status registers StatusTfr, StatusBlock, StatusSrcTran, StatusDstTran,StatusErr is ORed to produce a single bit for each interrupt type in the Combined Status register (StatusInt). This register is read-only.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**StatusInt:** [BAR + 98000h] + 360h

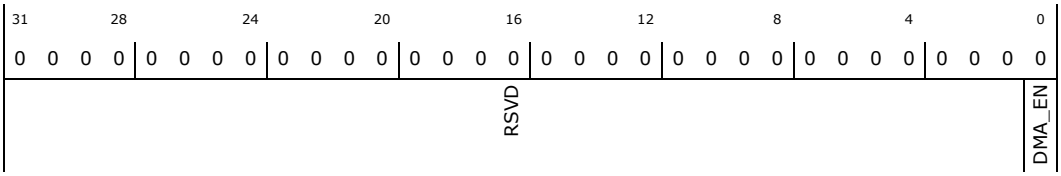
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:5 | 0h<br>RO | **RSVD:** Reserved |
| 4 | 0h<br>RO | **ERR:** OR of the contents of StatusErr register. |
| 3 | 0h<br>RO | **DSTT:** OR of the contents of StatusDst register. |
| 2 | 0h<br>RO | **SRCT:** OR of the contents of StatusSrcTran register |
| 1 | 0h<br>RO | **BLOCK:** OR of the contents of StatusBlock register. |
| 0 | 0h<br>RO | **TFR:** OR of the contents of StatusTfr register. |

## 21.15.126 reg_DmaCfgReg_type (DmaCfgReg)—Offset 398h

This register is used to enable the DMA, which must be done before any channel activity can begin. If the global channel enable bit is cleared while any channel is still active, then DmaCfgReg.DMA_EN still returns 1 to indicate that there are channels still active until hardware has terminated all activity on all channels, at which point the DmaCfgReg.DMA_EN bit returns 0.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DmaCfgReg:** [BAR + 98000h] + 398h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

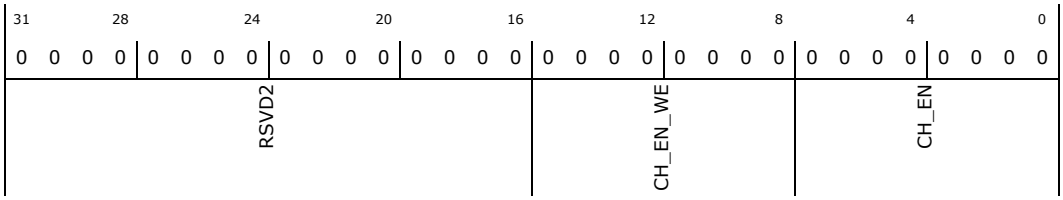
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:1 | 0h<br>RO | **RSVD:** Reserved |
| 0 | 0h<br>RW | **DMA_EN:** DMA Enable bit. 0 = DMA Disabled 1 = DMA Enabled |

## 21.15.127 reg_ChEnReg_type (ChEnReg)—Offset 3A0h

This is the DMA Channel Enable Register. If software needs to set up a new channel, then it can read this register in order to find out which channels are currently inactive, it can then enable an inactive channel with the required priority. All bits of this register are cleared to 0 when the global DMA channel enable bit, DmaCfgReg(0), is 0. When the global channel enable bit is 0, then a write to the ChEnReg register is ignored and a read will always read back 0. The channel enable bit, ChEnReg.CH_EN, is written only if the corresponding channel write enable bit, ChEnReg.CH_EN_WE, is asserted on the

same OCP write transfer. For example, writing hex 01x1 writes a 1 into ChEnReg(0), while ChEnReg(7:1) remains unchanged. Writing hex 00xx leaves ChEnReg(7:0) unchanged. Note that a read-modified write is not required.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

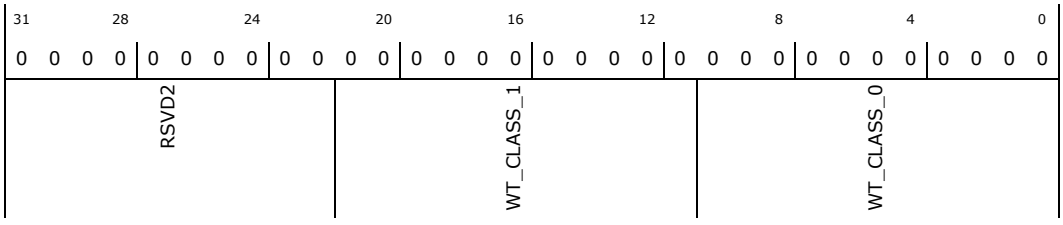
**ChEnReg:** [BAR + 98000h] + 3A0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:16 | 0h<br>RO | **RSVD2:** Reserved |
| 15:8 | 0h<br>WO | **CH_EN_WE:** Channel enable write enable. |
| 7:0 | 0h<br>RW | **CH_EN:** Enables/Disables the channel. Setting this bit enables a channel, clearing this bit disables the channel. 0 = Disable the Channel 1 = Enable the Channel The ChEnReg.CH_EN bit is automatically cleared by hardware to disable the channel after the last OCP transfer of the DMA transfer to the destination has completed. Software can therefore poll this bit to determine when this channel is free for a new DMA transfer. |

## 21.15.128 reg_CLASS_PRIORITY0_LO_type (ClassPriority0_LO)—Offset 3B8h



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**ClassPriority0_LO:** [BAR + 98000h] + 3B8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |

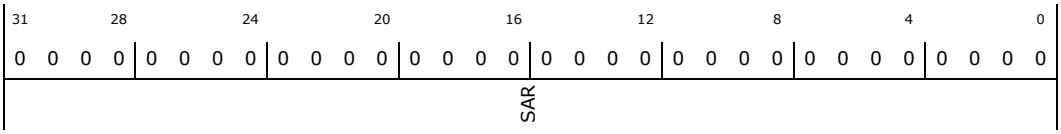
## 21.16.1 reg_SAR_type (SAR0)—Offset 0h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SAR0:** [BAR + 9C000h] + 0h

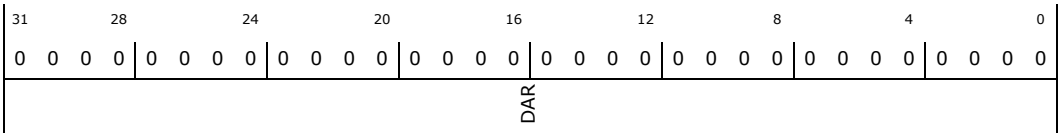
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length ) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.16.2 reg_DAR_type (DAR0)—Offset 8h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DAR0:** [BAR + 9C000h] + 8h

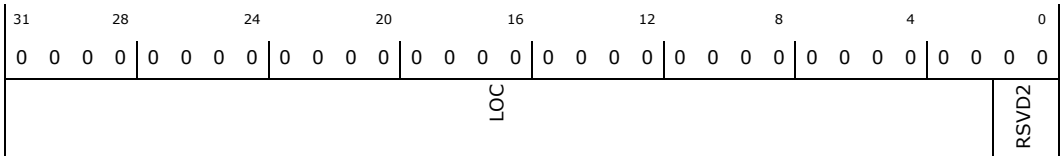
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length ) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.16.3 reg_LLP_type (LLP0)—Offset 10h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**LLP0:** [BAR + 9C000h] + 10h

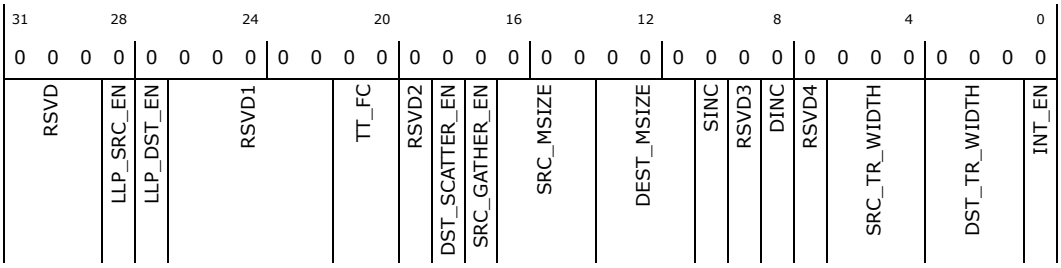
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 00000000h<br>RW | **LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit. |
| 1:0 | 0h<br>RO | **RSVD2:** Reserved |

## 21.16.4 reg_CTL_LO_type (CTL_LO0)—Offset 18h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_LO0:** [BAR + 9C000h] + 18h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

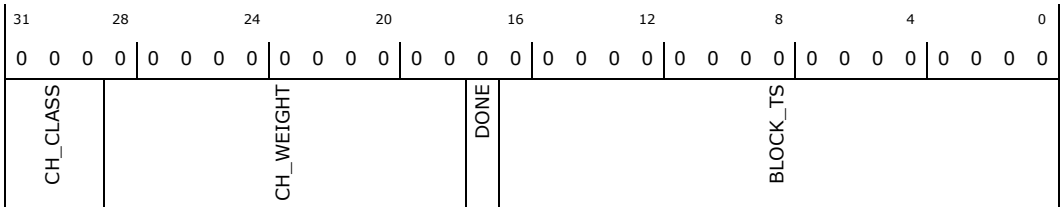
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RO | **RSVD:** Reserved |
| 28 | 0h<br>RW | **LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 27 | 0h<br>RW | **LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 26:22 | 0h<br>RO | **RSVD1:** RSVD |
| 21:20 | 0h<br>RW | **TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA. |
| 19 | 0h<br>RO | **RSVD2:** Reserved |
| 18 | 0h<br>RW | **DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control. |
| 17 | 0h<br>RW | **SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control. |
| 16:14 | 0h<br>RW | **SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field. |
| 13:11 | 0h<br>RW | **DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field. |
| 10 | 0h<br>RW | **SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 9 | 0h<br>RO | **RSVD3:** Reserved |
| 8 | 0h<br>RW | **DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change) |
| 7 | 0h<br>RO | **RSVD4:** Reserved |
| 6:4 | 0h<br>RW | **SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 3:1 | 0h<br>RW | **DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 0 | 0h<br>RW | **INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled. |

## 21.16.5 reg_CTL_HI_type (CTL_HI0)—Offset 1Ch

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_HI0:** [BAR + 9C000h] + 1Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

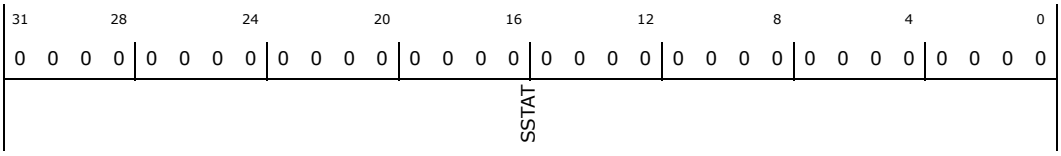
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RW | **CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description |
|---|---|---|
| 28:18 | 0h<br>RW | **CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17 | 0h<br>RW | **DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared. |
| 16:0 | 0h<br>RW | **BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1). |

## 21.16.6 reg_SSTAT_type (SSTAT0)—Offset 20h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTAT0:** [BAR + 9C000h] + 20h

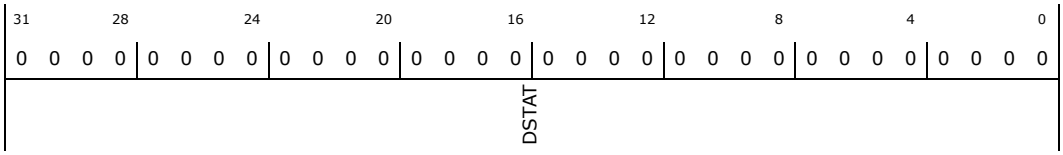
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface. |

## 21.16.7 reg_DSTAT_type (DSTAT0)—Offset 28h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTAT0:** [BAR + 9C000h] + 28h

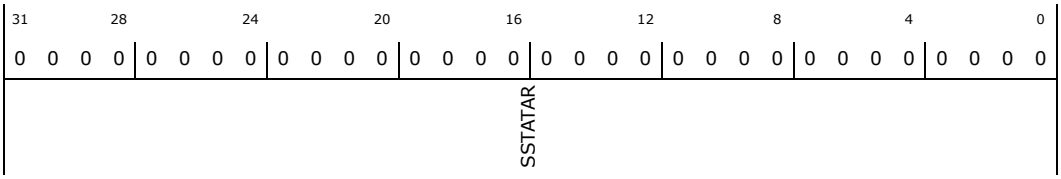
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface. |

## 21.16.8 reg_SSTATAR_type (SSTATAR0)—Offset 30h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTATAR0:** [BAR + 9C000h] + 30h

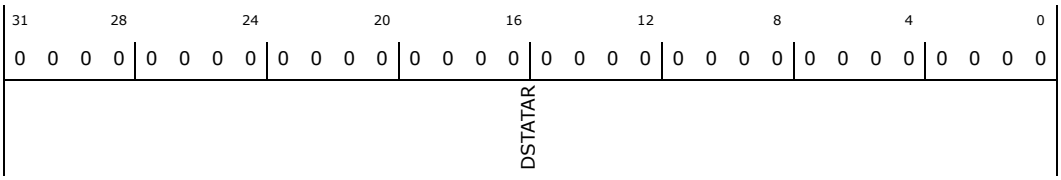
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block. |

## 21.16.9 reg_DSTATAR_type (DSTATAR0)—Offset 38h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTATAR0:** [BAR + 9C000h] + 38h

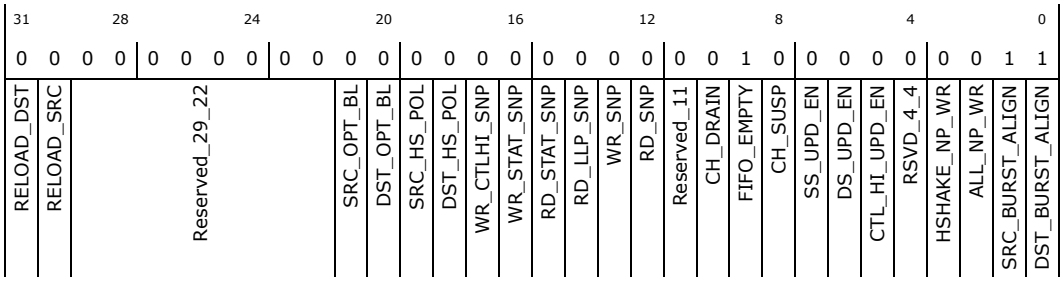
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block. |

## 21.16.10 reg_CFG_LO_type (CFG_LO0)—Offset 40h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_LO0:** [BAR + 9C000h] + 40h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

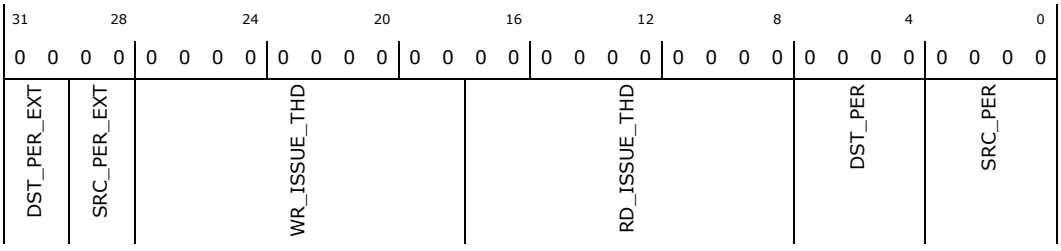
**Default:** 00000203h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h RW | **RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 30 | 0h RW | **RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 29:22 | 00h RO | **Reserved_29_22:** Reserved |
| 21 | 0h RW | **SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled |
| 20 | 0h RW | **DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled |
| 19 | 0h RW | **SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 18 | 0h RW | **DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 17 | 0h RW | **WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values |
| 16 | 0h RW | **WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values |
| 15 | 0h RW | **RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values |
| 14 | 0h RW | **RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors |
| 13 | 0h RW | **WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port |
| 12 | 0h RW | **RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port |
| 11 | 0b RO | **Reserved_11:** Reserved |
| 10 | 0b RW | **CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted |
| 9 | 1b RO | **FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty |

| Bit Range | Default & Access | Description |
|---|---|---|
| 8 | 0h<br>RW | **CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source. |
| 7 | 0h<br>RW | **SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 6 | 0h<br>RW | **DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 5 | 0h<br>RW | **CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 4 | 0h<br>RO | **RSVD_4_4:** Reserved |
| 3 | 0h<br>RW | **HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted) |
| 2 | 0h<br>RW | **ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used. |
| 1 | 1h<br>RW | **SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary |
| 0 | 1h<br>RW | **DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary |

## 21.16.11 reg_CFG_HI_type (CFG_HI0)—Offset 44h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_HI0:** [BAR + 9C000h] + 44h

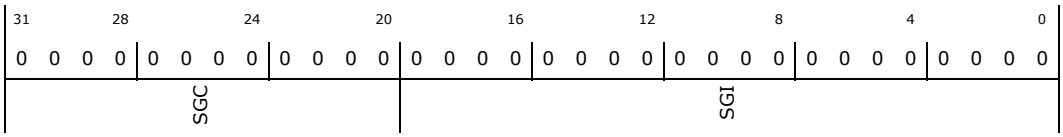
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RW | **DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range. |
| 29:28 | 0h<br>RW | **SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range. |
| 27:18 | 0h<br>RW | **WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW. |
| 17:8 | 0h<br>RW | **RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW. |
| 7:4 | 0h<br>RW | **DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |
| 3:0 | 0h<br>RW | **SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |

## 21.16.12 reg_SGR_type (SGR0)—Offset 48h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SGR0:** [BAR + 9C000h] + 48h

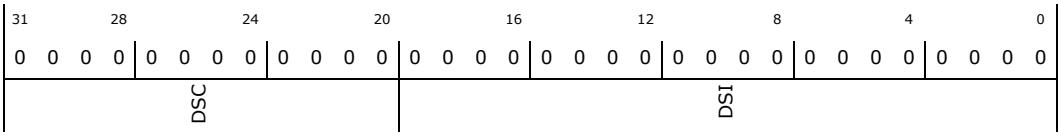
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries. |
| 19:0 | 0h<br>RW | **SGI:** Source gather interval. |

## 21.16.13 reg_DSR_type (DSR0)—Offset 50h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSR0:** [BAR + 9C000h] + 50h

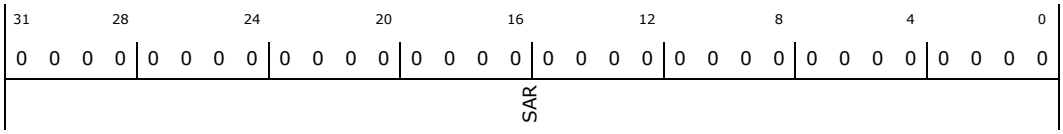
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries. |
| 19:0 | 0h<br>RW | **DSI:** Destination scatter interval. |

## 21.16.14 reg_SAR_type (SAR1)—Offset 58h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SAR1:** [BAR + 9C000h] + 58h

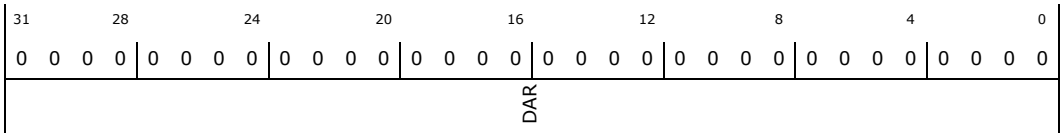
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length ) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.16.15 reg_DAR_type (DAR1)—Offset 60h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DAR1:** [BAR + 9C000h] + 60h

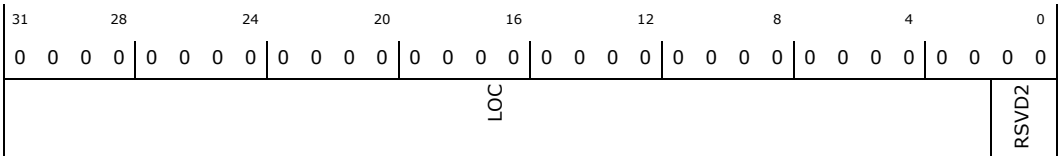
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length ) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.16.16 reg_LLP_type (LLP1)—Offset 68h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**LLP1:** [BAR + 9C000h] + 68h

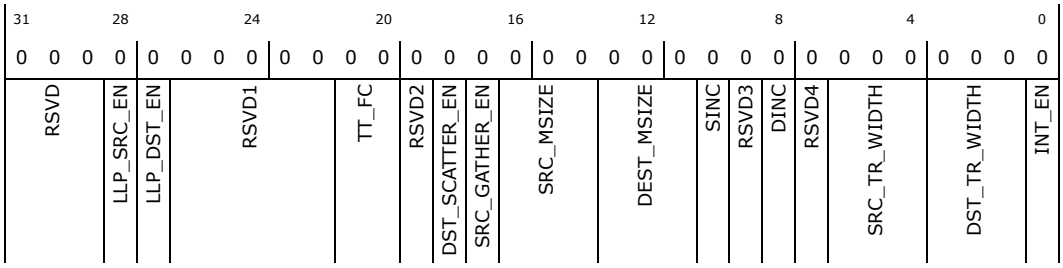
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 00000000h<br>RW | **LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit. |
| 1:0 | 0h<br>RO | **RSVD2:** Reserved |

## 21.16.17 reg_CTL_LO_type (CTL_LO1)—Offset 70h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_LO1:** [BAR + 9C000h] + 70h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

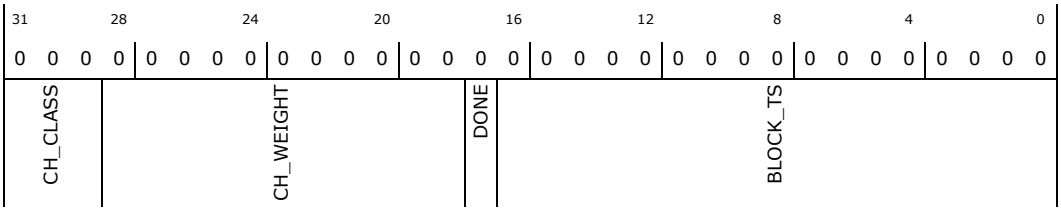
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RO | **RSVD:** Reserved |
| 28 | 0h<br>RW | **LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 27 | 0h<br>RW | **LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 26:22 | 0h<br>RO | **RSVD1:** RSVD |
| 21:20 | 0h<br>RW | **TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA. |
| 19 | 0h<br>RO | **RSVD2:** Reserved |
| 18 | 0h<br>RW | **DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control. |
| 17 | 0h<br>RW | **SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control. |
| 16:14 | 0h<br>RW | **SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field. |
| 13:11 | 0h<br>RW | **DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field. |
| 10 | 0h<br>RW | **SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 9 | 0h<br>RO | **RSVD3:** Reserved |
| 8 | 0h<br>RW | **DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change) |
| 7 | 0h<br>RO | **RSVD4:** Reserved |
| 6:4 | 0h<br>RW | **SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 3:1 | 0h<br>RW | **DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 0 | 0h<br>RW | **INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled. |

## 21.16.18 reg_CTL_HI_type (CTL_HI1)—Offset 74h

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_HI1:** [BAR + 9C000h] + 74h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

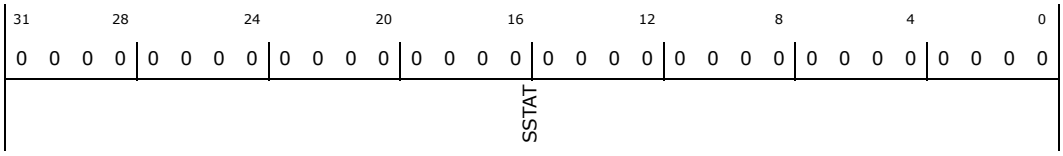
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RW | **CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description |
|---|---|---|
| 28:18 | 0h<br>RW | **CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17 | 0h<br>RW | **DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared. |
| 16:0 | 0h<br>RW | **BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1). |

## 21.16.19 reg_SSTAT_type (SSTAT1)—Offset 78h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTAT1:** [BAR + 9C000h] + 78h

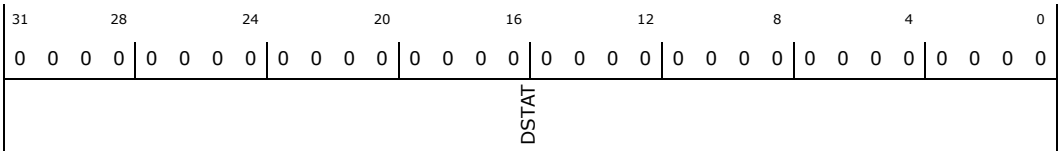
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface. |

## 21.16.20 reg_DSTAT_type (DSTAT1)—Offset 80h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTAT1:** [BAR + 9C000h] + 80h

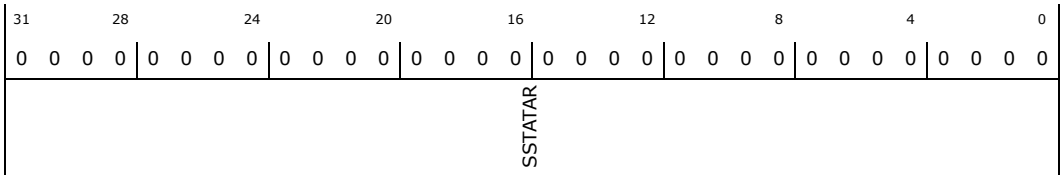
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface. |

## 21.16.21 reg_SSTATAR_type (SSTATAR1)—Offset 88h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTATAR1:** [BAR + 9C000h] + 88h

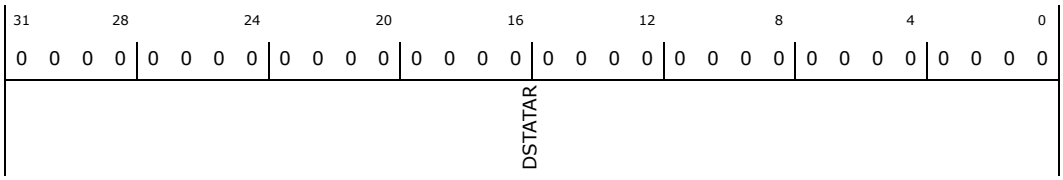
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block. |

## 21.16.22 reg_DSTATAR_type (DSTATAR1)—Offset 90h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTATAR1:** [BAR + 9C000h] + 90h

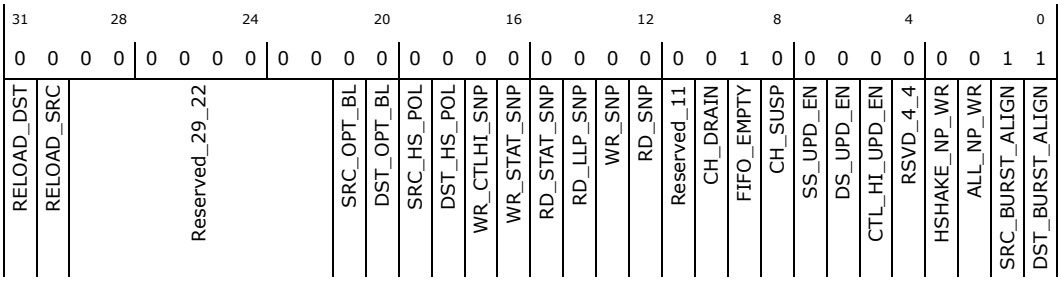
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block. |

## 21.16.23 reg_CFG_LO_type (CFG_LO1)—Offset 98h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_LO1:** [BAR + 9C000h] + 98h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

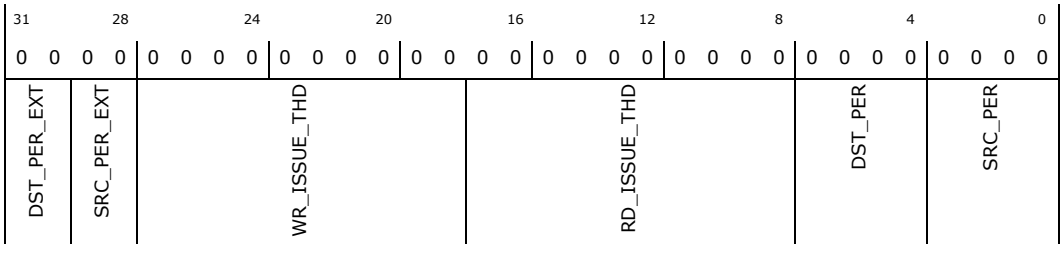
**Default:** 00000203h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h<br>RW | **RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 30 | 0h<br>RW | **RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 29:22 | 00h<br>RO | **Reserved_29_22:** Reserved |
| 21 | 0h<br>RW | **SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled |
| 20 | 0h<br>RW | **DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled |
| 19 | 0h<br>RW | **SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 18 | 0h<br>RW | **DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 17 | 0h<br>RW | **WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values |
| 16 | 0h<br>RW | **WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values |
| 15 | 0h<br>RW | **RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values |
| 14 | 0h<br>RW | **RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors |
| 13 | 0h<br>RW | **WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port |
| 12 | 0h<br>RW | **RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port |
| 11 | 0b<br>RO | **Reserved_11:** Reserved |
| 10 | 0b<br>RW | **CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted |
| 9 | 1b<br>RO | **FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty |

| Bit Range | Default & Access | Description |
|---|---|---|
| 8 | 0h<br>RW | **CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source. |
| 7 | 0h<br>RW | **SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 6 | 0h<br>RW | **DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 5 | 0h<br>RW | **CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 4 | 0h<br>RO | **RSVD_4_4:** Reserved |
| 3 | 0h<br>RW | **HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted) |
| 2 | 0h<br>RW | **ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used. |
| 1 | 1h<br>RW | **SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary |
| 0 | 1h<br>RW | **DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary |

## 21.16.24 reg_CFG_HI_type (CFG_HI1)—Offset 9Ch

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_HI1:** [BAR + 9C000h] + 9Ch

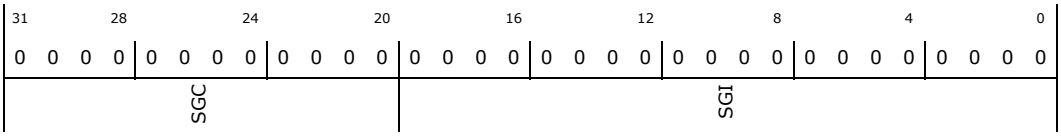
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RW | **DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range. |
| 29:28 | 0h<br>RW | **SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range. |
| 27:18 | 0h<br>RW | **WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW. |
| 17:8 | 0h<br>RW | **RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW. |
| 7:4 | 0h<br>RW | **DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |
| 3:0 | 0h<br>RW | **SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |

## 21.16.25 reg_SGR_type (SGR1)—Offset A0h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SGR1:** [BAR + 9C000h] + A0h

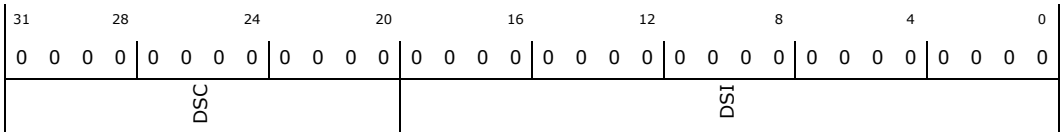
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries. |
| 19:0 | 0h<br>RW | **SGI:** Source gather interval. |

## 21.16.26 reg_DSR_type (DSR1)—Offset A8h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSR1:** [BAR + 9C000h] + A8h

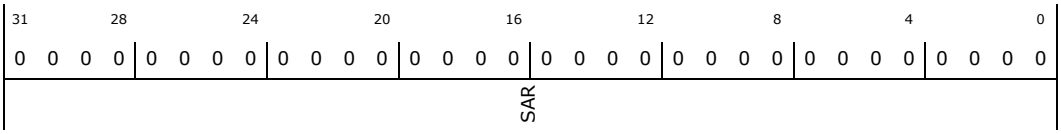
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries. |
| 19:0 | 0h<br>RW | **DSI:** Destination scatter interval. |

## 21.16.27 reg_SAR_type (SAR2)—Offset B0h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SAR2:** [BAR + 9C000h] + B0h

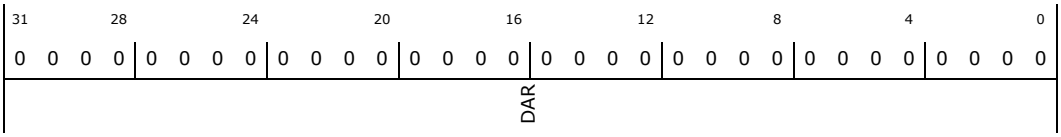
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length ) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.16.28 reg_DAR_type (DAR2)—Offset B8h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DAR2:** [BAR + 9C000h] + B8h

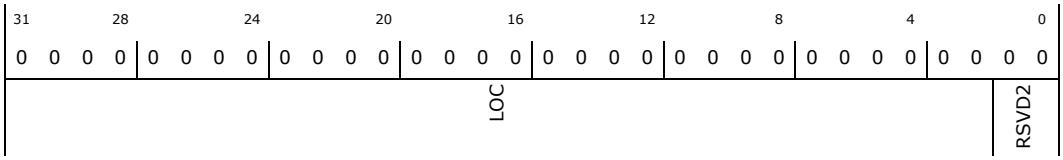
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length ) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.16.29 reg_LLP_type (LLP2)—Offset C0h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**LLP2:** [BAR + 9C000h] + C0h

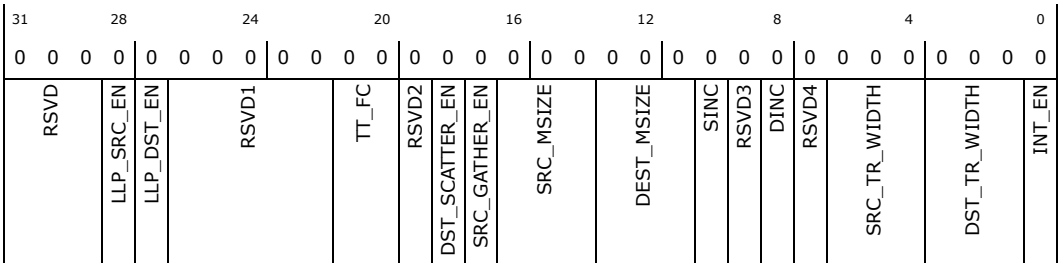
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 00000000h<br>RW | **LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit. |
| 1:0 | 0h<br>RO | **RSVD2:** Reserved |

## 21.16.30 reg_CTL_LO_type (CTL_LO2)—Offset C8h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_LO2:** [BAR + 9C000h] + C8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

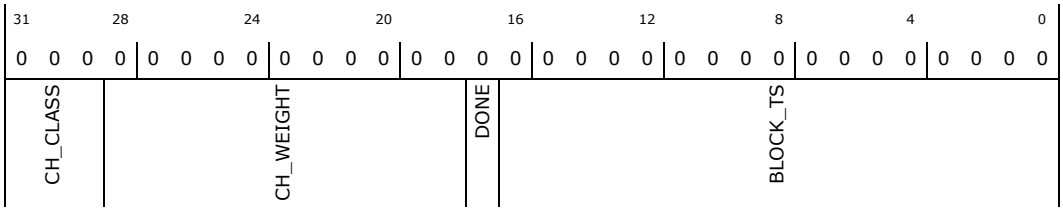
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RO | **RSVD:** Reserved |
| 28 | 0h<br>RW | **LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 27 | 0h<br>RW | **LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 26:22 | 0h<br>RO | **RSVD1:** RSVD |
| 21:20 | 0h<br>RW | **TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA. |
| 19 | 0h<br>RO | **RSVD2:** Reserved |
| 18 | 0h<br>RW | **DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control. |
| 17 | 0h<br>RW | **SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control. |
| 16:14 | 0h<br>RW | **SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field. |
| 13:11 | 0h<br>RW | **DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field. |
| 10 | 0h<br>RW | **SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 9 | 0h<br>RO | **RSVD3:** Reserved |
| 8 | 0h<br>RW | **DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change) |
| 7 | 0h<br>RO | **RSVD4:** Reserved |
| 6:4 | 0h<br>RW | **SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 3:1 | 0h<br>RW | **DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 0 | 0h<br>RW | **INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled. |

## 21.16.31 reg_CTL_HI_type (CTL_HI2)—Offset CCh

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_HI2:** [BAR + 9C000h] + CCh

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

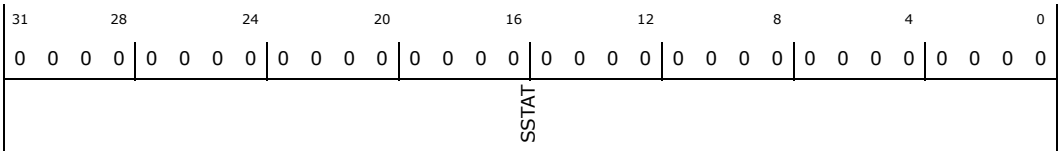
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RW | **CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description |
|---|---|---|
| 28:18 | 0h<br>RW | **CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17 | 0h<br>RW | **DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared. |
| 16:0 | 0h<br>RW | **BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1). |

## 21.16.32 reg_SSTAT_type (SSTAT2)—Offset D0h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTAT2:** [BAR + 9C000h] + D0h

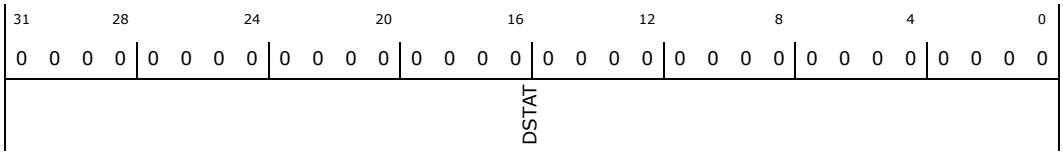
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface. |

## 21.16.33 reg_DSTAT_type (DSTAT2)—Offset D8h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTAT2:** [BAR + 9C000h] + D8h

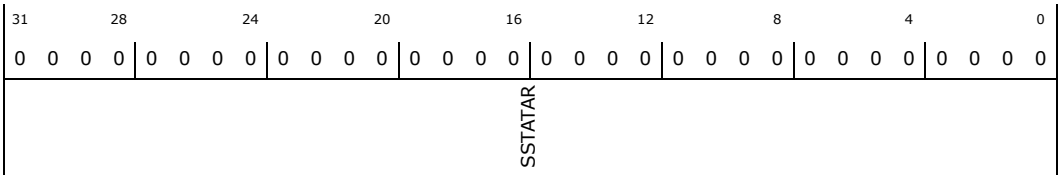
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface. |

## 21.16.34 reg_SSTATAR_type (SSTATAR2)—Offset E0h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTATAR2:** [BAR + 9C000h] + E0h

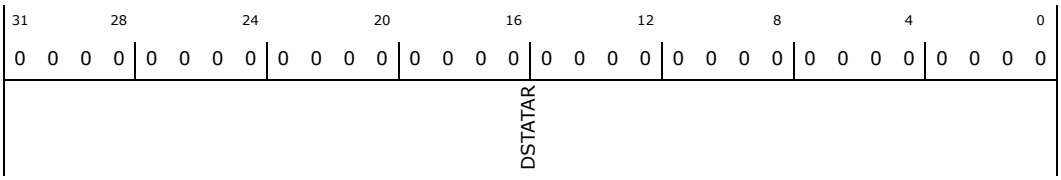
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block. |

## 21.16.35 reg_DSTATAR_type (DSTATAR2)—Offset E8h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTATAR2:** [BAR + 9C000h] + E8h

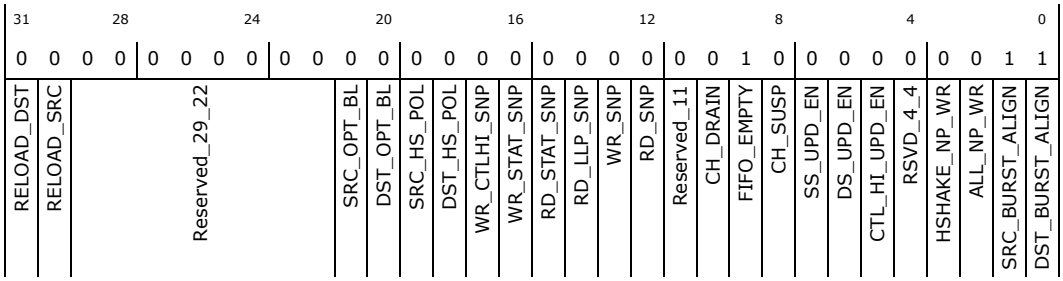
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block. |

## 21.16.36 reg_CFG_LO_type (CFG_LO2)—Offset F0h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_LO2:** [BAR + 9C000h] + F0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

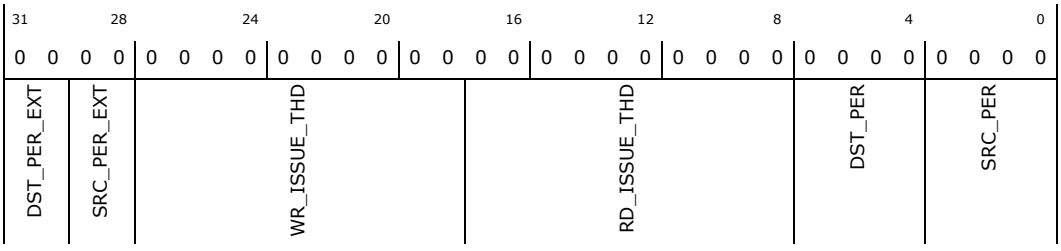
**Default:** 00000203h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h<br>RW | **RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 30 | 0h<br>RW | **RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 29:22 | 00h<br>RO | **Reserved_29_22:** Reserved |
| 21 | 0h<br>RW | **SRC_OPT_BL:** Optimize Source Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE)) *** This bit should be set to (0) if Source HW-Handshake is enabled |
| 20 | 0h<br>RW | **DST_OPT_BL:** Optimize Destination Burst Length : 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE)) *** This bit should be set to (0) if Destination HW-Handshake is enabled |
| 19 | 0h<br>RW | **SRC_HS_POL:** Source Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 18 | 0h<br>RW | **DST_HS_POL:** Destination Handshaking Interface Polarity. 0 = Active high 1 = Active low |
| 17 | 0h<br>RW | **WR_CTLHI_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the CTL_HI register values |
| 16 | 0h<br>RW | **WR_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port for writing back the SSTAT/DSTAT register values |
| 15 | 0h<br>RW | **RD_STAT_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading SSTAT/DSTAT register values |
| 14 | 0h<br>RW | **RD_LLP_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port for reading LLP Descriptors |
| 13 | 0h<br>RW | **WR_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Write Port |
| 12 | 0h<br>RW | **RD_SNP:** This Snoop-Attribute bit is driven on the MSB of MReqInfo of DMA Read Port |
| 11 | 0b<br>RO | **Reserved_11:** Reserved |
| 10 | 0b<br>RW | **CH_DRAIN:** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted |
| 9 | 1b<br>RO | **FIFO_EMPTY:** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty |

| Bit Range | Default & Access | Description |
|---|---|---|
| 8 | 0h<br>RW | **CH_SUSP:** Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source. |
| 7 | 0h<br>RW | **SS_UPD_EN:** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 6 | 0h<br>RW | **DS_UPD_EN:** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 5 | 0h<br>RW | **CTL_HI_UPD_EN:** CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0) |
| 4 | 0h<br>RO | **RSVD_4_4:** Reserved |
| 3 | 0h<br>RW | **HSHAKE_NP_WR:** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-of-block writes which will be Non-Posted) |
| 2 | 0h<br>RW | **ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used. |
| 1 | 1h<br>RW | **SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary |
| 0 | 1h<br>RW | **DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary |

## 21.16.37 reg_CFG_HI_type (CFG_HI2)—Offset F4h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_HI2:** [BAR + 9C000h] + F4h

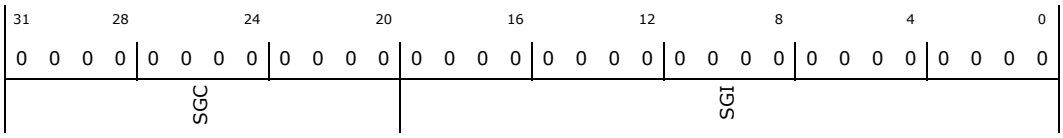
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RW | **DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range. |
| 29:28 | 0h<br>RW | **SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range. |
| 27:18 | 0h<br>RW | **WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW. |
| 17:8 | 0h<br>RW | **RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW. |
| 7:4 | 0h<br>RW | **DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |
| 3:0 | 0h<br>RW | **SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |

## 21.16.38 reg_SGR_type (SGR2)—Offset F8h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SGR2:** [BAR + 9C000h] + F8h

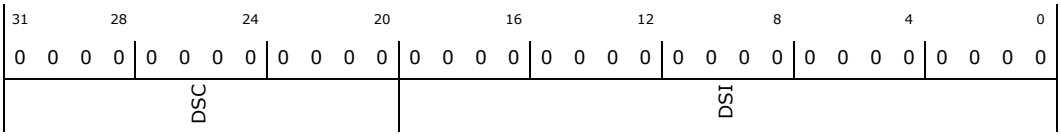
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries. |
| 19:0 | 0h<br>RW | **SGI:** Source gather interval. |

## 21.16.39 reg_DSR_type (DSR2)—Offset 100h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSR2:** [BAR + 9C000h] + 100h

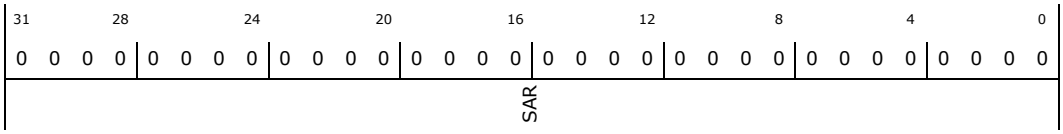
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries. |
| 19:0 | 0h<br>RW | **DSI:** Destination scatter interval. |

## 21.16.40 reg_SAR_type (SAR3)—Offset 108h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SAR3:** [BAR + 9C000h] + 108h

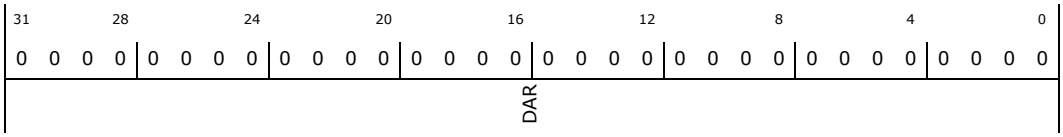
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length ) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.16.41 reg_DAR_type (DAR3)—Offset 110h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DAR3:** [BAR + 9C000h] + 110h

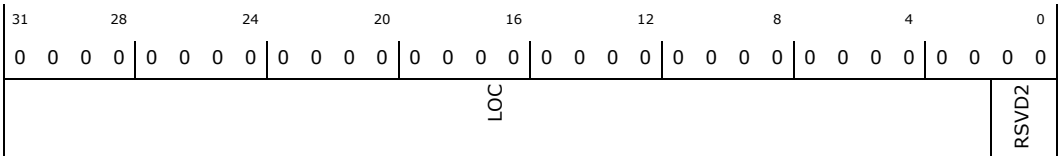
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length ) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.16.42 reg_LLP_type (LLP3)—Offset 118h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**LLP3:** [BAR + 9C000h] + 118h

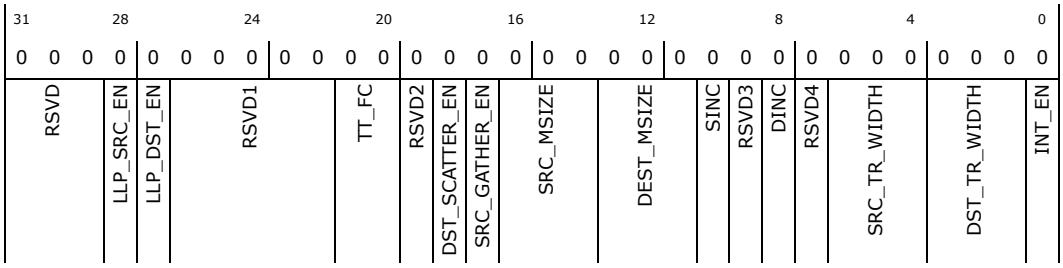
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 00000000h<br>RW | **LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit. |
| 1:0 | 0h<br>RO | **RSVD2:** Reserved |

## 21.16.43 reg_CTL_LO_type (CTL_LO3)—Offset 120h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_LO3:** [BAR + 9C000h] + 120h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

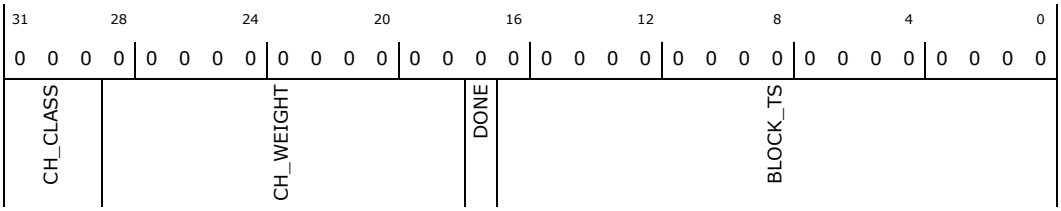
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RO | **RSVD:** Reserved |
| 28 | 0h<br>RW | **LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 27 | 0h<br>RW | **LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 26:22 | 0h<br>RO | **RSVD1:** RSVD |
| 21:20 | 0h<br>RW | **TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA. |
| 19 | 0h<br>RO | **RSVD2:** Reserved |
| 18 | 0h<br>RW | **DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control. |
| 17 | 0h<br>RW | **SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control. |
| 16:14 | 0h<br>RW | **SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field. |
| 13:11 | 0h<br>RW | **DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field. |
| 10 | 0h<br>RW | **SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 9 | 0h<br>RO | **RSVD3:** Reserved |
| 8 | 0h<br>RW | **DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change) |
| 7 | 0h<br>RO | **RSVD4:** Reserved |
| 6:4 | 0h<br>RW | **SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 3:1 | 0h<br>RW | **DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 0 | 0h<br>RW | **INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled. |

## 21.16.44 reg_CTL_HI_type (CTL_HI3)—Offset 124h

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_HI3:** [BAR + 9C000h] + 124h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

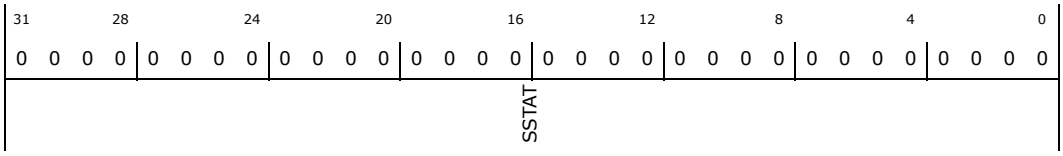
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RW | **CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description |
|---|---|---|
| 28:18 | 0h<br>RW | **CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17 | 0h<br>RW | **DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared. |
| 16:0 | 0h<br>RW | **BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1). |

## 21.16.45 reg_SSTAT_type (SSTAT3)—Offset 128h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTAT3:** [BAR + 9C000h] + 128h

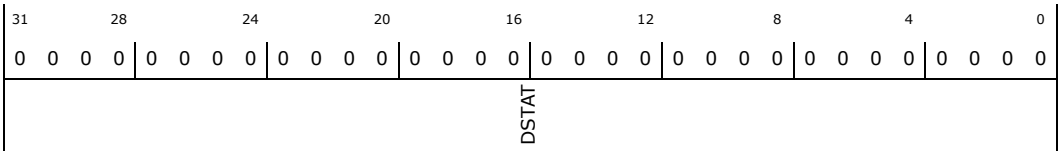
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface. |

## 21.16.46 reg_DSTAT_type (DSTAT3)—Offset 130h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTAT3:** [BAR + 9C000h] + 130h

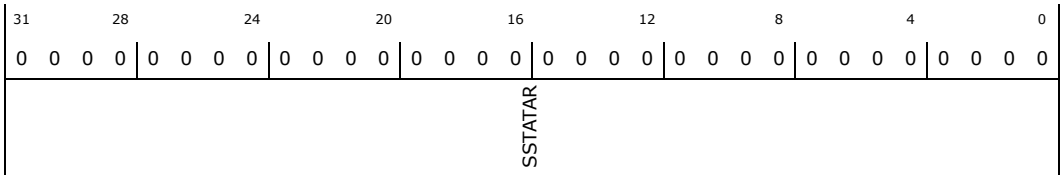
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTAT:** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface. |

## 21.16.47 reg_SSTATAR_type (SSTATAR3)—Offset 138h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTATAR3:** [BAR + 9C000h] + 138h

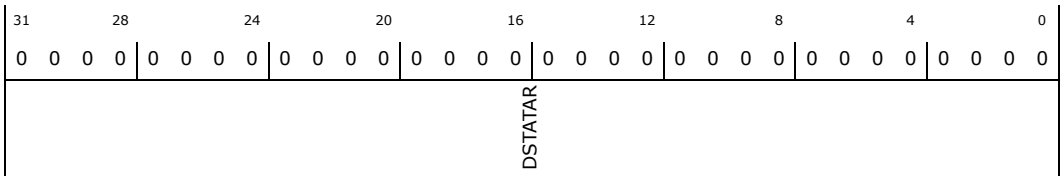
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTATAR:** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block. |

## 21.16.48 reg_DSTATAR_type (DSTATAR3)—Offset 140h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTATAR3:** [BAR + 9C000h] + 140h

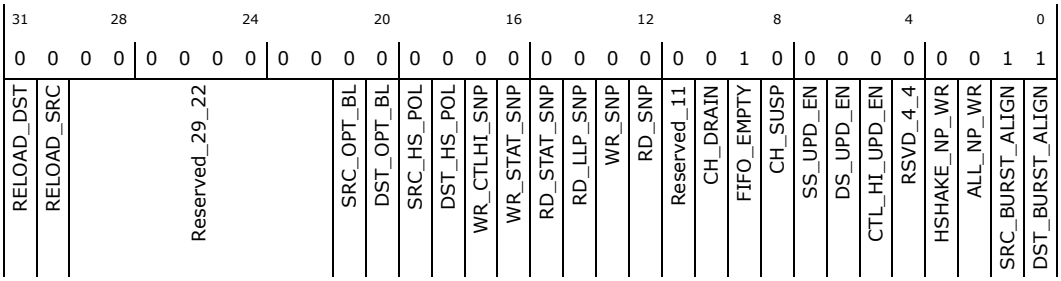
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DSTATAR:** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block. |

## 21.16.49 reg_CFG_LO_type (CFG_LO3)—Offset 148h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer.This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_LO3:** [BAR + 9C000h] + 148h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000203h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31 | 0h<br>RW | **RELOAD_DST:** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 30 | 0h<br>RW | **RELOAD_SRC:** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. |
| 29:22 | 00h<br>RO | **Reserved_29_22:** Reserved |

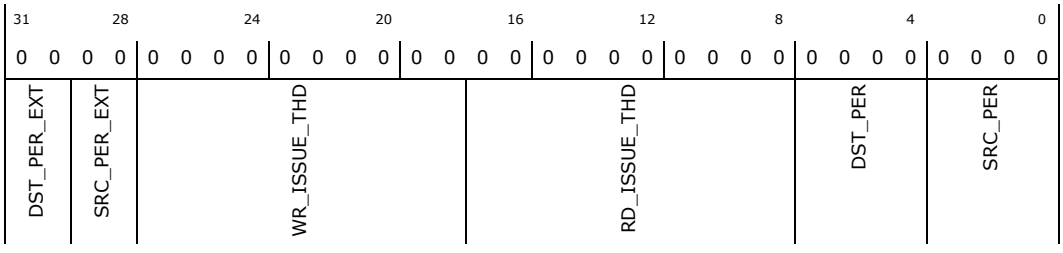
| 2 | 0h<br>RW | **ALL_NP_WR:** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW-Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used. |
| 1 | 1h<br>RW | **SRC_BURST_ALIGN:** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary |
| 0 | 1h<br>RW | **DST_BURST_ALIGN:** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary |

## 21.16.50 reg_CFG_HI_type (CFG_HI3)—Offset 14Ch

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CFG_HI3:** [BAR + 9C000h] + 14Ch

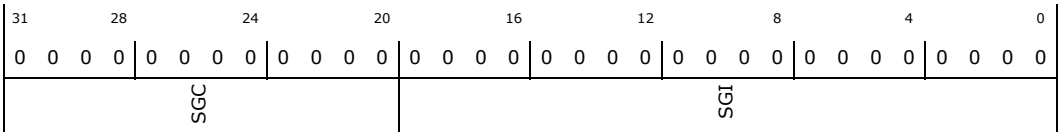
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:30 | 0h<br>RW | **DST_PER_EXT:** Destination Peripheral Extension : This 2-bit field is used to extend the DST_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall destination peripheral ID becomes DST_PER_EXT[1:0], DST_PER[3:0] which covers the (0-63) range. |
| 29:28 | 0h<br>RW | **SRC_PER_EXT:** Source Peripheral Extension : This 2-bit field is used to extend the SRC_PER field below beyond the Synopsys limit of (0-15) to accommodate additional hardware handshaking interfaces (16-63). In other words, the overall source peripheral ID becomes SRC_PER_EXT[1:0], SRC_PER[3:0] which covers the (0-63) range. |
| 27:18 | 0h<br>RW | **WR_ISSUE_THD:** Write Issue Threshold. Used to relax the issue criterion for Writes (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW. |
| 17:8 | 0h<br>RW | **RD_ISSUE_THD:** Read Issue Threshold. Used to relax the issue criterion for Reads (Refer to Section 4.1.1.4). Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW. |
| 7:4 | 0h<br>RW | **DST_PER:** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |
| 3:0 | 0h<br>RW | **SRC_PER:** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface. NOTE: For correct DMA operation, only one peripheral (source or destination) should be assigned to the same handshaking interface. For more details on mapping please refer to 3.5.3 HARDWARE HANDSHAKE INTERFACE MAPPING TO DMA CHANNELS |

## 21.16.51 reg_SGR_type (SGR3)—Offset 150h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SGR3:** [BAR + 9C000h] + 150h

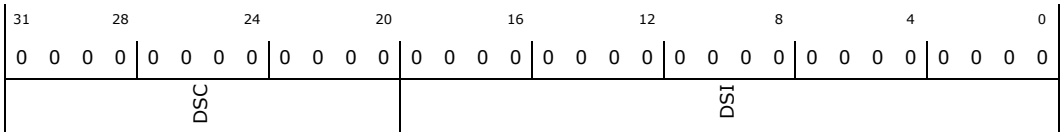
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **SGC:** Source gather count. Source contiguous transfer count between successive gather boundaries. |
| 19:0 | 0h<br>RW | **SGI:** Source gather interval. |

## 21.16.52 reg_DSR_type (DSR3)—Offset 158h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSR3:** [BAR + 9C000h] + 158h

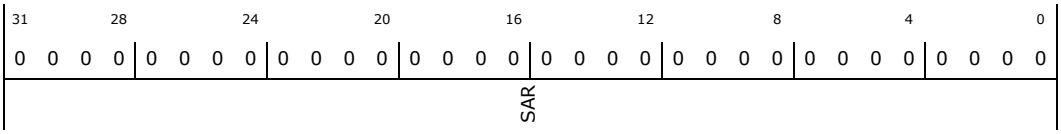
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:20 | 0h<br>RW | **DSC:** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries. |
| 19:0 | 0h<br>RW | **DSI:** Destination scatter interval. |

## 21.16.53 reg_SAR_type (SAR4)—Offset 160h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SAR4:** [BAR + 9C000h] + 160h

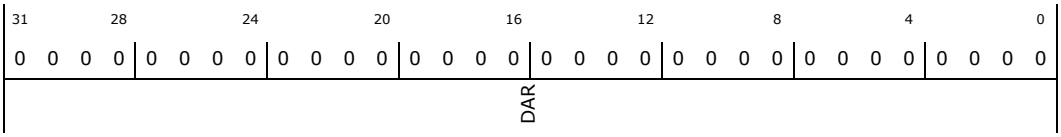
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SAR:** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length ) 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.16.54 reg_DAR_type (DAR4)—Offset 168h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DAR4:** [BAR + 9C000h] + 168h

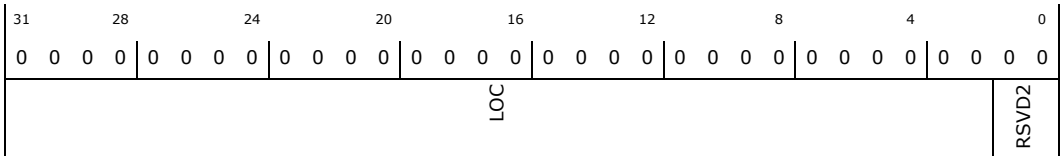
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **DAR:** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length ) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

## 21.16.55 reg_LLP_type (LLP4)—Offset 170h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation LLP.LOC != 0 is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of LLP.LOC != 0. If LLP.LOC is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type. LLP.LOC != 0 contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**LLP4:** [BAR + 9C000h] + 170h

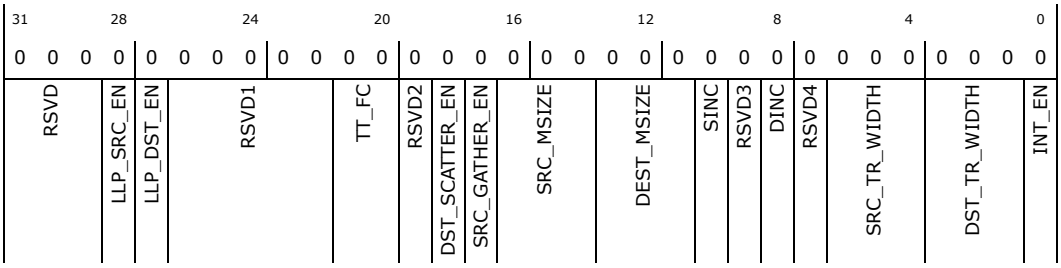
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:2 | 00000000h<br>RW | **LOC:** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit. |
| 1:0 | 0h<br>RO | **RSVD2:** Reserved |

## 21.16.56 reg_CTL_LO_type (CTL_LO4)—Offset 178h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_LO4:** [BAR + 9C000h] + 178h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

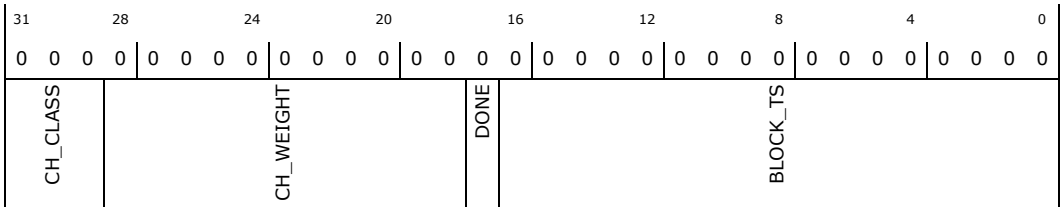
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RO | **RSVD:** Reserved |
| 28 | 0h<br>RW | **LLP_SRC_EN:** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 27 | 0h<br>RW | **LLP_DST_EN:** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1) |
| 26:22 | 0h<br>RO | **RSVD1:** RSVD |
| 21:20 | 0h<br>RW | **TT_FC:** Transfer Type and Flow Control. The following transfer types are supported. Memory to Memory (00) Memory to Peripheral (01) Peripheral to Memory (10) Peripheral to Peripheral (11) Flow Control is always assigned to the DMA. |
| 19 | 0h<br>RO | **RSVD2:** Reserved |
| 18 | 0h<br>RW | **DST_SCATTER_EN:** Destination scatter enable bit: 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control. |
| 17 | 0h<br>RW | **SRC_GATHER_EN:** Source gather enable bit: 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control. |
| 16:14 | 0h<br>RW | **SRC_MSIZE:** Source Burst Transaction Length. Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. TABLE 5-1 talks about the encoding for this field. |
| 13:11 | 0h<br>RW | **DEST_MSIZE:** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination. TABLE 5-1 talks about the encoding for this field. |
| 10 | 0h<br>RW | **SINC:** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change) |

| Bit Range | Default & Access | Description |
|---|---|---|
| 9 | 0h<br>RO | **RSVD3:** Reserved |
| 8 | 0h<br>RW | **DINC:** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change) |
| 7 | 0h<br>RO | **RSVD4:** Reserved |
| 6:4 | 0h<br>RW | **SRC_TR_WIDTH:** Source Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1. Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2. For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 3:1 | 0h<br>RW | **DST_TR_WIDTH:** Destination Transfer Width. BURST_SIZE = (2 ^ MSIZE) 1.Transferred Bytes Per Burst = (BURST_SIZE * TR_WIDTH) 2.For incrementing addresses and (Transfer_Width ( 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported (due to OCP limitations) Table 5-2 lists the decoding for this field. For a non-memory peripheral, this is typically the peripheral (source) FIFO width. |
| 0 | 0h<br>RW | **INT_EN:** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled. |

## 21.16.57 reg_CTL_HI_type (CTL_HI4)—Offset 17Ch

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**CTL_HI4:** [BAR + 9C000h] + 17Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

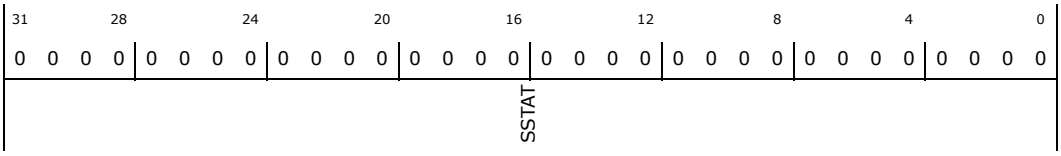
**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:29 | 0h<br>RW | **CH_CLASS:** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description |
|---|---|---|
| 28:18 | 0h<br>RW | **CH_WEIGHT:** Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to (2^11-1)=2047, Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17 | 0h<br>RW | **DONE:** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared. |
| 16:0 | 0h<br>RW | **BLOCK_TS:** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to (2^17 -1) = (128 KB - 1). |

## 21.16.58 reg_SSTAT_type (SSTAT4)—Offset 180h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**SSTAT4:** [BAR + 9C000h] + 180h

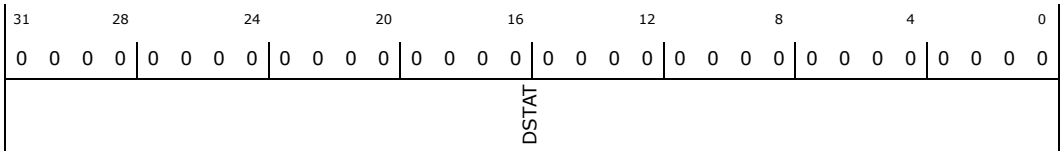
**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
| 31:0 | 0h<br>RW | **SSTAT:** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA slave interface. |

## 21.16.59 reg_DSTAT_type (DSTAT4)—Offset 188h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.



### Access Method

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**DSTAT4:** [BAR + 9C000h] + 188h

**BAR Type:** PCI Configuration Register (Size: 32 bits)
**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description |
|---|---|---|
