Intel Atom® Processor E3800 Product Family

Datasheet

October 2018

Revision 4.3

Document Number: 538136, Rev. 4.3

Contents

Figures

Tables

Revision History

Revision Number	Description	Revision Date
1.0	Initial release.	October 2013
1.5	Chapter 2, "Physical Interfaces" • Updated the table details of the GPIO Signals for GPIO_S0_SC[046], GPIO_S0_SC[047], GPIO_S0_SC[048], GPIO_S5[15], GPIO_S5[16], GPIO_S5[17]. Chapter 5, "Integrated Clock" • Added table note (SoC Clock Outputs) that Intel recommends 25 MHz. 19.2 MHz is not validated. Chapter 6, "Power Management" • De-featured C6IS for all SKUs. • Updated the table details of the SoC Sx-States to SLPT_S*# for PMC_PLTRST# from 0 or 1 to High or Low to match platform understanding. • Remove VCC and VNN from Bay Trail-M/D SoC Power Rail DC Specs & Max Current table. Chapter 7, "Power Up and Reset Sequence" • Updated the figure and notes of the S0 to S3 to S4/S5 (Power Down) Sequence. • Updated the table of the S4/S5 to S0 (Power Up) Sequence for t3 parameter from 100 max to 95 min (no max). Chapter 9, "Electrical Specifications" • Updated the table details of the 25 MHz Platform Clock AC Specification. Chapter 11, "Processor Core" • Updated 11.1 note on Thermal management support. Chapter 12, "System Memory Controller" • Updated 12.2.2 table title and details for "Supported DDR3L Memory Size Per Rank" and "Supported DDR3L SO-DIMM Size". Chapter 16, "Storage Control Cluster (eMMC, SDIO, SD Card)" • Updated the supported SDIO/SD card bandwidth is up to 400Mbits per seconds. Chapter 18, "USB Host Controller Interfaces (xHCI, EHCI)" • Added figure note of the xHCI and EHCI Port Mapping. • Updated USB configuration register to correctly reflect the power well. Chapter 22, "Intel® Trusted Execution Engine (TXE)" • Updated chapter title to Intel® Platform Trust Technology (PTT). Chapter 29, "Platform Controller Unit (PCU) Overview" • Added a note to Platform Clock Support section that Intel recommends 25 MHz as 19.2 MHz is not validated.	December 2013
2.0	Chapter 7, "Power Up and Reset Sequence" • Updated the 7.2.2 note 4 • OK to swap V1P0A and V1P8A • Measurement point for timing is 90% (10% on power down) Chapter 9, "Electrical Specifications" • Added S3 power spec per measurements • Added generic clock jitter specs	February 2014

Revision Number	Description	Revision Date
2.5	Chapter 2, "Physical Interfaces" • Updated 2.28 RTC_VCC detail Chapter 7, "Power Up and Reset Sequence" • Updated the 7.2.2 note 7 • Updated the 7.3.1 note 6 and note 7 • Measurement point for timing is 90% (10% on power down) Chapter 9, "Electrical Specifications" • Added 9.5.18 GPIO VIH max and VIL min • Added 9.5.19 I2C VIH max and VIL min	April 2014
3.0	Chapter 2, "Physical Interfaces" • Updated RTC_VCC detail Chapter 7, "Power Up and Reset Sequence" • Updated slew rate to 10ms. • Measurement point for timing is 10% on power down Chapter 9, "Electrical Specifications" • Added 9.5.18 GPIO VIH max and VIL min • Added 9.5.19 I2C VIH max and VIL min Chapter 11, "Processor Core" • Removed support on C1E and C6C Chapter 14, "Graphics, Video and Display" • Updated 14.10.11 MSR (MSR_READ) offset to 180000h Chapter 16, "Storage Control Cluster (eMMC, SDIO, SD Card)" • Updated the Preset value feature to not PoR. • Updated SDIO support SDR12/25. Chapter 22, "Intel® Trusted Execution Engine (TXE)" • Updated name of chapter to "Intel® Trusted Execution Engine (TXE)". • Clarified use of descriptor mode and other requirements for the boot SPI. • Added registers for Intel® TXE.	July 2014

Revision Number	Description	Revision Date
3.5	Chapter 2, "Physical Interfaces" • Changed Figure 3 USB_ULPI_REFCLK to output Chapter 5, "Integrated Clock" • Updated the MCSI clock to 80-500 MHz Chapter 7, "Power Up and Reset Sequence" • Updated Table 58, max tolerance time, to 2000us - to avoid in rush current • removed PMC_SUSPWRDNACK from figure 13 • updated PMC_SUSPWRDNACK in figure 14 Chapter 9, "Electrical Specifications" • Added SPI NOR AC Spec • Updated GPIO Vih/Vil min and max • changed the I2S max clock frequency to 12.288 MHz Chapter 11, "Processor Core" • Added Note: "L1 has parity protection and L2 has an ECC Protection." Chapter 12, "System Memory Controller" • Removed DECCSTAT OFFSET 61h register Chapter 13, "SoC Transaction Router" • Updated register TRR - OFFSET B1h Chapter 22, "Intel® Trusted Execution Engine (TXE)" • updated the SSP to support 24 bits data sample sizes Chapter 29, "Platform Controller Unit (PCU) Overview" • De-Featured Top Swap Mechanism	September 2014

Revision Number	Description	Revision Date
3.6	Chapter 1, "Introduction" • Changed Figure 1, "SoC Block Diagram" on page 34 • Changed Chapter 1, "Terminology" • Changed Chapter 1, "Display Controller" • Changed Chapter 1, "Graphics and Media Engine" • Changed Chapter 1, "SKU List" Chapter 2, "Physical Interfaces" • Changed Figure 3, "Signals (2 of 2)" on page 43 • Changed Chapter 2, "Pin States Through Reset" • Changed Table 9, "USB 2.0 Device Interface Signals" on page 49 • Changed Table 13, "Digital Display Interface Signals" on page 51 • Changed Chapter 2, "PCU – iLB – Low Pin Count (LPC) Bridge Interface Signals" • Changed Table 24, "PCU - Serial Peripheral Interface (SPI) Signals" on page 58 • Changed Table 30, "Power and Ground Pins" on page 66 Chapter 5, "Integrated Clock" • Updated Table 48, "SoC Clock Outputs" on page 88 Chapter 6, "Power Management" • Updated Table 50, "General Power States for System" on page 92 • Changed Chapter 6, "Package C-States" Chapter 7, "Power Up and Reset Sequence" • Updated Chapter 7, "G3 to S0" • Updated Table 63, "S3/S4/S5 to S0 Cause of Wake Events" on page 111 • Updated Chapter 7, "S0 to S3 and S4/S5/G3 Sequence" • Updated Chapter 7, "S0 to S3 to S4/S5 (Power Down) Sequence without S0ix" • Updated Table 63, "S3/S4/S5 to S0 Cause of Wake Events" on page 111 • Updated Chapter 7, "Reset Behavior" Chapter 8, "Thermal Management" • Updated Chapter 8, "Thermal Management" Chapter 9, "Electrical Specifications" • Updated Table 66, "Intel Atom® Processor E3800 Product Family Thermal Specifications" on page 118 • Updated Table 68, "Power Rail DC Specs and Max Current" on page 120 • Updated Table 69, "VCC and VNN Currents" on page 122 • Updated Table 75, "VGA_DDCCLK, VGA_DDCDATA Signal DC Specification" on page 133 • Updated Table 79, "DDI DDC Signal DC Specification (DDI[1:0]_DDCDATA, DDI[1:0]_DDCCLK)" on page 135 • Updated Table 83, "PCI Express* DC Clock Request Input Signal Characteristics" on page 137 • Updated Table 86, "SD Card DC Specification" on page 138 • Updated Table 87, "eMMC 4.5 Signal DC Electrical Specifications" on page 139 • Updated Table 88, "TAP Signal Group DC Specification (TAP_TCK, TAP_TRSRT#, TAP_TMS, TAP_TDI)" on page 140 • Updated Table 89, "TAP Signal Group DC Specification (TAP_TDO)" on page 140 • Updated Table 90, "TAP Signal Group DC Specification (TAP_PRDY#, TAP_PREQ#)" on page 141 • Updated Table 97, "Power Management 1.8V Suspend Well Signal Group DC Specification" on page 148 • Updated Table 100, "iLB RTC Well DC Specification (ILB_RTC_TEST#)" on page 149 • Added Table 105, "GPIO 3.3V Suspend Well Signal Group DC Specification (GPIO_S5[43:0])" on page 151 • Updated Table 106, "GPIO 1.8V Core Well Signal Group DC Specification (GPIO_S0_SC[101:0])" on page 152 • Updated Table 107, "GPIO 1.8V Suspend Well Signal Group DC Specification (GPIO_S5[43:0])" on page 152 • Updated Table 108, "I2C Signal Electrical Specifications" on page 153	January 2015

Revision Number	Description	Revision Date
3.6	• Updated Table 140, "PCU - SPI NOR AC Specification" on page 197 • Updated Table 140, "PCU - SPI NOR AC Specification" on page 197 Chapter 12, "System Memory Controller" • Updated Chapter 12, "Features" Chapter 14, "Graphics, Video and Display" • Updated Chapter 14, "Features" • Updated Chapter 14, "Video Engine" • Updated Table 170, "Hardware Accelerated Video Decode Codec Support" on page 423 Chapter 15, "MIPI-Camera Serial Interface (CSI) and ISP" • Updated Chapter 15, "Features" Updated Table 178, "Imaging Capabilities" on page 1048 Chapter 16, "Storage Control Cluster (eMMC, SDIO, SD Card)" • Updated Chapter 16, "SDIO/SD Card Interface Features" Chapter 21, "Low Power Engine (LPE) for Audio (I$^{2S)}$" • Updated Chapter 21, "External Timer" • Updated Table 227, "Clock Frequencies" on page 2817 Chapter 30, "PCU – Power Management Controller (PMC)" • Updated Table 292, "Transitions Due to Power Button" on page 4348 • Updated Chapter 30, "PMC_RSTBTN# Signal" • UpdatedTable 293, "System Power Planes" on page 4349 • Updated Table 294, "Causes of SMI and SCI" on page 4352 Chapter 31, "PCU – Serial Peripheral Interface (SPI)" • Updated Chapter 31, "Descriptor Mode" Chapter 32, "PCU – Universal Asynchronous Receiver/Transmitter (UART)" • Updated Chapter 32, "UART Enable/Disable" Chapter 33, "PCU – System Management Bus (SMBus)" • Added Chapter 33, "SPD Write Disable" Chapter 34, "PCU – Intel® Legacy Block (iLB) Overview" • Updated Chapter 34, "Non-Maskable Interrupt"	January 2015

Revision Number	Description	Revision Date
3.7	Chapter 1 • Remove eSATA capable from Section 1.2.8 Chapter 7.2.1 • Updated Table 60 • Updated Table 61 Chapter 9.3 • Updated Table 68, Added AC Voltage Tolerance for Platform Rail Chapter 9.6.1 • Removed Figure 19, Crystal Clock Timing • Removed Table 106, Crystal Clock Timings Chapter 9.5.8 • Updated Table 91 Chapter Note: • Updated Table 140 • Added Figure 68 Chapter 9.6.19 • Updated Table 142 • Updated Figure 69 Chapter 19.6.87 • Added Note to Bit Range 31 Section 23.6 • Removed Note from Bit Range 28 Chapter 39 • Added a note to Chapter 39, "Memory Mapped Use" • Updated Section 39.8.299 — Removed the VLV_GPIO_configuration_primer_presentation — Removed cross reverences from Bit Rages 30:24, 22:16, 14:8, and 6:0 • Updated Section 39.8.300 — Removed cross reverences from Bit Rages 30:24, 22:16, 14:8, and 6:0 • Updated Section 39.8.301 — Removed cross reverences from Bit Rages 30:24, 22:16, 14:8, and 6:0 • Updated Section 39.8.302 — Removed cross reverences from Bit Rages 30:24, 22:16, 14:8, and 6:0 • Updated Section 39.10.143 — Removed the VLV2_GPIO_configuration_primer_presentation — Removed cross reverences from Bit Rages 30:24, 22:16, 14:8, and 6:0 • Updated Section 39.10.144 • Removed cross reverences from Bit Rages 30:24, 22:16, 14:8, and 6:0 • Updated Section 39.10.145 — Removed cross reverences from Bit Rages 30:24, 22:16, 14:8, and 6:0 • Updated Section 39.10.146 — Removed cross reverences from Bit Rages 30:24, 22:16, 14:8, and 6:0	April 2015

Revision Number	Description	Revision Date
3.8	Chapter 4 • Updated Table 42 Section 7.2.2 • Updated Note page 106, Delay timing changed from 2000 µs to 10 ms Chapter 9.3 • Updated Table 68, Added AC Voltage Tolerance for Platform Rail	June 2015
3.9	Chapter 2.7 • Revised Table 29. Chapter 4.2 • Added New Table 44 • Revised Table 45 Chapter 4.2.2.1 • Added Table 44 • Revised Table 45 Chapter 9.5.6 • Revised Table 99 • Revised Table 100 and added Note 3. Chapter 9.5.18 • Revised Table 104 through Table 107 Chapter 9.6.4 • Revised Table 111 Chapter 9.6.10.1 • Revised Table 125 Chapter 12.3.9, DRFC (DRFC)—Offset 8h • Revised Bit Range 14:12 Chapter 17 • Added Note 1 Chapter 26.2.3 • Revised last bullet Chapter 26.2.3.3 • Master-Receiver and Slave-Transmitter paragraph revised. Chapter 26.3.1 Revised Step 6 bullets	October 2015

Revision Number	Description	Revision Date
4.0	Section 2.24 • Updated Table 26 Section 2.27 • Revised Table 29 Section 7.3 • Revised Note for Figure 12 Section 9.3 • Revised Table 70 Section 9.6.4 • Revised Table 113 Section 13.4 • Revised Table 162 • Added Table 13.4.8, “CUNIT_MSG_CTRL_REG_EXT—Offset D8h” on page 349 Section 16 • Added Second Note Section 30.1 • Revised Table 292 Section 30.7.15 Revised TCO Timer reload value	May 2016

Revision Number	Description	Revision Date
4.1	Section 1.2.1 • Updated Chapter 11 cross reference Section 1.2.2 • Updated Chapter 12 cross reference Section 1.2.3 • Updated Chapter 14 cross reference Section 1.2.4 • Updated Chapter 14 cross reference Section 1.2.5 • Updated Chapter 15 cross reference Section 1.2.6 • Updated Chapter 6 cross reference Section 1.2.7 • Updated Chapter 15 cross reference Section 1.2.8 • Updated Chapter 17 cross reference Section 1.2.9 • Updated Chapter 18 cross reference Section 1.2.10 • Updated Chapter 18 cross reference Section 1.2.11 • Updated Chapter 19 cross reference Section 1.2.12.1 • Updated Chapter 21 cross reference Section 1.2.12.2 • Updated Chapter 20 cross reference Section 1.2.13 • Updated Chapter 16 cross reference Section 1.2.14 • Updated Chapter 22 cross reference Section 1.2.15 • Updated Chapter 24 cross reference Section 1.2.16 • Updated Chapter 29 cross reference Section 1.2.17 • Updated Chapter 10 cross reference Section 6.1 • Revised second bullet statement and added new bullet Section 6.3.4.3 • Added new bullet Section 6.3.5 • Revised first paragraph • Added new and updated Table Notes • Removed Figure 11. Package C-state Entry and Exit Section 6.3.5.2, Package C1 removed	July 2016

Revision Number	Description	Revision Date
4.1 Cont.	Section 6.3.5.3 • Revised bullet Section 6.3.5.3, Package C7 State added	July 2016
4.2	Section 2.24 • Updated Table 26 Section 7.3.1 • Updated Section 63 Section 12.2.1 • Updated Section 157 Revised Section 26.7.1,“I2C Control Register (IC_CON)—Offset 0h” Revised Section 26.9.2, “I2C Target Address Register (IC_TAR)—Offset 4h” Revised Section 27.6.3, “Interrupt Identification Register and FIFO Control Register. (IIR_FCR)—Offset 8h” Section 30.1 • Updated Table 290	December 2016

Revision Number	Description	Revision Date
4.3	Section 4.1.2 • Updated Table 42 Section 7.3.1 • Updated Table 12 • Updated Table 61 Section 9.6.10.1 • Updated Table 127 Removed Chapter "PCU - SPI AC Specification" Removed Figure "SPI AC Timing" Section 17.1 • Updated Table 192 Section 18.9 • Updated Section 215 • Added Section 18.9.24,"USB Test Per Port Register 1 (USB2_TEST_PERPORT_REG1_LANE0/1/2/3) - Offset 4113h/4213h/4313h/4413h" • Added Section 18.9.25,"Per Port RCOMP High Speed Pull down Register (PER_PORT_RCOMP_HS_PULLDOWN_REGISTER_LANE0/1/2/3) - Offset 4123h/4223h/4323h/4423h" • Added Section 18.9.26,"USB Per Port (USB2_PER_PORT_2_LANE0/1/2/3) - Offset 4126h/4226h/4326h/4426h" Section 26.7.2 • Updated table Section 27.2.2 • Updated Table 280 Revised Section 34.2.1 Revised Section 35.2.2 Revised Section 35.3.2.2 Section 35.6 • Updated Table 325 • Added Section 35.6.25,"Manufacturer ID (PCIE_REG_MANUFACTURER_ID) - Offset F8h" Section 39.10.91 • Added Notes	October 2018

§ §

1 Introduction

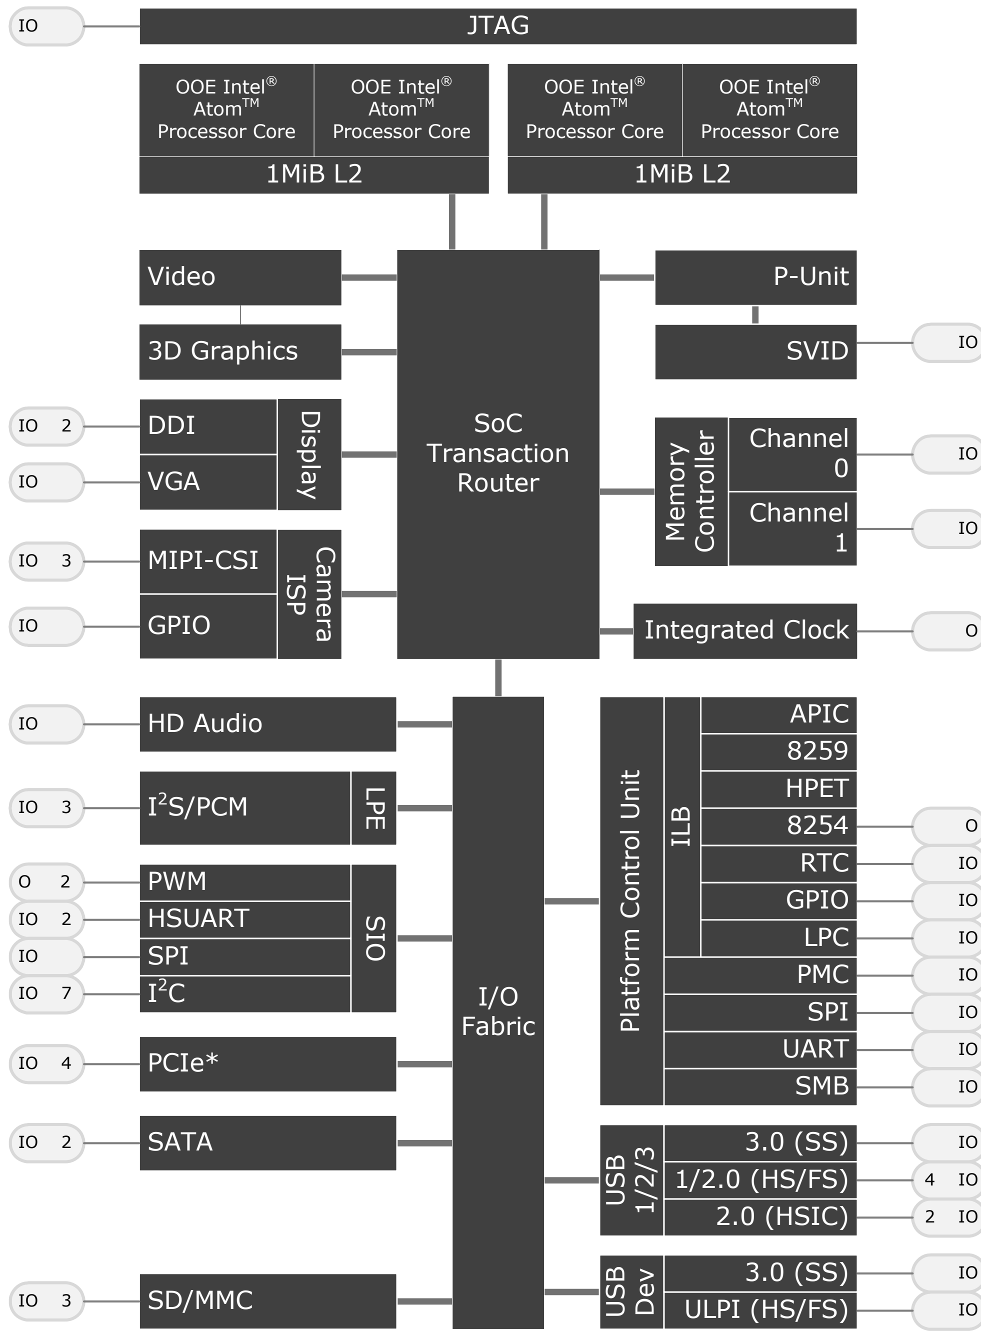
The Intel Atom ® Processor E3800 Product Family is the Intel Architecture (IA) SoC that integrates the next generation Intel® processor core, Graphics, Memory Controller, and I/O interfaces into a single system-on-chip solution.

The figures below show the system level block diagram of the SoC. Refer to the subsequent chapters for detailed information on the functionality of the different interface blocks.

Notes: Throughout this document Intel Atom ® Processor E3800 Product Family is referred to as the SoC or Processor.

This document details features of the silicon only. For platform support and software, contact your Intel representative.

Figure 1. SoC Block Diagram



1.1 Terminology

Term	Description
ACPI	Advanced Configuration and Power Interface
Cold Reset	A Host reset with Power Cycle. See Table 135
CRT	Cathode Ray Tube
CRU	Clock Reset Unit
DP	Display Port
DTS	Digital Thermal Sensor
EMI	Electro Magnetic Interference
eDP	embedded Display Port
HDMI	High Definition Multimedia Interface. HDMI supports standard, enhanced, or high-definition video, plus multi-channel digital audio on a single cable. HDMI transmits all Advanced Television Systems Committee (ATSC) HDTV standards and supports 8-channel digital audio, with bandwidth to spare for future requirements and enhancements (additional details available at http://www.hdmi.org/).
IGD	Internal Graphics Unit
Intel® TXE	Intel® Trusted Execution Engine
LCD	Liquid Crystal Display
LPE	Low Power Engine
MIPI CSI	MIPI Camera Interface Specification
MPEG	Moving Picture Experts Group
MSI	Message Signaled Interrupt. MSI is a transaction initiated outside the host, conveying interrupt information to the receiving agent through the same path that normally carries read and write commands.
MSR	Model Specific Register, as the name implies, is model-specific and may change from processor model number (n) to processor model number (n+1). An MSR is accessed by setting ECX to the register number and executing either the RDMSR or WRMSR instruction. The RDMSR instruction will place the 64 bits of the MSR in the EDX: EAX register pair. The WRMSR writes the contents of the EDX: EAX register pair into the MSR.
PCIe*	PCI Express* (PCIe*) is a high-speed serial interface. The PCIe* configuration is software-compatible with the existing PCI specifications.
PWM	Pulse Width Modulation
Rank	A unit of DRAM corresponding to the set of SDRAM devices that are accessed in parallel for a given transaction. For a 64-bit wide data bus using 8-bit (x8) wide SDRAM devices, a rank would be eight devices. Multiple ranks can be added to increase capacity without widening the data bus, at the cost of additional electrical loading.
SCI	System Control Interrupt. SCI is used in the ACPI protocol.
SDRAM	Synchronous Dynamic Random Access Memory
SERR	System Error. SERR is an indication that an unrecoverable error has occurred on an I/O bus.

Term	Description
SMI	System Management Interrupt is used to indicate any of several system conditions (such as thermal sensor events, throttling activated, access to System Management RAM, chassis open, or other system state related activity).
SIO	Serial I/O
TMDS	Transition-Minimized Differential Signaling. TMDS is a serial signaling interface used in DVI and HDMI to send visual data to a display. TMDS is based on low-voltage differential signaling with 8/10b encoding for DC balancing.
VCO	Voltage Controlled Oscillator
Warm Reset	Host Reset without Power Cycle. See Table 134

1.2 Feature Overview

All features subject to software availability.

1.2.1 Processor Core

See Chapter 11, "Processor Core" for more details.

- Up to four IA-compatible low power Intel® processor cores
  - One thread per core
- Two-wide instruction decode, out of order execution
- On-die, 32 KB 8-way L1 instruction cache and 24 KB 6-way L1 data cache per core
- On-die, 1 MB, 16-way L2 cache, shared per two cores
- L1 has parity protection and L2 has ECC protection
- 36-bit physical address, 48-bit linear address size support
- Supported C-states: C0, C1, C6
- Supports Intel® Virtualization Technology (Intel® VT-x)

1.2.2 System Memory Controller

See Chapter 12, "System Memory Controller" for more details.

- Supports up to two channels of DDR3L
- 64 bit data bus for each channel
- ECC supported in single channel mode only
- Supports x8 and x16 DDR3L SDRAM device data widths
- Supports DDR3L with 1066 or 1333 MT/s data rates
  - Total memory bandwidth supported is 8.5 GB/s (for 1066 MT/s single channel) scalable to 21.3GB/s(for 1333 MT/s dual channel)
- Supports different physical mappings of bank addresses to optimize performance

- Out-of-order request processing to increase performance
- Aggressive power management to reduce power consumption
- Proactive page closing policies to close unused pages

1.2.3 Display Controller

See Chapter 14, "Graphics, Video and Display" for more details.

- Support 2 DDI ports to enable eDP 1.3, DP 1.1a, DVI, or HDMI 1.4a
- Support 2 panel power sequence for 2 eDP ports
- Support Audio on DP and HDMI
- Supports Intel® Display Power Saving Technology (DPST) 6.0, Panel Self Refresh (PSR) and Display Refresh Rate Switching Technology (DRRS)
- Supports one VGA port

Note: These feature are not applicable to the E3805 SKU.

1.2.4 Graphics and Media Engine

See Chapter 14, "Graphics, Video and Display" for more details.

- Intel's 7th generation (Gen 7) graphics and media encode/decode engine
- VED video decoder in addition to Gen 7 Media decoder
- Supports DX*11, OpenGL 3.0 (OGL 3.0), OpenCL 1.2 (OCL 1.2), OpenGLES 2.0 (OGLES 2.0)
- GPU shader is capable of up to 8 gigaflops
- 4x anti-aliasing
- Full HW acceleration for decode of Up to 1080p@60fps and 3x 4kx2k @30fps (H.264/JPEG/MJPEG/MVC/MPEG-2 /WMV9/VC1)
- Full HW acceleration for encode of Up to 1080p@60fps and 1x 4kx2k @30fps (H.264)
- Supports 2.0 Stereoscopic 3D Stretch
- Polyphase 8 tap scaling
- HD HQV

Note: These feature are not applicable to the E3805 SKU.

1.2.5 Image Signal Processor

See Chapter 15, "MIPI-Camera Serial Interface (CSI) and ISP" for more details.

- Support up to three MIPI CSI ports
- Support for up to 24MP sensors

- Supports Stereoscopic Video

1.2.6 Power Management

See Chapter 6, "Power Management" for more details.

- ACPI 5.0 support
- Processor states: C0-C6
- Display device states: D0, D3
- Graphics device states: D0, D3
- System sleep states: S0, S3, S4, S5
- Dynamic I/O power reductions (disabling sense amps on input buffers, tristating output buffers)
- Active power-down of display links
- Downloadable power management firmware

1.2.7 PCI Express*

The SoC has four PCI Express* lanes and up to four PCI Express root ports, each supporting the PCI Express Base specification Rev 2.0 at a maximum of 5 Gbit/s data transfer rates.The root ports configurations are flexible and can be configured to be (4) x1, (2) x2's, (1) x2 plus (2) x1's, and (1) x4.

See Chapter 15, "MIPI-Camera Serial Interface (CSI) and ISP" for more details.

1.2.8 SATA

See Chapter 17, "Serial ATA (SATA)" for more details.

- Two (2) SATA Revision 2.0 ports
- Legacy IDE (including IRQ)/Native IDE/AHCI appearance to OS
- Partial/Slumber power management modes with wake
- Capable of 3 Gbit/s transfer rate

1.2.9 USB xHCI Controller

See Chapter 18, "USB Host Controller Interfaces (xHCI, EHCI)" for more details.

- Supports USB 3.0/2.0/1.1
- Implements xHCI software host controller interface
- One USB 3.0 Super Speed (SS) port
- Four ports multiplexed with EHCI controller that are High Speed/Full Speed (HS/FS)
- Two High Speed Inter Chip (HSIC) ports compliant with USB 2.0

1.2.10 USB 2.0 EHCI Controller

See Chapter 18, “USB Host Controller Interfaces (xHCI, EHCI)” for more details.

- Internal Rate Matching Hub to support USB 1.1 to 2.0 devices
- Four Ports multiplexed with xHCI controller
- Enhanced EHCI descriptor caching

1.2.11 USB 2.0 (ULPI) and 3.0 Device

See Chapter 19, “USB Device Controller Interfaces (3.0, ULPI)” for more details.

- Supports one USB 3.0 SS port with USB device compatibility
- Supports one ULPI port with HS/LS support

1.2.12 Audio Controllers

1.2.12.1 Low Power Engine (LPE) Audio

LPE is a complete audio solution based on an internal audio processing engine, which includes three I^2S output ports. See Chapter 21, “Low Power Engine (LPE) for Audio (I^2S)” for more details.

LPE supports:

- I^2S and DDI with dedicated DMA
- MP3, AAC, AC3/DD+, WMA9, PCM (WAV)

Note: Codecs supported depend on software and may be different.

1.2.12.2 Intel® High Definition Audio (Intel® HD Audio)

See Chapter 20, “Intel® High Definition Audio” for more details.

- Four in + four out streams (Only 3 used)
- One stream for each DDI, available for HDMI and DP
- No wake on audio (modem) support

1.2.13 Storage Control Cluster (eMMC, SDIO, SD)

See Chapter 16, “Storage Control Cluster (eMMC, SDIO, SD Card)” for more details.

- Supports one SDIO 3.0 controller
- Supports one eMMC 4.5 controller
- Supports one SDXC controller

1.2.14 Intel® Trusted Execution Engine (Intel® TXE)

Intel® TXE is a security co-processor used to enable security features.

See Chapter 22, "Intel® Trusted Execution Engine (TXE)" for more details.

Security features include:

- Isolated execution environment for crypto operations (SKU-enabled)
- Supports secure boot - with customer programmable keys to secure code

Note: The SoC requires TXE firmware in the PCU SPI flash image to function. Contact your Intel® representative for details.

1.2.15 Serial I/O (SIO)

See Chapter 24, "Serial IO (SIO) Overview" for links to more information about each interface.

- Controller for external devices via SPI, UART, I^2C or PWM
- Each port is multiplexed with general purpose I/O for configurations flexibility
- Supports up to 7 I^2C, 2 HSUART, 2 PWM, 1 SPI interface

1.2.16 Platform Control Unit (PCU)

The platform controller unit is a collection of HW blocks, including SMBus, UART, debug/boot SPI and Intel legacy block (iLB), that are critical to implement a Windows* compatible platform. See Chapter 29, "Platform Controller Unit (PCU) Overview" for links to more information about each interface.

Key PCU features include:

- SMBus Host controller - supports SMBus 2.0 specification
- Universal Asynchronous Receiver/Transmitter (UART) with COM1 interface
- A Serial Peripheral Interface (SPI) for Flash only - stores boot FW and system configuration data
- Intel Legacy Block (iLB) supports legacy PC platform features
  - RTC, Interrupts, Timers, General Purpose I/Os (GPIO) and Peripheral interface (LPC for TPM) blocks.

1.2.17 Package

This SoC is packaged in a Flip-Chip Ball Grid Array (FCBGA) package with 1170 solder balls with 0.593 mm (minimum) ball pitch. The package dimensions are 25mm x 27mm. See Chapter 10, "Ballout and Package Information" for more details.

1.2.18 SKU List

Table 1. Intel Atom ® Processor E3800 Product Family SKUs

SKU	Processor Number	CPU	TDP (W)	Core LFM (MHz)/ HFM (GHz)	Tj (°C)	GFX Normal / Burst (MHz)	DDR (MT/s)
Premium	E3845	4	10	500 / 1.91	-40 to 110	542 / 792	1333
Hi	E3827	2	8	500 / 1.75	-40 to 110	542 / 792	1333
Intermediate	E3826	2	7	533 / 1.46	-40 to 110	533 / 667	1066
Mid	E3825	2	6	533 / 1.33	-40 to 110	533 / NA	1066
Entry	E3815	1	5	533 / 1.46	-40 to 110	400 / NA	1066
Headless	E3805	2	3	533 / 1.33	-40 to 110	NA	1066

§

2 Physical Interfaces

Many interfaces contain physical pins. These groups of pins make up the physical interfaces. Because of the large number of interfaces and the small size of the package, Some interfaces share their pins with GPIOs, while others use dedicated physical pins. This chapter summarizes the physical interfaces, including the diversity in GPIO multiplexing options.

Figure 2. Signals (1 of 2)

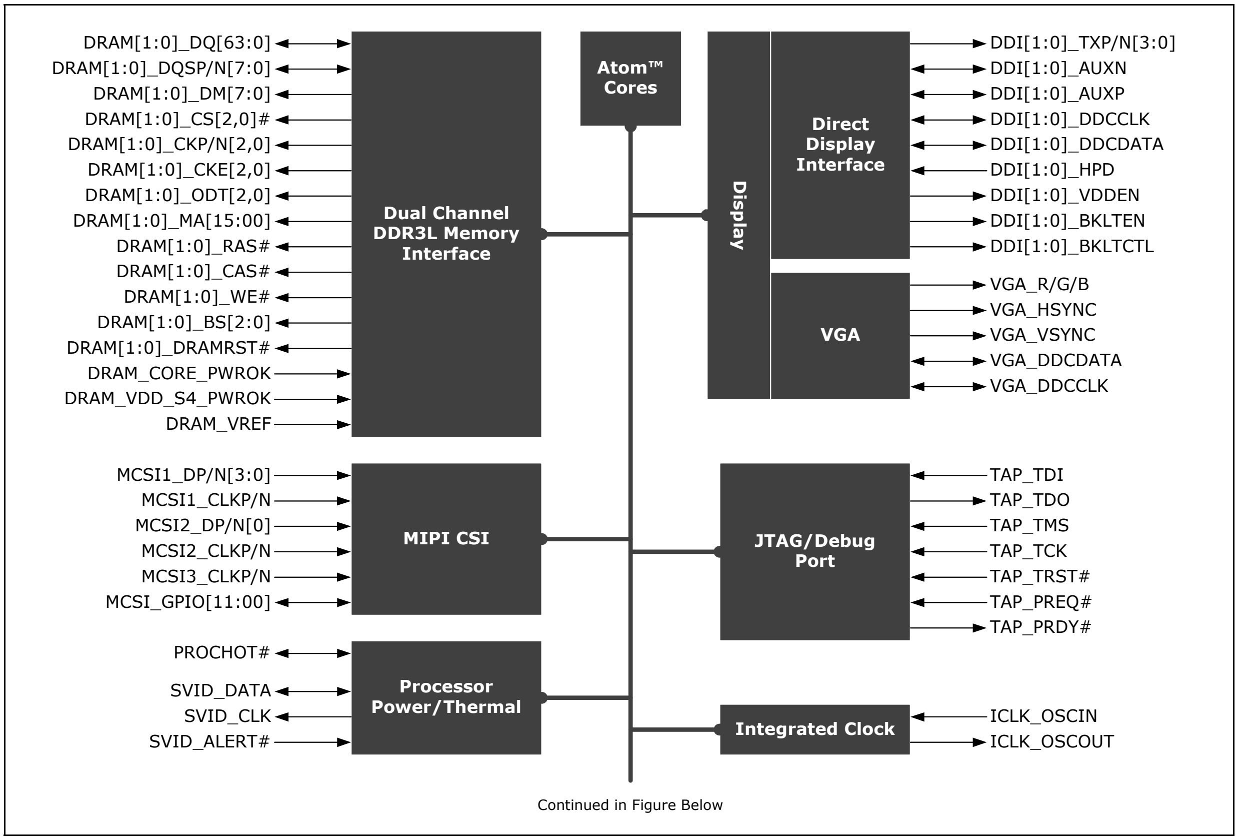


Figure 3. Signals (2 of 2)

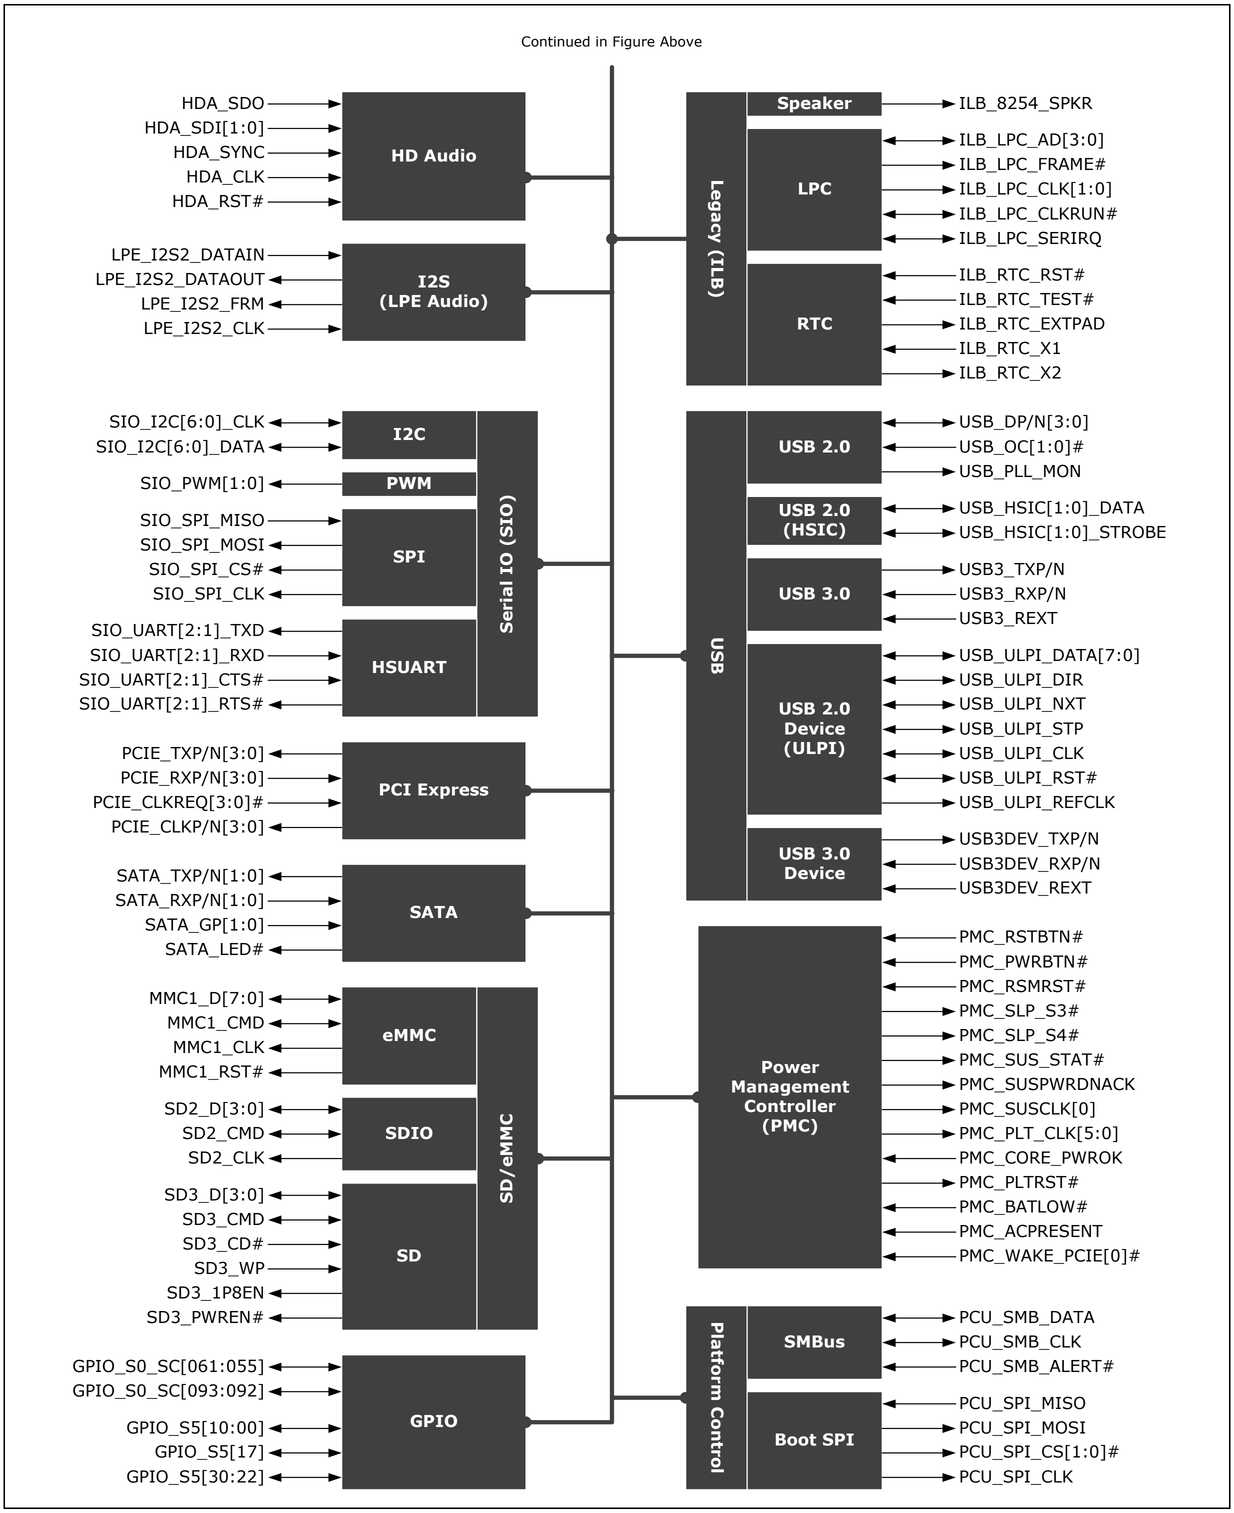

2.1 Pin States Through Reset

This chapter describes the states of each signal before, during and directly after reset. Additionally, Some signals have internal pull-up/pull-down termination resistors, and their values are also provided (Term). Termination tolerances are +/- 50% unless otherwise specified by electrical specs (PCIe*, and other differential termination). All signals with the "†" symbol are muxed and may not be available without configuration. See Section 2.30, "Configurable IO: GPIO Muxing" on page 68.

Note: The internal termination resistor values & pull directions described in this chapter are the power-on defaults. Firmware & software may change the termination value, pull direction or disable the termination completely, on a pin-by-pin basis, using the _PCONF0 register corresponding to that pin.

Table 2. Platform Power Well Definitions

Power Type	Power Well Description
V1P05S	1.05 V rail. On in S0 only.
V1P0A	1.0 V rail. On in S0 through S4/5.
V1P0S	1.0 V rail. On in S0 only.
V1P24A	1.24 V rail. On in S0 through S4/5.
V1P24S	1.24 V rail. On in S0 only.
V1P35U	1.35 V rail. On in S0 through S3.
V1P8A	1.8 V rail. On in S0 through S4/5.
V1P35S	1.35 V rail. On in S0 only.
V1P8S	1.8 V rail. On in S0 only.
V3P3A	3.3 V rail. On in S0 through S4/5.
VAUD	1.5 V rail for HD Audio. 1.8 V rail for I^2S. On in S0 only.
VCC	Variable core rail. On in S0 only.
VLPC	1.8 or 3.3 V rail for LPC. On in S0 only.
VNN	Variable rail. On in S0 only.
VPCIESATA	1.0 V rail for PCIe* and SATA. On in S0 only.
VRTC	RTC voltage rail. On in S0 through G3.
VSDIO	1.8 or 3.3 V rail for SD3. On in S0 only.
VSFR	1.35 V rail for internal PLLs. On in S0 only.
VUSB2	3.3 V rail. On in S0 through S4/5.
VVGA_GPIO	3.3 V rail for VGA sideband. On in S0 only.

Table 3. Default Buffer State Definitions

Buffer State	Description
High-Z	The SoC places this output in a high-impedance state. For inputs, external drivers are not expected.
Do Not Care	The state of the input (driven or tristated) does not affect the SoC. For outputs, it is assumed that the output buffer is in a high-impedance state.
V_{OH}	The SoC drives this signal high with a termination of 50 Ω.
V_{OL}	The SoC drives this signal low with a termination of 50 Ω.
Unknown	The SoC drives or expects an indeterminate value.
V_{IH}	The SoC expects/requires the signal to be driven high.
V_{IL}	The SoC expects/requires the signal to be driven low.
Pull-up	This signal is pulled high by a pull-up resistor (internal value specified in "Term" column).
Pull-down	This signal is pulled low by a pull-down resistor (internal value specified in "Term" column).
Running/T	The clock is toggling, or the signal is transitioning.
Off	The power plane for this signal is powered down. The SoC does not drive outputs, and inputs should not be driven to the SoC. (VSS on output)

2.2 System Memory Controller Interface Signals

See Chapter 12, "System Memory Controller" for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 4. DDR3L System Memory Signals

Signal Name	Dir	Term	Plat. Power	Default Buffer State: S4/S5	Default Buffer State: S3	Default Buffer State: Reset	Default Buffer State: Enter S0	Notes
DRAM0_CKP[2,0]	O	-	V1P35U	Off	High-Z	High-Z	High-Z	
DRAM0_CKN[2,0]	O	-	V1P35U	Off	High-Z	High-Z	High-Z

DRAM1_ODT[2,0]	O	-	V1P35U	Off	V_{OL}	V_{OL}	V_{OL}	
DRAM1_DQ[63:0]	I/O	-	V1P35U	Off	High-Z	High-Z	High-Z	
DRAM1_DM[7:0]	O	-	V1P35U	Off	High-Z	High-Z	High-Z	
DRAM1_DQSP[7:0]	I/O	-	V1P35U	Off	High-Z	High-Z	High-Z	
DRAM1_DQSN[7:0]	I/O	-	V1P35U	Off	High-Z	High-Z	High-Z	
DRAM_VDD_S4_PWROK	I	-	V1P35U	V_{IL}	V_{IH}	Unknown	V_{IH}	
DRAM_CORE_PWROK	I	-	V1P35U	V_{IL}	V_{IL}	Unknown	V_{IH}	
DRAM_VREF	I	-	V1P35U					
DRAM_RCOMP[2:0]	-	-	V1P35U					

2.3 PCI Express* 2.0 Interface Signals

See Chapter 21, "PCI Express* 2.0" for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 5. PCI Express* 2.0 Interface Signals

				Default Buffer State				
Signal Name	**Dir**	**Term**	**Plat. Power**	**S4/S5**	**S3**	**Reset**	**Enter S0**	**Notes**
PCIE_TXP[3:0]	O	50	VPCIESATA	Off	Off	V_{OL}	V_{OL}	
PCIE_TXN[3:0]	O	50	VPCIESATA	Off	Off	V_{OL}	V_{OL}	
PCIE_RXP[3:0]	I	50	VPCIESATA	Off	Off	High-Z	High-Z	
PCIE_RXN[3:0]	I	50	VPCIESATA	Off	Off	High-Z	High-Z	
PCIE_CLKP[3:0]	O	-	V1P0S	Off	Off	Running/ V_{IL}	Running/ V_{IL}	
PCIE_CLKN[3:0]	O	-	V1P0S	Off	Off	Running/ V_{IL}	Running/ V_{IL}	
PCIE_CLKREQ[3:0]#†	I	20k(H)	V1P8S	Off	Off	Pull_up	Pull_up	
PCIE_RCOMP_P/N	-	-						

NOTE: All signals with the "†" symbol are muxed and may not be available without configuration.

2.4 USB 2.0 Host (EHCI/xHCI) Interface Signals

See Chapter 18, "USB Host Controller Interfaces (xHCI, EHCI)" for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 6. USB 2.0 Interface Signals

				Default Buffer State				
Signal Name	**Dir**	**Term**	**Plat. Power**	**S4/S5**	**S3**	**Reset**	**Enter S0**	**Notes**
USB_DN[3:0]	I/O	-	VUSB2					
USB_DP[3:0]	I/O	-	VUSB2					
USB_OC[1:0]#†	I	20k(H)	V1P8A	Pull-up	Pull-up	Pull-up	Pull-up	
USB_RCOMPI	I	-	-					
USB_RCOMPO	O	-	-					

NOTE: All signals with the "†" symbol are muxed and may not be available without configuration.

2.5 USB 2.0 HSIC Interface Signals

See Chapter 18, "USB Host Controller Interfaces (xHCI, EHCI)" for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 7. USB 2.0 HSIC Interface Signals

				Default Buffer State				
Signal Name	**Dir**	**Term**	**Plat. Power**	**S4/S5**	**S3**	**Reset**	**Enter S0**	**Notes**
USB_HSIC0_DATA	I/O	-	V1P24A	Running	Running	V_{OH}	Running	
USB_HSIC0_STROBE	I/O	-	V1P24A	V_{OH}				
USB_HSIC1_DATA	I/O	-	V1P24A			V_{OH}		
USB_HSIC1_STROBE	I/O	-	V1P24A	V_{OH}				
USB_HSIC_RCOMP	I	-	V1P24A			V_{OH}		

2.6 USB 3.0 (xHCI) Host Interface Signals

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 8. USB 3.0 Interface Signals

				Default Buffer State				
Signal Name	**Dir**	**Term**	**Plat. Power**	**S4/S5**	**S3**	**Reset**	**Enter S0**	**Notes**
USB3_TXN[0]	O	-	V1P0A					
USB3_TXP[0]	O	-	V1P0A					
USB3_RXN[0]	I	-	V1P0A					
USB3_RXP[0]	I	-	V1P0A					
USB3_REXT[0]	I	-	V1P0A	V_{OL}	V_{OL}	V_{OH}	V_{OH}	

2.7 USB 2.0 Device (ULPI) Interface Signals

See Chapter 19, "USB Device Controller Interfaces (3.0, ULPI)" for more details.

Note: S0ix is not supported for Bay Trail-I SKUs.

Table 9. USB 2.0 Device Interface Signals

Signal Name	Dir	Term	Plat. Power	Default Buffer State				
				S4/S5	S3	Reset	Enter S0	Notes
USB_ULPI_CLK†	I	20k(L)	V1P8A	Pull-down	Pull-down	Pull-down	Pull-down	Pull-down
USB_ULPI_DATA[0:7]†	I/O	20k(L)	V1P8A	Pull-down	Pull-down	Pull-down	Pull-down	Pull-down
USB_ULPI_DIR†	I	20k(H)	V1P8A	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up
USB_ULPI_NXT†	I	20k(L)	V1P8A	Pull-down	Pull-down	Pull-down	Pull-down	Pull-down
USB_ULPI_STP†	O	20k(H)	V1P8A	Pull-up	Pull-up	Pull-up	Pull-up	Pull-up
USB_ULPI_REFCLK†	O	20k(L)	V1P8A	Pull-down	Pull-down	Pull-down	Pull-down	Pull-down
USB_ULPI_RST#†	O	-	V1P8A	Pull-down	Pull-down	Pull-down	Pull-down	Pull-down

NOTE: All signals with the "†" symbol are muxed and may not be available without configuration.

2.8 USB 3.0 Device Interface Signals

See Chapter 19, "USB Device Controller Interfaces (3.0, ULPI)" for more details.

Note: S0ix is not supported for Bay Trail-I SKUs.

Table 10. USB 3.0 Device Interface Signals

Signal Name	Dir	Term	Plat. Power	Default Buffer State				
				S4/S5	S3	Reset	Enter S0	Notes
USB3DEV_TXN[0]	O	-	V1P0S					
USB3DEV_TXP[0]	O	-	V1P0S					
USB3DEV_RXN[0]	I	-	V1P0S					
USB3DEV_RXP[0]	I	-	V1P0S					
USB3DEV_REXT[0]	I	-	V1P0S					

2.9 Serial ATA (SATA) 2.0 Interface Signals

See Chapter 17, “Serial ATA (SATA)” for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 11. SATA 2.0 Interface Signals

Signal Name	Dir	Term	Plat. Power	Default Buffer State				
				S4/S5	S3	Reset	Enter S0	Notes
SATA_TXP[1:0]	O		VPCIESATA	Off	Off			
SATA_TXN[1:0]	O		VPCIESATA	Off	Off			
SATA_RXP[1:0]	I		VPCIESATA	Off	Off			
SATA_RXN[1:0]	I		VPCIESATA	Off	Off			
SATA_LED#†	O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	Pull-up
SATA_GP[1:0]†	I	20k(L)	V1P8S	Off	Off	Pull-down	Pull-down	Pull-down
SATA_RCOMP_P/N	-	-	1.0 V					

NOTE: All signals with the “†” symbol are muxed and may not be available without configuration.

2.10 Integrated Clock Interface Signals

See Chapter 5, “Integrated Clock” for more details..

Table 12. Integrated Clock Interface Signals

Signal Name	Dir	Term	Plat. Power	Default Buffer State				
				S4/S5	S3	Reset	Enter S0	Notes
ICLK_OSCIN	I	-		Off	Off	Running	Running	
ICLK_OSCOUT	O	-		Off	Off	Running	Running	
ICLK_ICOMP	-	-		Off	Off			
ICLK_RCOMP	-	-		Off	Off			
ICLK_DRAM_TERM[1:0]	-	-	-	Pull-down	Pull-down	Pull-down	Pull-down	
ICLK_USB_TERM[1:0]	-	-	-	Pull-down	Pull-down	Pull-down	Pull-down	

2.11 Display - Digital Display Interface (DDI) Signals

See Chapter 14, "Graphics, Video and Display" for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 13. Digital Display Interface Signals

				Default Buffer State				
Signal Name	**Dir**	**Term**	**Plat. Power**	**S4/S5**	**S3**	**Reset**	**Enter S0**	**Notes**
DDI0_TXP[3:0]	O		V1P0S	Off	Off			
DDI0_TXN[3:0]	O		V1P0S	Off	Off			
DDI0_AUXP	I/O		V1P0S	Off	Off			
DDI0_AUXN	I/O		V1P0S	Off	Off			
DDI0_BKLTCTL†	I/O	20k(L)	V1P8S	Off	Off	Pull-down	Pull-down	
DDI0_BKLTEN†	I/O	20k(L)	V1P8S	Off	Off	Pull-down	Pull-down	
DDI0_DDCCLK†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
DDI0_DDCDATA†	I/O	20k(L)[1]	V1P8S	Off	Off	Pull-down[1]	Pull-up[2]	
DDI0_HPD†	I/O	20k(L)	V1P8S	Off	Off	Pull-down	Pull-down	
DDI0_VDDEN†	I/O	20k(L)	V1P8S	Off	Off	Pull-down	Pull-down	
DDI_RCOMP_P/N	-	-	V1P0S					
DDI1_TXP[3:0]	O		V1P0S	Off	Off			
DDI1_TXN[3:0]	O		V1P0S	Off	Off			
DDI1_AUXP	I/O		V1P0S	Off	Off			
DDI1_AUXN	I/O		V1P0S	Off	Off			
DDI1_BKLTCTL†	I/O	20k(L)	V1P8S	Off	Off	Pull-down	Pull-down	
DDI1_BKLTEN†	I/O	20k(L)	V1P8S	Off	Off	Pull-down	Pull-down	
DDI1_DDCCLK†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
DDI1_DDCDATA†	I/O	20k(L)[1]	V1P8S	Off	Off	Pull-down[1]	Pull-up[2]	
DDI1_HPD†	I/O	20k(L)	V1P8S	Off	Off	Pull-down	Pull-down	
DDI1_VDDEN†	I/O	20k(L)	V1P8S	Off	Off	Pull-down	Pull-down	

NOTE: 1. The internal pull-down resistor is disabled upon assertion of PMC_CORE_PWROK.
NOTE: 2. When the corresponding DDI port is used, an external pull-up resistor is required.
NOTE: 3. All signals with the "†" symbol are muxed and may not be available without configuration.

2.12 Display – VGA Interface Signals

See Chapter 14, "Graphics, Video and Display" for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 14. VGA Interface Signals

					Default Buffer State				
Signal Name	**Dir**	**Term**	**Plat. Power**	**Type**	**S4/S5**	**S3**	**Reset**	**Enter S0**	**Notes**
VGA_RED	O		VVGA_GPIO		Off	Off	High-Z		
VGA_GREEN	O		VVGA_GPIO		Off	Off	High-Z		
VGA_BLUE	O		VVGA_GPIO		Off	Off	High-Z		
VGA_IREF					Off	Off	V_{OL}		
VGA_IRTN					Off	Off	High-Z		
VGA_HSYNC	O		VVGA_GPIO		Off	Off	V_{OL}		
VGA_VSYNC	O		VVGA_GPIO		Off	Off	V_{OL}		
VGA_DDCCLK	O		VVGA_GPIO		Off	Off	High-Z		
VGA_DDCDATA	I/O		VVGA_GPIO		Off	Off	High-Z		

2.13 MIPI Camera Serial Interface (CSI) and ISP Interface Signals

See Chapter 15, "MIPI-Camera Serial Interface (CSI) and ISP" for more details.

Note: S0ix is not supported for Bay Trail-I SKUs.

Table 15. MIPI CSI Interface Signals (Sheet 1 of 2)

				Default Buffer State				
Signal Name	**Dir**	**Term**	**Plat. Power**	**S4/S5**	**S3**	**Reset**	**Enter S0**	**Notes**
MCSI1_CLKN	I		V1P24S	Off				
MCSI1_CLKP	I		V1P24S	Off				
MCSI1_DN[0:3]	I		V1P24S	Off				
MCSI1_DP[0:3]	I		V1P24S	Off				
MCSI2_CLKN	I		V1P24S	Off				
MCSI2_CLKP	I		V1P24S	Off				
MCSI2_DN[0]	I		V1P24S	Off				
MCSI2_DP[0]	I		V1P24S	Off				

Table 15. MIPI CSI Interface Signals (Sheet 2 of 2)

Signal Name	Dir	Term	Plat. Power	Default Buffer State S4/S5	S3	Reset	Enter S0	Notes
MCSI3_CLKN	I		V1P24S	Off				
MCSI3_CLKP	I		V1P24S	Off				
MCSI_RCOMP	-		V1P24S	Off	High-Z	High-Z	High-Z	

2.14 Intel® High Definition Audio Interface Signals

See Chapter 20, "Intel® High Definition Audio" for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 16. HD Audio Interface Signals

Signal Name	Dir	Term	Plat. Power	Default Buffer State S4/S5	S3	Reset	Enter S0	Notes
HDA_SDO†	O	20k(L)	VAUD	Off	Off	Pull-down	Pull-down	
HDA_SDI[1:0]†	I	20k(L)	VAUD	Off	Off	Pull-down	Pull-down	
HDA_CLK†	O	20k(L)	VAUD	Off	Off	Pull-down	Pull-down	
HDA_RST#†	O	20k(L)	VAUD	Off	Off	Pull-down	Pull-down	
HDA_SYNC†	O	20k(L)	VAUD	Off	Off	Pull-down	Pull-down	
HDA_LPE_RCOMP	-							

NOTE: All signals with the "†" symbol are muxed and may not be available without configuration.

2.15 Low Power Engine (LPE) for Audio (I^2S) Interface Signals

See Chapter 21, "Low Power Engine (LPE) for Audio (I^2S)" for more details.

Note: S0ix is not supported for Bay Trail-I SKUs.

Table 17. LPE Interface Signals

Signal Name	Dir	Term	Plat. Power	Default Buffer State: S4/S5	S3	Reset	Enter S0	Notes
LPE_I2S[2:0]_CLK	I/O	20k(L)	V1P8S	Off	Off	Pull-down	Pull-down	
LPE_I2S[2:0]_FRM	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
LPE_I2S[2:0]_DATAOUT	O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
LPE_I2S[2:0]_DATAIN	I	20k(L)	V1P8S	Off	Off	Pull-down	Pull-down	

2.16 Storage Control Cluster (eMMC, SDIO, SD) Interface Signals

See Chapter 16, "Storage Control Cluster (eMMC, SDIO, SD Card)" for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 18. Storage Control Cluster (eMMC, SDIO, SD) Interface Signals (Sheet 1 of 2)

Signal Name	Dir	Term	Plat. Power	Default Buffer State: S4/S5	S3	Reset	Enter S0	Notes
MMC1_D[7:0]†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
MMC1_CMD†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
MMC1_CLK†	I/O	20k(L)	V1P8S	Off	Off	Pull-down	Pull-down	
MMC1_RST#†	I/O	20k(L)	V1P8S	Off	Off	Pull-down	Pull-down	
MMC1_RCOMP	I/O	-	V1P8S					
SD2_D[3:0]†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SD2_CMD†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SD2_CLK†	I/O	20k(L)	V1P8S	Off	Off	Pull-down	Pull-down	
SD3_D[3:0]†	I/O	20k(H)	VSDIO	Off	Off	Pull-up	Pull-up	
SD3_CMD†	I/O	20k(H)	VSDIO	Off	Off	Pull-up	Pull-up	
SD3_CLK†	I/O	20k(L)	VSDIO	Off	Off	Pull-down	Pull-down	
SD3_PWREN#†	O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SD3_CD#†	I	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SD3_1P8EN†	O	20k(L)	V1P8S	Off	Off	Pull-down	Pull-down	

Table 18. Storage Control Cluster (eMMC, SDIO, SD) Interface Signals (Sheet 2 of 2)

Signal Name	Dir	Term	Plat. Power	Default Buffer State S4/S5	S3	Reset	Enter S0	Notes
SD3_WP†	I	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SD3_RCOMP	-	-	VSDIO					

NOTE: All signals with the "†" symbol are muxed and may not be available without configuration.
NOTE: VSDIO voltage selection is controlled by SD3_1P8EN. 3.3V is default due to pull-down. VSDIO can be either 1.8 or 3.3 V when these VSDIO referenced signals are configured to be GPIO's to meet different platform requirements.

2.17 SIO – High Speed UART Interface Signals

See Chapter 27, "SIO – High Speed UART" for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 19. High Speed UART Interface Signals

Signal Name	Dir	Term	Plat. Power	Default Buffer State S4/S5	S3	Reset	Enter S0	Notes
SIO_UART1_RXD†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_UART1_TXD†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_UART1_RTS#†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_UART1_CTS#†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_UART2_RXD†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_UART2_TXD†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_UART2_RTS#†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_UART2_CTS#†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	

NOTE: All signals with the "†" symbol are muxed and may not be available without configuration.

2.18 SIO – I^{2}C Interface Signals

See Chapter 26, "SIO - I^{2}C Interface" for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 20. SIO - I^{2}C Interface Signals

				Default Buffer State				
Signal Name	**Dir**	**Term**	**Plat. Power**	**S4/S5**	**S3**	**Reset**	**Enter S0**	**Notes**
SIO_I2C0_DATA†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_I2C0_CLK†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_I2C1_DATA†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_I2C1_CLK†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_I2C2_DATA†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_I2C2_CLK†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_I2C3_DATA†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_I2C3_CLK†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_I2C4_DATA†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_I2C4_CLK†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_I2C5_DATA†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_I2C5_CLK†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_I2C6_DATA†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_I2C6_CLK†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	

NOTE: All signals with the "†" symbol are muxed and may not be available without configuration.

2.19 SIO – Serial Peripheral Interface (SPI) Signals

See Chapter 25, "SIO - Serial Peripheral Interface (SPI)" for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 21. SIO - Serial Peripheral Interface (SPI) Signals (Sheet 1 of 2)

				Default Buffer State				
Signal Name	**Dir**	**Term**	**Plat. Power**	**S4/S5**	**S3**	**Reset**	**Enter S0**	**Notes**
SIO_SPI_CLK†	I/O	20k(L)	V1P8S	Off	Off	Pull-down	Pull-down	
SIO_SPI_CS#†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	

Table 21. SIO - Serial Peripheral Interface (SPI) Signals (Sheet 2 of 2)

Signal Name	Dir	Term	Plat. Power	Default Buffer State S4/S5	S3	Reset	Enter S0	Notes
SIO_SPI_MOSI†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
SIO_SPI_MISO†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	

NOTE: All signals with the "†" symbol are muxed and may not be available without configuration.

2.20 PCU – iLB – Real Time Clock (RTC) Interface Signals

See Chapter 36, "PCU – iLB – Real Time Clock (RTC)" for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 22. PCU - iLB - Real Time Clock (RTC) Interface Signals

Signal Name	Dir	Term	Plat. Power	Default Buffer State S4/S5	S3	Reset	Enter S0	Notes
ILB_RTC_X1	I	-	VRTC	Running	Running	Running	Running	
ILB_RTC_X2	O	-	VRTC	Running	Running	Running	Running	
ILB_RTC_RST#	I	-	VRTC	V_{IH}	V_{IH}	V_{IH}	V_{IH}	
ILB_RTC_TEST#	I	-	VRTC	V_{IH}	V_{IH}	V_{IH}	V_{IH}	
ILB_RTC_EXTPAD	O	-	VRTC					

2.21 PCU – iLB – Low Pin Count (LPC) Bridge Interface Signals

See Chapter 35, "PCU – iLB – Low Pin Count (LPC) Bridge" for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Note: If the VGA interface is used, VLPC must have a nominal voltage of 3.3V.

Table 23. PCU - iLB - LPC Bridge Interface Signals

Signal Name	Dir	Term	Plat. Power	Default Buffer State				
				S4/S5	S3	Reset	Enter S0	Notes
ILB_LPC_AD[3:0]†	I/O	20k(H)	VLPC	Off	Off	Pull-up	Running	
ILB_LPC_FRAME#†	I/O	20k(H)	VLPC	Off	Off	V_{OH}	Running	
ILB_LPC_SERIRQ†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Running	
ILB_LPC_CLKRUN#†	I/O	20k(H)	VLPC	Off	Off	Pull-up	Running	
ILB_LPC_CLK[1:0]†	I/O	20k(L)	VLPC	Off	Off	V_{OL}	Running	
LPC_RCOMP	-		VLPC					

NOTE: All signals with the "†" symbol are muxed and may not be available without configuration.

2.22 PCU – Serial Peripheral Interface (SPI) Signals

See Chapter 31, "PCU – Serial Peripheral Interface (SPI)" for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 24. PCU - Serial Peripheral Interface (SPI) Signals

Signal Name	Dir	Term	Plat. Power	Default Buffer State				
				S4/S5	S3	Reset	Enter S0	Notes
PCU_SPI_CLK	O	20k(H)	V1P8A	Pull-up	Pull-up	Pull-up	Running	
PCU_SPI_CS[0]#	O	20k(H)	V1P8A	Pull-up	Pull-up	Pull-up	Running	
PCU_SPI_CS[1]#†	O	20k(H)	V1P8A	Pull-up	Pull-up	Pull-up	Running	
PCU_SPI_MOSI	I/O	20k(H)	V1P8A	Pull-up	Pull-up	Pull-up	Pull-up	
PCU_SPI_MISO	I	20k(H)	V1P8A	Pull-up	Pull-up	Pull-up	Pull-up	

NOTE: All signals with the "†" symbol are muxed and may not be available without configuration.

2.23 PCU – System Management Bus (SMBus) Interface Signals

See Chapter 33, "PCU – System Management Bus (SMBus)" for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 25. PCU - System Management Bus (SMBus) Interface Signals

				Default Buffer State				
Signal Name	**Dir**	**Term**	**Plat. Power**	**S4/S5**	**S3**	**Reset**	**Enter S0**	
PCU_SMB_CLK†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
PCU_SMB_DATA†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	
PCU_SMB_ALERT#†	I/O	20k(H)	V1P8S	Off	Off	Pull-up	Pull-up	

2.24 PCU – Power Management Controller (PMC) Interface Signals

See Chapter 30, "PCU – Power Management Controller (PMC)" for more details.

Note: S0ix is not supported for Bay Trail-M/D SKUs and Bay Trail-I SKUs.

Table 26. PCU - Power Management Controller (PMC) Interface Signals (Sheet 1 of 2)

				Default Buffer State				
Signal Name	**Dir**	**Term**	**Plat. Power**	**S4/S5**	**S3**	**Reset**	**Enter S0**	**Notes**
PMC_PLTRST#	O	-	V1P8A	V_{OL}	V_{OL}	V_{OL}->V_{OH}	V_{OH}

2.28 Power And Ground Pins

Power Rail Ball Name Format: [Function]_[Voltage]_[S-State]{_[Filter]}:

- [Function]: The SoC function associated with the power rail.
  — E.g CORE, USB, …
- [Voltage]: The nominal voltage associated with the power rail.
  — E.g. 1P05, 3P3, VCC, …
- [S-State]: The ACPI system state, from S0 to G3, when the this rail is turned off.
- [Filter]: An optional indicator that one or more power rail balls have unique filtering requirements or requirement to be uniquely identified.

Note: The Resume power well is a set of supply rails (where [S-State] = G3) that must be powered even when S3/4/5 states aren't used. The "Resume Well" is also referred to as the "Suspend Power Well", "Always on/SUS", "SUS power", or "SUS well".

Table 30. Power and Ground Pins (Sheet 1 of 2)

Power Rails	Platform Power	Nominal Voltages	First Off State

VSS	-	-	-
VSSA	-	-	-

Note: USB_HSIC_V1P24_G3 pin(s) can be connected to V1P0A platform rail if USB HSIC is not used. MIPI_V1P24_S3 can be grounded if MIPI interfaces (CSI) aren't used.

Note: If the VGA interface is used, LPC_V1P8V3P3_S3 must have a nominal voltage of 3.3V.

2.29 Hardware Straps

All straps are sampled on the rising edge of PMC_CORE_PWROK. Defaults are based on internal termination.

Table 31. Straps

Signal Name	Function	Default	Strap Exit	Strap Description
GPIO_S0_SC[056]	Legacy	1b	PMC_CORE_PWROK de-asserted	Top Swap (A16 Override) 0 = Top address bit is inverted 1 = Top address bit is unchanged
GPIO_S0_SC[063]	Legacy	1b	PMC_CORE_PWROK de-asserted	BIOS Boot Selection 0 = LPC 1 = SPI
GPIO_S0_SC[065]	Legacy	1b	PMC_CORE_PWROK de-asserted	Security Flash Descriptors 0 = Override 1 = Normal Operation
DDI0_DDCDATA	Display	0b	PMC_CORE_PWROK de-asserted	DDI0 Detect 0 = DDI0 not detected 1 = DDI0 detected
DDI1_DDCDATA	Display	0b	PMC_CORE_PWROK de-asserted	DDI1 Detect 0 = DDI1 not detected 1 = DDI1 detected

2.30 Configurable IO: GPIO Muxing

Not all interfaces may be active at the same time. To provide flexibility, some interfaces are muxed with configurable IO balls. An interface's signal is selected by a function number. See Section 10.3, "Ball Name and Function by Location" on page 214 for details of which balls are muxed, and what functions are available by ball.

Note: Configurable IO defaults to function 0 at boot. All configurable IO with GPIO's for function 0 default to input at boot.

2.31 Reserved Pins

Reserved pins are non functional pins. Unless otherwise specified in this document or related collateral, reserved pins should not be connected to anything. RSVD_GND pins must be connect to the common ground plane (VSS), but don't provide a return path for currents.

§

3 Register Access Methods

There are six different common register access methods:

- Fixed IO Register Access
- Fixed Memory Mapped Register Access
- IO Referenced Register Access
- Memory Referenced Register Access
- PCI Configuration Register Access (Indirect - via Memory or IO registers)
- Message Bus Register Access (Indirect - via PCI Configuration Registers)

3.1 Fixed IO Register Access

Fixed IO registers are accessed by specifying their 16-bit address in a PORT IN and/or PORT OUT transaction from the CPU core. This allows direct manipulation of the registers. Fixed IO registers are unmovable register in IO space.

Table 32. Fixed IO Register Access Method Example (P80 Register)

Type: I/O Register (Size: 32 bits)	**P80:** 80h

3.2 Fixed Memory Mapped Register Access

Fixed Memory Mapped IO (MMIO) registers are accessed by specifying their 32/36-bit address in a memory transaction from the CPU core. This allows direct manipulation of the registers. Fixed MMIO registers are unmovable registers in memory space.

Table 33. Fixed Memory Mapped Register Access Method Example (IDX Register)

Type: Memory Mapped I/O Register (Size: 32 bits)	**IDX:** FEC00000h

3.3 IO Referenced Register Access

IO referenced registers use programmable base address registers (BARs) to select a range of IO addresses that it will use to decode PORT IN and/or PORT OUT transactions from the CPU to directly access a register. Thus, the IO BARs act as pointers to blocks of actual IO registers. To access an IO referenced register for a specific IO base address, start with that base address and add the register's offset. Example pseudo code for an IO referenced register read is shown below:

```
Register_Snapshot = IOREAD([IO_BAR]+Register_Offset)
```

Base address registers are often located in the PCI configuration space and are programmable by the BIOS/OS. Other base address register types may include fixed memory registers, fixed IO registers or message bus registers.

Table 34. Referenced IO Register Access Method Example (HSTS Register)

Type: I/O Register (Size: 8bits)	**HSTS:** [_IOBAR] + 0h **_IOBAR Type:** PCI Configuration Register (Size: 32 bits) **_IOBAR Reference:** [B:0, D:31, F:3] + 20h

3.4 Memory Referenced Register Access

The SoC uses programmable base address registers (BARs) to set a range of physical address (memory) locations that it will use to decode memory reads and writes from the CPU to directly access a register. These BARs act as pointers to blocks of actual memory mapped IO (MMIO) registers. To access a memory referenced register for a specific base address, start with that base address and add the register's offset. Example pseudo code for a read is shown below:

```
Register_Snapshot = MEMREAD([Mem_BAR]+Register_Offset)
```

Base address registers are often located in the PCI configuration space and are programmable by the BIOS/OS. Other common base address register types include fixed memory registers and IO registers that point to MMIO register blocks.

Table 35. Memory Mapped Register Access Method Example (_MBAR Register)

Type: Memory Mapped I/O Register (Size: 8bits)	**HSTS:** [_MBAR] + 0h **_MBAR Type:** PCI Configuration Register (Size: 32 bits) **_MBAR Reference:** [B:0, D:31, F:3] + 10h

3.5 PCI Configuration Register Access

Access to PCI configuration space registers is performed through one of two different configuration access methods (CAMs):

- IO indexed - PCI CAM
- Memory mapped - PCI Enhanced CAM (ECAM)

Each PCI function has a standard PCI header consisting of 256 bytes for the IO access scheme (CAM), or 4096 bytes for the enhanced memory access method (ECAM). Invalid read accesses return binary strings of 1s.

Table 36. PCI Register Access Method Example (VID Register)

Type: PCI Configuration Register (Size: 16bits)	**VID:** [B:0, D:31, F:3] + 0h

3.5.1 PCI Configuration Access - CAM: IO Indexed Scheme

Accesses to configuration space using the IO method relies on two 32-bit IO registers:

- **CONFIG_ADDRESS** - IO Port CF8h
- **CONFIG_DATA** - IO Port CFCh

These two registers are both 32-bit registers in IO space. Using this indirect access mode, software uses CONFIG_ADDRESS (CF8h) as an index register, indicating which configuration space register to access, and CONFIG_DATA (CFCh) acts as a window to the register pointed to in CONFIG_ADDRESS. Accesses to CONFIG_ADDRESS (CF8h) are internally captured. Upon a read or write access to CONFIG_DATA (CFCh), configuration cycles will be generated to the PCI function specified by the address captured in CONFIG_ADDRESS. The format of the address is shown below.

Table 37. PCI CONFIG_ADDRESS Register (IO PORT CF8h) Mapping

Field	CONFIG_ADDRESS Bits
Enable PCI Config. Space Mapping	31
Reserved	30:24
Bus Number	23:16
Device Number	15:11
Function Number	10:08
Register/Offset Number	07:02

Note: Bit 31 of CONFIG_ADDRESS must be set for a configuration cycle to be generated.

Pseudo code for a PCI register read is shown below:

- MyCfgAddr[23:16] = bus; MyCfgAddr[15:11] = device; MyCfgAddr[10:8] = funct;
- MyCfgAddr[7:2] = dWordMask(offset); MyCfgAddr[31] = 1;
- IOWRITE(0xCF8, MyCfgAddr)
- Register_Snapshot = IOREAD(0xCFC)

3.5.2 PCI Configuration Access - ECAM: Memory Mapped Scheme

A flat, 256 MiB memory space may also be allocated to perform configuration transactions. This is enabled through the BUNIT.BECREG message bus register (Port: 3h, Register: 27h) found in the SoC Transaction Router. BUNIT.BECREG allows remapping this 256 MiB region anywhere in physical memory space. Memory accesses within the programmed MMIO range result in configuration cycles to the appropriate PCI devices specified by the memory address as shown below.

Table 38. PCI Configuration Memory Bar Mapping

ECAM Memory Address Field	ECAM Memory Address Bits
Use from BAR: BUNIT.BECREG[31:28]	31:28
Bus Number	27:20
Device Number	19:15
Function Number	14:12
Register Number	11:02

Note: ECAM accesses are only possible when BUNIT.BECREG.ECENABLE (bit 0) is set.

Pseudo code for an enhanced PCI configuration register read is shown below:

- MyCfgAddr[27:20] = bus; MyCfgAddr[19:15] = device; MyCfgAddr[14:12] = funct;
- MyCfgAddr[11:2] = dw_offset; MyCfgAddr[31:28] = BECREG[31:28];
- Register_Snapshot = MEMREAD(MyCfgAddr)

3.6 Message Bus Register Access

Accesses to the message bus space is through the SoC Transaction Router's PCI configuration registers. This unit relies on three 32-bit PCI configuration registers to generate messages:

- Message Bus Control Register (MCR) - PCI[B:0,D:0,F:0] + D0h
- Message Data Register (MDR) - PCI[B:0,D:0,F:0] + D4h
- Message Control Register eXtension (MCRX) - PCI[B:0,D:0,F:0] + D8h

This indirect access mode is similar to PCI CAM. Software uses the MCR/MCRX as an index register, indicating which message bus space register to access (MCRX only when required), and MDR as the data register. Writes to the MCR trigger message bus transactions.

Writes to MCRX and MDR will be captured. Writes to MCR will generate an internal 'message bus' transaction with the opcode and target (port, offset, bytes) specified in the MCR and the captured MCRX. When a write opcode is specified in MCR, the data that was captured by MDR is used for the write. When a data read opcode is specified in MCR, the data will be available in the MDR register after the MCR write completes (non-posted). The format of MCR and MCRX are shown below.

Table 39. MCR Description (Sheet 1 of 2)

Field	MBPR Bits
OpCode (typically 10h for read, 11h for write)	31:24

Table 39. MCR Description (Sheet 2 of 2)

Field	MBPR Bits
Port	23:16
Offset/Register	15:08
Byte Enable	07:04

Table 40. MCRX Description

Field	MBPER Bits
Offset/Register Extension. This is used for messages sent to end points that require more than 8 bits for the offset/register. These bits are a direct extension of MCR[15:8].	31:08

Most message bus registers are located in the SoC Transaction Router. The default opcode messages for those registers are as follows:

- Message 'Read Register' Opcode: 06h
- Message 'Write Register' Opcode: 07h

Registers with different opcodes will be specified as applicable. Pseudo code of a message bus register read is shown below (where ReadOp==0x06):

- MyMCR[31:24] = ReadOp; MyMCR[23:16] = port; MyMCR[15:8] = offset;
- MyMCR[7:4] = 0xf
- PCIWRITE(0, 0, 0, 0xD0, MyMCR)
- Register_Snapshot = PCIREAD(0, 0, 0, 0xD4)

3.7 Register Field Access Types

Table 41. Register Access Types and Definitions (Sheet 1 of 2)

Access Type	Meaning	Description
RO	Read Only	In some cases, if a register is read only, writes to this register location have no effect. However, in other cases, two separate registers are located at the same location where a read accesses one of the registers and a write accesses the other register. See the I/O and memory map tables for details.
WO	Write Only	In some cases, if a register is write only, reads to this register location have no effect. However, in other cases, two separate registers are located at the same location where a read accesses one of the registers and a write accesses the other register. See the I/O and memory map tables for details.
R/W	Read/Write	A register with this attribute can be read and written.

Table 41. Register Access Types and Definitions (Sheet 2 of 2)

Access Type	Meaning	Description
R/WC	Read/Write Clear	A register bit with this attribute can be read and written. However, a write of 1 clears (sets to 0) the corresponding bit and a write of 0 has no effect.
R/WO	Read/Write-Once	A register bit with this attribute can be written only once after power up. After the first write, the bit becomes read only.
R/WLO	Read/Write, Lock-Once	A register bit with this attribute can be written to the non-locked value multiple times, but to the locked value only once. After the locked value has been written, the bit becomes read only.
Default	Default	When the processor is reset, it sets its registers to predetermined default states. The default state represents the minimum functionality feature set required to successfully bring up the system. Hence, it does not represent the optimal system configuration. It is the responsibility of the system initialization software to determine configuration, operating parameters, and optional system features that are applicable, and to program the processor registers accordingly.

§

4 Mapping Address Spaces

The SoC supports four different address spaces:

- Physical Address Space Mappings
- IO Address Space
- PCI Configuration Space
- Message Bus Space

The CPU core can only directly access *memory space* through memory reads and writes and *IO space* through the IN and OUT IO port instructions. *PCI configuration space* is indirectly accessed through IO or memory space, and the *Message Bus space* is accessed through PCI configuration space. See Chapter 3, "Register Access Methods" for details.

This chapter describes how the memory, IO, PCI and Message Bus spaces are mapped to interfaces in the SoC.

Note: See Chapter 13, "SoC Transaction Router" for registers specified in the chapter.

4.1 Physical Address Space Mappings

There are 64 GB (36-bits) of physical address space that can be used as:

- Memory Mapped IO (MMIO - IO fabric)
- Physical Memory (DRAM)

The CPU core can access the full physical address space, while downstream devices can only access SoC DRAM, and each CPU core's local APIC. Peer to peer transactions are not supported.

Most devices map their registers and memory to the physical address space. This chapter summarizes the possible mappings.

4.1.1 SoC Transaction Router Memory Map

The SoC Transaction Router maps the physical address space as follows:

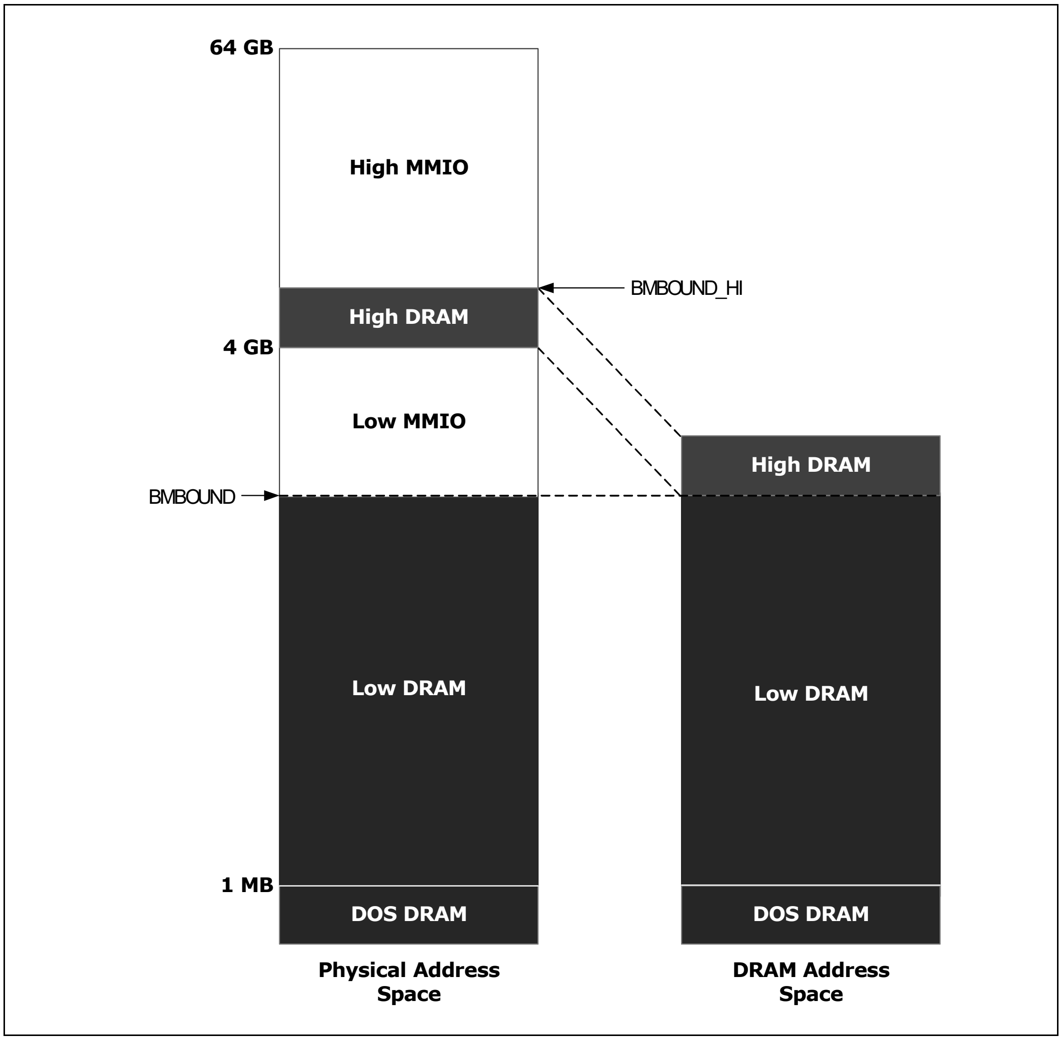
- CPU core to DRAM
- CPU core to IO fabric (MMIO)
- CPU core to extended PCI registers (ECAM accesses)
- IO fabric to CPU cores (local APIC interrupts)

Although 64 GB (36-bits) of physical address space is accessible, some MMIO must exist for devices and software with 32-bit limits. Further, all DRAM should remain accessible for devices and software with access to memory above 4 GB. These goals are accomplished by moving a section DRAM to start at the fixed 4 GB boundary, leaving a hole below 4 GB for MMIO. This creates the following distinct memory regions:

- DOS DRAM + Low DRAM
- Low MMIO
- High DRAM
- High MMIO

There are two registers used to create these regions, BMBOUND and BMBOUND_HI. Their use is shown in Figure 4.

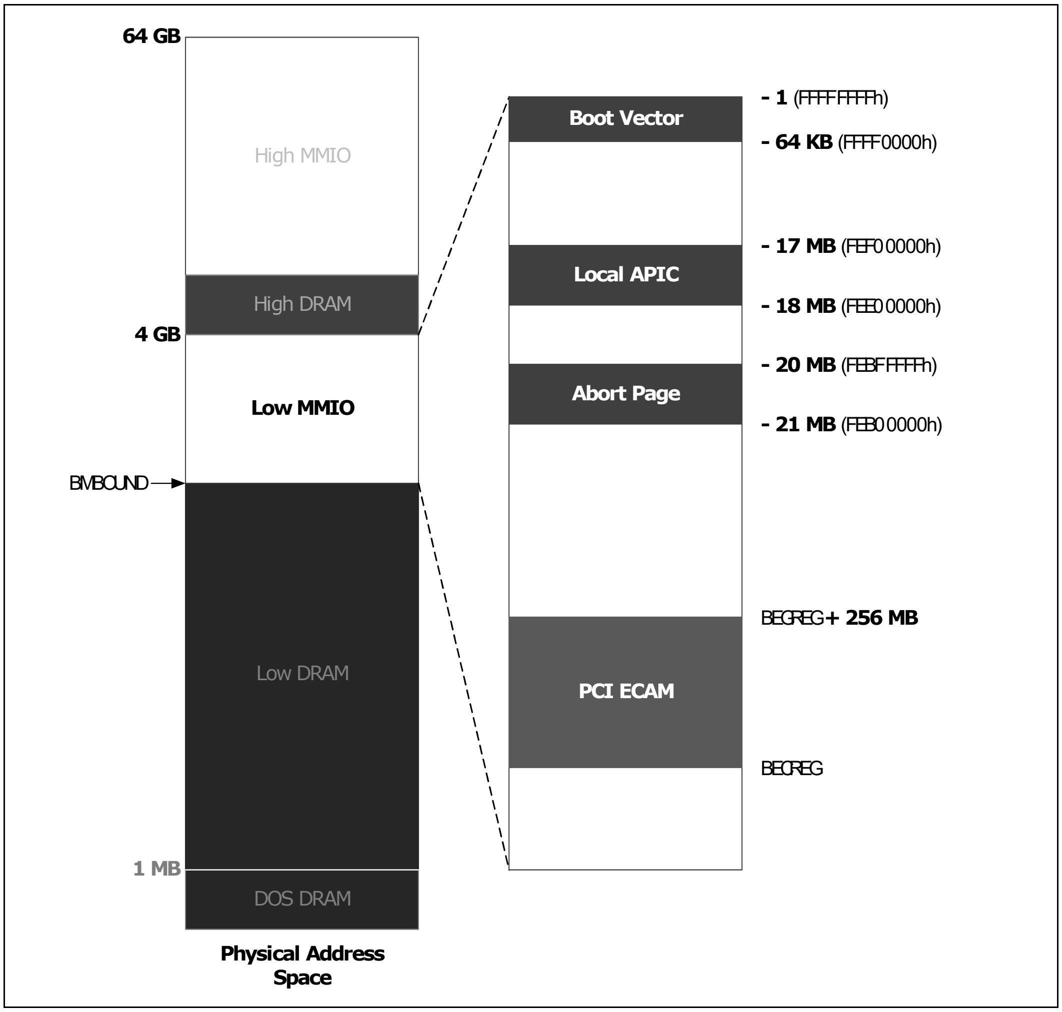
Figure 4. Physical Address Space - DRAM & MMIO



4.1.1.1 Low MMIO

The low MMIO mappings are shown in Figure 5.

Figure 5. Physical Address Space - Low MMIO



By default, CPU core reads targeting the **Boot Vector** range (FFFFFFFFh-FFFF0000h) are sent to the boot Flash connected to the Platform Controller Unit, and write accesses target DRAM. This allows the boot strap CPU core to fetch boot code from the boot Flash, and then shadow that code to DRAM.

Upstream writes from the IO fabric to the **Local APIC** range (FEE00000h-FEF00000h) are sent to the appropriate CPU core's APIC.

Write accesses from a CPU core to the **Abort Page** range (FEB00000h-FEBFFFFFh) will be dropped, and reads will always return all 1's in binary.

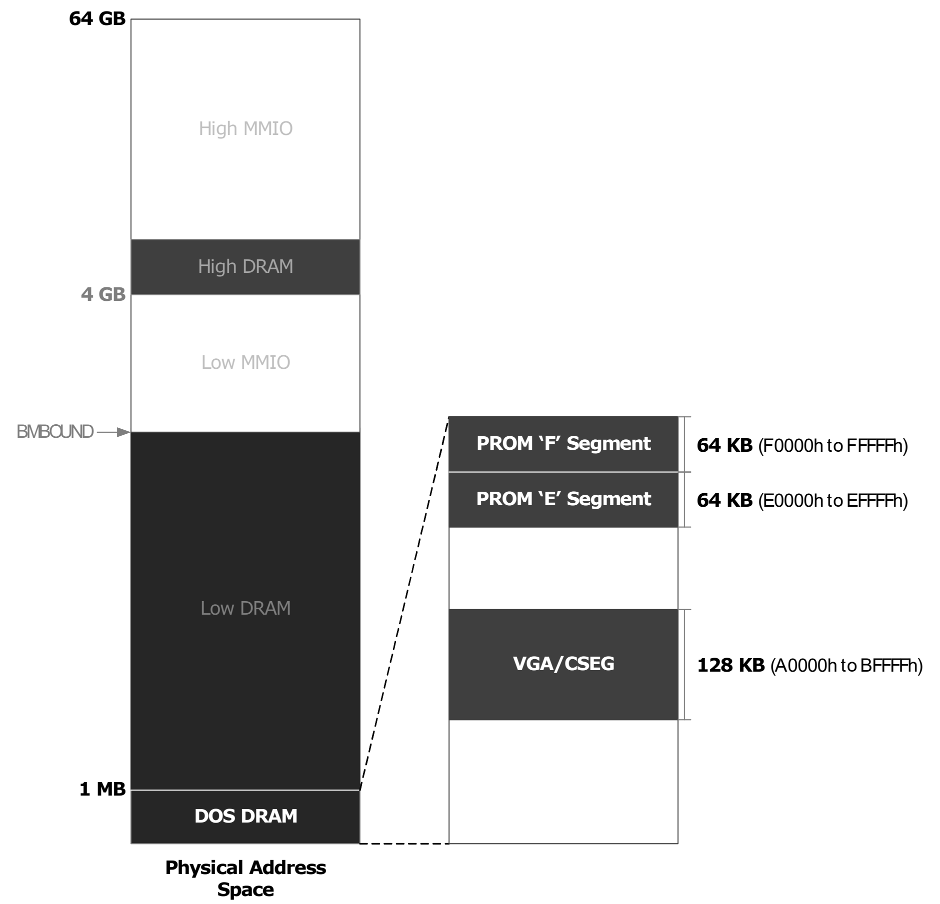
Accesses in the 256 MB **PCI ECAM** range starting at BECREG generate enhanced PCI configuration register accesses when enabled (BECREG.ECENABLE). Unlike traditional memory writes, writes to this range are non-posted when enabled. See Chapter 3, "Register Access Methods" for more details.

All other downstream accesses in the Low MMIO range are sent to the IO Fabric for further decode based on PCI resource allocations. The IO Fabric's subtractive agent (for unclaimed accesses) is the Platform Controller Hub.

4.1.1.2 DOS DRAM

The DOS DRAM is the memory space below 1 MB. In general, accesses from a processor targeting DOS DRAM target system DRAM. Exceptions are shown in the below figure.

Figure 6. Physical Address Space - DOS DRAM



Processor writes to the 64 KB (each) **PROM 'E'** and **'F'** segments (E0000h-EFFFFh and F0000h-FFFFFh) always target DRAM. The BMISC register is used to direct CPU core reads in these two segments to DRAM or the IO fabric (MMIO).

CPU core accesses to the 128 KB **VGA/CSEG** range (A0000h-BFFFFh) can target DRAM or the IO fabric (MMIO). The target is selected with the BMISC.ABSEGINDRAM register.

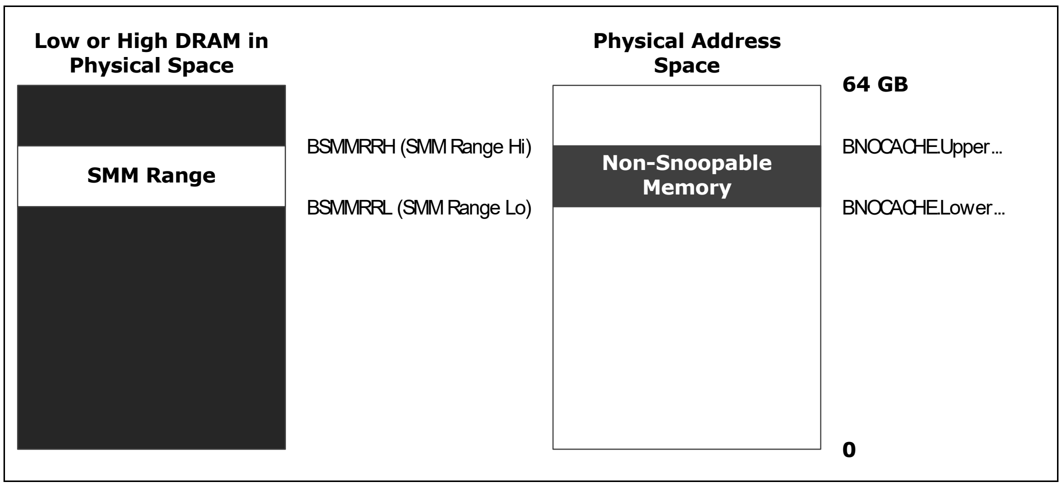
4.1.1.3 Additional Mappings

There are two additional mappings available in the SoC Transaction Router:

- SMM range
- Non-snoop range

Figure 7 shows these mappings.

Figure 7. Physical Address Space - SMM and Non-Snoop Mappings



SMI handlers running on a CPU core execute out of SMM memory. To protect this memory from non-CPU core access, the **SMM Range** (BSMMRRL-BSMMRRH) may be programmed anywhere in low or high DRAM space (1 MB aligned). This range will only allow accesses from the CPU cores.

To prevent snoops of the CPU cores when DMA devices access a specific memory region, the **Non-Snoopable Memory range** (BNOCACHE.Lower-BNOCACHE.Upper) can be programmed anywhere in physical address space. This range is enabled via the BNOCACHECTL register's enable bit (BNOCACHECTL.Enable).

4.1.2 IO Fabric (MMIO) Map

Memory accesses targeting MMIO are routed by the IO fabric to programmed PCI ranges, or routed to the PCU by default (subtractive agent). Programmed PCI ranges can be moved within low or high MMIO, and most can be disabled.

Note: Not all devices can be mapped to high MMIO.

Fixed MMIO is claimed by the Platform Controller Unit (PCU). The default regions are listed below. Movable ranges are not shown. See the register maps of all PCU devices for details.

Table 42. Fixed Memory Ranges in the Platform Controller Unit (PCU)

Device	Start Address	End Address	Comments
Low BIOS (Flash Boot)	000E0000h	000FFFFFh	Starts 128 KB below 1 MB; Firmware/ BIOS
IO APIC	FEC00000h	FEC00040h	Starts 20 MB below 4 GB
HPET	FED40000h	FED003FFh	Starts 19 MB below 4 GB
TPM (LPC)	FED40000h	FED40FFFh	Starts 16 KB above HPET range
High BIOS/Boot Vector	FFFF0000h	FFFFFFFFh	Starts 64 KB below 4 GB; Firmware/ BIOS

The following PCI devices may claim memory resources in MMIO space:

- Graphics/Display (High MMIO capable)
- PCI Express* (High MMIO capable)
- SATA
- SD/MMC/SDIO
- SIO
- HD Audio
- Platform Controller Unit (PCU) (Multiple BARs)
- xHCI USB
- EHCI USB
- USB Device
- LPE/I^2S
- ISP/MIPI-CSI

See each device's interface chapter for details.

Warning: Variable memory ranges should not be set to conflict with other memory ranges. There will be unpredictable results if the configuration software allows conflicts to occur. Hardware does not check for conflicts.

4.2 IO Address Space

There are 64 KB + 3 bytes of IO space (0h-10002h) for accessing IO registers. Most IO registers exists for legacy functions in the PCU or for PCI devices, while some are claimed by the SoC Transaction Router for graphics and for the PCI configuration space access registers.

4.2.1 SoC Transaction Router IO Map

The SoC claims IO transactions for VGA/Extended VGA found in the display/graphics interface. It also claims the two 32-bit registers at port CF8h and CFCh used to access PCI configuration space.

4.2.2 IO Fabric IO Map

4.2.2.1 PCU Fixed IO Address Ranges

Below table shows the fixed IO space ranges seen by a processor.

Table 43. Fixed IO Ranges in the Platform Controller Unit (PCU)

Device	IO Address	Comments
8259 Master	20h-21h, 24h-25h, 28h-29h, 2Ch-2Dh, 30h-31h, 34h-35h, 38h-39-, 3Ch-3Dh	
8254s	40h-43h, 50h-53h	
PS2 Control	60h, 64h	
NMI Controller	61h, 63h, 65h, 67h	
RTC	70h-77h	
Port 80h	80h-83h	
Init Register	92h	
8259 Slave	A0h-A1h, A4h-A5h, A8h-A9h, ACh-ADh, B0h-B1h, B4h-B5h, B8h-B9h, BCh-BDh, 4D0h-4D1h	
PCU UART	3F8h-3FFh	
Reset Control	CF9h	Overlaps PCI IO registers
Active Power Management	B2h-B3h	

Table 44. Fixed IO Ranges in the SoC Transaction Router, Serial ATA and PCIe* Blocks

Device	IO Address	Comments
SATA Legacy IDE Mode - Secondary Channel Legacy Taskfile Command Block	170h - 177h	
SATA Legacy IDE Mode - Primary Channel Legacy Taskfile Command Block	1F0h - 1F7h	
SATA Legacy IDE Mode - Secondary Channel Legacy Taskfile Control Block	374h - 377h	
SATA Legacy IDE Mode - Primary Channel Legacy Taskfile Control Block	3F4h - 3F7h	
PCI Express*: VGA Legacy Control & Status	3B0h - 3BBh, 3C0h - 3DFh	Only active if `INTR_BCTRL.VE=1b`
PCI Configuration Access Address	CF8h	
PCI Configuration Access Data	CFCh	

4.2.2.2 Variable IO Address Ranges

Table 45 shows the variable IO decode ranges. They are set using base address registers (BARs) or other similar means. Plug-and-play (PnP) software (PCI/ACPI) can use their configuration mechanisms to set and adjust these values.

Warning: The variable IO ranges should not be set to conflict with other IO ranges. There will be unpredictable results if the configuration software allows conflicts to occur. Hardware does not check for conflicts.

Table 45. Movable IO Ranges Decoded by PCI Devices on the IO Fabric (Sheet 1 of 2)

Device	Size (bytes)	Target
ACPI Power Management (PCU)	128	ACPI_BASE_ADDR (PM1BLK): PCI[B:0,D:31,F:0] + 40h
SMBus (PCU)	32	SMBA: PCI[B:0,D:31,F:3] + 20h
GPIO (PCU)	256	GBA: PCI[B:0,D:31,F:0] + 48h
RCBA (PCU)	1024	RCRB_BA: PCI[B:0,D:31,F:0] + F0h
Display Controller	8	IOBAR (PCI[B:0,D2,F:0] + 20h)
PCI Express: ISA Legacy	Variable[1]	IOBL_SSTS.IOBA (PCI[B:0,D28,F:0] + 1Ch)
SATA Native & AHCI Mode - Legacy IDE / AHCI Index Data Pair	32	LBAR (PCI[B:0,D19,F:0] + 20h)
SATA Native Mode - Serial ATA Index Data Pair	16	SIDPBA (PCI[B:0,D19,F:0] + 24h)
SATA Native Mode - Primary Command Block	8	PCMDBA (PCI[B:0,D19,F:0] + 10h)

Table 45. Movable IO Ranges Decoded by PCI Devices on the IO Fabric (Sheet 2 of 2)

Device	Size (bytes)	Target
SATA Native Mode - Secondary Command Block	8	SCMDBA (PCI[B:0,D19,F:0] + 18h)
SATA Native Mode - Primary Control Block	4	PCTLBA (PCI[B:0,D19,F:0] + 14h
SATA Native Mode - Secondary Control Block	4	SCTLBA (PCI[B:0,D19,F:0] + 1Ch)

NOTES 1: Size is defined by the configuration of `IOBL_SSTS.IOLA`

4.3 PCI Configuration Space

All PCI devices/functions are shown below. Table below will always take priority.

Table 46. PCI Devices and Functions (Sheet 1 of 2)

Bus	Device	Function	Device ID	Device Description	Function Description
0	0	0	0F00h	SoC Transaction Router	
0	2	0	0F31h	Graphics & Display	
0	3	0	0F38h	Camera Image Signal Processor	
0	16	0	0F14h	Storage Control Cluster (SCC)	eMMC Port (de-featured - use Device 23 instead)
0	17	0	0F15h		SDIO Port
0	18	0	0F16h		SD Port
0	19	0	0F20h (IDE) 0F21h (IDE) 0F22h (AHCI) 0F23h (AHCI)	SATA	
0	20	0	0F35h	xHCI USB	
0	21	0	0F28h	Low Power Engine Audio	Host Bridge + three I^{2}S Ports (0-2)
0	22	0	0F37h	USB Device	
0	23	0	0F50h	Storage Control Cluster (SCC)	eMMC 4.5 Port
0	24	0	0F40h	Serial IO (SIO)	DMA
		1	0F41h		I^{2}C Port 1
		2	0F42h		I^{2}C Port 2
		3	0F43h		I^{2}C Port 3
		4	0F44h		I^{2}C Port 4
		5	0F45h		I^{2}C Port 5
		6	0F46h		I^{2}C Port 6
		7	0F47h		I^{2}C Port 7
0	26	0	0F18h	Trusted Execution Engine	

Table 46. PCI Devices and Functions (Sheet 2 of 2)

Bus	Device	Function	Device ID	Device Description	Function Description
0	27	0	0F04h	HD Audio	
0	28	0	0F48h	PCI Express*	Root Port 1
		1	0F4Ah		Root Port 2
		2	0F4Ch		Root Port 3
		3	0F4Eh		Root Port 4
0	29	0	0F34h	EHCI USB	
0	30	0	0F06h	Serial IO (SIO)	DMA
		1	0F08h		PWM Port 1
		2	0F09h		PWM Port 2
		3	0F0Ah		HSUART Port 1
		4	0F0Ch		HSUART Port 2
		5	0F0Eh		SPI Port
0	31	0	0F1Ch	Platform Controller Unit	LPC: Bridge to Intel Legacy Block
0	31	3	0F12h	Platform Controller Unit	SMBus Port

5 Integrated Clock

Clocks are integrated, consisting of multiple variable frequency clock domains, across different voltage domains. This architecture achieves a low power clocking solution that supports the various clocking requirements of the SoC’s many interfaces.

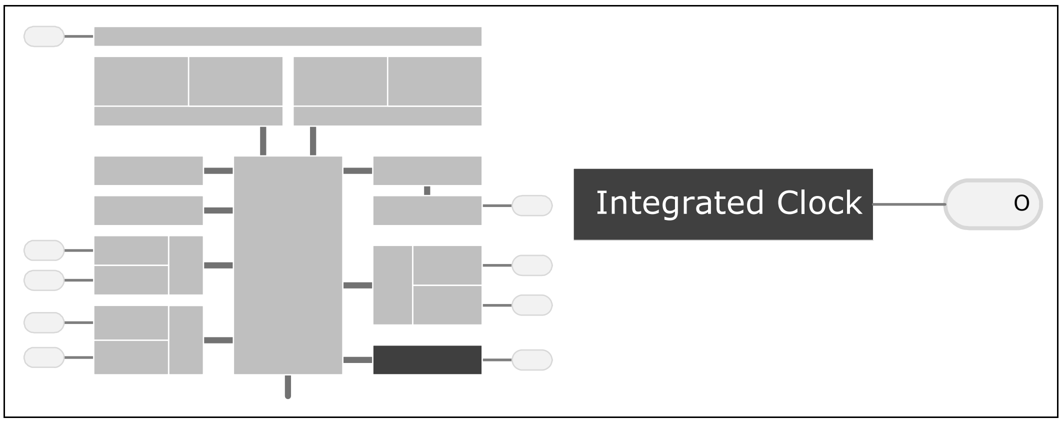

Figure 9. Clocking Example

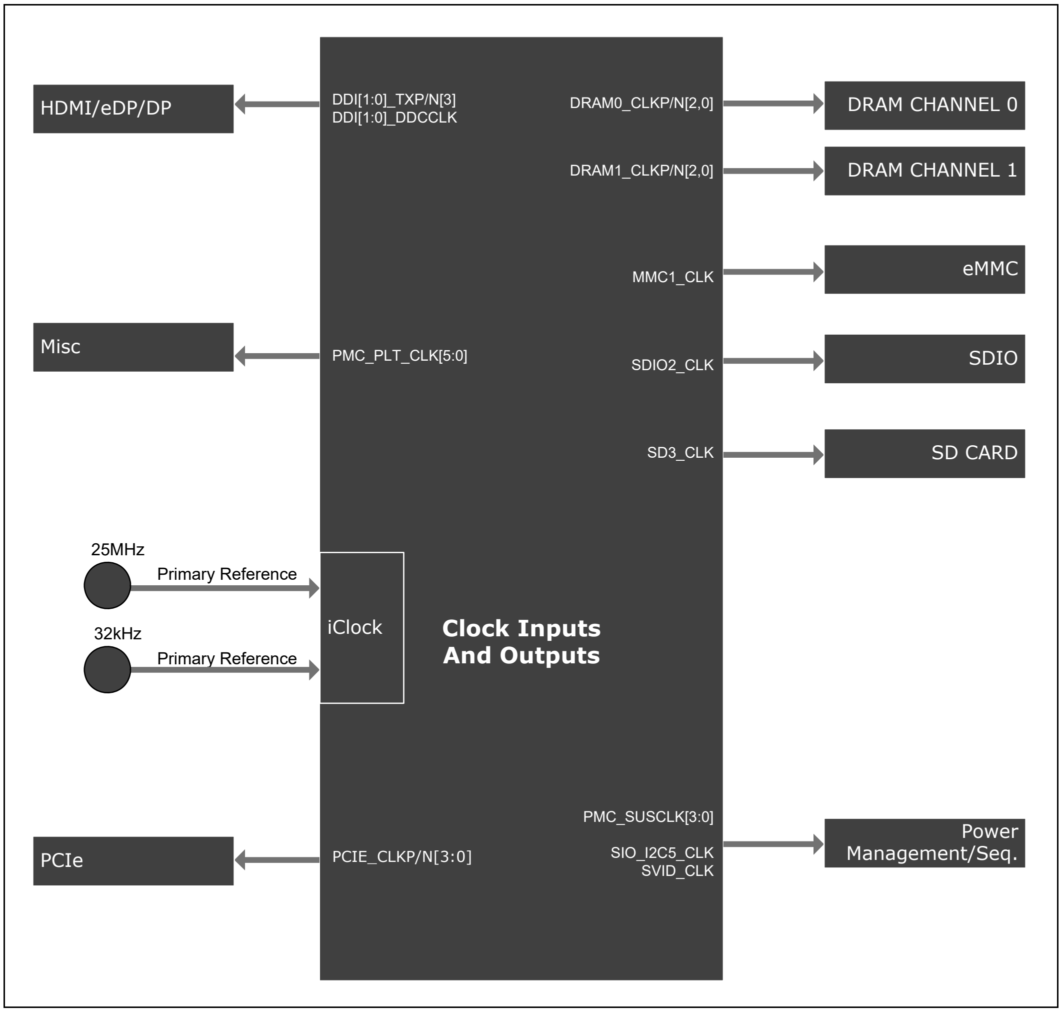


5.1 Features

Platform clocking is provided internally by the Integrated Clock logic. No external clock chips are required for the SoC to function. All the required platform clocks are provided by two crystal inputs: a 25 MHz primary reference for the integrated clock block and a 32.768 kHz reference for the Real Time Clock (RTC) block.

The different inputs and outputs are listed below.

Table 47. SoC Clock Inputs

Clock Domain	Signal Name	Frequency	Usage/Description
Main	ICLK_OSCIN ICLK_OSCOUT	25 MHz	Reference crystal for the iCLK PLL
RTC	ILB_RTC_X1 ILB_RTC_X2	32.768 kHz	RTC crystal I/O for RTC block
MIPI CSI	MCSI1_CLKP/N MCSI2_CLKP/N MCSI3_CLKP/N	80-500 MHz	Clocks for cameras
LPC	ILB_LPC_CLK[1]	33 MHz	Can be configured as an input to compensate for board routing delays through Soft Strap.
USB PHY	USB_ULPI_CLK	60 MHz	Interface clock from ULPI PHY.

Table 48. SoC Clock Outputs (Sheet 1 of 2)

Clock Domain	Signal Name	Frequency	Usage/Description
Memory	DRAM0_CKP/N[2,0] DRAM1_CKP/N[2,0]	533/667 MHz	Drives the Memory ranks 0-1. Data rate (MT/s) is 2x the clock rate. Note: The frequency is fused in each SoC. It is not possible to support both frequencies on one SoC.
eMMC	MMC1_CLK MMC1_45_CLK	25-50 MHz 25-200 MHz	Clock for eMMC 4.41 devices Clock for eMMC 4.51 devices Actual clock can run as low as 400 kHz during initialization.
SDIO	SD2_CLK	25-50 MHz	Clock for SDIO devices
SD Card	SD3_CLK	25-50 MHz	Clock for SD card devices
SPI	PCU_SPI_CLK	20 MHz, 33 MHz, 50 MHz	Clock for SPI flash
PMIC/COMMS	PMC_SUSCLK[3:0]	32.768 kHz	Pass through clock from RTC oscillator
LPC	ILB_LPC_CLK[0:1]	33 MHz	Provided to devices requiring LPC clock
HDA	HDA_CLK	24 MHz	Serial clock for external HDA codec device
PCI Express	PCIE_CLKN[3:0] PCIE_CLKP[3:0]	100 MHz	Differential Clocks supplied to external PCI express devices based on assertion of PCIE_CLKREQ[3:0]# inputs
USB PHY	USB_ULPI_REFCLK	19.2 MHz	Clock for USB devices
HDMI	DDI[1:0]_TXP/N[3]	25-148.5 MHz	Differential clock for HDMI devices
HDMI DDC	DDI[1:0]_DDCCLK	100 kHz	Clock for HDMI DDC devices

Table 48. SoC Clock Outputs (Sheet 2 of 2)

Clock Domain	Signal Name	Frequency	Usage/Description
VGA DDC	VGA_DDCCLK	100 kHz	Clock for VGA DDC devices
SVID	SVID_CLK	25 MHz	Clock used by voltage regulator
I^2S	LPE_I2S[2:0]_CLK	12.5 MHz	Continuous serial clock for I^2S interfaces
Platform Clocks	PMC_PLT_CLK [5:0]	25 MHz	Platform clocks. For example: PLT_CLK [2:0] - Camera PLT_CLK [3] - Audio Codec PLT_CLK [4] - PLT_CLK [5] - COMMs
SIO SPI	SIO_SPI_CLK	15 MHz	SPI clock output
I^2C	SIO_I2C[6:0]_CLK	100 kHz, 400 kHz, 1 MHz, 3.4 MHz	I^2C clocks Note: In I2C Controller the parameter called IC_CAP_LOADING can be set to 400pf/100pf. As per specification 3.4MHz is supported in 100pf loading while 1.7MHz is the max frequency at 400pf load.
SMBus	PCU_SMB_CLK	10 kHz - 100 kHz	Drives SMBus device

§

6 Power Management

This chapter provides information on the following power management topics:

- ACPI States
- Processor Core
- PCI Express
- Integrated Graphics Controller

6.1 Power Management Features

- ACPI System States support (S0, S3, S4, S5)
- Processor Core/ States support (C0 – C6)
- Processor Package States Support (C0-C7)
- SoC Graphics Adapter States support D0 – D3.
- Support Link Power Management (LPM)
- Thermal throttling
- Dynamic I/O power reductions (disabling sense amps on input buffers, tri-stating output buffers)
- Active power down of Display links

6.2 Power Management States Supported

The Power Management states supported by the processor are described in this section.

6.2.1 S-State Definition

6.2.1.1 S0 - Full On

This is the normal operating state of the processor. In S0, the core processor will transition in and out of the various processor C-States and P-States.

6.2.1.2 S3 - Suspend to RAM (Standby)

S3 is a suspend state in which the core power planes of the processor are turned off and the suspend wells remain powered.

- All power wells are disabled, except for the suspend and RTC wells.
- The core processor’s macro-state is saved in memory.

- Memory is held in self-refresh and the memory interface is disabled, except the CKE pin as it is powered from the memory voltage rail. CKE is driven low.

6.2.1.3 S4 - Suspend to Disk (Hibernate)

S4 is a suspend state in which most power planes of the processor are turned off, except for the suspend and RTC well. In this ACPI state, system context is saved to the hard disk.

Key features:

- No activity is allowed.
- All power wells are disabled, except for the suspend and RTC well.

6.2.1.4 S5 - Soft Off

From a hardware perspective the S5 state is identical to the S4 state. The difference is purely software; software does not write system context to hard disk when entering S5.

The following table shows the differences in the sleeping states with regards to the processor's output signals.

Table 49. SoC Sx-States to SLP_S*#

State	S0	S3	S4	S5	Reset w/o Power Cycle	Reset w/ Power Cycle
CPU Executing	In C0	OFF	OFF	OFF	No	OFF
PMC_SLP_S3#	HIGH	LOW	LOW	LOW	HIGH	LOW
PMC_SLP_S4#	HIGH	HIGH	LOW	LOW	HIGH	LOW
S0 Power Rails	ON	OFF	OFF	OFF	ON	OFF
PMC_PLTRST#	HIGH	LOW	LOW	LOW	LOW	LOW
PMC_SUS_STAT#	HIGH	LOW	LOW	LOW	HIGH	LOW
PCIe Links	L0, L1	L3	L3	L3	L3 Ready	L3

NOTES: The processor treats S4 and S5 requests the same. The processor does not have PMC_SLP_S5#. PMC_SUS_STAT# is required to drive low (asserted) even if core well is left on because PMC_SUS_STAT# also warns of upcoming reset.

6.2.2 System States

Table 50. General Power States for System

States/Sub-states	Legacy Name / Description
G0/S0/C0	**FULL ON:** CPU operating. Individual devices may be shut down to save power. The different CPU operating levels are defined by Cx states.
G0/S0/Cx	**Cx State:** CPU manages C-state itself.
G1/S3	**Suspend-To-RAM(STR):** The system context is maintained in system DRAM, but power is shut to non-critical circuits. Memory is retained, and refreshes continue. All external clocks are shut off; RTC clock and internal ring oscillator clocks are still toggling.
G1/S4	**Suspend-To-Disk (STD):** The context of the system is maintained on the disk. All of the power is shut down except power for the logic to resume. The S4 and S5 states are treated the same.
G2/S5	**Soft-Off:** System context is not maintained. All of the power is shut down except power for the logic to restart. A full boot is required to restart. A full boot is required when waking. The S4 and S5 states are treated the same.
SoC G3	**SoC Mechanical OFF.** System context is not maintained. All power to the SoC is shutdown except for the RTC. All of the power to the rest of the system is shut down except power for the logic to restart. No SoC “Wake” events are possible, because the SoC does not have any power. when SoC power returns, transition will depend on the state just prior to the entry to SoC G3.
G3	**Mechanical OFF.** System is not maintained. All power shutdown except for the RTC. No “Wake” events are possible, because the system does not have any power. This state occurs if the user removes the batteries, turns off a mechanical switch, or if the system power supply is at a level that is insufficient to power the “waking” logic. When system power returns, transition will depend on the state just prior to the entry to G3.

Table 51 shows the transitions rules among the various states. Note that transitions among the various states may appear to temporarily transition through intermediate states. These intermediate transitions and states are not listed in the table.

Table 51. ACPI PM State Transition Rules (Sheet 1 of 2)

Present State	Transition Trigger	Next State
G0/S0/C0	IA Code **MWAIT** or LVL Rd	C0/S0/Cx
	PM1_CNT.SLP_EN bit set	G1/Sx or G2/S5 state (specified by PM1_CNT.SLP_TYP)
	Power Button Override	G2/S5
	Mechanical Off/Power Failure	G3

Table 51. ACPI PM State Transition Rules (Sheet 2 of 2)

Present State	Transition Trigger	Next State
G0/S0/Cx	Cx break events which include: CPU snoop, MSI, Legacy Interrupt, AONT timer	G0/S0/C0
	Power Button Override	G2/S5
	System Power Failure	G3
G1/S3,G1/S4	Any Enabled Wake Event	G0/S0/C0
	Power button Override	G2/S5
	Resume Well Power Failure	G3
G2/S5	Any Enabled Wake Event	G0/S0/C0
	Resume Well Power Failure	G3
G3	Power Returns	Option to go to S0/C0 (reboot) or G2/S5 (stay off until power button pressed or other enabled wake event) or G1/S4 (if system state was S4 prior to the power failure). Some wake events are preserved through a power failure.

6.2.3 Processor States

Table 52. Processor Core/ States Support

State	Description
C0	Active mode, processor executing code
C1	AutoHALT state
C6	Deep Power Down. Prior to entering the Deep Power Down Technology (code named C6) State, The core process will flush its cache and save its core context to a special on die SRAM on a different power plane. Once Deep Power Down Technology (code named C6) sequence has completed. The core processor's voltage is completely shut off.

6.2.4 Integrated Graphics Display States

Table 53. SoC Graphics Adapter State Control

State	Description
D0	Full on, Display active
D3	Power off display

6.2.5 Integrated Memory Controller States

Table 54. Main Memory States

States	Description
Powerup	CKE asserted. Active mode.
Precharge Powerdown	CKE de-asserted (not self-refresh) with all banks closed.
Active Powerdown	CKE de-asserted (not self-refresh) with at least one bank active.
Self-Refresh	CKE de-asserted using device self-refresh

6.2.6 PCI Express* (PCIe*) States

Table 55. PCI Express* States

States	Description
L0	Full on – Active transfer state
L0s	First Active Power Management low power state – Low exit latency
L1	Lowest Active Power Management - Longer exit latency
L3	Lowest power state (power-off) – Longest exit latency

6.2.7 Interface State Combinations

Table 56. G, S and C State Combinations

Global (G) State	Sleep (S) State	Processor Core (C) State	Processor State	System Clocks	Description
G0	S0	C0	Full On	On	Full On
G0	S0	C1	Auto-Halt	On	Auto-Halt
G0	S0	C6	Deep Power Down	On	Deep Power Down
G1	S3	Power off		Off except RTC & internal ring OSC	Suspend to RAM
G1	S4	Power off		Off except RTC & internal ring OSC	Suspend to Disk
G2	S5	Power off		Off except RTC & internal ring OSC	Soft Off
G3	NA	Power Off		Power off	Hard Off

Table 57. D, S and C State Combinations

Graphics Adapter (D) State	Sleep (S) State	(C) State	Description
D0	S0	C0	Full On, Displaying
D0	S0	C1	Auto-Halt, Displaying
D0	S0	C6	Deep Sleep, Display Off
D3	S0	Any	Not Displaying
D3	S3		Not Displaying Graphics Core power off.
D3	S4		Not Displaying Suspend to disk Core power off

NOTE:S0ix is not supported for Bay Trail-M/D and Bay Trail-I.

6.3 Processor Core Power Management

While executing code, Enhanced Intel SpeedStep® Technology optimizes the processor's frequency and core voltage based on workload. Each frequency and voltage operating point is defined by ACPI as a P-state. When the processor is not executing code, it is idle. A low-power idle state is defined by ACPI as a C-state. In general, lower power C-states have longer entry and exit latencies.

6.3.1 Enhanced Intel SpeedStep® Technology

The following are the key features of Enhanced Intel SpeedStep® Technology:

- Applicable to Processor Core Voltage and Graphic Core Voltage
- Multiple frequency and voltage points for optimal performance and power efficiency. These operating points are known as P-states.
- Frequency selection is software controlled by writing to processor MSRs. The voltage is optimized based on the selected frequency:
  — If the target frequency is higher than the current frequency, Core_VCC_S3 is ramped up slowly to an optimized voltage. This voltage is signaled by the SVID signals to the voltage regulator. Once the voltage is established, the PLL locks on to the target frequency.
  — If the target frequency is lower than the current frequency, the PLL locks to the target frequency, then transitions to a lower voltage by signaling the target voltage on the SVID signals.
- The processor controls voltage ramp rates by requesting appropriate ramp rates from an external SVID controller.
- Because there is low transition latency between P-states, a significant number of transitions per second are possible.

- Thermal Monitor mode.
  — Refer to Chapter 8, "Thermal Management"

6.3.2 Dynamic Cache Sizing

Dynamic Cache Sizing allows the processor to flush and disable a programmable number of L2 cache ways upon each Deeper Sleep entry under the following condition:

- The C0 timer that tracks continuous residency in the Normal state, has not expired. This timer is cleared during the first entry into Deeper Sleep to allow consecutive Deeper Sleep entries to shrink the L2 cache as needed.
- The predefined L2 shrink threshold is triggered.

The number of L2 cache ways disabled upon each Deeper Sleep entry is configured in the BBL_CR_CTL3 MSR. The C0 timer is referenced through the CLOCK_CORE_CST_CONTROL_STT MSR. The shrink threshold under which the L2 cache size is reduced is configured in the PMG_CST_CONFIG_CONTROL MSR. If the ratio is zero, then the ratio will not be taken into account for Dynamic Cache Sizing decisions. Refer to the BIOS Writer's Guide for more details.

6.3.3 Low-Power Idle States

When the processor core is idle, low-power idle states (C-states) are used to save power. More power savings actions are taken for numerically higher C-state. However, higher C-states have longer exit and entry latencies. Resolution of C-state occur at the thread, processor core, and processor core level.

6.3.3.1 Clock Control and Low-Power States

The processor core supports low power states at core level. The central power management logic ensures the entire processor core enters the new common processor core power state. For processor core power states higher than C1, this would be done by initiating a P_LVLx (P_LVL6) I/O read to all of the cores. States that require external intervention and typically map back to processor core power states. States for processor core include Normal (C0, C1).

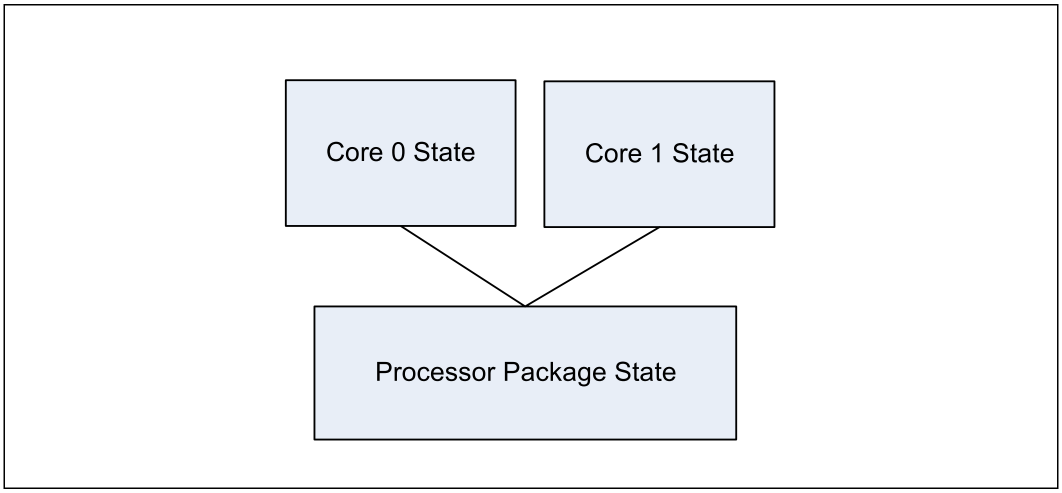
The processor core implements two software interfaces for requesting low power states: MWAIT instruction extensions with sub-state specifies and P_LVLx reads to the ACPI P_BLK register block mapped in the processor core's I/O address space. The P_LVLx I/O reads are converted to equivalent MWAIT C-state requests inside the processor core and do not directly result in I/O reads on the processor core bus. The monitor address does not need to be setup before using the P_LVLx I/O read interface. The sub-state specifications used for each P_LVLx read can be configured in a software programmable MSR by BIOS.

The Cx state ends due to a break event. Based on the break event, the processor returns the system to C0. The following are examples of such break events:

- Any unmasked interrupt goes active

- Any internal event that will cause an NMI or SMI_B
- CPU Pending Break Event (PBE_B)
- MSI

Figure 10. Idle Power Management Breakdown of the Processor Cores



6.3.4 Processor Core C-States Description

The following state descriptions assume that both threads are in common low power state.

6.3.4.1 Core C0 State

The normal operating state of a core where code is being executed.

6.3.4.2 Core C1 State

C1 is a low power state entered when a core execute a HLT or MWAIT(C1) instruction.

A System Management Interrupt (SMI) handler returns execution to either Normal state or the C1 state. See the *Intel® 64 and IA-32 Architecture Software Developer's Manual, Volume 3A/3B: System Programmer's Guide* for more information.

While a core is in C1 state, it processes bus snoops and snoops from other threads.

6.3.4.3 Core C6 State

Individual core can enter the C6 state by initiating a P_LVL3 I/O read or an MWAIT(C6) instruction. Before entering core C6, the core will save its architectural state to a dedicated SRAM. Once complete, a core will have its voltage reduced to zero volts. During exit, the core is powered on and its architectural state is restored.

There are various types of C-state:

- C6NS implies only the core should be powergated, but the L2 cache contents should be retained.
- C6FS implies the core should be powergates, and the L2 cache can be fully flushed to get even more power savings.

6.3.5 Package C-States

The processor supports package C0, C6 and C7 power states. The following is a summary of the general rules for package C-state entry. These apply to all package Cstates unless specified otherwise:

- Package C-state request is determined by the lowest numerical core C-state amongst all cores.
- A package C-state is automatically resolved by the processor depending on the core idle power states and the status of the platform components.
- Each core can be at a lower idle power state than the package if the platform does not grant the processor permission to enter a requested package C-state.
- The platform may allow additional power savings to be realized in the processor.
- For package C-states, the processor is not required to enter C0 before entering any other C-state.
- Entry in to a package C-state may be subject to auto-demotion - that is the processor may keep the package in a shallower package C-state then requested by the OS if the processor determines via heuristics that the shallower C-state results in better power/performance.

The processor exits a package C-state when a break event is detected. Depending on the type of break event, the processor does the following:

- If a core break event is received, the target core is activated and the break event message is forwarded to the target core.
    — If the break event is not masked, the target core enters the core C0 state and the processor enters package C0.
    — If the break event is masked, the processor attempts to re-enter its previous package state.
- If the break event was due to a memory access or snoop request.
    — But the platform did not request to keep the processor in a higher package C-state, the package returns to its previous C-state.
    — And the platform requests a higher power C-state, the memory access or snoop request is serviced and the package remains in the higher power C-state.

Table 58. Coordination of Module and Core Power States at the Package Level

Module C-State		Core/Module 1 C0	Core/Module 1 C1	Core/Module 1 C6NS	Core/Module 1 C6FS
Core 0	C0	C0	C0	C0	C0
	C1	C0	C0	C0	C0
	C6NS	C0	C0	C0	C6c
	C6FS	C0	C0	C6C	C6

Package C-State		Core/Module 1 C0	Core/Module 1 C6C	Core/Module 1 C6
Module 0	C0	C0	C0	C0
	C6C	C0	C6C	C6C
	C6	C0	C6C	C7

NOTE:
1. 2 Cores of the SoC will make up one module.

6.3.5.1 Package C0

The normal operating state for the processor. The processor remains in the normal state when at least one of its cores is in the C0 state or when the platform has not granted permission to the processor to go into a low power state. Individual cores may be in lower power idle states while the package is in C0.

6.3.5.2 Package C1

No additional power reduction actions are taken in the package C1 state.

The package enters the C1 low power state when:

- At least one core is in the C1 state.
- The other cores are in a C1 or lower power state.

No notification to the system occurs upon entry to C1.

6.3.5.3 Package C6 State

A processor enters the package C6 low power state when:

- At least one core is in the C6 state.

- The other cores are in a C6 or lower power state, and the processor has been granted permission by the platform.
- The platform has allowed a package C6 state.

In package C6 state, all cores have saved their architectural state and have had their core voltages reduced to zero volts.

6.3.6 Graphics Power Management

6.3.6.1 Graphics and video decoder C-State

GFX C-State (GC6) and VED C-state (VC6) are designed to optimize the average power to the graphics and video decoder engines during times of idleness. GFX C-state is entered when the graphics engine, has no workload being currently worked on and no outstanding graphics memory transactions. VED S-state is entered when the video decoder engine has no workload being currently worked on and no outstanding video memory transactions. When the idleness condition is met, the processor will power gate the Graphics and video decoder engines.

6.3.6.2 Intel® Display Power Saving Technology (Intel® DPST)

The Intel DPST technique achieves backlight power savings while maintaining visual experience. This is accomplished by adaptively enhancing the displayed image while decreasing the backlight brightness simultaneously. The goal of this technique is to provide equivalent end-user image quality at a decreased backlight power level.

1. The original (input) image produced by the operating system or application is analyzed by the Intel DPST subsystem. An interrupt to Intel® DPST software is generated whenever a meaningful change in the image attributes is detected. (A meaningful change is when the Intel DPST software algorithm determines that enough brightness, contrast, or color change has occurred to the displaying images that the image enhancement and backlight control needs to be altered.)
2. Intel DPST subsystem applies an image-specific enhancement to increase image contrast, brightness, and other attributes.
3. A corresponding decrease to the backlight brightness is applied simultaneously to produce an image with similar user-perceived quality (such as brightness) as the original image. Intel DPST 5.0 has improved the software algorithms and has minor hardware changes to better handle backlight phase-in and ensures the documented and validated method to interrupt hardware phase-in.

6.3.6.3 Intel® Automatic Display Brightness

The Intel Automatic Display Brightness feature dynamically adjusts the backlight brightness based upon the current ambient light environment. This feature requires an additional sensor to be on the panel front. The sensor receives the changing ambient light conditions and sends the interrupts to the Intel Graphics driver. As per the change in Lux, (current ambient light illuminance), the new backlight setting can be adjusted through BLC. The converse applies for a brightly lit environment. Intel Automatic Display Brightness increases the back light setting.

6.3.6.4 Intel® Seamless Display Refresh Rate Switching Technology (Intel® SDRRS Technology)

When a Local Flat Panel (LFP) supports multiple refresh rates, the Intel® Display Refresh Rate Switching power conservation feature can be enabled. The higher refresh rate will be used when on plugged in power or when the end user has not selected/enabled this feature. The graphics software will automatically switch to a lower refresh rate for maximum battery life when the design application is on battery power and when the user has selected/enabled this feature.

There are two distinct implementations of Intel SDRRS—static and seamless. The static Intel SDRRS method uses a mode change to assign the new refresh rate. The seamless Intel SDRRS method is able to accomplish the refresh rate assignment without a mode change and therefore does not experience some of the visual artifacts associated with the mode change (SetMode) method.

6.4 Memory Controller Power Management

The main memory is power managed during normal operation and in low-power ACPI Cx states.

6.4.1 Disabling Unused System Memory Outputs

Any system memory (SM) interface signal that goes to a memory module connector in which it is not connected to any actual memory devices (such as DIMM connector is unpopulated, or is single-sided) is tri-stated. The benefits of disabling unused SM signals are:

- Reduced power consumption.
- Reduced possible overshoot/undershoot signal quality issues seen by the processor I/O buffer receivers caused by reflections from potentially un-terminated transmission lines.

When a given rank is not populated, the corresponding chip select and CKE signals are not driven.

At reset, all rows must be assumed to be populated, until it can be proven that they are not populated. This is due to the fact that when CKE is tristated with an SO-DIMM present, the DIMM is not guaranteed to maintain data integrity.

SCKE tri-state should be enabled by BIOS where appropriate, since at reset all rows must be assumed to be populated.

6.4.2 DRAM Power Management and Initialization

The processor implements extensive support for power management on the SDRAM interface. There are four SDRAM operations associated with the Clock Enable (CKE) signals, which the SDRAM controller supports. The processor drives four CKE pins to perform these operations.

6.4.2.1 Initialization Role of CKE

During power-up, CKE is the only input to the SDRAM that is recognized (other than the DDR3 reset pin) once power is applied. It must be driven LOW by the DDR controller to make sure the SDRAM components float DQ and DQS during power- up.

CKE signals remain LOW (while any reset is active) until the BIOS writes to a configuration register. Using this method, CKE is guaranteed to remain inactive for much longer than the specified 200 micro-seconds after power and clocks to SDRAM devices are stable.

6.4.2.2 Conditional Self-Refresh

Intel Rapid Memory Power Management (Intel RMPM) conditionally places memory into self-refresh in the package C3 and C6 low-power states. RMPM functionality depends on graphics/display state (relevant only when internal graphics is being used), as well as memory traffic patterns generated by other connected I/O devices.

When entering the Suspend-to-RAM (STR) state, the processor core flushes pending cycles and then places all SDRAM ranks into self refresh. In STR, the CKE signals remain LOW so the SDRAM devices perform self-refresh.

The target behavior is to enter self-refresh for the package C3 and C6 states as long as there are no memory requests to service.

6.4.2.3 Dynamic Power Down Operation

Dynamic power-down of memory is employed during normal operation. Based on idle conditions, a given memory rank may be powered down. The IMC implements aggressive CKE control to dynamically put the DRAM devices in a power down state.The processor core controller can be configured to put the devices in active power down (CKE deassertion with open pages) or precharge power down (CKE deassertion with all pages closed). Precharge power down provides greater power savings but has a bigger performance impact, since all pages will first be closed before putting the devices in power down mode.

If dynamic power-down is enabled, all ranks are powered up before doing a refresh cycle and all ranks are powered down at the end of refresh.

6.4.2.4 DRAM I/O Power Management

Unused signals should be disabled to save power and reduce electromagnetic interference. This includes all signals associated with an unused memory channel. Clocks can be controlled on a per SO-DIMM basis. Exceptions are made for per SO-DIMM control signals such as CS#, CKE, and ODT for unpopulated SO-DIMM slots.

The I/O buffer for an unused signal should be tri-stated (output driver disabled), the input receiver (differential sense-amp) should be disabled, and any DLL circuitry related ONLY to unused signals should be disabled. The input path must be gated to prevent spurious results due to noise on the unused signals (typically handled automatically when input receiver is disabled).

6.5 PCI Express* (PCIe*) Power Management

- Active power management support using L0s, and L1 states.
- All inputs and outputs disabled in L3 Ready state.

§

7 Power Up and Reset Sequence

This chapter provides information on the following topics:

- "Power Up Sequences"
- "Power Down Sequences"
- "Reset Behavior"

7.1 SoC System States

7.1.1 System Sleeping States Control (S-states)

The SoC supports the S0, S3, S4, and S5 sleep states. S4 and S5 states are identical from a hardware and power perspective. The differentiation is software determined (S4 = Suspend to Disk).

The SoC platform architecture assumes the usage of an external power management controller e.g., CPLD or PMIC. Some flows in this section refer to the power management controller for support of the S-states transitions.

The SoC sleep states are described in Chapter 6, "Power Management".

7.2 Power Up Sequences

7.2.1 RTC Power Well Transition (G5 to G3 States Transition)

When RTC_VCC (Real Time Clock power) is applied via RTC battery, the following occurs (see Figure 11 for timing):

1. RTC_VCC ramps. ILB_RTC_TEST# should be low.
2. The system starts the real time clock oscillator.
3. A minimum of t1 units after RTC_VCC ramps, the external RTC RC circuit de-asserts ILB_RTC_TEST# and ILB_RTC_RTC#. The system is now in the G3 state. RTC oscillator is unlikely to be stable at this point.

Figure 11. RTC Power Well Timing Diagrams

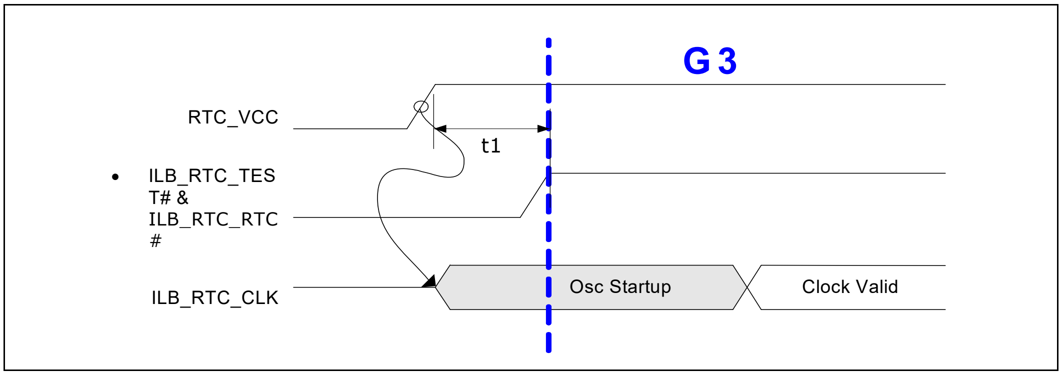


Table 60. RTC Power Well Timing Parameters

Parameter	Description	Min	Max	Units
t1	RTC_VCC to ILB_RTC_TEST# and ILB_RTC_RTC# de-assertion	18	-	ms

NOTES:
1. This delay is typically created from an RC circuit.
2. The oscillator startup times are component and design specific. A crystal oscillator can take several second to reach a large enough voltage swing. A silicon oscillator can have startups times <10 ms.

7.2.2 G3 to S0

The timings shown in Figure 12 occur when a board event such as AC power is applied or power management controller (PMIC) power button is pressed. The following occurs:

1. Suspend (SUS/Always On) wells ramp in the order shown.
2. The external power management controller de-asserts PMC_RSMRST# after the suspend rails become stable.
3. PMC_SUSCLK will begin toggling after the de-assertion of PMC_RSMRST#.
4. The system is now in S4/S5 state. Depending on policy bits (GEN_PMCON1.PWR_FLR & GEN_PMCON1.AG3E), the SoC either waits for a wake event to transition to S0 or continues to S0 state automatically.
5. The transition from S4/S5 to S0 is initiated.
6. The SoC de-asserts PMC_SLP_S4#, and the DRAM (VDD/Un-switched) well ramps.
7. After the DRAM power rail ramp, the external power management controller drives DRAM_VDD_S4_PWROK high.
8. The SoC de-asserts PMC_SLP_S3#, and the Core (S0/Switched On) wells ramp in the order shown.
9. After all of Core power rails are stable, external power management controller drives PMC_CORE_PWROK and DRAM_CORE_PWROK to HIGH, the SoC will then

fetch the descriptor region and soft straps data from the PCU located SPI interface, followed by the SoC de-asserting PMC_SUS_STAT#.

10. The SoC de-asserts PMC_PLTRST# after PMC_SUS_STAT# is stable. The PMC_PLTRST# is the main platform reset to other components.
11. The SoC will begin fetching data from the PCU-located SPI interface and proceed to finish initialization and start code execution (BIOS).

Note: There is no hard time requirement for transitions for the Always on/SUS rails (V1.0A, V1.2A, V1.8A, V3.3A). A 10 µs to 10 ms delay is required for two adjacent rails of them to avoid inrush current which may be caused by multiple loads turning on simultaneously or fast charging of VR output decoupling.

Figure 12. G3/S5 to S0 Cold Boot Sequence

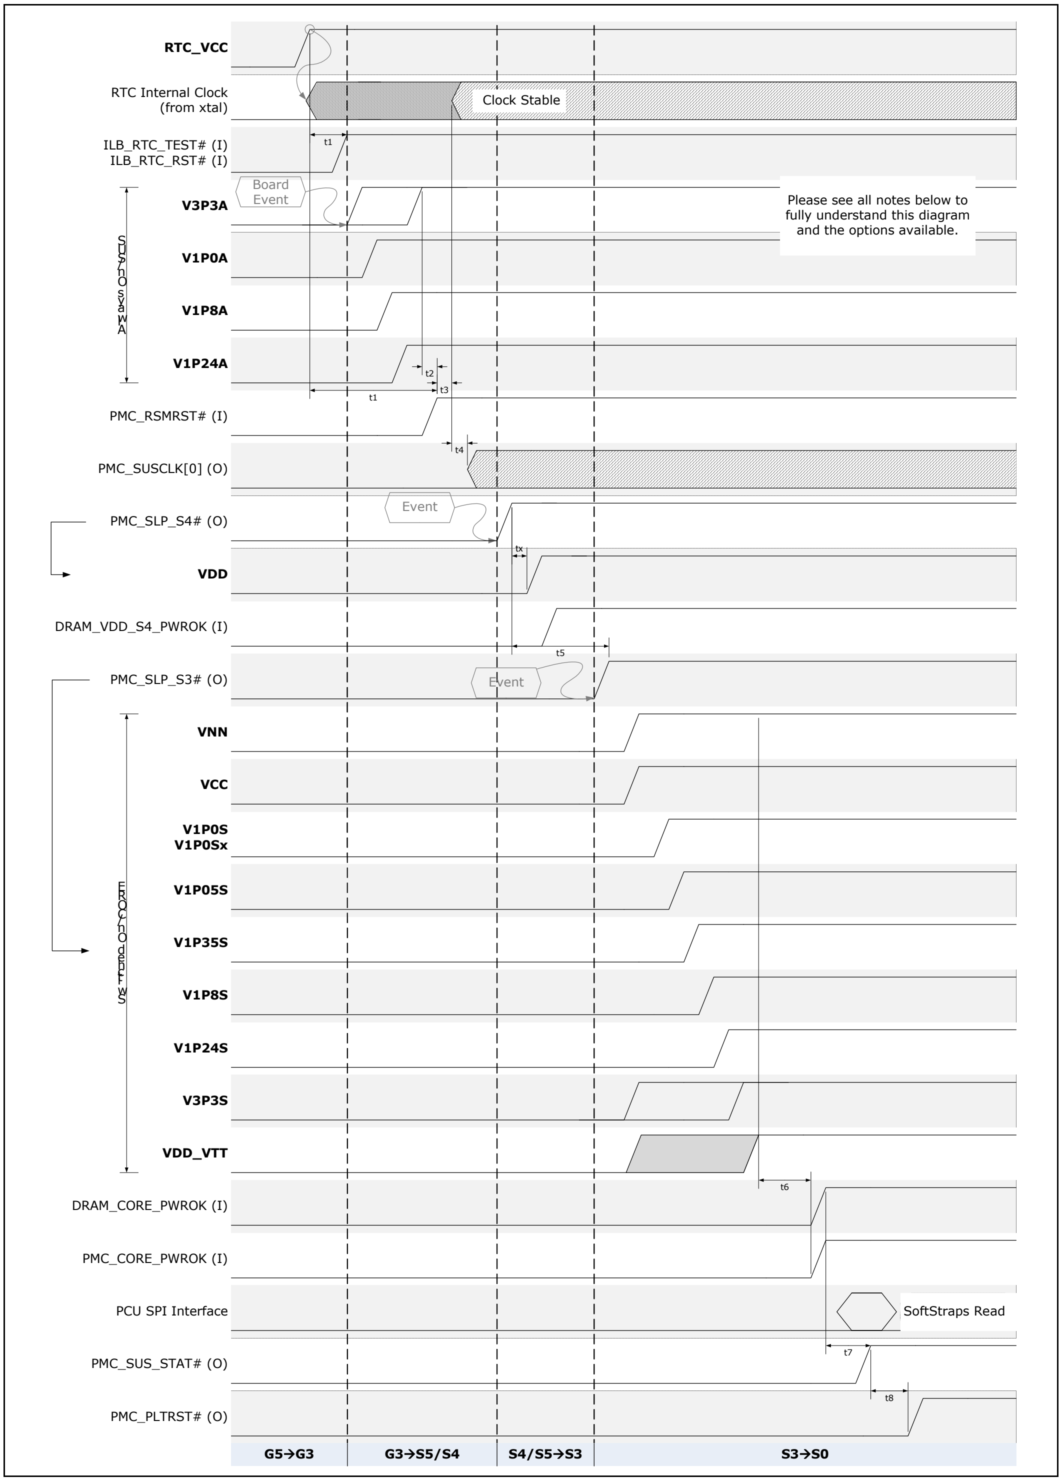

Table 61. S4/S5 to S0 (Power Up) Sequence

Parameter		Min	Max	Unit
t1	RTC_VCC to ILB_RTC_TEST# and ILB_RTC_RTC# de-assertion RTC_VCC to PMC_RSMRST# de-assertion	18	-	ms
t2	V3P3A (SUS Rails) valid to PMC_RSMRST# de-assertion (t1 still applies in applications without RTC battery)	10	-	us
t3	PMC_RSMRST# to Internal RTC Clock assumed stable[2]	95		ms
t4	Internal RTC Clock assumed stable to PMC_SUSCLK[0] toggling[2]	5		ms
t5	PMC_SLP_S4# de-assertion to PMC_SLP_S3# de-assertion	30	-	us
t6a	Core well stable to DRAM_CORE_PWROK and PMC_CORE_PWROK assertion (No PCIe devices)	10	-	ms
t6b	Core well stable to DRAM_CORE_PWROK and PMC_CORE_PWROK assertion (for power rails needed by PCIe devices)	99	-	ms
t7	DRAM/PMC_CORE_PWROK to PMC_SUS_STAT#	1	-	ms
t8	PMS_SUS_STAT# de-assertion to PMC_PLTRST# de-assertion	60	-	us
tx	PMC_SLP_S4# de-assertion to VDDQ ramp start	0	-	ms

NOTES:.

1. RTC and SUS power rails may come up at the same time if no RTC battery is used.
2. Must ensure RTC clock is oscillating before these counts. SoC counts this time assuming a RTC clock of 32.768 KHz. Depending on how stable the oscillations are, however, this time can vary (+/-). This is effectively the *typical* amount of time the SoC waits to help ensure the clock is stable enough to proceed with power sequencing. It's more likely a min since RTC clock will typically run slow until stable.
3. Wake events shown in figure depend on platform configuration.
4. In the SUS rail sequence, V3P3A can be first in sequence if required for designs, otherwise it can end the SUS sequence.
5. An alternate SUS rail sequence allows swapping V1P8A with V1P0A.
6. For power rail sequences, at least 10us delay is required between rails to avoid inrush current caused by multiple loads turning on simultaneously and fast charging of VR output decoupling. A maximum delay of 2 ms is allowed. Measurement of delay is at the 90% of full voltage mark of the prior rail to 10% later rail.
7. VCC can follow VNN in the CORE rail sequence or at the same time. Reference platform sequences both at the same time.
8. "Board Event" is platform specific. Most likely enabled by a platform power management controller or PMIC via a dedicated power button or when AC power is applied.
9. For exit from S4 and S3 Events, see "Cause of Wake Events" table in this chapter. S4 wake is required from PMC_PWRBTN# without prior configuration. S3 wake event is only used when the platform directly transitions to S3 (STR).
10. The V1P35S rail "VGA_V1P35_S3_F1" must be powered on as shown above. All other V1P35S/VSFR ([X]_V1P35_S3_F[x]) rails can either power on as shown, or power on after V3P3S.
11. PMC_SUSPWRDNACK is intended to be used at power-down and, since its state after a power-down is variable, it is recommended that a system treats PMC_SUSRWRDNACK as a Do Not Care during power-on. For systems that are unable to treat PMC_SUSPWRDNACK as a Do Not Care during power-on, the following power-on state is always valid: - 1) PMC_SUSPWRDNACK will always be low, until PMC_SLP_S3# de-asserts, if PMC_SUSPWRDNACK was low upon entry into S5. PMC_SUSPWRDNACK is always low when entering S5 from G3.
12. Where no maximum timing is specified, it is expected that the maximum timing should typically be within one unit of time of the minimum timing, under normal operating conditions. Due to potential variability in operating conditions, no maximum timing can be guaranteed however.
13. When HDA_LPE_V1P5V1P8_S3 is powered by a V1P5S rail, the V1P5S rail sequencing should meet the same sequencing requirements as the V1P8S rail.

7.3 Power Down Sequences

7.3.1 S0 to S3 and S4/S5/G3 Sequence

Entry to Sleep states (S3,S4, S5) is initiated by any of the following methods:

- Setting the desired sleep type in PM1_CNT.SLP_TYP and setting PM1_CNT.SLP_EN.
- Detection of an external catastrophic temperature event may cause a transition to S5, if the system is designed to do so.

The following sequence applies to S0-S3 and S0-S4/S5 transitions.

1. The Operating System Power Management (OSPM) will handle the enabling or disabling of interrupt generation after S3 resume. The Operating System Power Management (OSPM) will need to read and clear Wake status information and the processing of the clearing wake status which will include enabling interrupts (both at the core level and platform level).
2. All interrupts in the processor need to be disabled before the S3 sequence is started (and re-enabled on exit). The CPU APIC must be disabled.
3. When the desired sleep state is set in the PM1_CNT.TYP and PM1_CNT.SLP_EN registers, a sleep state request is sent to the PMC.
4. The PMC flushes all the internal buffers to main memory.
5. The PMC places the PCI Express* devices into the L2/L3 state. The PMC will wait until the PCI Express* devices are in the L2/L3 state before preceding. A timeout will occur in 1 ms if there is a non-functional PCI Express* device.

The Power Down Sequence is shown in Figure 13 below.

Additional assumptions:

- Entry to a Cx state is mutually exclusive with software-initiated entry to a Sleep state. This is because the processor(s) can only perform one register access at a time. This requirement is enforced by the CPU as well as the OS. The system may hang if it attempts to do a C-state and S-state at the same time.
- The G3 system state cannot be entered via any software mechanism. The G3 state indicates a complete loss of power. In this state, the RTC well may or may not be powered by an external coin cell battery.
- An external Power Management Controller (PMIC/EC) can be used to put the SoC in G3 when the S4/S5 state is requested by the SoC. This is done to save power in S4/S5 state. This G3 like state, known as SoC G3, is enabled by removing SUS rails via when the SUSPWRDNACK pin is asserted on power down. Doing so prevents the use of any of SUS wake events including USB, RTC, and GPIOs including the power button. The external Power Management Controller (or re-application of power) is required to return to S0.

Figure 13. S0 to S3 to S4/S5 (Power Down) Sequence without S0ix

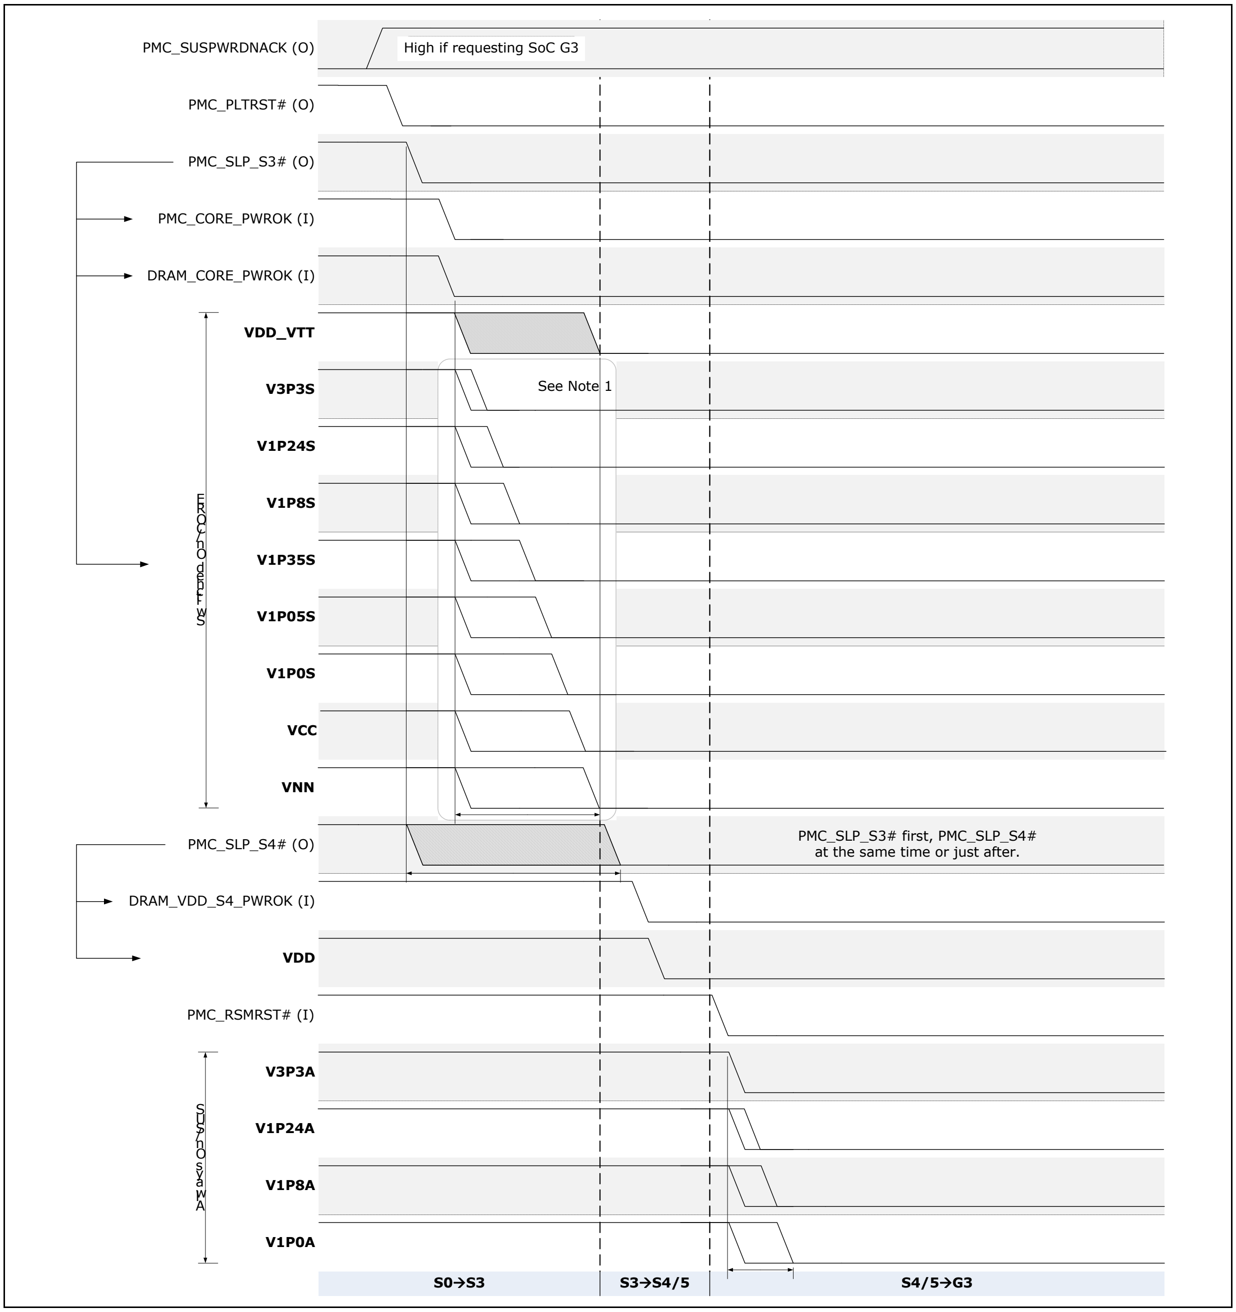

Table 62. S0 to G3 (Power Down) Sequence

Parameter	Description	Min	Max	Unit
t1	Power rail slew rate: From 90% to 10% of voltage typical	0.1	10	ms
t2	Tail to rail kick off delay[1]	0	3	ms

NOTES:.
1. The rail to rail kick off delay min is 0 ms and max 3 ms.
2. The Power Down Slew rate min is 0.1 ms and max is 10 ms.
3. Switched/CORE rails should be turned off at the same time. Alternately, it's ok to turn off all Switch/CORE rails in the reverse order of power up paying attention to t2 timing if so. Both sequences are shown.
4. An alternate SUS rail sequence allows swapping V1P8A with V1P0A.
5. SUS rails are turned off only if entering SoC G3 state (SoC lets the board/PMIC power management system know if this is ok - that there are no wake up events expected by the SoC). They can turn off at the same time, or in reverse power up order, just like the Switched/CORE rails.
6. VDD_VTT shows a range of times at which it can turn off. Any time within this range is fine.
7. SLP_S3# can be active before or after DRAM_CORE_PWROK and PMC_CORE_PWROK, but DRAM_CORE_PWROK should go low before memory power rails go low and PMC_CORE_PWROK should go low before Switched/CORE rails go low.
8. Measurement of delays is at the 10% voltage mark. Contact your Intel representative for additional details.
9. The V1P35S rail "VGA_V1P35_S3_F1" must be powered down as shown above. All other V1P35S/VSFR ([X]_V1P35_S3_F[x]) rails can either power down as shown, or power down before V3P3S.

7.3.2 S3/S4/S5 to S0 (Exit Sleep States)

Sleep states (S3-S5) are exited based on Wake events. The Wake events will force the system to a full on state (S0), although some non-critical subsystems might still be powered down and have to be brought back manually. For example, the hard disk may be powered down during a sleep state, and have to be enabled via an I/O pin before it can be used. Upon exit from software-entered Sleep states (i.e., those initiated via the PM1_CNT.SLP_EN bit), the PM1_STS_EN.WAK_STS bit will be set.

To enable Wake Events, the possible causes of wake events (and their restrictions) are shown in Table 63.

Table 63. S3/S4/S5 to S0 Cause of Wake Events (Sheet 1 of 2)

Cause	Type	How Enabled
RTC Alarm[1]	Internal	Set PM1_STS_EN.RTC_EN register bit
PMC_PWRBTN# (Power Button)	External	Default enabled as Wake event
GPIO_S5[7:0][1]	External	GPE0a_EN register (after having gone to S5 via PM1_CNT.SLP_EN, but not after a power failure.) Note: GPIOs that are in the core well are not capable of waking the system from sleep states where the core well is not powered.

Table 63. S3/S4/S5 to S0 Cause of Wake Events (Sheet 2 of 2)

Cause	Type	How Enabled
PMC_WAKE_PCIE[0:3]#[1] (PCI Express WAKE#)	External	PM1_STS_EN.PCIEXP_WAKE_DIS register bit Note: When the PMC_WAKE_PCIE# pin is active and the PM1_STS_EN.PCIEXP_WAKE_DIS register bit is clear, CPU will wake the platform.
Primary PME#[1]	Internal	GPEOa_EN.PME_B0_EN register bit. This wake status bit includes multiple internal agents: HD Audio EHCI (USB2) xHCI SATA Note: SATA can only trigger a wake event if it had asserted its PME prior to S3/S4/S5 entry and software doesn't clear GPE0a_STS.PME_B0_STS, a wake event would still result. PME_B0_S5_DIS bit is used to prevent these devices from waking from S5. Does not apply to wake from S3.
PMC - Initiated[1]	Internal	No enable bits. The PMC can wake the host independent of other wake events listed, if desired. A bit is provided in PRSTS for reporting this wake event to BIOS. Note that this wake event may be used as a wake trigger on behalf of some other wake source.

Note: 1. It is not possible to wake the SoC using this event after a Global Reset, Go-to-S5 type reset.

2. When the HDA_LPE_V1P5V1P8_S3 is powered by a V1P5S rail, the V1P5S rail sequencing should meet the same sequencing requirements as the V1P8S rail.

7.3.3 Handling Power Failures

The power failures can occur if the AC power or battery is removed. In this case, when the system was originally in a S0 state, power failure bit (GEN_PMCON1.PWR_FLR) is set after a power failure. Software can clear the bit.Chapter 7, “Handling Power Failures”

7.4 Reset Behavior

There are several ways to reset the processor.

Table 64. Types of Resets (Sheet 1 of 2)

Trigger	Description	Note
Write of 0Eh to Reset Control Register (RST_CNT)	Write of 0Eh to the Reset Control register	Host Reset with Power Cycle
Write of 06h to Reset Control Register (RST_CNT)	Write of 06h to the Reset Control register	Host Reset without Power Cycle with PMC_PLTRST# assertion
PMC_RSTBTN# & RST_CNT.full_rst = 0	User presses the reset button, causing the PMC_RSTBTN# signal to go active (after the debounce logic)	Host Reset without Power Cycle PMC_PLTRST# assertion enabled/ disabled by RST_CNT.sys_rst
Write of 4h to Reset Control Register (RST_CNT)	Write of 4h to Reset Control Register (RST_CNT)	Host Reset without Power Cycle without PMC_PLTRST# assertion
PMC_RSTBTN# & RST_CNT.full_rst = 1	User presses the reset button, causing the PMC_RSTBTN# signal to go active (after the debounce logic)	Host Reset with Power Cycle
Power Failure	PMC_CORE_PWROK signal goes inactive in S0/S1	Global Reset with Power Cycle
S3/S4/S5	The processor is reset when going to S3, S4 or S5 state	Sx Entry
Processor Thermal Trip	The internal thermal sensor signals a catastrophic temperature condition – transition to S5 and reset asserts	Global Reset, Go-to-S5
PMC_PWRBTN# Power Button Override	4-second press causes transition to S5 (and reset asserts)	Global Reset, Go-to-S5
CPU Shutdown with Policy to assert PMC_PLTRST#	Shutdown special cycle from CPU can cause either INIT or Reset Control-style PMC_PLTRST#	Global Reset with Power Cycle (if ETR.CF9GR = 1b) Host Reset with Power Cycle (if RST_CNT.full_rst= 1b), Host Reset without Power Cycle (others setting)
Write of 06h or 0Eh to Reset Control Register (RST_CNT)	ETR.CF9GR = 1b	Global Reset with Power Cycle
Host Partition Reset Entry Timeout	Host partition reset entry sequence took longer than the allowed timeout value (presumably due to a failure to receive one of the internal or external handshakes)	Global Reset with Power Cycle
S3/S4/S5 Entry Timeout	S3, S4, or S5 entry sequence took longer than the allowed timeout value (presumably due to a failure to receive one of the internal or external handshakes)	Global Reset, Go-to-S5

Table 64. Types of Resets (Sheet 2 of 2)

Trigger	Description	Note
PMC Watchdog Timer	PMC firmware watchdog time expires twice	Global Reset, Go-to-S5
TCO Watchdog Timer	TCO timer	RST_CNT.full_rst = 0: Host Reset without Power Cycle RST_CNT.full_rst = 1: Host Reset with Power Cycle
Host Reset promoted to Global Reset	During boot, TXE FW may promote a Host Reset to a Global Reset in order to apply new TXE or PMC firmware	Global Reset with Power Cycle

Note: - Host Reset without Power Cycle: All processor functionality not required for correct operation during & after reset, excluding the PMC, is reset and the SoC remain in S0.

- Host Reset with Power Cycle: All processor functionality not required for correct operation during & after reset, excluding the PMC, is reset and the SoC transitions to S5 and then to S0.

- Global Reset with Power Cycle: All processor functionality not required for correct operation during & after reset, including the PMC, is reset and the SoC transitions to S5 and then S0.

- Global Reset, Go-to-S5: All processor functionality not required for correct operation upon wake, including the PMC, are reset and the SoC transitions to S5.

8 Thermal Management

The SoC's thermal management system helps in managing the overall thermal profile of the system to prevent overheating and system breakdown. The architecture implements various proven methods of maintaining maximum performance while remaining within the thermal spec. Throttling mechanisms are used to reduce power consumption when thermal limits of the device are exceeded and the system is notified of critical conditions via interrupts or thermal signalling pins. SoC thermal management differs from legacy implementations primarily by replacing dedicated thermal management hardware with firmware.

The thermal management features are:

- Eight digital thermal sensors (DTS)
- Supports a hardware trip point and four programmable trip points based on the temperature indicated by thermal sensors.
- Supports different thermal throttling mechanisms.

8.1 CPU Thermal Management Registers

The description of the control and status registers can be found in the *Bay Trail SoC BIOS Writer's Guide*.

8.2 Thermal Sensors

SoC provides thermal sensors that use ring oscillator based DTS (Digital Thermal Sensor) to provide more accurate measure of system thermals.

The SoC instantiates multiple digital thermal sensors (one DTS for each processor core, one for each BIU-Bus Interface Unit, and two for non-core SoC) and sensor grouping configurations are provided to optionally select the maximum of all sensors for thermal readout and interrupt generation.

DTS output are adjusted for silicon variations. For a given temperature the output from DTS is always the same irrespective of silicon.

Table 65. Temperature Reading Based on DTS (If T_{J-MAX} =90°C) (Sheet 1 of 2)

DTS Counter Value	Temperature Reading
127	90°C
137	80°C
147	70°C
157	60°C
167	50°C

Table 65. Temperature Reading Based on DTS (If $T_{J\text{-}MAX}$ =90°C) (Sheet 2 of 2)

DTS Counter Value	Temperature Reading
177	40°C
187	30°C
197	20°C
207	10°C

Note: DTS encoding of 127 always represents $T_{J\text{-}MAX}$.If $T_{J\text{-}MAX}$ is at 110°C instead of 90°C then the encoding 127 from DTS indicates 110°C, 137 indicates 90°C and so forth.

Thermal trip points are of two types:

- **Hard Trip**: The Catastrophic trip points generated by DTS's based on predefined temperature setting defined in fuses.
- **Programmable Trips**: four programmable trip settings (Hot, Aux2, Aux1, Aux0) that can be set by firmware/software. Default value for Hot Trip is from Fuses.

Note: DTS accuracy is around 8°C under 60°C and around 6°C above 60°C.

8.3 SoC Programmable Trips

Programmable trips can be programmed to cause different actions when triggered to reduce temperature of the die.

8.3.1 Aux3 Trip

By default, the Aux 3 (Hot Trip) point is set by fuses but the software/firmware has an option to set these to a different value.

This trip point is enabled by firmware to monitor and control the system temperature while the rest of the system is being set up.

8.3.2 Aux2, Aux1, Aux0 Trip

These are fully programmable trip points for general hardware protection mechanisms. The programmable trips are only active after software/firmware enables the trip.

Note: Unlike Aux3, the Aux[2:0] trip registers are defaulted to zero. To prevent spurious results, software/firmware should program the trip values prior to enabling the trip point.

8.4 Platform Trips

8.4.1 PROCHOT#

The platform components use the signal PROCHOT# to indicate thermal events to SoC.

The processor core HOT trip as well as the processor AUX 3 trip are individually sent to firmware, which internally combines them and drives the appropriate PROCHOT back. Assertion of the PROCHOT# input will trigger Thermal Monitor 1 or Thermal Monitor 2 throttling mechanisms if they are enabled.

8.5 Thermal Throttling Mechanisms

Thermal throttling mechanisms are implemented to try to reduce temperature by reducing power consumption in response to a HOT condition. Actions taken as a result of Thermal Trip indication can be as simple as throttling bandwidth and frequency to as drastic as shutting down the PLL's and the entire system. Actions are primarily taken in to prevent system breakdown and are dependent on the severity of the trips.

8.6 Thermal Status

The firmware captures Thermal Trip events (other than THERMTRIP) in status registers to trigger thermal actions. Associated with each event is a set of programmable actions. For a complete list of refer to the *Bay Trail SoC BIOS Writer's Guide.*

§

9 Electrical Specifications

This chapter is split into the following sections:

- "Thermal Specifications"
- "Storage Conditions"
- "Voltage and Current Specifications"
- "Crystal Specifications"
- "DC Specifications"
- "AC Specifications"

9.1 Thermal Specifications

These specifications define the operating thermal limits of the SoC. Thermal solutions not designed to provide the following level of thermal capability may affect the long-term reliability of the processor and system, but more likely result in performance throttling to ensure silicon junction temperatures within spec. For more details on thermal solution design, refer to this product's Thermal/Mechanical Design Guide.

This section specifies the thermal specifications for all SKUs. Some definitions are needed, however. "Tj Max" defines the maximum operating silicon junction temperature. Unless otherwise specified, all specifications in this document assume Tj Max as the worse case junction temperature. This is the temperature needed to ensure TDP specifications when running at guaranteed CPU and graphics frequencies. "TDP" defines the thermal dissipated power for a worse case estimated real world thermal scenario.

Table 66. Intel Atom® Processor E3800 Product Family Thermal Specifications

SKU	T_j Min/Max	TDP
E3845	-40 to 110 °C	10 W @ Tj Max
E3827	-40 to 110 °C	8 W @ Tj Max
E3826	-40 to 110 °C	7 W @ Tj Max
E3825	-40 to 110 °C	6 W @ Tj Max
E3815	-40 to 110 °C	5 W @ Tj Max
E3805	-40 to 110 °C	3 W @ Tj Max

9.2 Storage Conditions

This section specifies absolute maximum and minimum storage temperature and humidity limits for given time durations. Failure to adhere to the specified limits could result in physical damage to the component. If this is suspected, Intel recommends a visual inspection to determine possible physical damage to the silicon or surface components.

Table 67. Storage Conditions Prior to Board Attach

Symbol	Parameter	Min	Max
Tabsolute storage	Device storage temperature when exceeded for any length of time.	-25 °C	125 °C
Tshort term storage	The ambient storage temperature and time for up to 72 hours.	-25 °C	85 °C
Tsustained storage	The ambient storage temperature and time for up to 30 months.	-5 °C	40 °C
RHsustained storage	The maximum device storage relative humidity for up to 30 months.		60% @ 24 °C

Note:

- Specified temperatures are not to exceed values based on data collected. Exceptions for surface mount re-flow are specified by the applicable JEDEC standard. Non-adherence may affect processor reliability.
- Component product device storage temperature qualification methods may follow JESD22-A119 (low temperature) and JESD22-A103 (high temperature) standards when applicable for volatile memory.
- Component stress testing is conducted in conformance with JESD22-A104.
- The JEDEC J-JSTD-020 moisture level rating and associated handling practices apply to all moisture sensitive devices removed from the moisture barrier bag.

9.2.1 Post Board-Attach

The storage condition limits for the component once attached to the application board are not specified. Intel does not conduct component-level certification assessments post board-attach given the multitude of attach methods, socket types, and board types used by customers.

Provided as general guidance only, board-level Intel-branded products are specified and certified to meet the following temperature and humidity limits:

- Non-Operating Temperature Limit: -40 °C to 70 °C
- Humidity: 50% to 90%, non-condensing with a maximum wet-bulb of 28 °C

9.3 Voltage and Current Specifications

The I/O buffer supply voltages are specified at the SoC package balls. The tolerances shown in Table 86 are inclusive of all noise from DC up to 20 MHz. The voltage rails should be measured with a bandwidth limited oscilloscope with a roll-off of 3 dB/decade above 20 MHz under all operating conditions. Table 94 indicates which supplies are connected directly to a voltage regulator or to a filtered voltage rail. For voltage rails that are connected to a filter, they should be measured at the input of the filter. If the recommended platform decoupling guidelines cannot be met, the system designer will have to make trade-offs between the voltage regulator out DC tolerance and the decoupling performances of the capacitor network to stay within the voltage tolerances listed below.

Table 68. Power Rail DC Specs and Max Current

Platform Rail	Voltage Tolerances	Max Icc
V1P0A - UNCORE_V1P0_G3 - USB3_V1P0_G3	1.0 V DC: ±2% AC: ±3%	375 mA
V1P24A - USB_HSIC_V1P24_G3 (Can connect to V1P0A when USB HSIC isn't used)	1.24 V DC: ±3% AC: ±2%	35 mA
V1P8A - PCU_V1P8_G3 - PMC_V1P8_G3 - UNCORE_V1P8_G3 - USB_V1P8_G3 - USB_ULPI_V1P8_G3	1.8 V DC: ±3% AC: ±2%	65 mA
V3P3A - PCU_V3P3_G3 - USB_V3P3_G3	3.3 V DC: ±2% AC: ±3%	55 mA
V1P0S - GPIO_V1P0_S3 - PCIE_SATA_V1P0_S3 - PCIE_V1P0_S3 - SATA_V1P0_S3 - SVID_V1P0_S3 - USB3DEV_V1P0_S3 - USB_V1P0_S3 - VGA_V1P0_S3	1.0 V DC: ±2% AC: ±3%	1.1 A
V1P0S - DRAM_V1P0_S3 - DDI_V1P0_S3 - UNCORE_V1P0_S3	1.0 V DC: ±2% AC: ±3%	2.5 A

Table 68. Power Rail DC Specs and Max Current

Platform Rail	Voltage Tolerances	Max Icc
V1P05S - CORE_V1P05_S3	1.05 V DC: ±2% AC: ±3%	1.3 A
V1P24S - MIPI_V1P24_S3 (can be grounded if MIPI CSI not used)	1.24 V DC: ±2% AC: ±3%	45 mA
V1P35S (VSFR) - ICLK_V1P35_S3_F[2:1] - VGA_V1P35_S3_F1(grounded if VGA not used) - DRAM_V1P35_S3_F1 - UNCORE_V1P35_S3_F[6:1]	1.35 V DC: ±3% AC: ±2%	400 mA
V1P5V1P8S (VAUD) - HDA_LPE_V1P5V1P8_S3	1.5 V (LV HDA) 1.8 V (LPE)	In V1P8S
V1P8S - UNCORE_V1P8_S3 - MIPI_V1P8_S3	1.8 V DC: ±3% AC: ±2%	10 mA
V1P8V3P3S (VSDIO,VLPC) - LPC_V1P8V3P3_S3 - SD3_V1P8V3P3_S3	1.8 V 3.3 V DC: ±2% AC: ±3%	8 mA
V3P3S - VGA_V3P3_S3	3.3 V DC: ±2% AC: ±3%	35 mA
VCC - CORE_VCC_S3	See Table 70	See Table 69
VNN - UNCORE_VNN_S3	See Table 70	See Table 69
VDD - DRAM_VDD_S4	1.35 V DC: ±2% AC: ±3%	1.3 A
VRTC - RTC_VCC	G3: 2-3.3 V at SoC Otherwise: V3P3A (pre diode drop)	100 uA (6 uA Avg.) (see note)

Note: RTC_VCC average current draw (G3) is specified at 27°C under battery conditions.

Note: S3/S4/S5 power is 20 mW max. S3/S4/S5 power is measured during S3/S4/S5 idle as a long term average over worst case silicon at room temperature (27°C). It is intended to define a limit of the power consumed by the SoC during the S3/S4/S5 state for battery life estimates and power budgeting. Breakdown is as follows: < 4 mA on V1P8A, < 15 mA on V1P0A, < 1 mW on V1P35U/V3P3A/V1P24A.

Table 69. VCC and VNN Currents

SKU	VCC Icc Max	VNN Icc Max
E3845	9 A	10 A
E3827	4 A	10 A
E3826	4 A	10 A
E3825	4 A	9 A
E3815	2 A	8 A
E3805	4 A	7 A

9.3.1 VCC and VNN Voltage Specifications

Table 70 and Table 86 list the DC specifications for the SoC power rails. They are valid only while meeting specifications for junction temperature, clock frequency, and input voltages. Care should be taken to read all notes associated with each parameter.

Table 70. VCC and VNN DC Voltage Specifications

Symbol	Parameter	Min	Typ	Max	Unit	Note
CORE_VCC_S3 VID	Core VID (voltage) Target Range	0.40		1.0	V	1
UNCORE_VNN_S3 VID	Uncore VID (voltage) Target Range	0.50		1.05	V	1
CORE_VCC/ UNCORE_VNN V_{BOOT}	Default target V_{CC}/V_{NN} voltage for initial power up.		1.0 or 1.1		V	2
VCC/VNN Tolerance	Tolerance of VCC/VNN voltage at VID target.	-5		5	%	

NOTES:
1. Each SoC is programmed with voltage identification value (VID), which is set at manufacturing and cannot be altered. Individual VID values are calibrated during manufacturing such that two SoCs at the same frequency may have different settings within the VID range above. VID targets employed by the SoC during a power management event are selected within the range uniquely hard-coded into each SoC.
2. See the VR12/IMVP7 Pulse Width Modulation specification for additional details. Either value is ok.

9.3.2 Voltage Identification (VID)

The VID specifications for the SoC CORE_VCC_S3 and UNCORE_VNN_S 3are defined by the IMVP7 Pulse Width Modulation (PWM) Specification. Table 71 specifies the voltage level corresponding to the eight bit VID value transmitted over serial VID (SVID) interface per IMVP7 specification. A ‘1’ in this table refers to a high voltage level and a ‘0’ refers to a low voltage level. If the voltage regulation circuit cannot supply the voltage that is requested, the voltage regulator must disable itself.

The SVID signals are CMOS push/pull drivers. Refer to Table 103 for the DC specifications for these signals. The VID codes will change due to performance, temperature and/or current load changes in order to minimize the power of the part. A voltage range is provided in Table 70. The specifications are set so that one voltage regulator can operate with all supported frequencies.

Individual SoC VID values may be set during manufacturing so that two devices at the same core frequency may have different default VID settings. This is shown in the VID range values in Table 70. The SoC provides the ability to operate while transitioning to an adjacent VID and its associated voltage. This will represent a DC shift in the loadline.

Note: Table below lists all voltages possible per IMVP7 specification. Not all voltages are valid on actual SKUs.

Table 71. IMVP7.0 Voltage Identification Reference (Sheet 1 of 8)

9.4 Crystal Specifications

There are two crystal. One for RTC which maintains time and provides initial timing reference for power sequencing. The other is for the Integrated Clock, which covers clocking for the entire SoC.

Table 72. ILB RTC Crystal Specification

Symbol	Parameter	Min	Typ	Max	Units	Notes
F_{RTC}	Frequency	-	32.768	-	kHz	1
T_{PPM}	Crystal frequency tolerance (see notes)	-	-	+/-50	ppm	1
R_{ESR}	ESR	-	-	50	kOhm	1
$C_{X1,2}$	Capacitance of X1, X2 pins				pF	1

NOTES:

1. These are the specifications needed to select a crystal oscillator for the RTC circuit.

2. Crystal tolerance impacts RTC time. A 10 ppm crystal is recommended for 1.7 s tolerance per day, RTC circuit itself contributes addition 10 ppm for a total of 20 ppm in this example.

Table 73. Integrated Clock Crystal Specification

Symbol	Parameter	Min	Typ	Max	Units	Notes
F_{ICLK}	Frequency	-	25	-	MHz	1
T_{PPM}	Crystal frequency tolerance & stability	-	-	+/-100	ppm	1
P_{DRIVE}	Crystal drive load	-	-	100	uW	1
R_{ESR}	ESR	-	-	100	Ohm	1
C_{LOAD}	Crystal load capacitance		18		pF	
C_{SHUNT}	Crystal shunt capacitance	-	-	6	pF	1
$C_{IN/OUT}$	Capacitance of oscillator pins				pF	1

NOTES:
1. These are the specifications needed to select a crystal oscillator for the Integrated Clock circuit. Crystal must be AT cut, fundamental, parallel resonance.

9.5 DC Specifications

Platform reference voltages are specified at DC only. V_{REF} measurements should be made with respect to the supply voltages specified in "Voltage and Current Specifications".

See the following DC Specifications in this section:

- "Display DC Specification"
- "PCI Express* DC Specification"
- "MIPI-Camera Serial Interface (CSI) DC Specification"
- "SCC - SDIO DC Specification"
- "SCC - SD Card DC Specification"
- "SCC - eMMC 4.5 DC Specification"
- "SATA DC Specification"
- "JTAG (TAP) DC Specification"
- "DDR3L Memory Controller DC Specification"
- "USB 2.0 Host DC Specification"
- "USB 3.0 DC Specification"
- "PCU - iLB - LPC DC Specification"
- "PCU - SPI (Platform Control Unit) DC Specification"
- "PCU - Power Management/Thermal (PMC) & iLB RTC DC Specification"
- "SVID DC Specification"
- "GPIO DC Specification"

- "SIO - I^2C DC Specification"
- "SIO - UART DC Specification"
- "I^2S (Audio) DC Specification"

Note: Care should be taken to read all notes associated with each parameter.

9.5.1 Display DC Specification

DC specifications for display interfaces:

- "Analog VGA Video DC Specification"
- "Digital Display Interface (DDI) Signals DC Specification"

9.5.1.1 Analog VGA Video DC Specification

Interface DC Specifications are referred to the VESA Video Signal Standard, version 1 revision 2.

Table 74. R,G,B/VGA DAC Display DC specification (Functional Operating Range)

Parameter	Min	Typ	Max	Units	Notes
Resolution		8		bits	1
Max Luminance (full-scale)	0.665	0.700	0.770	V	1,2,4 (white video level voltage)
Min Luminance		0.0		V	1,3,4 (black video level voltage)
LSB Current		73.2	8	µA	4,5
Integral Non Linearity (INL)	-1.0		+1.0	LSB	1,6
Differential Non-Linearity (DNL)	-1.0		+1.0	LSB	1,6
Video Channel-to-Channel Voltage amplitude mismatch			6	%	7
Monotonicity		Guaranteed			

NOTES:
1. Measured at each R,G,B termination according to the VESA Test Procedure – Evaluation of Analog Display Graphics Subsystems Proposal (Version 1, Draft 4, December 1, 2000).
2. Max steady-state amplitude
3. Min steady-state amplitude
4. Defined for a double 75 Ω termination
5. Set by external reference resistor value
6. INL & DNL measured and calculated according to VESA Video Signal Standards
7. Max fill-scale voltage difference among R,G,B outputs (percentage of steady-state full-scale voltage).

Table 75. VGA_DDCCLK, VGA_DDCDATA Signal DC Specification

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{REF}	I/O Voltage	VGA_V3P3_S3				
V_{IH}	Input High Voltage	2		Vref	V	1
V_{IL}	Input Low Voltage	0		0.8	V	2
V_{OL}	Output Low Voltage	0		0.4	V	3
Ii	Input Pin Leakage	-45		45	µA	4

NOTES:
1. V_{IH} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. V_{IL} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.
3. 3 mA sink current.
4. For VIN between 0V and VGA_V3P3_S3. Measured when driver is tri-stated.

Table 76. VGA_HSYNC and VGA_VSYNC DC Specification

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{REF}	I/O Voltage	VGA_V3P3_S3				
V_{OH}	Output High Voltage	2.4		V_{REF}	V	
V_{OL}	Output Low Voltage	0		0.5	V	
I_{OH}	Output High Current			8	mA	
I_{OL}	Output Low Current			8	mA	
I_i	Input Pin Leakage	-35		35	µA	1

NOTE:
1. For V_{IN} between 0-V and VGA_V3P3_S3. Measured when driver is tri-stated.

9.5.1.2 Digital Display Interface (DDI) Signals DC Specification

Table 77. DDI Main Transmitter DC specification

Symbol	Parameter	Min	Typ	Max	Units	Notes
$V_{TX\text{-}DIFFp\text{-}p\text{-}Level0}$	Differential Peak-to-peak Output Voltage Level 0	0.34	0.4	0.46	V	1
$V_{TX\text{-}DIFFp\text{-}p\text{-}Level1}$	Differential Peak-to-peak Output Voltage Level 1	0.51	0.6	0.68	V	1
$V_{TX\text{-}DIFFp\text{-}p\text{-}Level2}$	Differential Peak-to-peak Output Voltage Level 2	0.69	0.8	0.92	V	1
$VT_{X\text{-}DIFFp\text{-}p\text{-}Level3}$	Differential Peak-to-peak Output Voltage Level 3	0.85	1.2	1.38	V	1
$V_{TX\text{-}PREEMP\text{-}RATIO}$	No Pre-emphasis	0.0	0.0	0.0	dB	1
	3.5 dB Pre-emphasis	2.8	3.5	4.2	dB	1

Table 77. DDI Main Transmitter DC specification

Symbol	Parameter	Min	Typ	Max	Units	Notes
	6.0 dB Pre-emphasis	4.8	6.0	7.2	dB	1
	9.5 dB Pre-emphasis	7.5	9.5	11.4	dB	1
$V_{TX-DC-CM}$	Tx DC Common Mode Voltage	0		2.0	V	1
RLTX-DIFF	Differential Return Loss at 0.675GHz at Tx Package pins	12			dB	4
	Differential Return Loss at 1.35 GHz at Tx Package pins	9			dB	4
C_{TX}	AC Coupling Capacitor	75		200	nF	5
Voff	Single Ended Standby (off), output voltage	-10		10	mV	6 @ AVcc
Vswing	Single Ended output swing voltage	400		600	mV	
V_{OH} (<=165 MHz)	Single Ended high level, output voltage	-10		10	mv	6 @ AVcc
V_{OH}(>165 MHz)	Single Ended high level, output voltage	-200		10	mV	6 @ AVcc
V_{OL}(<=165 MHz)	Single Ended low level, output voltage	-600		-400	mV	6 @ AVcc
V_{OL}(>165MHz)	Single Ended low level, output voltage	-700		-400	mV	6 @ AVcc

NOTES:
1. For embedded connection, support of programmable voltage swing levels is optional.
2. Total drive current of the transmitter when it is shorted to its ground.
3. Common mode voltage is equal to Vbias_Tx voltage shown in Figure 14.
4. Straight loss line between 0.675 GHz and 1.35 GHz.
5. All DisplayPort Main Link lanes as well as AUX CH must be AC coupled. AC coupling capacitors must be placed on the transmitter side. Placement of AC coupling capacitors on the receiver side is optional.
6. AVcc =Analog Voltage level

Table 78. DDI AUX Channel DC Specification

Symbol	Parameter	Min	Typ	Max	Units	Notes
$V_{AUX-DIFFp-p}$	AUX Peak-to-peak Voltage at a transmitting Device	0.29		1.38	V	1
$V_{AUX-\_TERM\_R}$	AUX CH termination DC resistance		100		Ω	
$V_{AUX-DC-CM}$	AUX DC Common Mode Voltage	0		2.0	V	2

Table 78. DDI AUX Channel DC Specification

Symbol	Parameter	Min	Typ	Max	Units	Notes
$V_{AUX\text{-}TURN\text{-}CM}$	AUX turn around common mode voltage			0.3	V	3
I_{AUX_SHORT}	AUX Short Circuit Current Limit			90	mA	4
C_{AUX}	AC Coupling Capacitor	75		200	nF	5

NOTES:

1. $V_{AUX\text{-}DIFFp\text{-}p} = 2*|V_{AUXP} - V_{AUXM}|$
2. Common mode voltage is equal to V_{bias_Tx} (or V_{bias_Rx}) voltage.
3. Steady state common mode voltage shift between transmit and receive modes of operation.
4. Total drive current of the transmitter when it is shorted to its ground.
5. All DisplayPort Main Link lanes as well as AUX CH must be AC coupled. AC coupling capacitors must be placed on the transmitter side. Placement of AC coupling capacitors on the receiver side is optional.

NOTES:

Table 79. DDI DDC Signal DC Specification (DDI[1:0]_DDCDATA, DDI[1:0]_DDCCLK)

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{REF}	I/O Voltage	MIPI_V1P8_S3			V	
V_{IH}	Input High Voltage	$0.65*V_{REF}$		V_{REF}	V	1
V_{IL}	Input Low Voltage	0		$0.35*V_{REF}$	V	2
V_{OL}	Output Low Voltage	0		0.4	V	3
I_i	Input Pin Leakage	-30		30	µA	4

1. V_{IH} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. V_{IL} is defined as the maximum voltage level at a receiving agent that will be interpreted as a logical low value.
3. 3mA sink current.
4. For VIN between 0V and CORE_VCC_S3. Measured when driver is tri-stated.

Table 80. DDI DDC Misc Signal DC Specification (DDI[1:0]_HPD, DDI[1:0]_BKLTCTL, DDI[1:0]_VDDEN, DDI[1:0]_BKLTEN)

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{REF}	I/O Voltage	MIPI_V1P8_S3			V	
V_{IH}	Input High Voltage	$0.65*V_{REF}$		V_{REF}	V	1
V_{IL}	Input Low Voltage	0		$0.35*V_{REF}$	V	2
Z_{pu}	Pull up Impedance	40	50	60	Ω	3
Z_{pd}	Pull down Impedance	40	50	60	Ω	3
I_i	Input Pin Leakage	-20		20	µA	4

1. V_{IH} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. V_{IL} is defined as the maximum voltage level at a receiving agent that will be interpreted as a logical low value.
3. Measured at CORE_VCC_S3.
4. For VIN between 0V and CORE_VCC_S3. Measured when driver is tri-stated.

Figure 14. Definition of Differential Voltage and Differential Voltage Peak-to-Peak

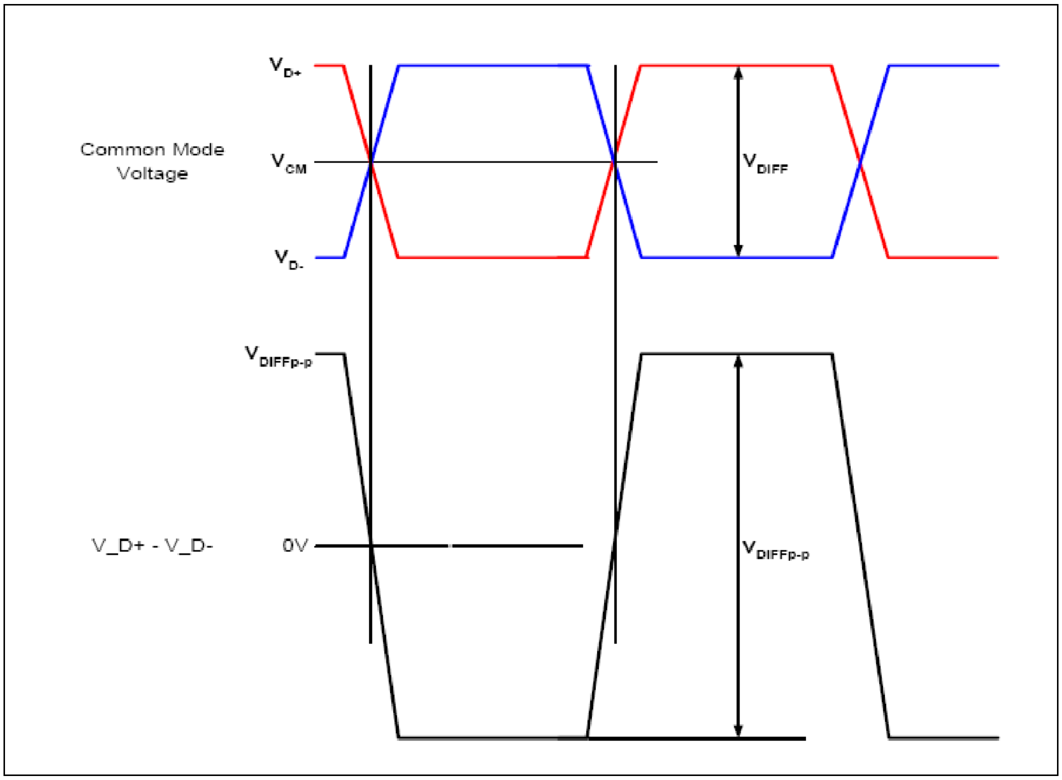

Figure 15. Definition of Pre-emphasis

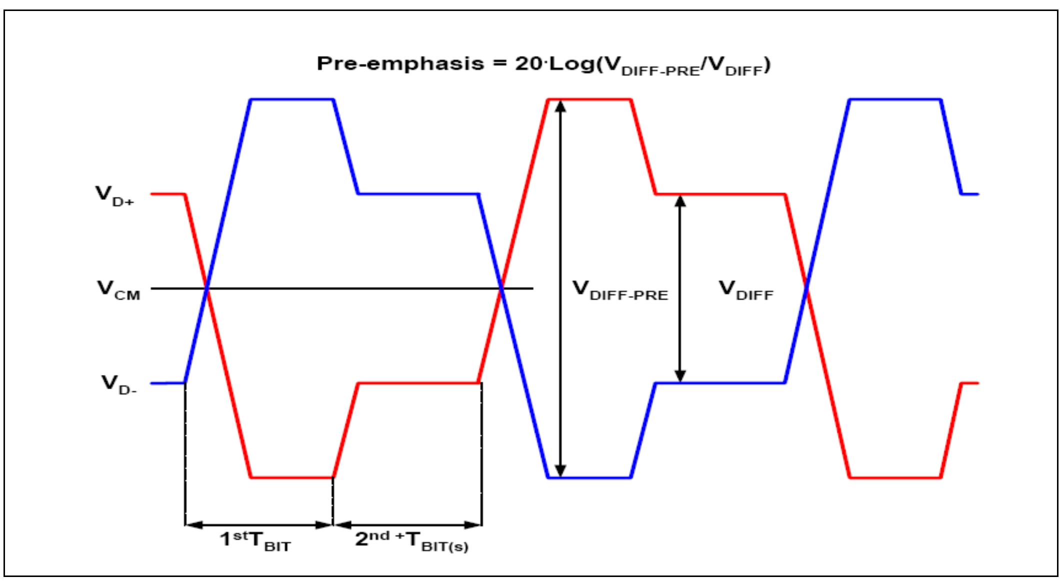


9.5.2 PCI Express* DC Specification

Table 81. PCI Express* DC Receive Signal Characteristics

Symbol	Parameter	Min	Typ	Max	Unit	Notes
$V_{RXDIFF\ Gen1}$	Differential RX Peak to Peak	175		1200	mV	1
$V_{RXDIFF\ Gen2}$	Differential RX Peak to Peak	100		1200	mV	1

NOTE:
1. PCI Express differential peak to peak = 2*|RXp[x] – RXn[x]|

Table 82. PCI Express* DC Transmit Characteristics

Symbol	Parameter	Min	Typ	Max	Unit	Notes
V_{TXDIFF}	Differential TX Peak to Peak	800		1200	mV	1
$V_{TXDIFF-LP}$	Differential TX Peak to Peak (low power mode)	400		1200	mV	1

NOTE:
1. PCI Express differential peak to peak = 2*|TXp[x] – TXn[x]|

Table 83. PCI Express* DC Clock Request Input Signal Characteristics

Symbol	Parameter	Min	Typ	Max	Unit	Notes
V_{REF}	I/O Voltage	UNCORE_V1P8_S3				
V_{IL}	Input Low Voltage	0		$0.3*V_{REF}$	V	1
V_{IH}	Input High Voltage	$0.65*V_{REF}$		V_{REF}	V	1

9.5.3 MIPI-Camera Serial Interface (CSI) DC Specification

Table 84. MIPI HS-RX/MIPI LP-RX Minimum, Nominal, and Maximum Voltage Parameters (Sheet 1 of 2)

Symbol	Parameter	Min.	Typ.	Max.	Unit	Notes
I_{LEAK}	Pin Leakage current	-10	–	10	µA	
MIPI-CSI HS-RX Mode						
$V_{CMRX(DC)}$	Common-mode voltage HS receive mode	70	–	330	mV	
V_{IDTH}	Differential input high threshold	–	–	70	mV	
V_{IDTL}	Differential input low threshold	-70	–	–	mV	
V_{IHHS}	Single-ended input high voltage	–	–	460	mV	
V_{ILHS}	Single-ended input low voltage	-40	–	–	mV	
$V_{TERM-EN}$	Single-ended threshold for HS termination enable	–	–	450	mV	
Z_{ID}	Differential input impedance	80	100	125	Ω	

Table 84. MIPI HS-RX/MIPI LP-RX Minimum, Nominal, and Maximum Voltage Parameters (Sheet 2 of 2)

Symbol	Parameter	Min.	Typ.	Max.	Unit	Notes
MIPI-CSI LP-RX Mode						
V_{IH}	Logic 1 input voltage	880	–	–	mV	
V_{IL}	Logic 0 input voltage, not in ULP state	–	–	550	mV	
$V_{IL\text{-}ULPS}$	Logic 0 input voltage, ULP state	–	–	300	mV	
V_{HYST}	Input hysteresis	25	–	–	mV	

9.5.4 SCC - SDIO DC Specification

Table 85 provides the SDIO DC Specification, for all other DC Specifications not listed in Table 85, refer to Table 106, "GPIO 1.8V Core Well Signal Group DC Specification (GPIO_S0_SC[101:0]).

Table 85. SDIO DC Specification

Symbol	Parameter	Min.	Typ.	Max.	Unit	Notes
V_{OH}	Output High Voltage	1.4	–	–	V	Measured at I_{OH} maximum.
I_{OH}/I_{OL}	Current at VoL/Voh	-2	–	–	mA	

9.5.5 SCC - SD Card DC Specification

Table 86 provides the SD Card DC Specification, for all other DC Specifications not listed in Table 86, refer to Table 106, "GPIO 1.8V Core Well Signal Group DC Specification (GPIO_S0_SC[101:0]).

Table 86. SD Card DC Specification

Symbol	Parameter	Min.	Max.	Unit
V_{REF}	I/O Voltage	SD3_V1P8V3P3_S3		
V_{OH}	Output High Voltage	$0.75*V_{REF}$	V_{REF}	V
V_{OL}	Output Low Voltage	0	$0.125*V_{REF}$	V
$V_{IH\ (3.3)}$	Input High Voltage (3.3 V)	$0.625*V_{REF}$	V_{REF}	V
$V_{IL\ (3.3)}$	Input Low Voltage (3.3 V)	0	$0.25*V_{REF}$	V
$V_{PEAK\ (3.3)}$	Peak Voltage on All lines	-0.3	$V_{REF}+0.3$	V
$V_{IH\ (1.8)}$	Input High Voltage (1.8 V)	1.28	V_{REF}	V

Table 86. SD Card DC Specification

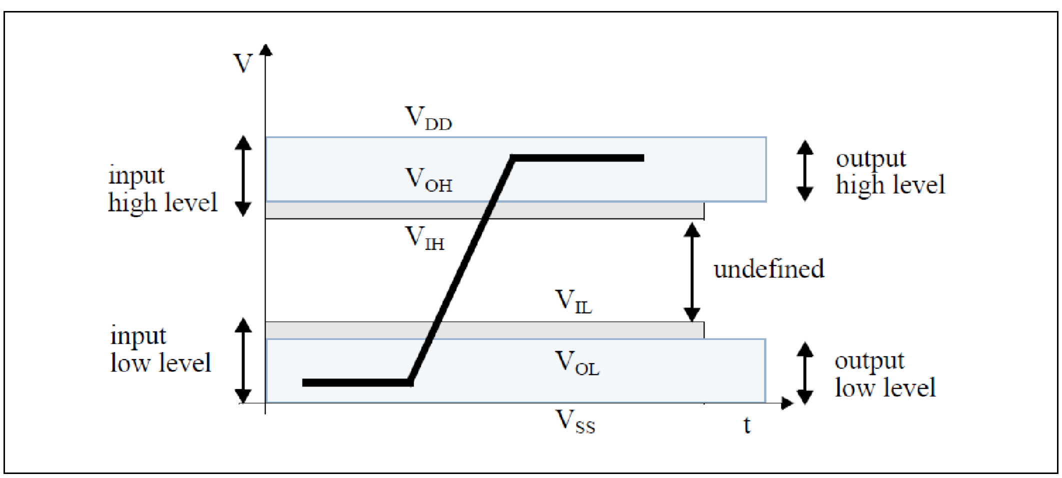
Symbol	Parameter	Min.	Max.	Unit
$V_{IL\ (1.8)}$	Input Low Voltage (1.8 V)	0	0.58	V
$V_{PEAK\ (1.8)}$	Peak Voltage on All lines	-0.3	V_{REF}+0.3	V
I_{OH}/I_{OL}	Current at VoL/Voh	-45	45	μA
$V_{hysteresis}$	Input Hysteresis	None		V
C_{LOAD}	Input Load Capacitance	4	9	pF

9.5.6 SCC - eMMC 4.5 DC Specification

Table 87. eMMC 4.5 Signal DC Electrical Specifications

Symbol	Parameter	Min	Max	Units
V_{REF}	I/O Voltage	UNCORE_V1P8_S3		
V_{OH}	Output HIGH voltage	V_{REF} - 0.45	V_{REF}	V
V_{OI}	Output LOW voltage	0	0.45	V
V_{IH}	Input HIGH voltage	0.65 * V_{REF}	V_{REF} + 0.3	V
V_{IL}	Input LOW voltage	-0.3	0.35 * V_{REF}	V
C_L	Bus Signal Line capacitance	-	30	pF
I_{LI}	Input Leakage Current	-2	2	μA
I_{L0}	Output Leakage Current	-2	2	μA

Figure 16. eMMC DC Bus signal level



9.5.7 JTAG (TAP) DC Specification

Table 88. TAP Signal Group DC Specification (TAP_TCK, TAP_TRSRT#, TAP_TMS, TAP_TDI)

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{REF}	I/O Voltage	PMC_V1P8_G3				
V_{IH}	Input High Voltage	$0.8*V_{REF}$		V_{REF}	V	1
V_{IL}	Input Low Voltage	0		$0.4*V_{REF}$	V	2
Z_{pu}	Pull up Impedance			60	Ω	3
Z_{pd}	Pull down Impedance			60	Ω	3
R_{wpu}	Weak Pull Impedance	1		4	kΩ	3
R_{wpd}	Weak Pull Down Impedance	1		4	kΩ	3
$R_{wpu-40K}$	Weak Pull Up Impedance 40K	20		70	kΩ	4
$R_{wpd-40K}$	Weak Pull Down Impedance 40K	20		70	kΩ	4

NOTES:
1. V_{IH} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. V_{IL} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.
3. Measured at PMC_V1P8_G3/2.
4. Rwpu_40k and Rwpd_40k are only used for TAP_TRST#

Table 89. TAP Signal Group DC Specification (TAP_TDO)

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{REF}	I/O Voltage	PMC_V1P8_G3				
V_{IH}	Input High Voltage	$0.8*V_{REF}$		V_{REF}	V	1
V_{IL}	Input Low Voltage	0		$0.5*V_{REF}$	V	2
Z_{pd}	Pull down Impedance			30	Ω	3
R_{wpu}	Weak Pull Impedance	1		4	kΩ	3
R_{wpd}	Weak Pull Down Impedance	1		4	kΩ	3

NOTES:
1. V_{IH} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. V_{IL} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.
3. Measured at PMC_V1P8_G3/2.

Table 90. TAP Signal Group DC Specification (TAP_PRDY#, TAP_PREQ#)

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{REF}	I/O Voltage	PMC_V1P8_G3				
V_{IH}	Input High Voltage	$0.64*V_{REF}$		V_{REF}	V	1
V_{IL}	Input Low Voltage	0		$0.4*V_{REF}$	V	2
Z_{pd}	Pull down Impedance			30	Ω	3
R_{wpu}	Weak Pull Impedance	1		4	kΩ	3

NOTES:
1. V_{IH} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. V_{IL} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.
3. Measured at PMC_V1P8_G3/2.

9.5.8 DDR3L Memory Controller DC Specification

Table 91. DDR3L Signal Group DC Specifications (Sheet 1 of 2)

Symbol	Parameter	Min	Type	Max	Units	Notes
V_{IL}	Input Low Voltage			DRAM_VREF - 200mV	V	1
V_{IH}	Input High Voltage	DRAM_VREF + 200mV			V	2, 3
V_{OL}	Output Low Voltage		(DRAM_VDD_S4 / 2)* (RON / (RON+RVTT_TERM))			3,4
V_{OH}	Output High Voltage		DRAM_VDD_S4 - ((DRAM_VDD_S4 /2)* (RON/(RON+RVTT_TERM))		V	3,4
I_{IL}	Input Leakage Current			5	µA	For all DRAM Signals
R_{ON}	DDR3L-RS Clock Buffer strength	26		40	Ω	5
C_{IO}	DQ/DQS/DQS# DDR3L-RS IO Pin Capacitance		3.0		pF	
VIH	Input High Voltage	1.1			V	DRAM_VDD_S4_PWROK DRAM_CORE_PWROK

Table 91. DDR3L Signal Group DC Specifications (Sheet 2 of 2)

Symbol	Parameter	Min	Type	Max	Units	Notes
VIL	Input Low Voltage			0.3	V	DRAM_VDD_S4_PWROK DRAM_CORE_PWROK
Pin Leakage				100	µA	
VIH	Input High Voltage	0.83			V	CMD/CTL
VIL	Input Low Voltage			0.55	V	CMD/CTL
Pin Leakage				50	µA	

NOTES:
1. V_{IL} is defined as the maximum voltage level at the receiving agent that will be received as a logical low value. DRAM_VREF is normally DRAM_VDD_S4/2
2. V_{IH} is defined as the minimum voltage level at the receiving agent that will be received as a logical high value. DRAM_VREF is normally DRAM_VDD_S4/2
3. V_{IH} and V_{OH} may experience excursions above DRAM_VDD_S4. However, input signal drivers must comply with the signal quality specifications.
4. RON is DRAM driver resistance whereas RTT_TERM is DRAM ODT resistance which is controlled by DRAM.
5.
6. DDR3L-1333 CLK buffer Ron is 26ohm and SR target is 4V/ns; DQ-DQS buffer Ron is 30ohms and SR target is 4V/ns; CMD/CTL buffer Ron is 20ohms and SR target is 1.8V/ns.

9.5.9 Intel® HD Audio DC Specification

Table 92. HDA Signal Group DC Specifications

Symbol	Parameter	Condition	Min	Max	Unit	Notes
VCC_{HDA}	HDA Supply Voltage		HDA_LPE_V1P5V1P8_S3			
V_{IH_HDA}	Input High Voltage		$0.6*VCC_{HDA}$		V	
V_{IL_HDA}	Input Low Voltage			$0.4*VCC_{HDA}$	V	
V_{OH_HDA}	Output High Voltage	Iout = -500µA	$0.9*VCC_{HDA}$		V	
V_{OL_HDA}	Output Low Voltage	Iout = 1500µA		$0.1*VCC_{HDA}$	V	
IIL_HDA	Input Leakage Current	$0<Vin<VCC_{HDA}$		±175	µA	1
C_{IN_HDA}	Input Pin Capacitance			7.5	pF	
L_{PIN_HDA}	Pin Inductance			20	nH	2

NOTES:
1. For HDA_SDI[x] buffers (or in general any bidirectional buffer with tri-state output), input leakage current also include hi-Z output leakage.
2. This is a recommendation, not an absolute requirement.

9.5.10 USB 2.0 Host DC Specification

Symbol	Parameter	Min	Typ	Max	Units	Notes
Supply Voltage:						
VBUS	High-power Port	4.75		5.25	V	2
VBUS	Low-power Port					
Supply Current:						
ICCPRT	High-power Hub Port (out)	500			mA	
ICCUPT	Low-power Hub Port (out)	100			mA	
ICCHPF	High-power Function (in)			500	mA	
ICCLPF	Low-power Function (in)			100	mA	
ICCINIT	Unconfigured Function/Hub (in)			100	mA	
ICCSH	Suspended High-power Device			2.5	mA	15
ICCSL	Suspended Low-power Device			500	μA	
Input Levels for Low-/full-speed:						
VIH	High (driven)	2.0			V	4
VIHZ	High (floating)	2.7		3.6	V	4
VIL	Low			0.8	V	4
VDI	Differential Input Sensitivity	0.2			V	|(D+)-(D-)|;Figure; Note 4
VCM	Differential Common Mode Range	0.8		2.5	V	Includes VDI range; Figure; Note 4
Input Levels for High-speed:						
VHSSQ	High-speed squelch detection threshold (differential signal amplitude)	100		150	mV	
VHSDSC	High speed disconnect detection threshold (differential signal amplitude)	525		625	mV	
	High-speed differential input signaling levels					
VHSCM	High-speed data signaling common mode voltage range (guideline for receiver)	-50		500	mV	
Output Levels for Low-/full-speed:						
VOL	Low	0.0		0.3	V	4,5

Symbol	Parameter	Min	Typ	Max	Units	Notes
VOH	High (Driven)	2.8		3.6	V	4,6
VOSE1	SE1	0.8			V	
VCRS	Output Signal Crossover Voltage	1.3		2.0	V	10
Output Levels for High-speed:						
VHSOI	High-speed idle level	-10		10	mV	
VHSOH	High-speed data signaling high	360		440	mV	
VHSOL	High-speed data signaling low	-10		10	mV	
VCHIRPJ	Chirp J level (differential voltage)	700		1100	mV	
VCHIRPK	Chirp K level (differential voltage)	-900		-500	mV	
Decoupling Capacitance:						
CHPB	Downstream Facing Port Bypass Capacitance (per hub)	120			µF	
CRPB	Upstream Facing Port Bypass Capacitance	1.0		10.0	µF	9
Input Capacitance for Low-/full-speed:						
CIND	Downstream Facing Port			150	pF	2
CINUB	Upstream Facing Port (w/o cable)			100	pF	3
CEDGE	Transceiver edge rate control capacitance			75	pF	
Input Impedance for High-speed:						
	TDR spec for high-speed termination					
Terminations:						
RPU	Bus Pull-up Resistor on Upstream Facing Port	1.425		1.575	kΩ	1.5 kΩ ±5%
RPD	Bus Pull-down Resistor on Downstream Facing Port	14.25		15.75	kΩ	1.5 kΩ ±5%
ZINP	Input impedance exclusive of pull-up/pull-down (for low-/full speed)	300			kΩ	
VTERM	Termination voltage for upstream facing port pull-up (RPU)	3.0		3.6	V	
Terminations in High-speed:						
VHSTERM	Termination voltage in high speed	-10		10	mV	

NOTES:
1. Measured at A plug.
2. Measured at A receptacle.
3. Measured at B receptacle.

4. Measured at A or B connector.
5. Measured with RL of 1.425 kΩ to 3.6 V.
6. Measured with RL of 14.25 kΩ to GND.
7. Timing difference between the differential data signals.
8. Measured at crossover point of differential data signals.
9. The maximum load specification is the maximum effective capacitive load allowed that meets the target VBUS drop of 330 mV.
10. Excluding the first transition from the Idle state.
11. The two transitions should be a (nominal) bit time apart.
12. For both transitions of differential signaling.
13. Must accept as valid EOP.
14. Single-ended capacitance of D+ or D- is the capacitance of D+/D- to all other conductors and, if present, shield in the cable. That is, to measure the single-ended capacitance of D+, short D-, VBUS, GND, and the shield line together and measure the capacitance of D+ to the other conductors.
15. For high power devices (non-hubs) when enabled for remote wakeup.

9.5.11 USB 3.0 DC Specification

Symbol	Parameter	Min	Typ	Max	Units	Notes
UI	Unit Interval	199.94		200.06	ps	1
$V_{TX\text{-}DIFF\text{-}PP}$	Differential peak-peak Tx voltage swing	0.9	1	1.05	V	
$V_{TX\text{-}DIFF\text{-}PP\text{-}LOW}$	Low-Power Differential peak-peak Tx voltage swing	0.4		1.2	V	2
$V_{TX\text{-}DE\text{-}RATIO}$	Tx De-Emphasis	3.45	3.5	3.65	dB	
$R_{TX\text{-}DIFF\text{-}DC}$	DC differential impedance	88		92	Ω	
$V_{TX\text{-}RCV\text{-}DETECT}$	The amount of voltage change allowed during Receiver Detection			0.6	V	3
$C_{AC\text{-}COUPLING}$	AC Coupling Capacitor	75		200	nF	4
$t_{CDR\_SLEW\_MAX}$	Maximum slew rate			10	ms/s	

NOTES:
1. The specified UI is equivalent to a tolerance of 300ppm for each device. Period does not account for SSC induced variations.
2. There is no de-emphasis requirement in this mode. De-emphasis is implementation specific for this mode.
3. Detect voltage transition should be an increase in voltage on the pin looking at the detect signal to avoid a high impedance requirement when an “off” receiver's input goes below output.
4. All transmitters shall be AC coupled. The AC coupling is required either within the media or within the transmitting component itself.

9.5.12 SATA DC Specification

Table 93. SATA TX/RX Signal Group DC Specifications

Symbol	Parameter	Min	Max	Unit	Notes
V_{IMIN_Gen1i}	Minimum Input Voltage for 1.5 Gb/s	325	-	mVdiffp-p	1
V_{IMAX_Gen1i}	Maximum Input Voltage for 1.5 Gb/s	-	600	mVdiffp-p	1
V_{IMIN_Gen2i}	Minimum Input Voltage for 3 Gb/s	275	-	mVdiffp-p	2
V_{IMAX_Gen2i}	Maximum Input Voltage for 3 Gb/s	-	750	mVdiffp-p	2
$V_{OMIN\_Gen1i,m}$	Minimum Output Voltage for 1.5 Gb/s	400	-	mVdiffp-p	3
$V_{OMAX\_Gen1i,m}$	Maximum Output Voltage for 1.5 Gb/s	-	600	mVdiffp-p	3
$V_{OMIN\_Gen2i,m}$	Minimum Output Voltage for 3 Gb/s	400	-	mVdiffp-p	3
$V_{OMAX\_Gen2i,m}$	Maximum Output Voltage for 3 Gb/s	-	700	mVdiffp-p	3

1. Applicable only when SATA port signaling rate is 1.5 Gb/s: SATA Vdiff, rx is measured at the SATA connector on the receiver side (generally, the motherboard connector), where SATA mVdiff p-p = 2*|SATA_RXP[x] – SATA_RXN[x]|
2. Applicable only when SATA port signaling rate is 3 Gb/s: SATA Vdiff, rx is measured at the SATA connector on the receiver side (generally, the motherboard connector), where SATA mVdiff p-p = 2*|SATA_RXP[x] – SATA_RXN[x]|
3. SATA Vdiff, tx is measured at the SATA connector on the transmit side (generally, the motherboard connector), where SATA mVdiff p-p = 2*|SATA_TXP[x] – SATA_TXN[x]|

For SATA_GP[x] and SATA_LED#, Please refer to the GPIO Buffer (1.8V) DC Specification in section "GPIO DC Specification".

9.5.13 PCU - SMBUS DC Specification

For SMBUS, Please refer to the GPIO Buffer (1.8V) DC Specification in section "GPIO DC Specification".

9.5.14 PCU - iLB - LPC DC Specification

Table 94. LPC Signal Group DC Specification (LPC_V1P8V3P3_S = 1.8V (ILB_LPC_AD][3:0], ILB_LPC_FRAME#, ILB_LPC_SERIRQ, ILB_LPC_CLKRUN#))

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{IH}	Input High Voltage	1.27	1.8	1.8 +0.1	V	
V_{IL}	Input Low Voltage	-0.1	0	0.58	V	
V_{OH}	Output High Voltage	0.9 x 1.8			V	
V_{OL}	Output Low Voltage			0.1 x 1.8	V	
I_{OH}	Output High Current		1.5		mA	

Table 94. LPC Signal Group DC Specification (LPC_V1P8V3P3_S = 1.8V (ILB_LPC_AD][3:0], ILB_LPC_FRAME#, ILB_LPC_SERIRQ, ILB_LPC_CLKRUN#))

Symbol	Parameter	Min	Typ	Max	Units	Notes
I_{OL}	Output Low Current		-0.5		mA	
I_{LEAK}	Input Leakage Current			30	µA	
C_{IN}	Input Capacitance	1		9	pF	

Table 95. LPC Signal Group DC Specification LPC_V1P8V3P3_S = 3.3V (ILB_LPC_AD[3:0], ILB_LPC_FRAME#, ILB_LPC_CLKRUN#)

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{IH}	Input High Voltage	0.5 x 3.3+ 0.7	3.3	3.3 +0.1	V	1
V_{IL}	Input Low Voltage	-0.1	0	0.5 x 3.3 - 0.7	V	2
V_{OH}	Output High Voltage	0.9 x 3.3			V	3
V_{OL}	Output Low Voltage			0.1 x 3.3	V	3
I_{OH}	Output High Current		1.5		mA	3
I_{OL}	Output Low Current		-0.5		mA	3
I_{LEAK}	Input Leakage Current			30	µA	
C_{IN}	Input Capacitance	1		9	pF	

NOTES:
1. V_{IH} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value, Applies to ILB_LPC_AD[3:0], ILB_LPC_CLKRUN#
2. V_{IL} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value. Applies to ILB_LPC_AD[3:0], ILB_LPC_CLKRUN#
3. V_{OH} is tested with Iout=500uA, V_{OL} is tested with Iout=1500uA
4. Applies to ILB_LPC_AD[3:0],ILB_LPC_CLKRUN# and ILB_LPC_FRAME#
5. ILB_LPC_SERIRQ is always a 1.8V I/O irrespective of the value of LPC_V1P8V3P3_S.

9.5.15 PCU - SPI (Platform Control Unit) DC Specification

Table 96. SPI Signal Group DC Specification (PCU_SPI_MISO, PCU_SPI_CS[1:0]#, PCU_SPI_MOSI, PCU_SPI_CLK)

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{REF}	I/O Voltage		PCU_1P8_G3		V	3
V_{IH}	Input High Voltage	0.5 *V_{REF}		V_{REF} + 0.5	V	2
V_{IL}	Input Low Voltage	-0.5		0.3 * V_{REF}	V	2
V_{OH}	Output High Voltage	0.9 * V_{REF}		1.8V	V	1
V_{OL}	Output Low Voltage			0.1 * V_{REF}	V	1
I_{OH}	Output High Current			1.5	mA	1
I_{OL}	Output Low Current	-0.5			mA	1

NOTES:
1. Applies to PCU_SPI_CS[1:0], PCU_SPI_CLK, PCU_SPI_MOSI
2. Applies to PCU_SPI_MISO and PCU_SPI_MOSI
3. The I/O buffer supply voltage is measured at the SoC package pins. The tolerances shown are inclusive of all noise from DC up to 20 MHz. In testing, the voltage rails should be measured with a bandwidth limited oscilloscope that has a rolloff of 3 dB/decade above 20 MHz.

9.5.16 PCU - Power Management/Thermal (PMC) & iLB RTC DC Specification

Table 97. Power Management 1.8V Suspend Well Signal Group DC Specification

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{REF}	I/O Voltage	PCU_1P8_G3			V	
V_{IH}	Input High Voltage	$0.8*V_{REF}$			V	1
V_{IL}	Input Low Voltage			$0.5*V_{REF}$	V	2
V_{OH}	Output High Voltage	$0.9*V_{REF}$		V_{REF}	V	1
V_{OL}	Output Low Voltage			$0.1*V_{REF}$	V	1

NOTES:
1. The data in this table apply to signals - PMC_ACPRESENT, PMC_BATLOW#, PMC_PLTRST#, PMC_PWRBTN#, PMC_SLP_S4#, PMC_SUS_STAT#, PMC_SUSCLK[3:0], PMC_SUSPWRDNACK
2. V_{IH} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
3. V_{IL} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.

Table 98. PMC_RSTBTN# 1.8V Core Well Signal Group DC Specification

Symbol	Parameter	Min	Typ	Max	Units	Notes
VREF	I/O Voltage	UNCORE_V1P8_S3			V	
V_{IH}	Input High Voltage	0.8* VREF			V	1
V_{IL}	Input Low Voltage			0.5* VREF	V	2

NOTES:
1. V_{IH} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. V_{IL} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.

Table 99. Power Management & RTC Well Signal Group DC Specification (PMC_RSMRST#, PMC_CORE_PWROK, ILB_RTC_RST#)

Symbol	Parameter	Min	Typ	Max	Units	Notes
VREF	I/O Voltage	RTC_VCC				
V_{IH}	Input High Voltage	2.0	-	VREF +0.5	V	1
V_{IL}	Input Low Voltage	- 0.5	-	0.78	V	2
I_I	Input leakage Current	0.1	1	100	µA	3

NOTES:
1. V_{IH} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. V_{IL} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.
3. I_I (Tyical) is specified at 30°C. V_{IL} (Maximum) is specified at Tj_{MAX}.

Table 100. iLB RTC Well DC Specification (ILB_RTC_TEST#)

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{IH}	Input High Voltage	2.0	-	VREF + 0.5	V	1
V_{IL}	Input Low Voltage	- 0.5	-	0.78	V	1

NOTES:
1. V_{IH} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. V_{IL} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.

Table 101. ILB RTC Oscillator Optional DC Specification (ILB_RTC_X1)

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{IH}	Input High Voltage	0.65	0.8	1.2	V	1
V_{IL}	Input Low Voltage			0.25	V	1

NOTES:
1. ILB_RTC_X1 DC specification is **only** used for applications with an active external clock source instead of a crystal. When a crystal is used (typical case) between ILB_RTC_X2 and ILB_RTC_X1, this spec is not used.

Table 102. PROCHOT# Signal Group DC Specification

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{REF}	I/O Voltage	CORE_V1P0_S3				
V_{IH}	Input High Voltage	$0.8*V_{REF}$		V_{REF}	V	1
V_{IL}	Input Low Voltage			$0.4*V_{REF}$	V	2
V_{OH}	Output High Voltage	$0.9*V_{REF}$		V_{REF}	V	
V_{OL}	Output Low Voltage			$0.1*V_{REF}$	V	

NOTES:
1. V_{IH} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical high value
2. V_{IL} is defined as the minimum voltage level at a receiving agent that will be interpreted as a logical low value.

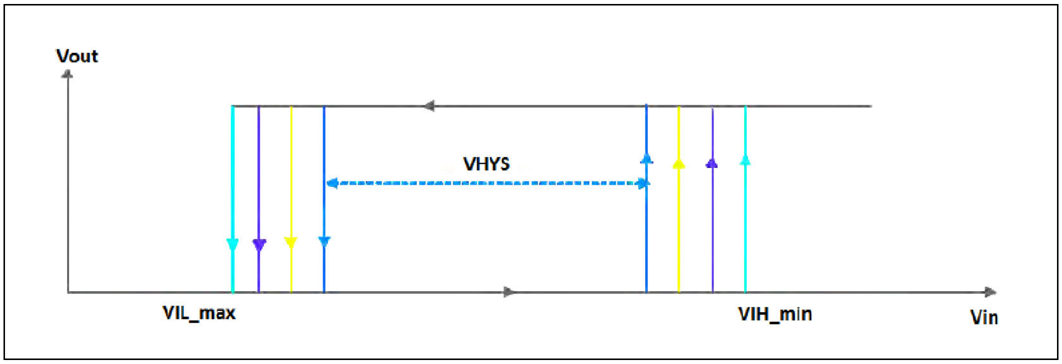
9.5.17 SVID DC Specification

Table 103. SVID Signal Group DC Specification (SVID_DATA, SVID_CLK, SVID_ALERT#)

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{REF}	I/O Voltage	SVID_V1P0_S3				
V_{IH}	Input High Voltage	$0.65*V_{REF}$			V	1
V_{IL}	Input Low Voltage			$0.44*V_{REF}$	V	1
V_{OH}	Output High Voltage				V	1
V_{OL}	Output Low Voltage			$0.1*V_{REF}$	V	4
V_{HYS}	Hysteresis Voltage	0.05			V	
R_{ON}	BUffer on Resistance	10		20	Ω	2
I_L	Leakage Current	-100		100	μA	3
C_{PAD}	Pad Capacitance			4.0	pF	4
V_{PIN}	Pin Capacitance			5.0	pF	

NOTES:
1. SVID_V1P0_S3 refers to instantaneous voltage VSS_SENSE
2. Measured at 0.31 * SVID_V1P0_S3
3. V_{IN} between 0V and SVID_V1P0_S3
4. CPAD includes die capacitance only. No package parasitic included.

Figure 17. Definition of VHYS in Table 169



9.5.18 GPIO DC Specification

GPIO Buffer is used across various interfaces on the SoC such as, GPIOs, I^2C, I2S, SPI, SDIO, SVID, UART, JTAG and ULPI

Note: I_{OX}# -> Spec is used for those GPIO which does not have industrial spec. Those GPIO interfaces that have its own industrial spec shouldn't refer to this spec.

Table 104. GPIO 3.3V Core Well Signal Group DC Specification(GPIO_S0_SC[101:0])

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{REF}	I/O Voltage	UNCORE_V3P3_S3				
V_{IH}	Input High Voltage	0.61* V_{REF}		1.24*V_{REF}	V	
V_{IL}	Input Low Voltage	-0.21*V_{REF}		0.24*V_{REF}	V	
V_{OH}	Output High Voltage	0.95* V_{REF}		V_{REF}	V	
V_{OL}	Output Low Voltage	0		0.1* V_{REF}	V	
V_{Hys}	Input Hysteresis	0.1			V	
I_L	Leakage Current			5	µA	
I_{OH}#	Output High Current			3	mA	
I_{OL}#	Output Low Current			-3	mA	
C_{LOAD}	Load Capacitance	2		75	pF	

Table 105. GPIO 3.3V Suspend Well Signal Group DC Specification (GPIO_S5[43:0])

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{REF}	I/O Voltage	PMC_V3P3_G3			V	
V_{IH}	Input High Voltage	0.61* V_{REF}		1.24*V_{REF}	V	
V_{IL}	Input Low Voltage	-0.21*V_{REF}		0.24*V_{REF}	V	
V_{OH}	Output High Voltage	0.95* V_{REF}		V_{REF}	V	
V_{OL}	Output Low Voltage	0		0.1* V_{REF}	V	

Table 105. GPIO 3.3V Suspend Well Signal Group DC Specification (GPIO_S5[43:0])

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{Hys}	Input Hysteresis	0.1			V	
I_L	Leakage Current			5	µA	
I_{OH}#	Output High Current			3	mA	
I_{OL}#	Output Low Current			-3	mA	
C_{LOAD}	Load Capacitance	2		75	pF	

Table 106. GPIO 1.8V Core Well Signal Group DC Specification (GPIO_S0_SC[101:0])

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{REF}	I/O Voltage	UNCORE_V1P8_S3				
V_{IH}	Input High Voltage	$0.65*V_{REF}$		$1.24*V_{REF}$	V	
V_{IL}	Input Low Voltage	$-0.21*V_{REF}$		$0.35 * V_{REF}$	V	
V_{OH}	Output High Voltage	V_{REF} -0.45		V_{REF}	V	
V_{OL}	Output Low Voltage	0		0.45	V	
V_{Hys}	Input Hysteresis	0.1			V	
I_L	Leakage Current			5	µA	
I_{OH}#	Output High Current			3	mA	
I_{OL}#	Output Low Current			-3	mA	
C_{LOAD}	Load Capacitance	2		75	pF	

Table 107. GPIO 1.8V Suspend Well Signal Group DC Specification (GPIO_S5[43:0])

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{REF}	I/O Voltage	PMC_V1P8_G3			V	
V_{IH}	Input High Voltage	$0.65*V_{REF}$		$1.24*V_{REF}$	V	
V_{IL}	Input Low Voltage	$-0.21*V_{REF}$		$0.35*V_{REF}$	V	
V_{OH}	Output High Voltage	V_{REF} - 0.45		V_{REF}	V	
V_{OL}	Output Low Voltage	0		0.45	V	
V_{Hys}	Input Hysteresis	0.1			V	
I_L	Leakage Current			5	µA	
I_{OH}#	Output High Current			3	mA	
I_{OL}#	Output Low Current			-3	mA	
C_{LOAD}	Load Capacitance	2		75	pF	

9.5.19 SIO - I^2C DC Specification

Table 108. I^2C Signal Electrical Specifications

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{REF}	I/O Voltage	UNCORE_V1P8_S3			V	
V_{IH}	Input High Voltage	0.7 * V_{REF}		1.24*V_{REF}	V	
V_{IL}	Input Low Voltage	0.21*V_{REF}		0.3 * V_{REF}	V	
V_{OL}	Output Low Voltage	0		0.2 * V_{REF}	V	
V_{Hys}	Input Hysteresis	0.1			V	
C_{PIN}	Pin Capacitance	2		5	pF	

9.5.20 SIO - UART DC Specification

Refer to the GPIO Buffer (1.8V) DC Specification, mentioned Section 106, "GPIO 1.8V Core Well Signal Group DC Specification (GPIO_S0_SC[101:0])" on page 152

9.5.21 I^2S (Audio) DC Specification

Refer to the GPIO Buffer (1.8V) DC Specification, mentioned Section 107, "GPIO 1.8V Suspend Well Signal Group DC Specification (GPIO_S5[43:0])" on page 152

9.6 AC Specifications

The timings specified in this section are defined at the SoC pads. Therefore, proper simulation of the signals is the only means to verify proper timing and signal quality.

See Chapter 2, "Physical Interfaces" for signal definitions and Chapter 10, "Ballout and Package Information" for the ball map. Generic timing diagrams can be found in "General AC Timing Diagrams".

The timings specified in this section should be used in conjunction with the SoC signal integrity models provided by Intel.

See the following DC Specifications in this section:

- "Integrated Clock 25 MHz Crystal AC Specification"
- "Platform Clocks AC Specification"
- "SVID AC Specification"
- "DDR3L Memory Controller AC Specification"
- "Display AC Specifications"
- "MIPI-Camera Serial Interface (CSI) AC Specification"
- "SCC - SD Card AC Specification"
- "SSC - SDIO AC specification"

- "SCC - eMMC 4.5 AC Specification"
- "SATA AC Specification"
- "USB 3.0 AC Specification"
- "ULPI USB 2.0 Device AC Specification"
- "Intel® HD Audio AC Specification"
- "I²S (Audio) AC Specification"
- "PCI Express* AC Specification"
- "PCU - PMC - Suspended Clock AC Specification"
- "1. SUSCLK duty cycle can range from 30% minimum to 70% maximum."
- "PCU - SPI NOR AC Specification"
- "PCU - iLB - LPC AC Specification"
- "SIO - I²C AC Specifications"
- "SIO - UART AC Specification"
- "JTAG AC Specification"

Note: Care should be taken to read all notes associated with a particular timing parameter.

9.6.1 Integrated Clock 25 MHz Crystal AC Specification

See"Crystal Specifications" for crystal selection.

9.6.2 Generic Clock Jitter AC Specification

Applies to the following clocks unless overridden below: SIO_I2C[0:6]_CLK, PMC+PLT_CLK[0:6], SIO_SPI_CLK, LPE_I2S[0:2]_CLK, TAP_CLK, PCU_SPI_CLK, ILB_LPC_CLK[0:1], SD3_CLK, SD2_CLK, MMC1_CLK, HDA_CLK, SVID_CLK, DDI[0:1]_DDCCLK, VGA_DDCLK.

Table 109. Generic Clock Jitter AC Specification

Symbol	Parameter	Min.	Typ	Max.	Unit	Notes
$T_{RISE/FALL}$	Minimum and Maximum Rise/Fall Time	1.5		20	ns	1, 3
T_{DC}	Duty Cycle	45		55	%	2
$T_{PEAKJIT}$	Peak Jitter (cycle to cycle)			300	ps	2
T_{PERJIT}	Period Jitter (peak to peak)			500	ps	4
T_{TIE}	Time Interval Error (peak to peak)			400	ps	5
T_{LONG}	Long Term Accuracy	-100		100	ps	

NOTES:
1. Edge Rate is measured from 10%-90% of supply voltage.
2. Cycle to cycle jitter measure for 100K samples.

3. Based on trace length of 25–200 mm, total maximum far end capacitance of 5 pF, EDS of 10 pF and board impedance of 30–75 Ω.
4. Period jitter value is measured by adjusting an oscilloscope to display a little more than one complete clock cycle with the display set to infinite persistence. Scope trigger is set on the first edge, and the period jitter is captured by measuring spread/peak-peak value of the second edge. 100K samples.
5. The TIE is estimated by measuring how far each active edge of the clock varies from its ideal position. 100K samples.

9.6.3 Platform Clocks AC Specification

Table 110. 25 MHz Platform Clock AC Specification

Symbol	Parameter	Min.	Typ	Max.	Unit	Notes
F_{PLT}	Frequency		25		MHz	
T_{DC}	Duty Cycle	45		55	%	
$T_{RISE/FALL}$	Minimum and Maximum Rise/Fall Time	5		20	ns	
V_{SWING}	Voltage Swing		1.8		V	
$T_{PEAKJIT}$	Peak Jitter (c-c)	-300		300	ps	
T_{PERJIT}	Period Jitter			500	ps	

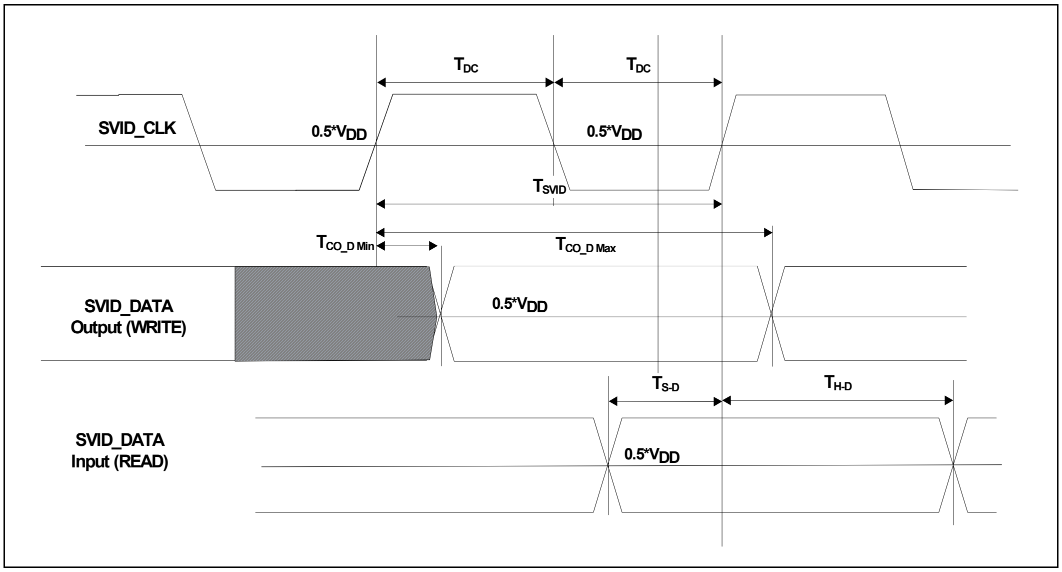
9.6.4 SVID AC Specification

Table 111. SVID AC Specification

Symbol	Parameter	Min.	Max.	Unit	Figure	Notes
F_{SVID}	SVID_CLK Frequency		25	MHz	18	
T_{DC}	SVID_CLK Duty Cycle	45	55	%		
T_{S_D}	SVID_DATA Input Setup Time	-2		ns	18	
T_{H_D}	SVID_DATA Input Hold Time	9		ns	18	
T_{CO_D}	Rising edge SVID_CLK to SVID_DATA Output	0	5	ns	18	
TRISE/ FALL	Minimum and Maximum Rise/Fall Time	0	5	ns		1, 2

NOTES:
1. Based on trace length of 0.2–4 inches, total maximum far end capacitance of 5 pF and board impedance of 25–75 Ω.
2. Measured from 30–70%

Figure 18. SVID Timing Diagram



9.6.5 DDR3L Memory Controller AC Specification

Note: The contents of this section are only valid for DRAM_VDD_S4 = 1.35V

Table 112. DDR3L Interface Timing Specification (Sheet 1 of 3)

Symbol	Parameter	Min	Max	Unit	Figure	Notes
DDR3L Electrical Characteristic and AC timings at 1066 MT/s						
T_{SLR_D}	DQ, DQSP, DQSN Input Slew Rate	3	5.5	V/ns		
System Memory Clock Timings						
$T_{CK(AVG)}$	Average CK Period		1.875	ns		
T_{CH}	Average CK High Time	0.45		tCKAVG		
T_{CL}	Average CK Low Time	0.45		tCKAVG		
T_{SKEW}	Skew between any System Memory Differential Clock Pair (CKP/CKN)		30	ps		
System Memory Command Signal Timings						
T_{CMD} (tCMDVB+tCMDVA)	Total CMD Buffer window available for command buffers (RAS#, CAS#, WE#, BS[2:0], MA)	1380		ps		1
System Memory Control Signal Timings						

Table 112. DDR3L Interface Timing Specification (Sheet 2 of 3)

Symbol	Parameter	Min	Max	Unit	Figure	Notes
T_{CTL} (tCTLVB + tCTLVA)	Total Control buffer Window available for Control buffers (CS#, CKE)	1400		ps		2
System Memory Data and Strobe Signal Timings						
T_{DVB}+T_{VDA}	Data, DQ and DM timing window available at the interface output for write commands. tDVB is data available before strobe and tDVA is data available after corresponding slope.	645		ps		3
T_{SU} + T_{HD}	Data, DQ Input Setup Plus Hold Time requirement for successful Read operation. These Setup and Hold numbers are measured w.r.t. corresponding strobe or Falling Edge	310		ps		4
T_{DQSS}	Strobe to rising clock edge during write.	-120		120	ps	
T_{WPRE}	DQSP/N Preamble duration (one dummy cycle)	0.9		tCKAVG		
T_{WPST}	DQSP/N Postamble Duration	0.4		tCKAVG		
DDR3L Electrical Characteristic and AC timings at 1333 MT/s. DRAM_VDD_S4 = 1.35 V						
T_{SLR_D}	DQ, DQSP, DQSN Input Slew Rate	3	5.5	V/ns		
System Memory Clock Timings						
$T_{CK(AVG)}$	Average CK Period		1.5	ns		
T_{CH}	Average CK High Time	0.45		tCKAVG		
T_{CL}	Average CK Low Time	0.45		tCKAVG		
T_{SKEW}	Skew between any System Memory Differential Clock Pair (CKP/CKN)		30	ps		
System Memory Command Signal Timings						
T_{CMD} (tCMDVB+tCMDVA)	Total CMD Buffer window available for command buffers (RAS#, CAS#, WE#, BS[2:0], MA)	1075		ps		1
System Memory Control Signal Timings						
T_{CTL} (tCTLVB + tCTLVA)	Total Control buffer Window available for Control buffers (CS#, CKE)	1125		ps		2
System Memory Data and Strobe Signal Timings						

Table 112. DDR3L Interface Timing Specification (Sheet 3 of 3)

Symbol	Parameter	Min	Max	Unit	Figure	Notes
T_{DVB}+T_{VDA}	Data, DQ and DM timing window available at the interface output for write commands. tDVB is data available before strobe and tDVA is data available after corresponding slope.	495		ps		3
T_{SU} + T_{HD}	Data, DQ Input Setup Plus Hold Time requirement for successful Read operation. These Setup and Hold numbers are measured w.r.t. corresponding strobe or Falling Edge	255		ps		4
T_{DQSS}		-120		120	ps	
T_{WPRE}	DQSP/N Preamble duration (one dummy cycle)	0.9		tCKAVG		
T_{WPST}	DQSP/N Postamble Duration	0.4		tCKAVG		

NOTES:
1. The CMD time is measured w.r.t. differential crossing of DRAM_CKP and DRAM_CKN. The tCMDVB and tCMDVA will be adjusted for proper CMD Setup and Hold time requirement at DRAM. The command timing assumes CMD-1N Mode.
2. The CTL time is measured w.r.t. differential crossing of DRAM_CKP and DRAM_CKN. The tCTLVB and tCTLVA will be adjusted for proper CTL Setup and Hold time requirement at DRAM.
3. The accurate strobe placement using write training algorithm will be performed which will guarantee the required Data setup/hold time w.r.t. strobe differential crossing at the DRAM input.
4. The Read training algorithm will center the DQS internally inside DRAM interface in order to have equal tSU and tHD timings.
5. All the timing windows are measured at 50% of the respective DRAM signal swing.

9.6.6 Display AC Specifications

9.6.6.1 DDI Main Transmitter AC specification

Table 113. DDI Main Transmitter AC specification (Sheet 1 of 2)

Symbol	Parameter	Min	Typ	Max	Units	Notes
f_{HBR}	Frequency for High Bit Rate	2.68569	2.7	2.70081	Gbps	1
f_{RBR}	Frequency for Reduced Bit Rate	1.61141	1.62	1.620048	Gbps	1
UI_High_Rate	Unit Interval for high bit rate (2.7 Gbps / lane)		370		ps	1
UI_Low_Rate	Unit Interval for high bit rate (1.62 Gbps / lane)		617		ps	1
Down_Spread_Amplitude	Link clock down Spreading	0		0.5	%	2
Down_Spread_Frequency	Link Clock down Spreading Frequency	30		33	kHz	3

Table 113. DDI Main Transmitter AC specification (Sheet 2 of 2)

Symbol	Parameter	Min	Typ	Max	Units	Notes
$T_{TX-EYE\_CHIP\_High\_Rate}$	Minimum TX Eye Width at Tx package pins	0.72			UI	4
$T_{TX-EYE-MEDIAN-to-MAX-JITTER\_CHIP\_\_High\_Rate}$	Maximum time between the jitter median and maximum deviation from the median at Tx package pins			0.147	UI	4
$T_{TX-EYE\_CHIP\_Low\_Rate}$	Minimum TX Eye Width at Tx package pins	0.82			UI	5
$T_{TX-EYE-MEDIAN-to-MAX-JITTER CHIP Low\_Rate}$	Maximum time between the jitter median and maximum deviation from the median at Tx package pins			0.09	UI	5
$T_{TX-RISE\_CHIP}$, $T_{TX-FALL\_CHIP}$	D+/D- TX Output Rise/Fall Time at Tx package pins	50		130	ps	6
ITX-SHORT	TX Short Circuit Current Limit			50	mA	7
$L_{TX-SKEWINTER\_PAIR}$	Lane-to-Lane Output Skew at Tx package pins			2	UI	
$L_{TX-SKEWINTRA\_PAIR}$	Lane Intra-pair Output Skew at Tx package pins			20	ps	
$T_{TX-RISE\_FALL\_MISMATCH\_CHIPDIFF}$	Lane Intra-pair Rise-fall Time Mismatch at Tx package pins.			5	%	8
$F_{TX-REJECTION-BW}$	Clock Jitter Rejection Bandwidth			4	MHz	9
$V_{TX-AC-CM}$	TX AC Common Mode Voltage			20	mV	2
C_{TX}	AC Coupling Capacitor	75		200	nF	11
T_{RISE}/T_{FALL}	Rise time/ Fall time (20%-80%)	75		-	ps	
$V_{UNDERSHOOT}$	Undershoot, max			0.25 of full differential amplitude		
$L_{TX-SKEWINTER\_PAIR}$	Intra-Pair skew at source connector			0.15 UI	ps	
$L_{TX-SKEWINTRA\_PAIR}$	Intra-Pair skew at source connector			1.212	ns	12
	Clock duty cycle, min/average/max	40	50	60	%	
	TMDS differential Clock Jitter			0.25	UI	

NOTES:
1. Frequency High limit = +300ppm; Low limit = -5300ppm
2. Range: 0% ~ 0.5% when downspread enabled
3. Range: 30 kHz ~33 kHz when downspread enabled.
4. For High Bit Rate.
5. For Reduced Bit Rate.
6. At 20 to 80
7. Total drive current of the transmitter when it is shorted to its ground.
8. Informative. D+ rise to D- fall mismatch and D+ fall to D- rise mismatch.

9. Informative. Transmitter jitter must be measured at source connector pins using a signal analyzer that has a 2nd order PLL with tracking bandwidth of 20MHz (for D10.2 pattern) and damping factor of 1.428.
10. Measured at 1.62 GHz and 2.7 GHz (if supported), within the frequency tolerance range. Time-domain measurement using a spectrum analyzer.
11. All DisplayPort Main Link lanes as well as AUX CH must be AC coupled. AC coupling capacitors must be placed on the transmitter side. Placement of AC coupling capacitors on the receiver side is optional.
12. 0.20* Tcharacter @165MHz

Table 114. DDI AUX Channel AC Specification

Symbol	Parameter	Min	Typ	Max	Units	Notes[1]
UI	AUX Unit Interval	0.4	0.5	0.6	µs	1
$T_{AUX\text{-}BUS\text{-}PARK}$	AUX CH bus park time	10			ns	2
$T_{CYCLE\text{-}to\text{-}CYCLE}$ Jitter	Maximum allowable UI variation within a single transaction at connector pins of a transmitting Device			0.08	UI	3
	Maximum allowable variation for adjacent bit times within a single transaction at connector pins of a transmitting Device			0.04	UI	4
I_{AUX_SHORT}	AUX Short Circuit Current Limit			90	mA	5
C_{AUX}	AC Coupling Capacitor	75		200	nF	6

NOTES:
1. Results in the bit rate of 1Mbps including the overhead of ManchesterII coding.
2. Period after the AUX CH STOP condition for which the bus is parked
3. Equal to 48 ns maximum. The transmitting Device is a Source Device for a Request transaction and a Sink Device for a Reply Transaction
4. Equal to 24 ns maximum. The transmitting Device is a Source Device for a Request transaction and a Sink Device for a Reply Transaction.
5. Total drive current of the transmitter when it is shorted to its ground.
6. The AUX CH AC-coupling capacitor placed on both the DP upstream and downstream devices.

9.6.6.2 Analog VGA Display AC Specification

The VGA DAC (digital-to-analog converter) consists of three identical 8-bit DACs to provide red, green, and blue color components. Each DAC can output a current from 0 to 255 units of current, where one unit of current (LSB) is defined based on the VESA video signal standard.

Table 115. R,G,B / VGA DAC Display AC Specification (Sheet 1 of 2)

Symbol	Parameter	Min	Nom	Max	Unit	Notes
Pixel Clock Frequency = 300 MHz						
T_{RISE}	R,G,B Video Rise TIme	0.33		1.67	ns	1,2,8 (10-90% of “black”-to-”white” video transition)
T_{FALL}	R,G,B Video Fall TIme	0.33		1.67	ns	1,3,8 (90-10% of “black”-to-”white” video transition)
$T_{SETTLING}$	Settling time		1.0		ns	1,4,8
VO	Video Channel-to-Channel output skew		0.833		ns	1,5,8
	Overshoot/ Undershoot	-0.084		+0.084	V	1,6,8 (0.7V full-scale voltage step)

Table 115. R,G,B / VGA DAC Display AC Specification (Sheet 2 of 2)

Symbol	Parameter	Min	Nom	Max	Unit	Notes
	Noise Injection Ratio		2.5		%	
Pixel Clock Frequency = 350 MHz						
T_{RISE}	R,G,B Video Rise TIme	0.286		1.43	ns	1,2,8 (10-90% of "black"-to-"white" video transition)
T_{FALL}	R,G,B Video Fall TIme	0.286		1.43	ns	1,3,8 (90-10% of "black"-to-"white" video transition)
$T_{SETTLING}$	Settling time		0.857		ns	1,4,8
VO	Video Channel-to-Channel output skew		0.714		ns	1,5,8
	Overshoot/ Undershoot	-0.084		+0.084	V	1,6,8 (0.7V full-scale voltage step)
	Noise Injection Ratio		2.5		%	

NOTES:
1. Measured at each R,G,B termination according to the VESA Test Procedure - Evaluation of Analog Display Graphics Subsystems Proposal (Version 1, Draft 4, December 1, 2000).
2. R,G,B Max Video Rise/Fall Time: 50% of minimum pixel clock period
3. R,G,B Min Video Rise./Fall Time: 10% of minimum pixel clock period
4. Max settling time: 30% of minimum pixel clock period
5. Video channel-to-channel output skew: 25% of minimum pixel clock period
6. Overshoot/Undershoot: ±12% of "black"-to-"white" video step function
7. Noise Injection Ratio: 2.5% of maximum luminance voltage (dc to max pixel clock frequency)
8. R,G,B AC parameters are strongly dependent on the board design & implementation: actual performance may differ from values noted above depending on board implementation.

Table 116. VGA_HSYNC and VGA_VSYNC AC Specification

Symbol	Parameter	Min	Max	Units	Notes[1]
T_F	Fall Time	--	80% of minimum pixel clock period	ns	
T_R	Rise Time	--	80% of minimum pixel clock period	ns	
--	Overshoot/Undershoot	--	30% of high level signal voltage range	mA	1
--	Jitter (measured between Hsync pulses)	--	One half of the difference between max and min interval <15% of the pixel clock, DC to max.	V	2

NOTES:
1. No signal non-monotonicity / excursions allowed in the 0.5 to 2.4V range
2. Measured over 100,000 intervals. Horizontal refresh rate at all image format, worse-case screen patterns.

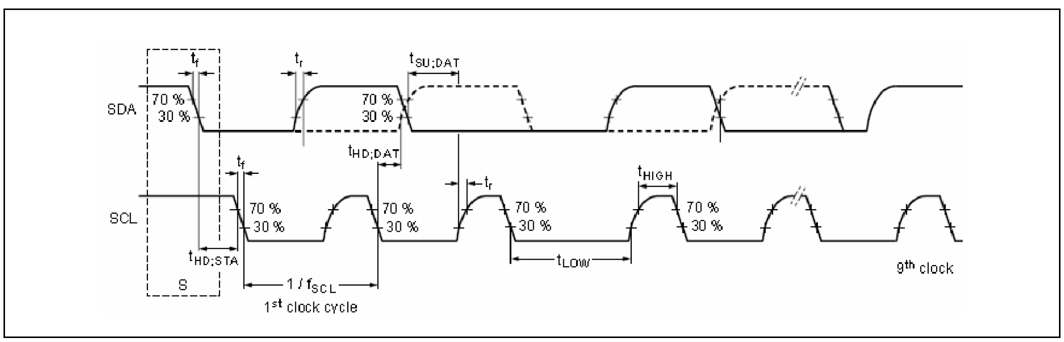
Table 117. VGA_DDCDATA, and VGA_DDCCLK Timing Specification

Symbol	Parameter	Standard mode 100kbits/s		Units	Figures
		Min	Max		
f_{SCL}	SCL Clock Frequency	0	100	kHz	34
t_{LOW}	Low Period of SCL Clock	4.7	--	µs	
t_{HIGH}	High Period of SCL Clock	4	--	µs	
t_R	Rise Time[1] of Both SDA and SCL Signals	--	1000	ns	
t_F	Fall Time[1] of Both SDA and SCL Signals	--	300	ns	
$t_{HD:DAT}$	Data Hold Time[3]	0	--	µs	
$t_{SU:DAT}$	Data Setup Time	250	--	ns	

NOTES:

1. Measurement point for rise and fall time: V_{IL}(min) - V_{IL}(max)
2. $t_{HD:DAT}$ is the data hold time that is measured from the falling edge of SCL, applies to data in transmission and the acknowledge.

Figure 34. VGA_DDCDATA, and VGA_DDCCLK Timing Diagram



9.6.7 MIPI-Camera Serial Interface (CSI) AC Specification

Based on version 2 of the MIPI-CSI specification.

Table 118. MIPI-CSI-2 Receiver Characteristics (Sheet 1 of 2)

Symbol	Parameter	Min.	Typ.	Max.	Unit	Notes
MIPI HS-Receiver Mode						
$\Delta V_{CMRX(HF)}$	Common-mode interference above 450 MHz	–	–	100	mV	2, 9
$\Delta V_{CMTX(LF)}$	Common-mode interference between 50–450 MHz	-50	–	50	mV	1, 4
C_{CM}	Common-mode termination	–	–	60	pF	3

Table 118. MIPI-CSI-2 Receiver Characteristics (Sheet 2 of 2)

Symbol	Parameter	Min.	Typ.	Max.	Unit	Notes
S_{CDRX}	differential to common-mode	–	–	-26	dB	From 0 to fMAX (1.33Ghz)
MIPI LP-Receiver Mode						
e_{spike}	Input pulse rejection	–	–	300	V*ps	5, 6, 7
T_{MIN-RX}	Minimum pulse width response	20	–	–	ns	8
V_{INT}	Peak interference amplitude	–	–	200	mV	
f_{INT}	Interference frequency	450	–	–	MHz	

NOTES:

1. Excluding static ground shift of 50 mV.
2. $\Delta V_{CMRX(HF)}$ is the peak amplitude of a sine wave superimposed on the receiver inputs.
3. For higher bit rates a 14 pF capacitor is needed to meet the common-mode return loss specification.
4. Voltage difference compared to the DC average common-mode potential.
5. Time-voltage integration of a spike above V_{IL} when in the LP-0 state or below V_{IH} when in the LP-1 state.
6. An impulse spike less than this will not change the receiver state.
7. In addition to the required glitch rejection, designers shall ensure rejection of known RF-interference.
8. An input pulse greater than this will toggle the output
9. Improves on DPHY specification, which requires 100 mV maximum.

Figure 35. Input Glitch Rejection of Low-Power Receivers

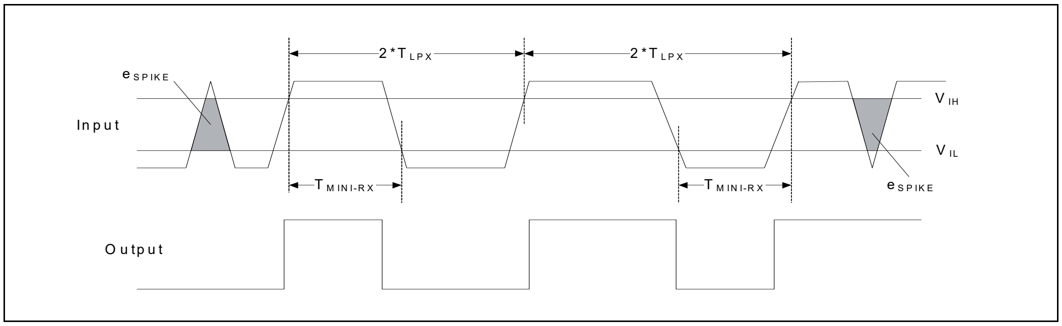


Table 119. MIPI-CSI-2 Clock Signal Specification

Symbol	Clock Parameter	Min.	Typ.	Max.	Unit	Notes
UI_{INST}	UI Instantaneous (In 1 or 2 or 3 or 4 Lane configuration)	1 (1Gbps/ 500Mhz)		2.77 (163 Mbps/ 80Mhz)	ns	1

NOTE: [1]The minimum UI shall not be violated for any single bit period, that is, any DDR half cycle within a data burst.

Figure 36. MIPI-CSI-2 Clock Definition

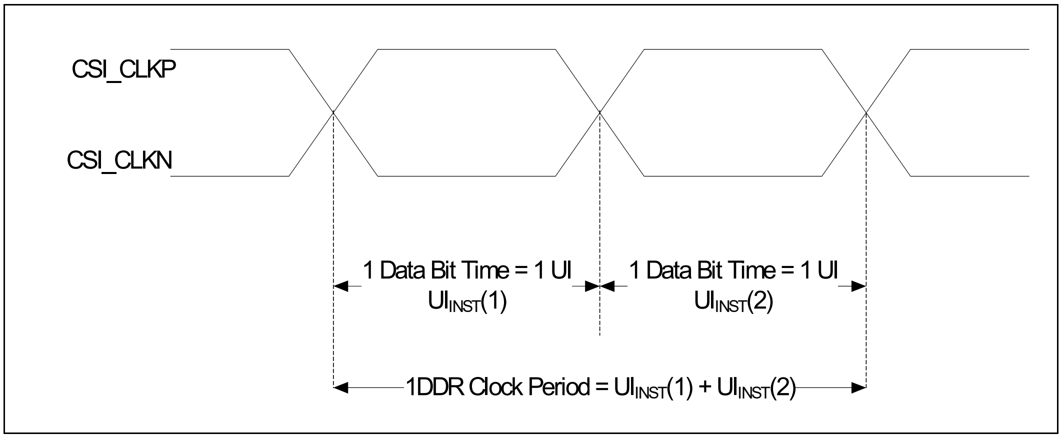

Table 120. MIPI CSI 2 Data Clock Timing Specifications

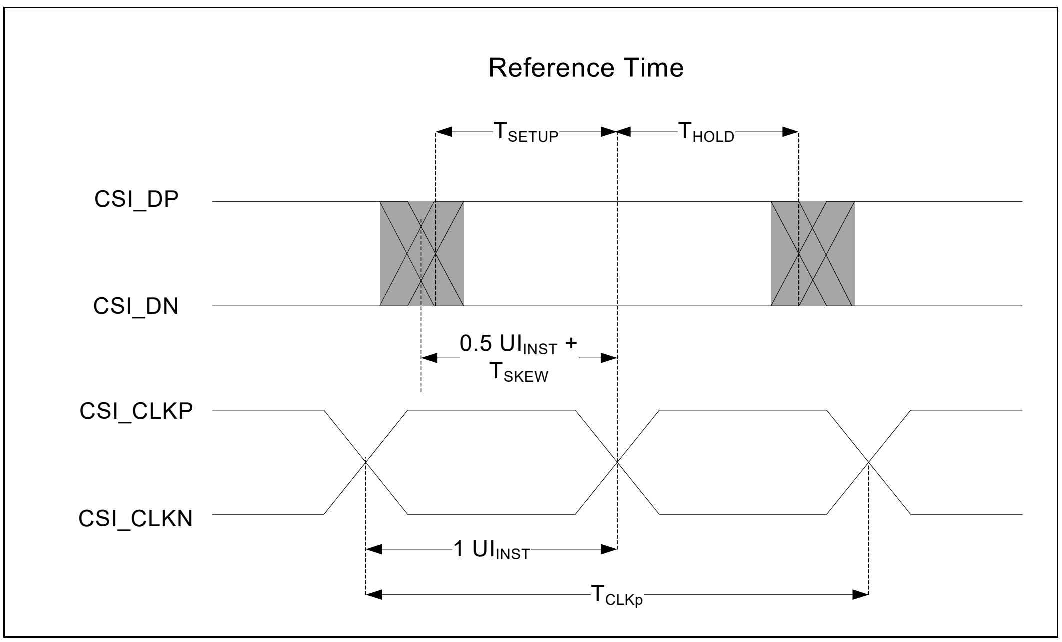
Symbol	Parameter	Min.	Typ.	Max.	Units	Notes
TSETUP[RX]	Data to Clock Setup Time [receiver]	0.15	–	–	UI_{INST}	1, 2
THOLD[RX]	Clock to Data Hold Time [receiver]	0.15	–	–	UI_{INST}	1, 2

NOTES:
1. Total silicon and package delay budget of $0.3*UI_{INST}$
2. Total setup and hold window for receiver of $0.3*UI_{INST}$

Figure 37. MIPI-CSI-2 Data to Clock Timing Definitions



9.6.8 SCC - SD Card AC Specification

Table 121. SD Card AC Specification

Symbol	Parameter	Min.	Max.	Unit	Figure	Notes
$T_{wc(DDR50)}$	CLK cycle time for DDR50 Mode	19	–	ns	41	
$T_{wc(SDR25)}$	CLK cycle time for SDR25 Mode	19	–	ns	42	
$T_{wc(SDR12)}$	CLK cycle time for SDR12 Mode	39	–	ns	45	
$T_{ODLY(DDR50)}$	SD_CLK Transitioning Edge to SDIO_D	2	6	ns	41	
$T_{ODLY(SDR25)}$	SD_CLK Rising Edge to SDIO_D	2	12	ns	42	
$T_{ODLY(SDR12)}$	SD_CLK Falling Edge to SDIO_D	0	12	ns	45	
T_{SU_SOC} (DDR)	SoC setup time (data valid before clock launched)	3	–	ns	41 (For DDR50 Mode)	
T_{SU_SOC} (SDR)	SoC setup time (data valid before clock launched)	5	–	ns	40 (For SDR12/25 Mode)	
T_{HD_SOC} (DDR)	SoC hold time (data valid after clock launched)	2	–	ns	41 (For DDR50 Mode)	
T_{HD_SOC} (SDR)	SoC hold time (data valid after clock launched)	2	–	ns	40 (For SDR12/25 Mode)	
$T_{RISE\ CLK}$/ $T_{FALL\ CLK}$ (1.8V)	Clock Rise and Fall Time (1.8V operation)	1	4	ns		1, 2, 3, 4
$T_{RISE\ CLK}$/ $T_{FALL\ CLK}$ (3.3V)	Clock Rise and Fall Time (3.3V operation)	1	4	ns		1, 2, 3, 4

1. Based on trace length of 0.25”–4”, 2–5 pF Far End Load for Port 0 AND 2–10 pF Far End Load (for Port 1 and Board impedance of 25–75 Ω.
2. Minimum time deviates from SDIO Specification 2.0, minimum time is not defined in specification.
3. Measured from 0.58–1.27V.

4. Takes into consideration EMI filter of 10 pF - 40 Ω -10 pF.

NOTES:

1. Measured at A plug.
2. Measured at A receptacle.
3. Measured at B receptacle.
4. Measured at A or B connector.
5. Measured with RL of 1.425 kΩ to 3.6 V.
6. Measured with RL of 14.25 kΩ to GND.
7. Timing difference between the differential data signals.
8. Measured at crossover point of differential data signals.
9. The maximum load specification is the maximum effective capacitive load allowed that meets the target VBUS drop of 330 mV.
10. Excluding the first transition from the Idle state.
11. The two transitions should be a (nominal) bit time apart.
12. For both transitions of differential signaling.
13. Must accept as valid EOP.
14. Single-ended capacitance of D+ or D- is the capacitance of D+/D- to all other conductors and, if present, shield in the cable. That is, to measure the single-ended capacitance of D+, short D-, VBUS, GND, and the shield line together and measure the capacitance of D+ to the other conductors.
15. For high power devices (non-hubs) when enabled for remote wakeup.

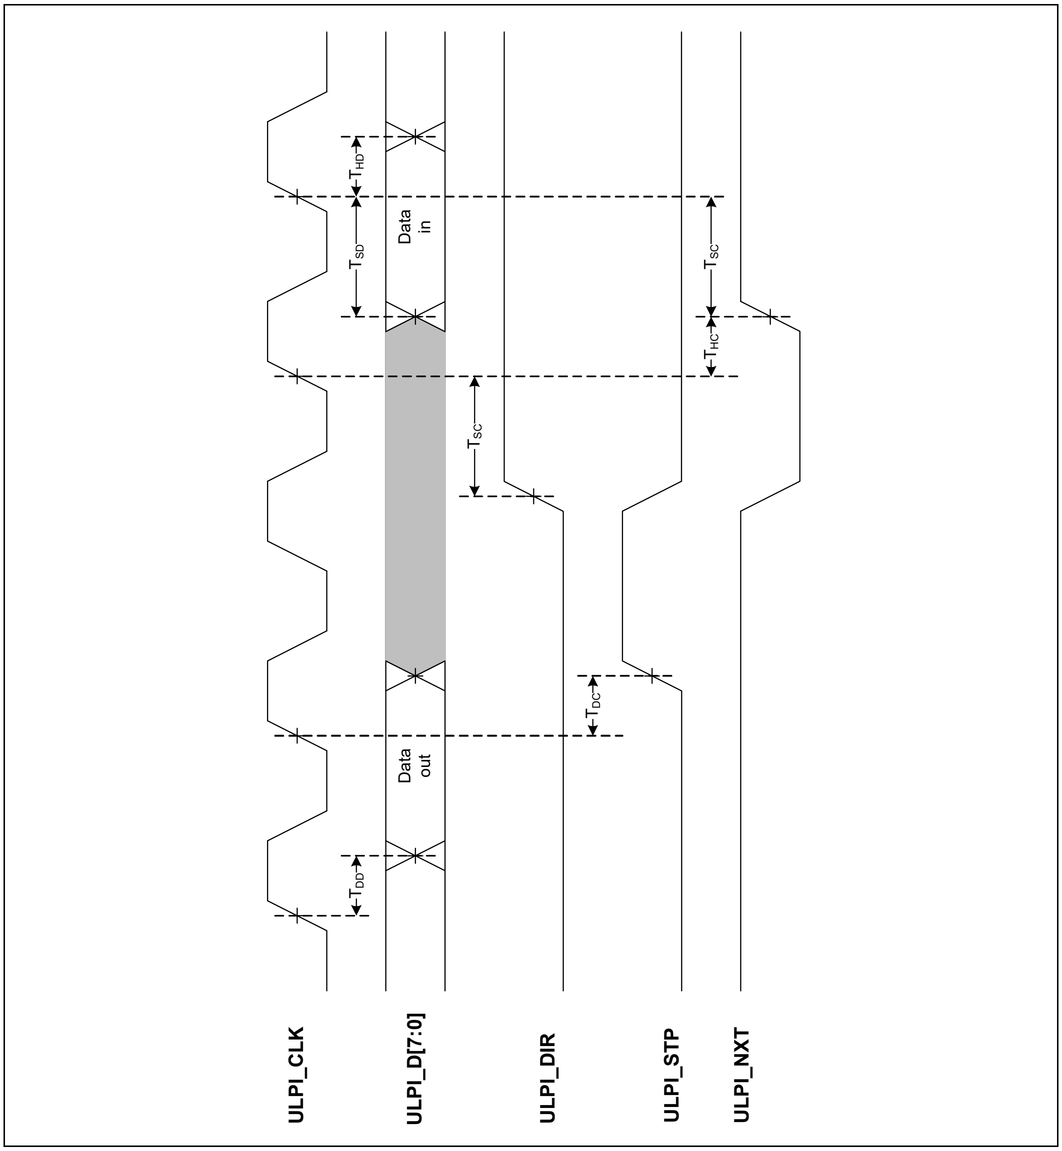
TSC,TSD	Setup time (control in, 8-bit data in) relative to rising clock edge at host	6		-	ns	
THC,THD	Hold time (control in, 8-bit data in) relative to rising clock edge at host	0			ns	
TDC,TDD	Output delay (control in, 8-bit data in) relative to rising clock edge at host	0		-	ns	3
TRISE/FALL	Rise/Fall time (control out, 8-bit data out)	2		7	ns	1,2,4

NOTES:
1. Based on trace length of 1–4”, Far End Load of 1–5 pF and board impedance of 30–75 ohms.
2. Measured from 10–90%.
3. Minimum time deviates from ULPI Specification, minimum time is not defined in ULPI Specification.
4. Minimum time and Maximum time not mentioned in the ULPI Specification.

Figure 59. ULPI Timing Diagram



9.6.15 Intel® HD Audio AC Specification

9.6.15.1 1.5-V AC specification

The output driver on the Intel HD Audio electrical link must be able to deliver an initial voltage of at least V_{IL_HDA} or V_{IH_HDA} respectively at the receiver through the bus with known characteristic impedance and at the same time meeting signal quality requirements.

The minimum and maximum drive characteristics of Intel HD Audio output buffers are defined by the V/I curves. Table 132 and Figure 60 describe the SDO buffer AC drive specification where as the Table 133 and Figure 61 describe the AC drive specification of the HDA_SDI[x] buffers. The AC drive specification for HDA_SYNC, HDA_RST# and HDA_CLK buffers is same as that of HDA_SDO.

These curves should be interpreted as traditional 'DC' transistor curves with the following exceptions: 'DC drive point' is the only position on the curves at which steady state operation is intended, while the higher currents are only reached momentarily during bus switching transients. The 'AC drive point' (real definition of buffer strength) defines the minimum instantaneous current required to switch the bus.

Adherence to these curves should be evaluated at worst case conditions. Minimum pull up curve is evaluated at minimum VCC_{HDA} and high temperature. Minimum pull down curve is evaluated at minimum VCC_{HDA} and high temperature. The maximum curve test points are evaluated at maximum VCC_{HDA} and low temperature.

Inputs must be clamped to both ground and power rails. The clamp diode characteristics are also listed here for reference.

Figure 60. V/I Curves for HDA_SDO buffers

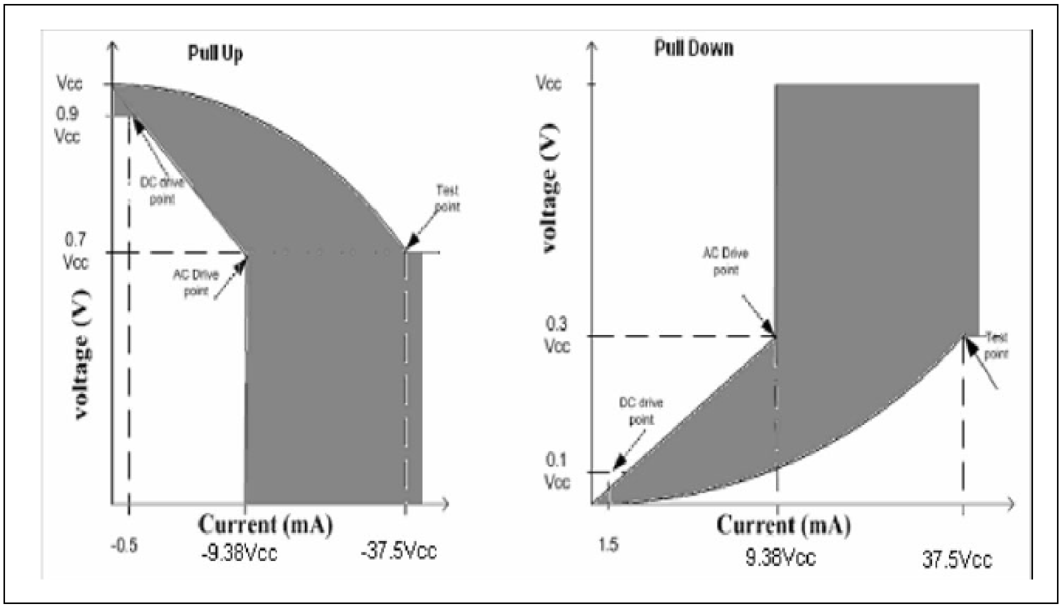


Table 132. HDA_SDO 1.5V Buffer AC Specification (Sheet 1 of 2)

Symbol	Parameter	Condition	Min	Max	Unit
I_{OH}	switching Current High	$0 < V_{O\_HDA} < 0.7VCC_{HDA}$	$-16.67VCC_{HDA}$		mA
		$0.7VCC_{HDA} < V_{O\_HDA} < 0.9VCC_{HDA}$	$-55.57(VCC_{HDA}\text{-Vout})$		mA

Table 132. HDA_SDO 1.5V Buffer AC Specification (Sheet 2 of 2)

Symbol	Parameter	Condition	Min	Max	Unit
		$0.7VCC_{HDA} < V_{O\_HDA} < VCC_{HDA}$		$(151.52/VCC_{HDA}) * (V_{O\_HDA}-VCC_{HDA}) * (V_{O\_HDA} + 0.4VCC_{HDA})$	mA
	(Test Point)	$V_{O\_HDA} = 0.7VCC_{HDA}$		$-50VCC_{HDA}$	mA
I_{OL}	Low Period of SCL Clock	$VCC_{HDA} > V_{O\_HDA} >0.3VCC_{HDA}$	$16.67VCC_{HDA}$		mA
		$0.3VCC_{HDA} > V_{O\_HDA} > 0.1VCC_{HDA}$	57.57Vout		mA
		$0.3VCC_{HDA} > V_{O\_HDA} >0$		$(238.1/VCC_{HDA}) * V_{O\_HDA} * (VCC_{HDA}-V_{O\_HDA})$	mA
	(Test Point)	$V_{O\_HDA} = 0.3VCC_{HDA}$		$50VCC_{HDA}$	mA
I_{CL}	Low Clamp Current	$-3 < V_{I\_HDA} < -1$	$-25 + (V_{I\_HDA}+1)/0.015$		
I_{CH}	High Clamp Current	$VCC_{HDA}+4 > Vin > VCC_{HDA}+1$	$25+(V_{I\_HDA}-VCC_{HDA}-1)/0.015$		
Slew_r	Output rise Slew rate	$0.25VCC_{HDA}$ to $0.75VCC_{HDA}$	0.5	1.5	V/ns Slew rate (note1)
Slew_f	Output rise Slew rate	$0.75VCC_{HDA}$ to $0.25VCC_{HDA}$	0.5	1.5	V/ns Slew rate (note1)

NOTE:

1. Slew rate is to be interpreted as the cumulative edge rate across the specified range, ($0.25VCC_{HDA}$ to $0.75VCC_{HDA}$ load for rise and $0.75VCC_{HDA}$ to $0.25VCC_{HDA}$ load for fall), rather than instantaneous rate at any point within the transition range.

Table 133. HDA_SDI[x] 1.5V Buffer AC Specification (Sheet 1 of 2)

Symbol	Parameter	Condition	Min	Max	Unit
I_{OH}	switching Current High	$0 < V_{O\_HDA} < 0.7VCC_{HDA}$	$-9.38VCC_{HDA}$		mA
		$0.7VCC_{HDA} < V_{O\_HDA} < 0.9VCC_{HDA}$	$-31.27(VCC_{HDA}-V_{O\_HDA})$		mA

Table 133. HDA_SDI[x] 1.5V Buffer AC Specification (Sheet 2 of 2)

Symbol	Parameter	Condition	Min	Max	Unit
		$0.7VCC_{HDA} < V_{O\_HDA} < VCC_{HDA}$		$(113.64/VCC_{HDA}) * (V_{O\_HDA}-VCC_{HDA}) * (V_{O\_HDA}+0.4VCC_{HDA})$	mA
	(Test Point)	$V_{O\_HDA} = 0.7VCC_{HDA}$		$-37.5VCC_{HDA}$	mA
I_{OL}	Low Period of SCL Clock	$VCC_{HDA} > V_{O\_HDA} > 0.3VCC_{HDA}$	$9.38VCC_{HDA}$		mA
		$0.3VCC_{HDA} > V_{O\_HDA} > 0.1VCC_{HDA}$	$31.27V_{O\_HDA}$		mA
		$0.3VCC_{HDA} > V_{O\_HDA} > 0$		$(178.57/VCC_{HDA}) * V_{O\_HDA} * (VCC_{HDA}-V_{O\_HDA})$	mA
	(Test Point)	$V_{O\_HDA} = 0.3VCC_{HDA}$		$37.55VCC_{HDA}$	mA
I_{CL}	Low Clamp Current	$-3 < V_{I\_HDA} < -1$	$-25 +(V_{I\_HDA}+1)/0.015$		
I_{CH}	High Clamp Current	$VCC_{HDA}+4 > V_{I\_HDA} > VCC_{HDA}+1$	$25+(V_{I\_HDA}-VCC_{HDA}-1)/0.015$		
Slew_r	Output rise Slew rate	$0.25VCC_{HDA}$ to $0.75VCC_{HDA}$	0.5	1.5	V/ns Slew rate (note1)
Slew_f	Output rise Slew rate	$0.75VCC_{HDA}$ to $0.25VCC_{HDA}$	0.5	1.5	V/ns Slew rate (note1)

NOTE:

1. Slew rate is to be interpreted as the cumulative edge rate across the specified range, ($0.25VCC_{HDA}$ to $0.75VCC_{HDA}$ load for rise and $0.75VCC_{HDA}$ to $0.25VCC_{HDA}$ load for fall), rather than instantaneous rate at any point within the transition range.

9.6.15.2 Maximum AC Ratings and Device Protection

All Intel HD Audio buffers should be capable of withstanding continuous exposure to the waveform shown in Figure 61. It is recommended that these waveforms be used as qualification criteria against which the long term reliability of each device is evaluated. Table 134 and Table 135 list the parameters of the waveform. This level of robustness should be guaranteed by design; it is not intended that this waveform should be used as a production test.

These waveforms are applied with the equivalent of a zero impedance voltage source, driving through a series resistor directly into each input or tri-stated output pin. The open-circuit voltage of the voltage source is shown in Figure 61, which is based on the worst case overshoot and undershoot expected in actual Intel HD Audio buses. The resistor values are calculated to produce the worst case current into an effective internal clamp diode.

Figure 61. Maximum AC Waveforms for 1.5 V Signaling

NOTE:

1. The voltage waveform is supplied at the resistor shown in the evaluation setup, not the package pin.
2. Any internal clamping in the device being tested will greatly reduce the voltage levels seen at the package pin.

Table 134. 1.5V Parameters for Maximum AC Signalling Waveforms

Symbol	Parameter	Min	Max	Unit
V_1	Overshoot Voltage		3.25	V
V_2	Undershoot Initial Voltage		1.65	V
V_3	Undershoot Voltage	-1.6		V
V_{pu}	Waveform peak-to-peak		3.25	V
V_{po}	Waveform peak-to-peak		3.25	V
t_{rf}	Rise/fall time	0.5	1.5	V/ns
f_{SDI}	Frequency of AC rating waveform as applied to SDI input buffers		24	MHz
f_{SDO}	Frequency of AC rating waveform as applied to SDO input buffers		24	MHz

Table 135. Resistance value for the AC rating Waveform

Condition	Value
Overshoot waveform at the codec	65 Ohms
Undershoot waveform ar the codec	101 Ohms
Overshoot waveform at the controller	108 Ohms

Table 135. Resistance value for the AC rating Waveform

Condition	Value
Undershoot waveform ar the controller	133 Ohms

NOTE:
1. The voltage waveform is supplied at the resistor shown in the evaluation setup, not the package pin.
2. Any internal clamping in the device being tested will greatly reduce the voltage levels seen at the package pin.

9.6.16 I^{2}S (Audio) AC Specification

9.6.16.1 I^{2}S Slave Mode AC Specification

Table 136. I^{2}S AC Timings

Symbol	Parameter	Min.	Max.	Units	Figure	Notes
T_{DC}	Clock Duty Cycle	45	55	%	62, 63, 64	
T_{I2S}	Clock Frequency		12.25	MHz	62, 63, 64	
$T_{S\text{-}RXD}$	Setup for DATAIN with respect to the CLK active edge.	6	–	ns	62, 63, 64	1, 2, 3
T_{H_RXD}	Hold for DATAIN with respect to the CLK active edge.	6	–	ns	62, 63, 64	1, 2, 3
$T_{S\text{-}FS}$	Setup for FRM with respect to the CLK active edge.	6	–	ns	62, 63, 64	1, 2, 3
T_{H_FS}	Hold for FRM with respect to CLK active edge.	20	–	ns	62, 63, 64	1, 2, 3
T_{CO_TXD}	Tco of DATAOUT with respect to CLK active edge at the host	–	18	ns	62, 63, 64	1, 2,3

NOTE:
1. Active edge refers to the mode selected.
2. For I^{2}S mode, data launches at falling edge and is being captured at rising edge.
3. For PCM mode data launches at rising edge and is being captured at falling edge. PCM Mode has two different modes, Short Frame Mode and Long Frame Mode.
   a. Short Frame Mode—FS is asserted one clock cycle earlier than data is launched by the Master.
   b. Long Frame Mode—FS and Data are launched on the same clock edge by the Master.

Figure 62. I²S Slave Port Timings in I²S Mode

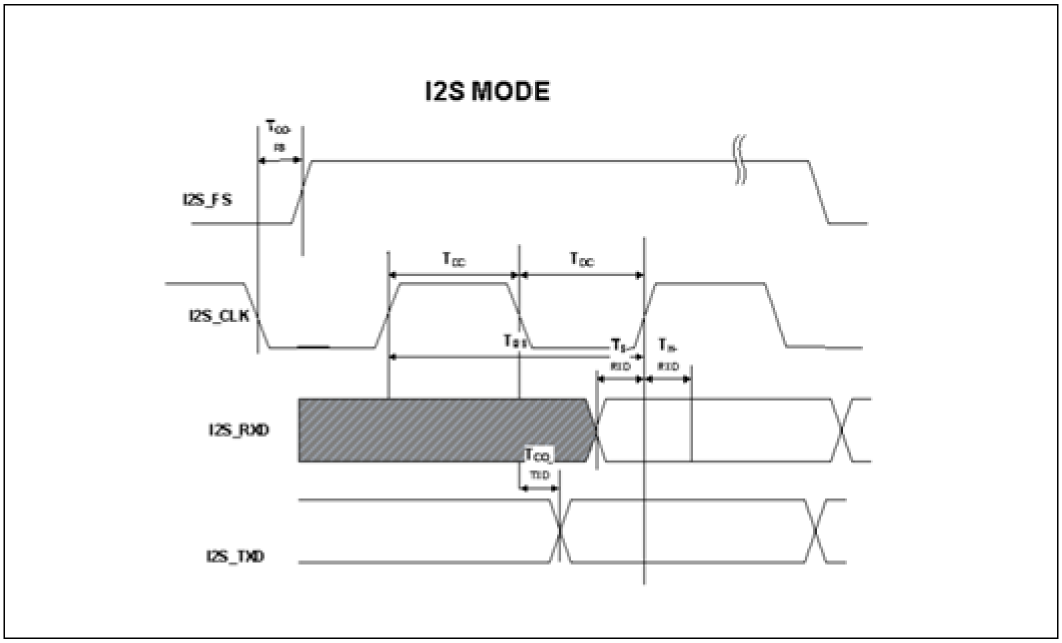

Figure 63. I²S Slave Port Timings in PCM Short Frame Mode

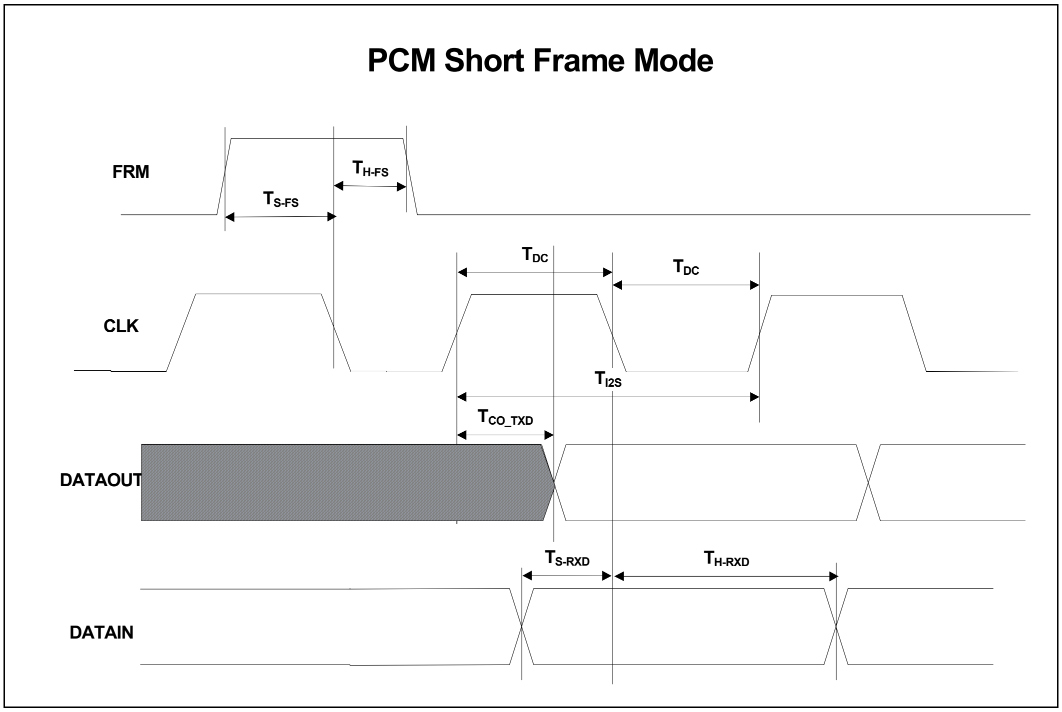

Figure 64. I^{2}S Slave Port Timings in PCM Long Frame Mode

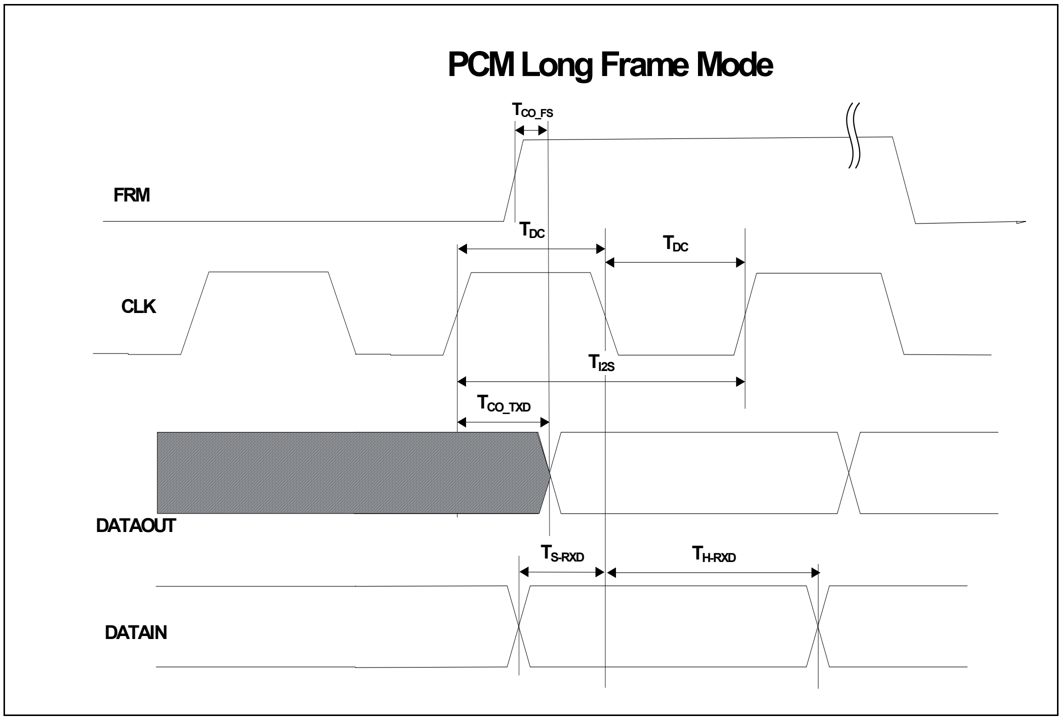

9.6.16.2 I^{2}S Master Mode AC Specification

Table 137. I^{2}S Master Mode AC Timing

Symbol	Parameter	Min.	Max.	Units	Figure
T_{DC}	Clock Duty Cycle	45	55	%	
T_{I2S}	Clock Frequency		12.5	MHz	
$T_{S\text{-}RXD}$	Setup for DATAIN with respect to the CLK active edge	10	–	ns	
$T_{H\text{-}RXD}$	Hold for DATAIN with respect to the CLK active edge	10	–	ns	
T_{CO_TXD}	T_{CO} of DATAOUT with respect to CLK active edge at the SoC	–	10	ns	
$T_{CO\text{-}FS}$	T_{CO} of FRM with respect to CLK at the SoC		10	ns	

9.6.17 PCI Express* AC Specification

Table 138. PCI Express* Interface Timings

Symbol	Parameter	Min	Typ	Max	Unit	Figures	Notes
Transmitter and Receiver Timings							
UI	Unit Interval – PCI Express* Gen 1 (2.5 GT/s)	399.88		400.12	ps		5
UI	Unit Interval – PCI Express* Gen 2 (5.0 GT/s)	199.9		200.1	ps		5
$T_{TX\text{-}EYE}$	Minimum Transmission Eye Width	0.7		—	UI	65	1,2
$T_{TX\text{-}RISE/Fall}$ (Gen1)	TXP/TXN Rise/Fall time	0.125			UI		1,2
$T_{TX\text{-}RISE/Fall}$ (Gen2)	TXP/TXN Rise/Fall time	0.15			UI		1,2
$T_{RX\text{-}EYE}$	Minimum Receiver Eye Width	0.40		—	UI	66	3,4

NOTES:
1. Specified at the measurement point into a timing and voltage compliance test load and measured over any 250 consecutive TX UIs. (Also refer to the Transmitter compliance eye diagram)
2. A $T_{TX\text{-}EYE}$ = 0.70 UI provides for a total sum of deterministic and random jitter budget of $T_{TXJITTER\text{-}MAX}$ = 0.30 UI for the Transmitter collected over any 250 consecutive TX UIs. The $T_{TXEYE\text{-}MEDIAN\text{-}to\text{-}MAX\text{-}JITTER}$ specification ensures a jitter distribution in which the median and the maximum deviation from the median is less than half of the total TX jitter budget collected over any 250 consecutive TX UIs. It should be noted that the median is not the same as the mean. The jitter median describes the point in time where the number of jitter points on either side is approximately equal as opposed to the averaged time value.
3. Specified at the measurement point and measured over any 250 consecutive UIs. The test load documented in the PCI Express* specification 2.0 should be used as the RX device when taking measurements (also refer to the Receiver compliance eye diagram). If the clocks to the RX and TX are not derived from the same reference clock, the TX UI recovered from 3500 consecutive UI must be used as a reference for the eye diagram.
4. A $T_{RX\text{-}EYE}$ = 0.40 UI provides for a total sum of 0.60 UI deterministic and random jitter budget for the Transmitter and interconnect collected any 250 consecutive UIs. The $T_{RX\text{-}EYE\text{-}MEDIAN\text{-}to\text{-}\text{-}MAX\text{-}JITTER}$ specification ensures a jitter distribution in which the median and the maximum deviation from the median is less than half of the total 0.6 UI jitter budget collected over any 250 consecutive TX UIs. It should be noted that the median is not the same as the mean. The jitter median describes the point in time where the number of jitter points on either side is approximately equal as opposed to the averaged time value. If the clocks to the RX and TX are not derived from the same reference clock, the TX UI recovered from 3500 consecutive UI must be used as the reference for the eye diagram.
5. Nominal Unit Interval is 400 ps for 2.5 GT/s and 200 ps for 5 GT/s.
6. PCIe Reference clocks follow PCI Express* specification with the exception of edge rate: Max = 8.0 V/ns instead of 4.0 V/ns. There should be no DC termination of the clocks.

Figure 65. PCI Express* Transmitter Eye

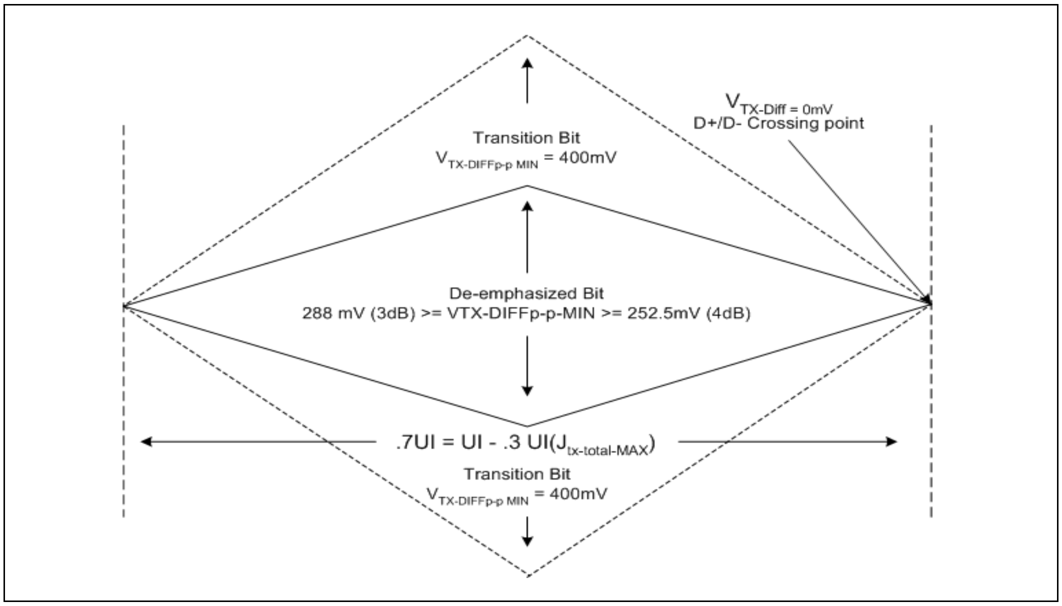

Figure 66. PCI Express* Receiver Eye

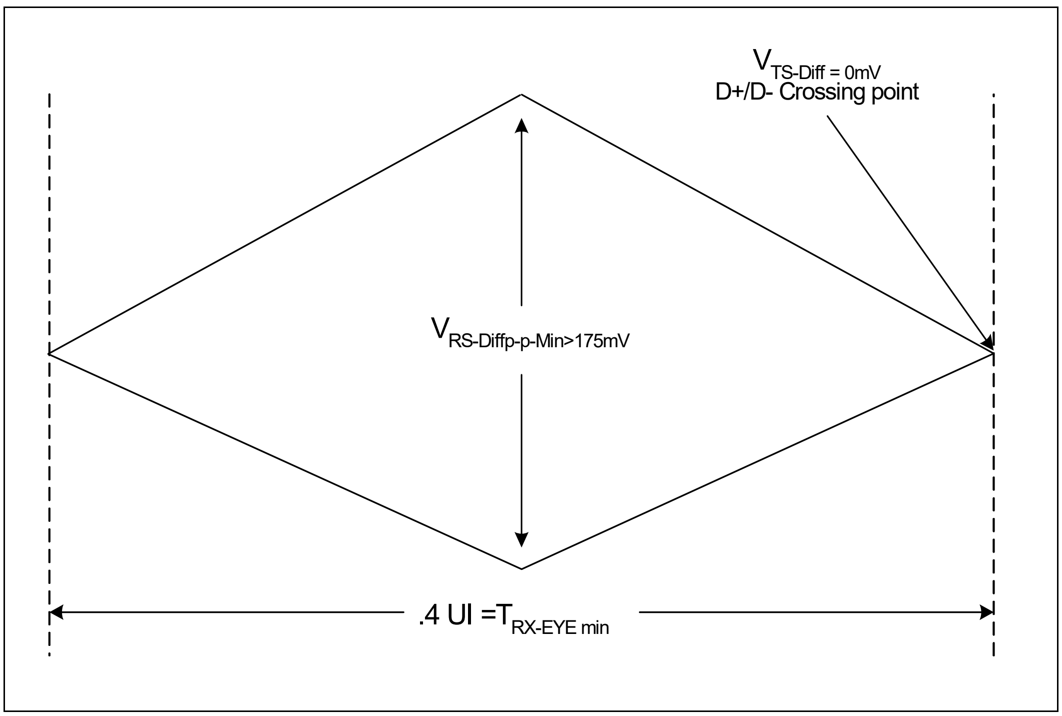


9.6.18 PCU - PMC - Suspended Clock AC Specification

Table 139. SUS Clock Timings

Symbol	Parameter	Min	Max	Units	Notes	Figure
f_{susclk}	Operating Frequency	32		kHz	1	
t39	High time	9.5	-	µs	1	
t39a	Low Time	9.5	-	µs	1	

Note: 1. SUSCLK duty cycle can range from 30% minimum to 70% maximum.

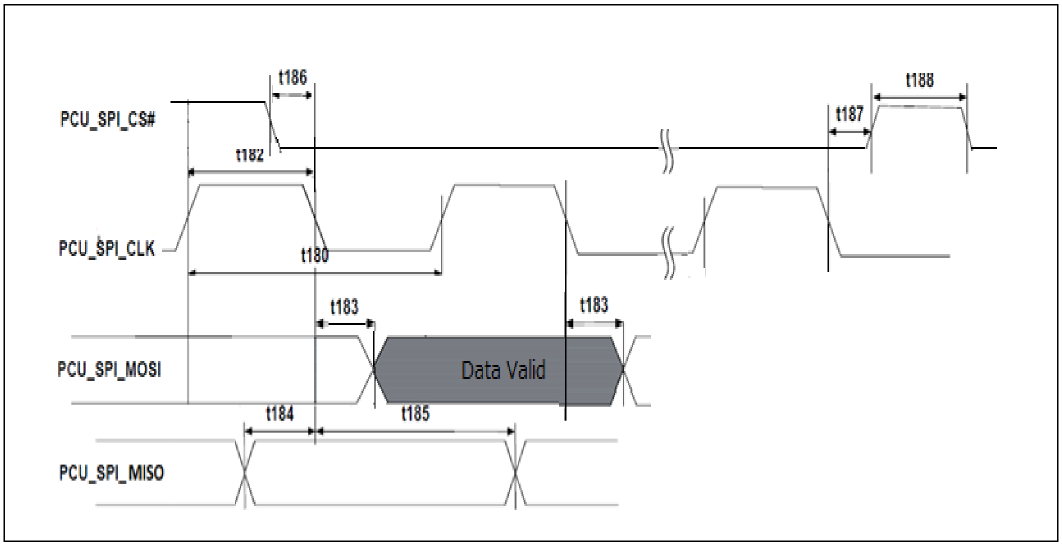
9.6.19 PCU - SPI NOR AC Specification

Table 140. PCU - SPI NOR AC Specification

Sym	Parameter	Min	Max	Units	Notes
t180	Serial Clock Frequency	20, 33, 50		MHz	
t182	SPI Clock duty cycle at Host	45	55	%	
t183	Tco of PCU_SPI_MOSI with respect to serial clock falling edge at the host	0	5	ns	
t184	Setup of PCU_SPI_MISO with respect to serial clock falling edge at the host	11	-	ns	
t185	Hold of PCU_SPI_MISO with respect to serial clock falling edge at the host	0	-	ns	1, 2, 3
t186	Setup of PCU_SPI_CS[1:0]# with respect to serial clock falling edge at the host	12	-	ns	
t187	Hold of PCU_SPI_CS[1:0]# with respect to serial clock falling edge at the host	5	-	ns	
t188/t189	Min Idle (de-assertion) time for PCU_SPI_CLK signals	32	-	ns	
Trise/Tfall	Rise / Fall time	-	2	ns	1,2

NOTES:
1. Based on trace length of up to 4” and board impedance of 30–75 Ω Measured from 30–70%.
2. Total maximum, capacitance of 25 pF

Figure 67. SPI NOR Timing



9.6.20 PCU - SMBUS AC Specification

Table 141. SMBUS Clock Signal Timings

Symbol	Parameter	Min	Max	Unit	Notes	Figure
f_{smb}	Operating Frequency	10	100	kHz		
t_{HIGH}	High time	4.0	50	us	1	68
t_{Low}	Low time	4.7		us		68
t_{RISE}	Rise time		1000	ns		68
t_{FALL}	Fall time		300	ns		68

1. The maximum high time (t_{HIGH} Max) provides a simple method for devices to detect bus idle conditions.

Table 142. SMBus Timing

Sym	Parameter	Min	Max	Units	Notes	Figure
t_{STOP_START}	Bus Tree Time Between Stop and Start Condition	4.7	—	µs		69
t_{START_HOLD}	Hold Time after (repeated) Start Condition. After this period, the first clock is generated.	4.0	—	µs		69
t_{START_SET}	Repeated Start Condition Setup Time	4.7	—	µs		69
t_{STOP_SET}	Stop Condition Setup Time	4.0	—	µs		69
t_{DATA_HOLD}	Data Hold Time	0	—	ns	1	69
t_{DATA_SET}	Data Setup Time	250	—	ns		69

Table 142. SMBus Timing

Sym	Parameter	Min	Max	Units	Notes	Figure
t_{DEV_TO}	Device Time Out	25	35	ms	2	
t_{SLVCLK_LOWEXT}	Cumulative Clock Low Extend Time (slave device)	—	25	ms	3	69
t_{MSTCLK_LOWEXT}	Cumulative Clock Low Extend Time (master device)	—	10	ms	4	69

1. tDATA_HOLD has a minimum timing for I2C of 0 ns, while the minimum timing for SMBus is 300 ns.
2. A device will timeout when any clock low exceeds this value.
3. tSLVCLK_LOWEXT is the cumulative time a slave device is allowed to extend the clock cycles in one message from the initial start to stop. If a slave device exceeds this time, it is expected to release both its clock and data lines and reset itself.
4. tMSTCLK_LOWEXT is the cumulative time a master device is allowed to extend its clock cycles within each byte of a message as defined from start-to-ack, ack-to-ack or ack-to-stop.

Figure 68. SMBus Transaction

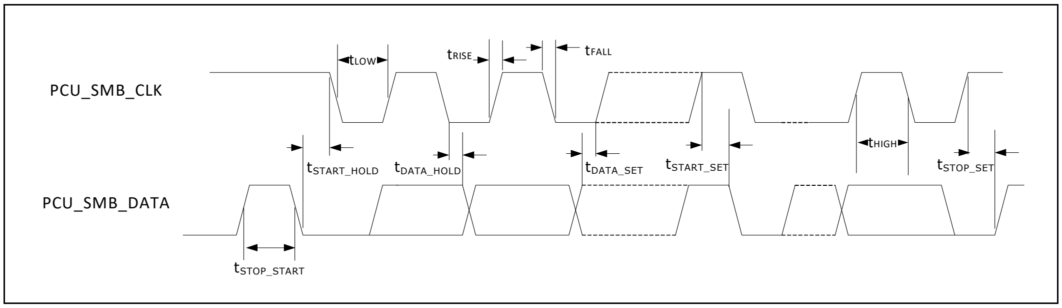


Figure 69. SMBus Timeout

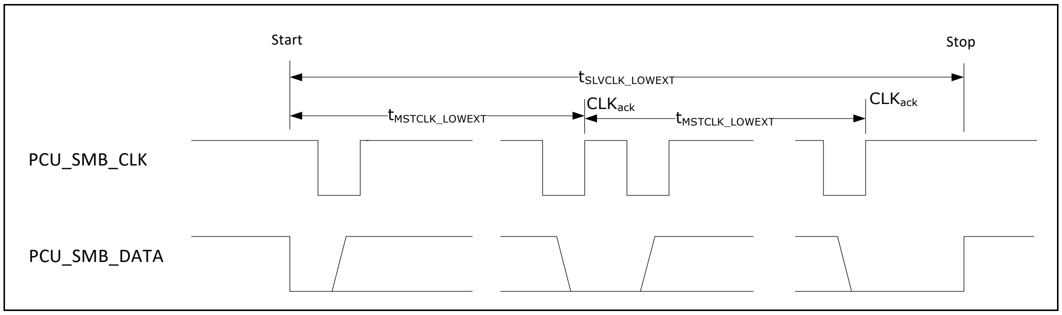

9.6.21 PCU - iLB - LPC AC Specification

Table 143. LPC AC Specifications (with loop back from ILB_LPC_CLK[0] to ILB_LPC_CLK[1])

Sym	Parameter	Min	Max	Units	Notes	Fig
T_{CO}	ILB_LPC_AD[3:0], ILB_LPC_FRAME#, ILB_LPC_SERIRQ Valid Delay from ILB_LPC_CLK[1] Rising	2	14	ns		73
T_{EN_AD}	ILB_LPC_AD[3:0], ILB_LPC_FRAME#, ILB_LPC_SERIRQ Output Enable Delay from ILB_LPC_CLK[1] Rising	2		ns		74
T_{FD_AD}	ILB_LPC_AD[3:0] Float Delay from ILB_LPC_CLK[1] Rising		28	ns		75
T_{SU_AD}	ILB_LPC_AD[3:0] Setup Time to ILB_LPC_CLK[1] Rising	7		ns		76
T_{HD_AD}	ILB_LPC_AD[3:0] Hold Time from ILB_LPC_CLK[1] Rising	0		ns		76
T_{lpc}	ILB_LPC_CLK[1:0] Duty Cycle	35	65	%	1	

NOTE:
1. High time is measured from 0.75 x PCU_1P8_G3. Low time is measured from 0.35 x PCU_1P8_G3
2. The load capacitance used for the LPC timing parameters is 30 pF
3. VT is 1/2 of LPC IO voltage

9.6.22 SIO - I²C AC Specifications

9.6.22.1 I²C Fast/Standard Mode Electrical Specification

Table 144. I²C Fast/Standard Mode AC Specifications (Sheet 1 of 2)

Symbol	Parameter	Standard-Mode		Fast-Mode		Fast-Mode Plus		Units	Notes	Figure
		Min.	Max.	Min.	Max.	Min.	Max.			
f_{SCL}	I²C_CLK clock frequency	0	100	0	400	0	1000	kHz		
$t_{HD:STA}$	Hold time (repeated) START condition. After this period, the first clock pulse is generated	4.0	–	0.6	–	0.26	–	µs		74
t_{LOW}	LOW period of the I²C_CLK clock	4.7	–	1.3	–	0.5	–	µs		74
t_{HIGH}	HIGH period of the I²C_CLK clock	4.0	–	0.6	–	0.26	–	µs		74

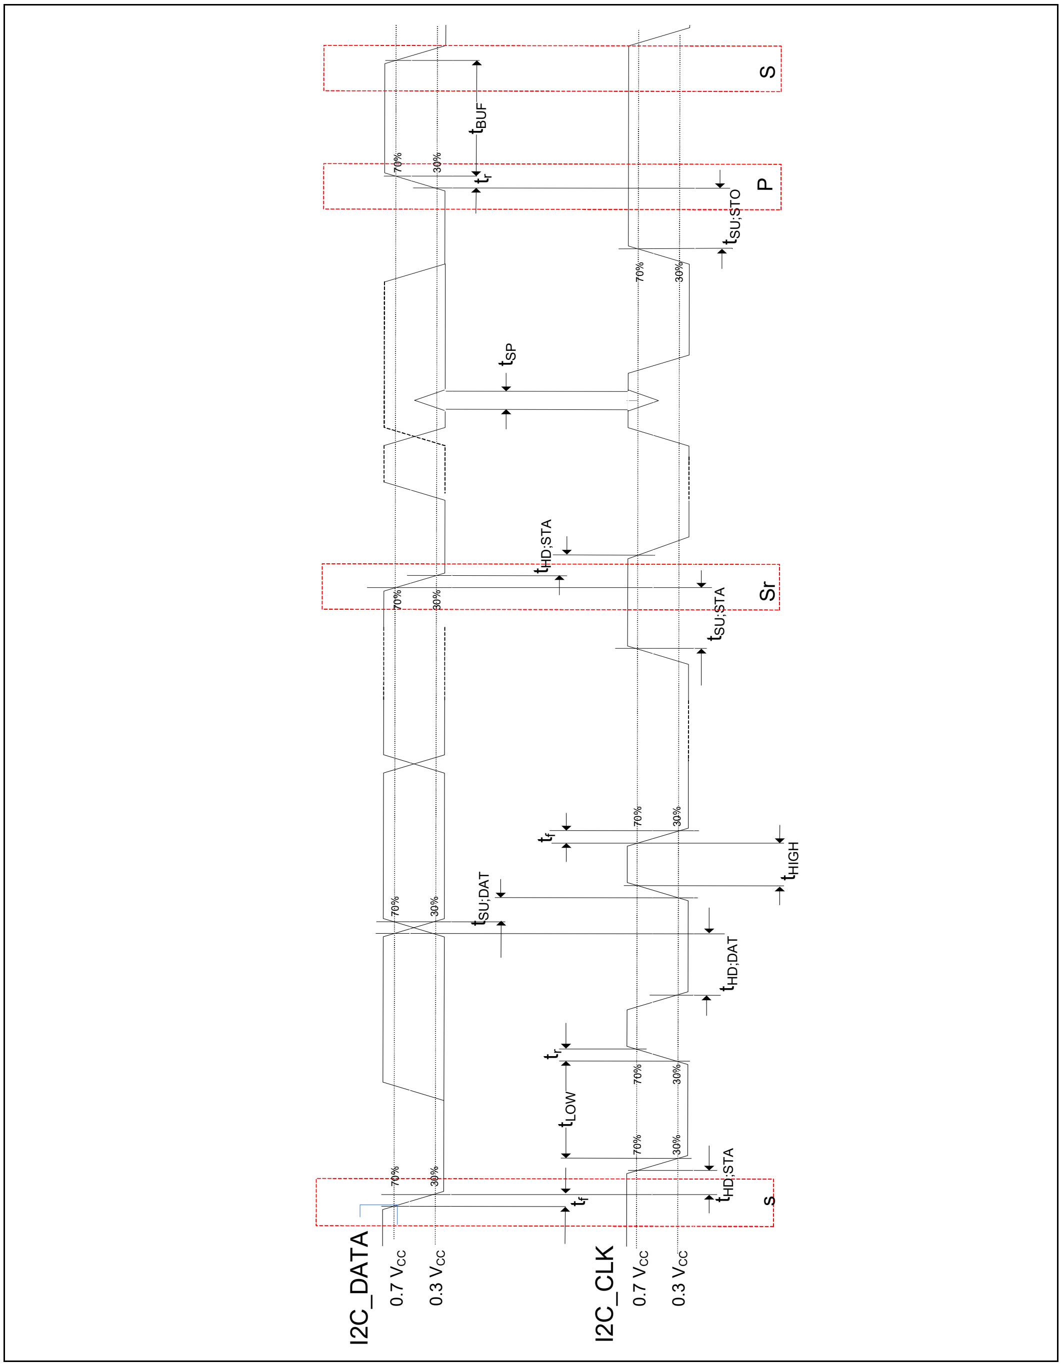
Table 144. I^2C Fast/Standard Mode AC Specifications (Sheet 2 of 2)

Symbol	Parameter	Standard-Mode		Fast-Mode		Fast-Mode Plus		Units	Notes	Figure
		Min.	Max.	Min.	Max.	Min.	Max.			
$t_{SU:STA}$	Set-up time for a repeated START condition	4.7	–	0.6	–	0.26	–	µs		74
$t_{HD:DAT}$	Data hold time: I^2C-bus devices	0	–	0	–	0	–	ns		74
$t_{SU:DAT}$	Data set-up time	250	–	100	–	50	–	ns	1	74
t_r	Rise time of both I^2C_DATA and I^2C_CLK signals	–	1000	20 + $0.1C_b$(5)	300	–	120	ns	2, 3	74
t_f	Fall time of both I^2C_DATA and I^2C_CLK signals	1	300	1	300	1	120	ns	5	74
$t_{SU:STO}$	Set-up time for STOP condition	4.0	–	0.6	–	0.26	-	µs		74
t_{BUF}	Bus free time between a STOP and START condition	4.7	–	1.3	–	0.5	–	µs		
C_b	Capacitive load for each bus line	–	130	–	130	-	-	pF		
V_{nL}	Noise margin at the LOW level for each connected device (including hysteresis)	0.1 V_{DD}	–	0.1 V_{DD}	–	0.1 V_{DD}	–	V		
V_{nH}	Noise margin at the HIGH level for each connected device (including hysteresis)	0.2 V_{DD}	–	0.2 V_{DD}	–	0.2 V_{DD}	–	V		

NOTES:

1. A Fast-mode I2C-bus device can be used in a Standard-mode I2C-bus system, but the requirement tSU; DAT ³ 250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the I2C_CLK signal. If such a device does stretch the LOW period of the I2C_CLK signal, it must output the next data bit to the I2C_DATA line tr max + tSU; DAT = 1000 + 250 = 1250 ns (according to the Standard-mode I2C-bus specification) before the I2C_CLK line is released
2. Cb = total capacitance of one bus line in pF.
3. No Active current source PU on I2C_CLK signals. Rise time is based upon the Pull-up resistor mentioned in the Platform Design Guide.
4. The maximum tHD;DAT could be 3.45 ms and 0.9 ms for Standard-mode and Fast-mode, but must be less than the maximum of tVD;DAT or tVD;ACK by a transition time. This maximum must only be met if the device does not stretch the LOW period (tLOW) of the I2C_CLK signal. If the clock stretches the I2C_CLK, the data must be valid by the set-up time before it releases the clock.
5. Specification deviates from the minimum time compared to Industrial specification.

Figure 74. Definition of Timing for F/S-Mode Devices on I^2C Bus

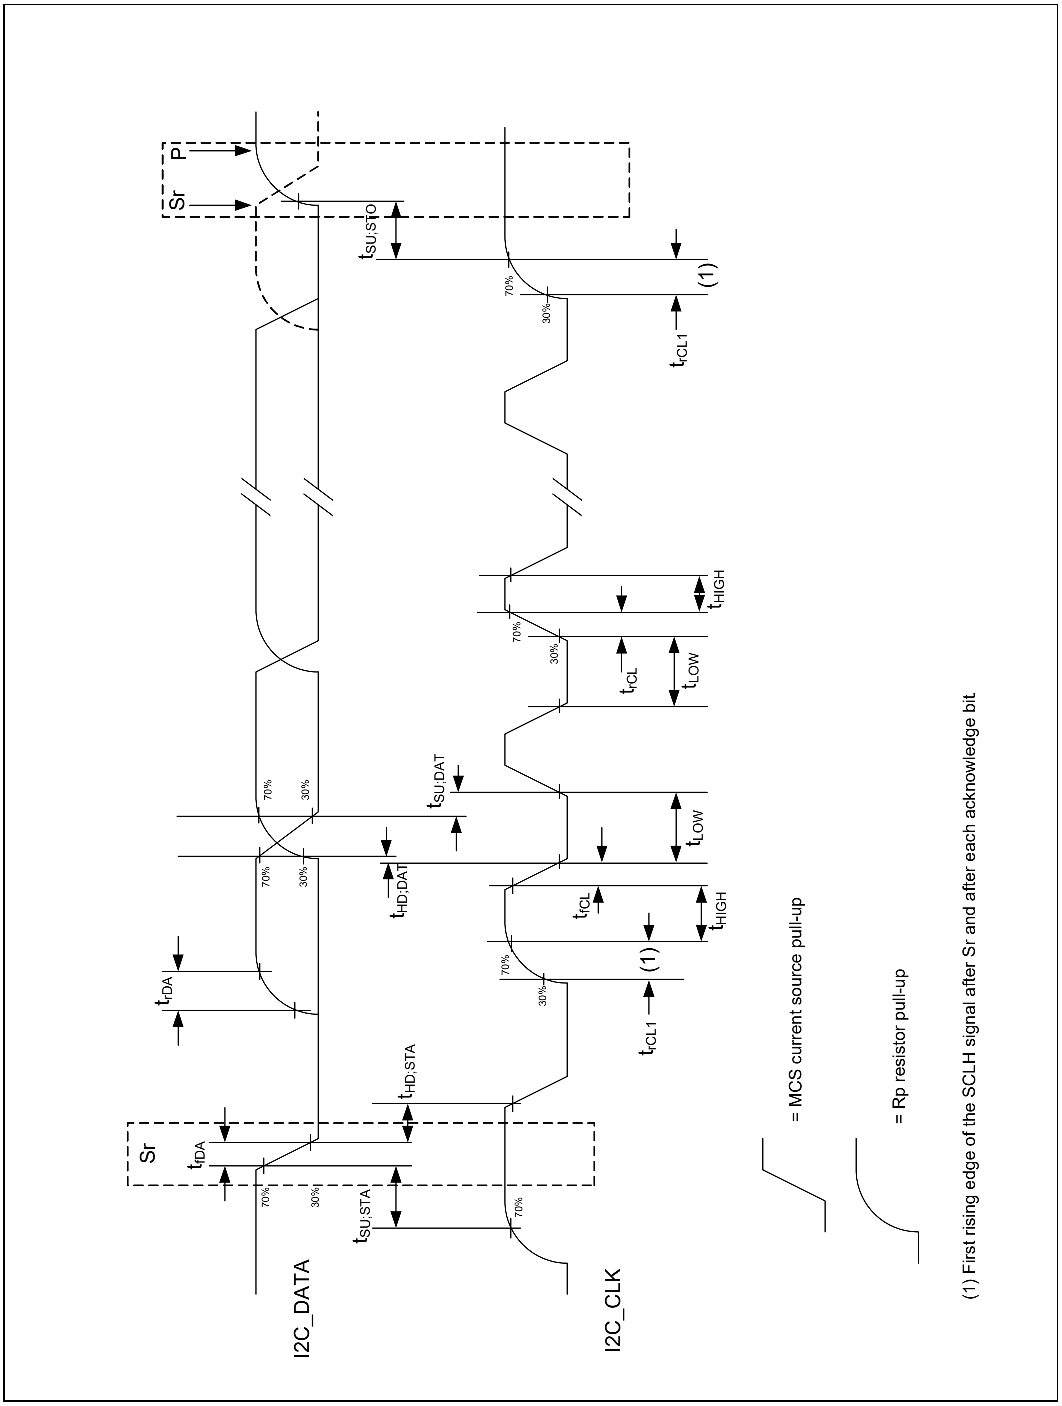


9.6.22.2 I^2C High Speed Mode Electrical Specification

Table 145. AC Specification for High Speed Mode I^2C—Bus Devices

Symbol	Parameter	C_b = 100 pF (max)		Units	Figure
		Min.	Max.		
f_{SCL}	I^2C_CLK clock frequency	0	1.7	MHz	
t_{SU}:STA	Set-Up time for a repeated START condition	160	–	ns	
t_{HD}:STA	Hold time (repeated) START condition.	160	–	ns	
t_{LOW}	LOW period of the I^2C_CLK clock	160	–	ns	
t_{HIGH}	HIGH period of the I^2C_CLK clock	60	–	ns	
t_{HD}:DAT	Data hold time: I^2C-bus devices	0	–	ns	
t_{SU}:DAT	Data set-up time	10	–	ns	
t_r CL	Rise time of I^2C_CLK signals	10	40	ns	
t_f CL	Fall time of I^2C_CLK signals	1	40	ns	
t_rCL1	Rise time of I^2C_CLK signal after a repeated START condition and after an acknowledge bit	10	40	ns	
t_r DA	Rise time of I^2C_DATA signals	10	80	ns	
t_f DA	Fall time of I^2C_DATA signals	1	80	ns	
$t_{SU:}$STO	Set-up time for STOP condition	160	–	ns	
V_{nL}	Noise margin at the LOW level for each connected device (including hysteresis)	0.1 V_{DD}	–	V	
V_{NH}	Noise margin at the HIGH level for each connected device (including hysteresis)	0.2 V_{DD}	–	V	

Figure 75. Definition of Timing for High Speed-Mode Devices on I²C Bus



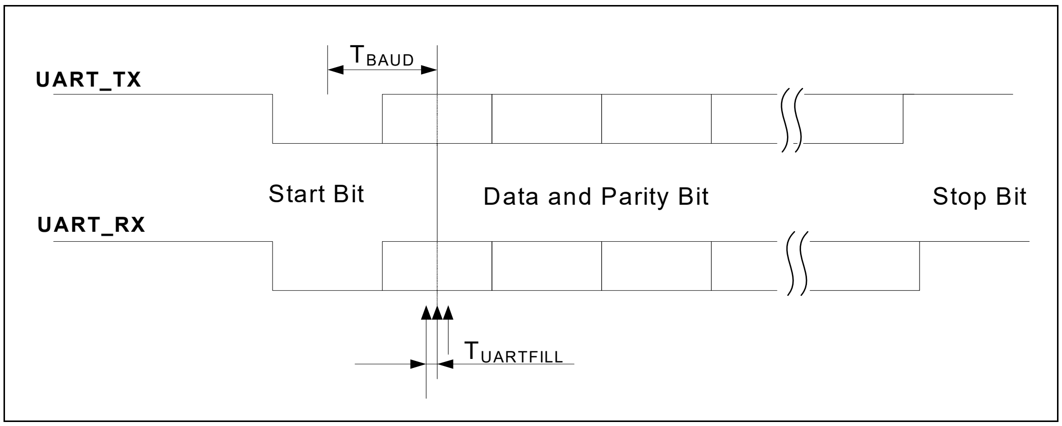
9.6.23 SIO - UART AC Specification

Table 146. UART AC Specification

Symbol	Parameter	Min.	Max.	Unit	Notes
T_{RISE}	Maximum Rise Time	2.5	5	ns	1, 2
T_{FALL}	Maximum Fall Time	2.5	5	ns	1, 2
$T_{UARTFIL}$	UART Sampling Filter Period	20		ns	3

NOTES:
1. Based on total trace length of 1-4”, Total maximum, capacitance of 27 pF and board impedance of 30–75Ω.
2. Measured from 10–90%.
3. Each bit including start and stop bit is sampled three times at center of a bit at an interval of 20 ns (minimum). If three sampled values do not agree, then UART noise error is generated.

Figure 76. UART Timing Diagram



9.6.24 JTAG AC Specification

Table 147. JTAG AC Specification

T# Parameter	Min	Max	Unit	Figure	Notes
T_P:TAP_TCK Period	15		ns		66 MHz
T_{CL}:TAP_TCK Clock Low Time	0.4 * T_{JC}		ns		
T_{CH}:TAP_TCK Clock High Time	0.4 * T_{JC}		ns		
T_{SU}:TAP_TDI, TAP_TMS Setup Time	11		ns	78	
T_H: TAP_TDI, TAP_TMS Hold Time	5		ns	78	
T_{CO}: TAP_TCK falling to TAP_TDO output valid		11	ns	78	
T_{CO}: TAP_TCK falling to TAP_TDO output high impedance		11	ns		
T_{18}: TAP_TRST# assert time	2		ns	79	

NOTES:
1. Unless otherwise noted, all specifications in this table apply to all SoC frequencies.
2. Not 100% tested. Specified by design characterization.
3. It is recommended that TAP_TMS be asserted while TAP_TRST# is being deasserted.
4. Board JTAG signal skew max = ±500 ps.

Figure 77. JTAG Timing Diagram

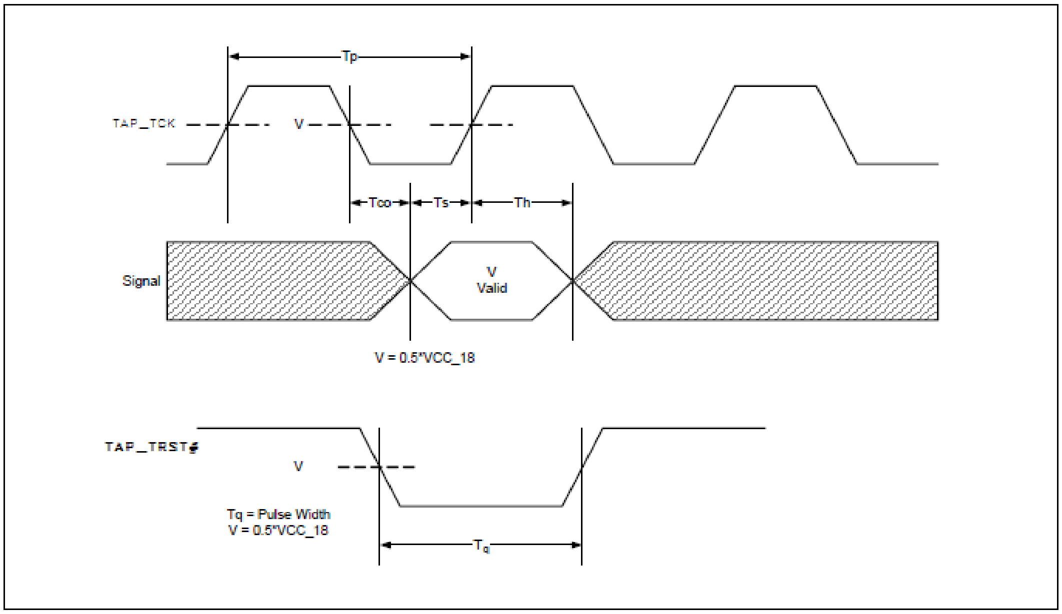


Table 148. Boundary Scan AC Specification

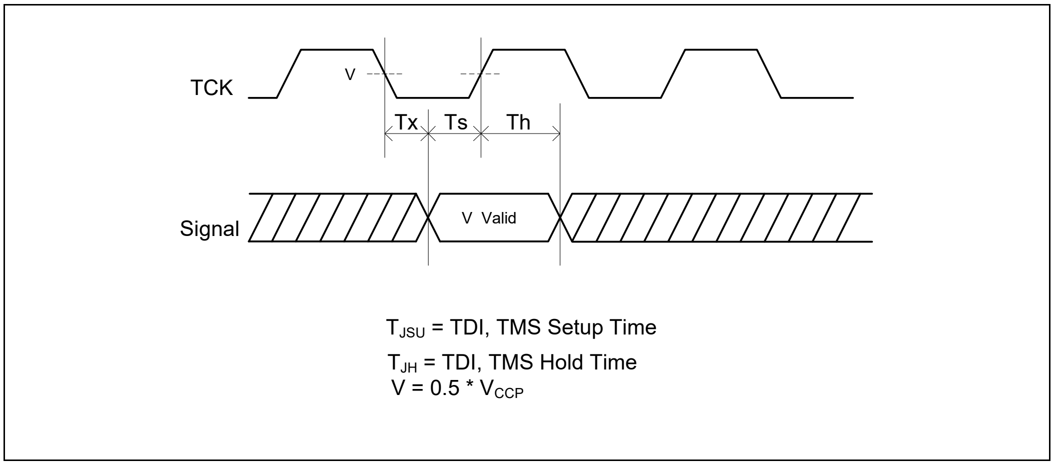
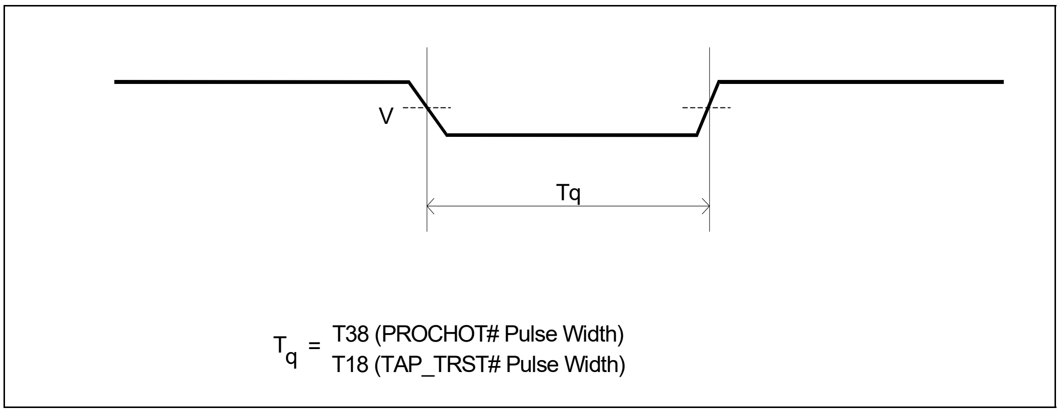
T# Parameter	Min	Max	Unit	Notes
Boundary scan all non test output/float delay	0.5	15	ns	Referenced to the falling edge of T_{CK}
Boundary scan all non test input setup	10		ns	Referenced to the falling edge of T_{CK}
Boundary scan all non test input hold	13		µs	Referenced to the falling edge of T_{CK}

Figure 78. TAP Valid Delay Timing Waveform



Refer to Table 88, Table 89, Table 90 for TAP Signal Group DC specifications and Table 147 for TAP Signal Group AC specifications.

Figure 79. Test Reset (TAP_TRST#), Async GTL Input and PROCHOT# Timing Waveform



9.6.25 General AC Timing Diagrams

Note that the measurement of the differential waveform according to these diagrams would have to be made directly at the load at the end of the line. In a real system, this is not possible because the end of the line is at the input pad of the SoC silicon.

§

10 Ballout and Package Information

The SoC comes in a **25 mm X 27 mm** Flip-Chip Ball Grid Array (FCBGA) package and consists of a silicon die mounted face down on an organic substrate populated with 1170 solder balls on the bottom side. Capacitors may be placed in the area surrounding the die. Because the die-side capacitors are electrically conductive, and only slightly shorter than the die height, care should be taken to avoid contacting the capacitors with electrically conductive materials. Doing so may short the capacitors and possibly damage the device or render it inactive.

The use of an insulating material between the capacitors and any thermal solution should be considered to prevent capacitor shorting. An exclusion, or keep out zone, surrounds the die and capacitors, and identifies the contact area for the package. Care should be taken to avoid contact with the package inside this area.

Refer to the *Bay Trail SoC Thermal and Mechanical Design Guide* for details on package mechanical dimensions and tolerance, as well as other key package attributes.

10.1 SoC Attributes

- Package parameters: 25 mm X 27 mm
- Ball Count:1170

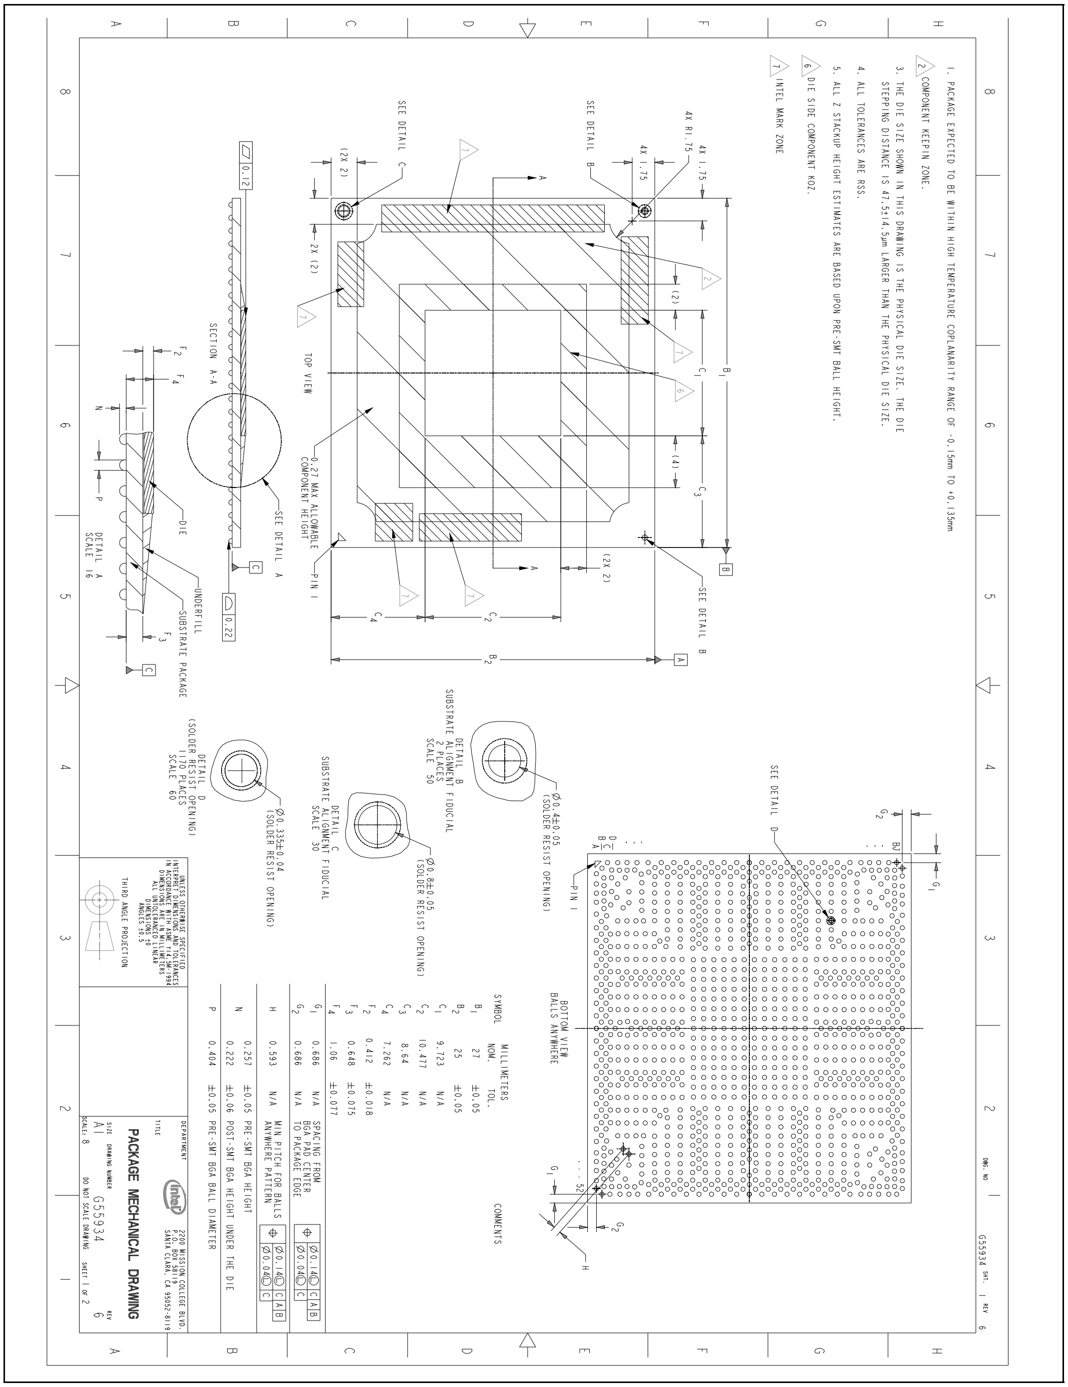
All Units: mm

Tolerances if not specified:

- .X: ± 0.1
- .XX: ± 0.05
- Angles: ± 1.0 degrees

10.2 Package Diagrams

Figure 89. Package Mechanical Drawing



10.3 Ball Name and Function by Location

Many I/O's are configurable GPIO's. These I/O's are multiplexed with other signals in the ball list. This table matches names and locations of every ball with all possible multiplexed signals (denoted as GPIO Functions). Configurable GPIO's default to function 0 during power on and may not match the ball name. BIOS (platform firmware) is responsible for enabling the platform specific configuration. Please see your BIOS vendor for details.

Note: The X & Y locations in Table 146 are measured in microns from the center of the package.

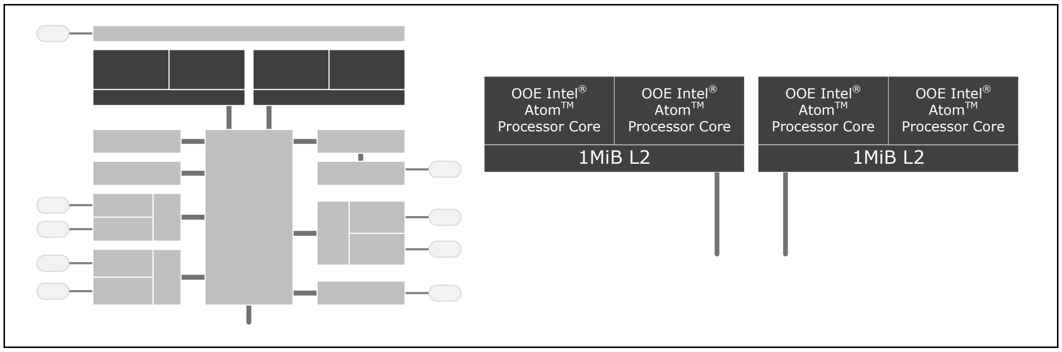
11 Processor Core

Up to four out-of-order execution processor cores are supported, each dual core module supports up to 1 MiB of L2 cache.



11.1 Features

- Single, Dual or Quad Out-of-Order Execution (OOE) processor cores
- Primary 32 KiB, 8-way L1 instruction cache and 24 KiB, 6-way L1 write-back data cache
- Cores are grouped into dual-core modules: modules share a 1 MiB, 16-way L2 cache (2 MiB total for Quad Core)
    — Dual core SKU's use 512 KiB per core. Each core has a dedicated link to memory.
- L1 caches has Parity Protection and L2 cache has ECC Protection
- Intel® Streaming SIMD Extensions 4.1 and 4.2 (SSE4.1 and SSE4.2), which include new instructions for media and for fast XML parsing
- Intel® 64 architecture
- Support for IA 32-bit
- Support for Intel® VT-x
- Support for Intel® Carry-Less Multiplication Instruction (PCLMULQDQ)
- Support for a Digital Random Number Generator (via RDRAND instruction)
- Supports C0, C1, C6
- Thermal management support via Intel® Thermal Monitor (TM1 and TM2)
- Uses Power Aware Interrupt Routing (PAIR)
- Uses 22 nm process technology
- Real Time Instruction Trace for debug

- Supports RTIT

Note: Intel® Hyper-Threading Technology is not supported.

11.1.1 Intel® Virtualization Technology (Intel® VT)

Intel® Virtualization Technology (Intel® VT) makes a single system appear as multiple independent systems to software. This allows multiple, independent operating systems to run simultaneously on a single system. Intel® VT comprises technology components to support virtualization of platforms based on Intel architecture microprocessors and chipsets. Intel® Virtualization Technology for IA-32, Intel® 64 and Intel® Architecture (Intel® VT-x) added hardware support in the processor to improve the virtualization performance and robustness.

Intel® VT-x specifications and functional descriptions are included in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B* and is available at: http://www.intel.com/products/processor/manuals/index.htm

Other Intel® VT documents can be referenced at: http://www.intel.com/technology/virtualization/index.htm

11.1.1.1 Intel® VT-x Objectives

- Robust: VMMs no longer need to use paravirtualization or binary translation. This means that they will be able to run off-the-shelf OSs and applications without any special steps.
- Enhanced: Intel® VT enables VMMs to run 64-bit guest operating systems on IA x86 processors.
- More reliable: Due to the hardware support, VMMs can now be smaller, less complex, and more efficient. This improves reliability and availability and reduces the potential for software conflicts.
- More secure: The use of hardware transitions in the VMM strengthens the isolation of VMs and further prevents corruption of one VM from affecting others on the same system. Intel® VT-x provides hardware acceleration for virtualization of IA platforms. Virtual Machine Monitor (VMM) can use Intel® VT-x features to provide improved reliable virtualized platform.

11.1.1.1.1 Intel® VT-x Features

- Extended Page Tables (EPT)
  - EPT is hardware assisted page table physical memory virtualization
  - Support guest VM execution in unpaged protected mode or in real-address mode
  - It eliminates VM exits from guest OS to the VMM for shadow page-table maintenance
- Virtual Processor IDs (VPID)

— A VM Virtual Processor ID is used to tag processor core hardware structures (such as TLBs) to allow a logic processor to cache information (such as TLBs) for multiple linear address spaces

— This avoids flushes on VM transitions to give a lower-cost VM transition time and an overall reduction in virtualization overhead

- Guest Preemption Timer

— Mechanism for a VMM to preempt the execution of a guest OS VM after an amount of time specified by the VMM. The VMM sets a timer value before entering a guest.

— The feature aids VMM developers in flexibility and Quality of Service (QoS) guarantees flexibility in guest VM scheduling and building Quality of Service (QoS) schemes

- Descriptor-Table Exiting

— Descriptor-table exiting allows a VMM to protect a guest OS from internal (malicious software based) attack by preventing relocation of key system data structures like IDT (interrupt descriptor table), GDT (global descriptor table), LDT (local descriptor table), and TSS (task segment selector)

— A VMM using this feature can intercept (by a VM exit) attempts to relocate these data structures and prevent them from being tampered by malicious software

- VM Functions

— A VM function is an operation provided by the processor that can be invoked using the VMFUNC instruction from guest VM without a VM exit

— A VM function to perform EPTP switching is supported and allows guest VM to load a new value for the EPT pointer, thereby establishing a different EPT paging structure hierarchy

11.1.2 Security and Cryptography Technologies

11.1.2.1 Advanced Encryption Standard New Instructions (AES-NI)

The processor supports Advanced Encryption Standard New Instructions (AES-NI) that are a set of Single Instruction Multiple Data (SIMD) instructions that enable fast and secure data encryption and decryption based on the Advanced Encryption Standard (AES). AES-NI are valuable for a wide range of cryptographic applications, for example: applications that perform bulk encryption/decryption, authentication, random number generation, and authenticated encryption. AES is broadly accepted as the standard for both government and industry applications, and is widely deployed in various protocols.

AES-NI consists of six Intel® SSE instructions. Four instructions, namely AESENC, AESENCLAST, AESDEC, and AESDELAST facilitate high performance AES encryption and decryption. The other two, AESIMC and AESKEYGENASSIST, support the AES key expansion procedure. Together, these instructions provide a full hardware for support AES, offering security, high performance, and a great deal of flexibility.

11.1.2.2 PCLMULQDQ Instruction

The processor supports the carry-less multiplication instruction, PCLMULQDQ. PCLMULQDQ is a Single Instruction Multiple Data (SIMD) instruction that computes the 128-bit carry-less multiplication of two, 64-bit operands without generating and propagating carries. Carry-less multiplication is an essential processing component of several cryptographic systems and standards. Hence, accelerating carry-less multiplication can significantly contribute to achieving high speed secure computing and communication.

11.1.2.3 Digital Random Number Generator

The processor introduces a software visible digital random number generation mechanism supported by a high quality entropy source. This capability is available to programmers through the new RDRAND instruction. The resultant random number generation capability is designed to comply with existing industry standards (ANSI X9.82 and NIST SP 800-90).

Some possible uses of the new RDRAND instruction include cryptographic key generation as used in a variety of applications including communication, digital signatures, secure storage, etc.

11.1.3 Power Aware Interrupt Routing

PAIR is an improvement in H/W routing of “redirectable” interrupts. Each core power-state is considered in the routing selection to reduce the power or performance impact of interrupts. System BIOS configures the routing algorithm, e.g. fixed-priority, rotating, hash, or PAIR, during setup via non-architectural register. The PAIR algorithm can be biased to optimize for power or performance and the largest gains will be seen in systems with high interrupt rates.

11.2 Platform Identification and CPUID

In addition to verifying the processor signature, the intended processor platform type must be determined to properly target the microcode update. The intended processor platform type is determined by reading bits [52:50] of the IA32_PLATFORM_ID register, (MSR 17h) within the processor. This is a 64-bit register that must be read using the RDMSR instruction. The 3 Platform Id bits, when read as a binary coded decimal (BCD) number, indicate the bit position in the microcode update header’s Processor Flags field that is asSoCiated with the installed processor.

Executing the CPUID instruction with EAX=1 will provide the following information.

EAX	Field description
[31:28]	Reserved
[27:20]	Extended Family value
[19:16]	Extended Model value
[15:13]	Reserved
[12]	Processor Type Bit
[11:8]	Family value
[7:4]	Model value
[3:0]	Stepping ID Value

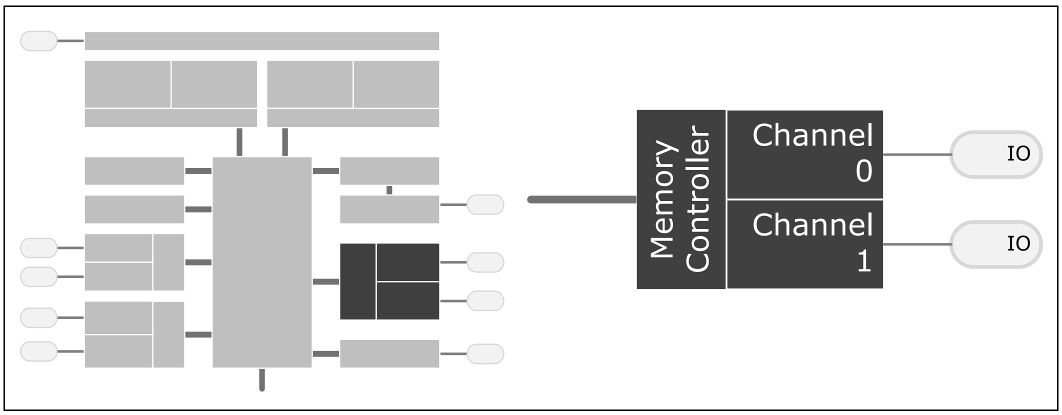
For more details on using the RDRAND instruction refer to Intel® Advanced Vector Extensions Programming Reference.

§

12 System Memory Controller

The system memory controller supports DDR3L protocol with up to two 64-bit wide dual rank channels at data rates up to 1333 MT/s. ECC is also available on a single channel.

Note: The memory data rate is fixed for each SKU. For example, a SKU that supports 1333 MT/s will only run at 1333 MT/s, nothing lower. For single channel use cases, Channel 0 must be used.



12.1 Signal Descriptions

See Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Type:** The buffer type found in Chapter 9, "Electrical Specifications"
- **Description**: A brief explanation of the signal's function

Table 150. Memory Channel 0 DDR3L Signals (Sheet 1 of 2)

Signal Name	Direction Type	Description
DRAM0_CKP[2,0] **DRAM0_CKN[2,0]**	O DDR3	**SDRAM and inverted Differential Clock:** (1 pair per Rank) The differential clock pair is used to latch the command into DRAM. Each pair corresponds to one rank on DRAM side.
DRAM0_CS[2,0]#	O DDR3	**Chip Select:** (1 per Rank). Used to qualify the command on the command bus for a particular rank.
DRAM0_CKE[2,0]	O DDR3	**Clock Enable:** (power management) It is used during DRAM power up/power down and Self refresh. *Note: DDR3L uses only DRAM0_CKE[2,0]. DRAM0_CKE[1,3] are not being used for DDR3L.*
DRAM0_MA[15:0]	O DDR3	**Memory Address:** Memory address bus for writing data to memory and reading data from memory. These signals follow common clock protocol w.r.t. DRAM0_CKN, DRAM0_CKP pairs
DRAM0_BS[2:0]	O DDR3	**Bank Select:** These signals define which banks are selected within each DRAM rank
DRAM0_RAS#	O DDR3	**Row Address Select:** Used with DRAM0_CAS# and DRAM0_WE# (along with DRAM0_CS#) to define the DRAM Commands
DRAM0_CAS#	O DDR3	**Column Address Select:** Used with DRAM0_RAS# and DRAM0_WE# (along with DRAM0_CS#) to define the DRAM Commands
DRAM0_WE#	O DDR3	**Write Enable Control Signal:** Used with DRAM0_WE# and DRAM0_CAS# (along with control signal, DRAM0_CS#) to define the DRAM Commands.
DRAM0_DQ[63:0]	I/O DDR3	**Data Lines:** Data signal interface to the DRAM data bus
DRAM0_DM[7:0]	O DDR3	**Data Mask:** DM is an output mask signal for write data. Output data is masked when DM is sampled HIGH coincident with that output data during a Write access. DM is sampled on both edges of DQS.
DRAM0_DQSP[7:0] **DRAM0_DQSN[7:0]**	I/O DDR3	**Data Strobes:** The data is captured at the crossing point of each 'P' and its compliment 'N' during read and write transactions. For reads, the strobe crossover and data are edge aligned, whereas in the Write command, the strobe crossing is in the centre of the data window.
DRAM0_ODT[2,0]	O DDR3	**On Die Termination:** ODT signal going to DRAM in order to turn ON the DRAM ODT during Write.

Table 150. Memory Channel 0 DDR3L Signals (Sheet 2 of 2)

Signal Name	Direction Type	Description
DRAM_RCOMP[2]	O Analog	**Resistor Compensation:** This signal needs to be terminated to VSS on board (refer to platform design guide for resistor value). This external resistor termination scheme is used for Resistor compensation of DRAM ODT strength.
DRAM_RCOMP[1]	O Analog	**Resistor Compensation:** This signal needs to be terminated to VSS on board (refer to platform design guide for resistor value). This external resistor termination scheme is used for Resistor compensation of DQ buffers
DRAM_RCOMP[0]	O Analog	**Resistor Compensation:** This signal needs to be terminated to VSS on board (refer to platform design guide for resistor value). This external resistor termination scheme is used for Resistor compensation of CMD buffers.
DRAM_VREF	I Analog	**Reference Voltage:** DRAM interface Reference Voltage
DRAM_CORE_PWROK	I Asynchronous CMOS	**Core Power OK:** This signal indicates the status of the DRAM Core power supply (power on in S0).
DRAM_VDD_S4_PWROK	I Asynchronous CMOS	**VDD Power OK:** Asserted once the VRM is settled. Used primarily in the DRAM PHY to determine S3 state.
DRAM0_DRAMRST#	O	**DRAM Reset:** This signal is used to reset DRAM devices.
ICLK_DRAM_TERM [1:0]	I/O	Pull-down to VSS through an 100kOhm 1% resistor.

Table 151. Memory Channel 1 DDR3L Signals (Sheet 1 of 2)

Signal Name	Direction Type	Description
DRAM1_CKP[2,0] **DRAM1_CKN[2,0]**	O DDR3	**SDRAM and inverted Differential Clock:** (1 pair per Rank) The differential clock pair is used to latch the command into DRAM. Each pair corresponds to one rank on DRAM side.
DRAM1_CS[2,0]#	O DDR3	**Chip Select:** (1 per Rank). Used to qualify the command on the command bus for a particular rank.
DRAM1_CKE[2,0]	O DDR3	**Clock Enable:** (power management) It is used during DRAM power up/power down and Self refresh. *Note: DDR3L uses only DRAM1_CKE[0,2]. DRAM1_CKE[1,3] are not being used for DDR3L.*

Table 151. Memory Channel 1 DDR3L Signals (Sheet 2 of 2)

Signal Name	Direction Type	Description
DRAM1_MA[15:0]	O DDR3	**Memory Address:** Memory address bus for writing data to memory and reading data from memory. These signals follow common clock protocol relative to DRAM1_CKN, DRAM1_CKP pairs
DRAM1_BS[2:0]	O DDR3	**Bank Select:** These signals define which banks are selected within each DRAM rank
DRAM1_RAS#	O DDR3	**Row Address Select:** Used with DRAM1_CAS# and DRAM1_WE# (along with DRAM1_CS#) to define the DRAM Commands
DRAM1_CAS#	O DDR3	**Column Address Select:** Used with DRAM1_RAS# and DRAM1_WE# (along with DRAM1_CS#) to define the DRAM Commands
DRAM1_WE#	O DDR3	**Write Enable Control Signal:** Used with DRAM1_WE# and DRAM1_CAS# (along with control signal, DRAM1_CS#) to define the DRAM Commands.
DRAM1_DQ[63:0]	I/O DDR3	**Data Lines:** Data signal interface to the DRAM data bus.
DRAM1_DM[7:0]	O DDR3	**Data Mask:** DM is an output mask signal for write data. Output data is masked when DM is sampled HIGH coincident with that output data during a Write access. DM is sampled on both edges of DQS.
DRAM1_DQSP[7:0] **DRAM1_DQSN[7:0]**	I/O DDR3	**Data Strobes:** The data is captured at the crossing point of DRAM1_DQSP[7:0] and its compliment 'N' during read and write transactions. For reads, the strobe crossover and data are edge aligned, whereas in the Write command, the strobe crossing is in the centre of the data window.
DRAM1_ODT[2,0]	O DDR3	**On Die Termination:** ODT signal going to DRAM in order to turn ON the DRAM ODT during Write.
DRAM1_DRAMRST#	O	**Reset DRAM:** This signal can be used to reset DRAM devices.

12.1.1 ECC Support

The system memory controller supports ECC. When ECC is enabled, only Memory Channel 0 will be active. Memory Channel 1 will be disabled and used for the ECC data signals. Signals on Memory Channel 1 not used for ECC will be tri-stated. The table below shows the details on the muxing relationship between the ECC signals and the Memory Channel 1 signals.

Note: Although ECC and non-ECC SO-DIMM's share the same socket, ECC SO-DIMMs are not pinout compatible with standard, non-ECC SO-DIMMs.

Table 152. ECC Signals and Memory Channel 1 Signal Muxing

Memory Channel 1 Signal Names	Ball #	Signal Names when ECC is Enabled
DRAM1_DQ[56]	AM52	DRAM0_ECC_DQ[0]
DRAM1_DQ[57]	AL51	DRAM0_ECC_DQ[1]
DRAM1_DQ[58]	AG53	DRAM0_ECC_DQ[2]
DRAM1_DQ[59]	AG51	DRAM0_ECC_DQ[3]
DRAM1_DQ[60]	AL53	DRAM0_ECC_DQ[4]
DRAM1_DQ[61]	AK51	DRAM0_ECC_DQ[5]
DRAM1_DQ[62]	AF52	DRAM0_ECC_DQ[6]
DRAM1_DQ[63]	AF51	DRAM0_ECC_DQ[7]
DRAM1_DM[7]	AK52	DRAM0_ECC_DM
DRAM1_DQSP[7]	AH52	DRAM0_ECC_DQSP
DRAM1_DQSN[7]	AJ51	DRAM0_ECC_DQSN

Table 153. ECC Signals

Signal Name	Direction Type	Description
DRAM0_ECC_DQ[7:0]	I/O DDR3	**ECC Check Data Bits** *These are muxed with channel 1.*
DRAM0_ECC_DM	O DDR3	**ECC Data Mask:** DM is an optional output mask signal for write data. Output data is masked when DM is sampled HIGH coincident with that output data during a Write access. DM is sampled on both edges of ECC_DQS. *This signal is muxed with channel 1 and may not be needed.*
DRAM0_ECC_DQSP **DRAM0_ECC_DQSN**	I/O DDR3	**ECC Data Strobes:** The data is captured at the crossing point the 'P' and its compliment 'N' during read and write transactions. For reads, the strobe crossover and data are edge aligned, whereas in the Write command, the strobe crossing is in the centre of the data window. *These are muxed with channel 1.*

12.2 Features

The system memory controller supports the following DDR3L DRAM technologies, Data Transfer Rates, SO-DIMM Modules and other features:

- DDR3L Data Transfer Rates (Fixed per SKU): 1066MT/s (Theoretical Maximum Bandwidth: 8.5 GB/s per channel) or 1333MT/s (Theoretical Maximum Bandwidth: 10.6 GB/s per channel)
- DDR3L SDRAM's (1.35 V DRAM interface I/Os, including DDR3L-RS)
- DDR3L DRAM Device Technology

    - Standard 1Gb, 2Gb and 4Gb technologies and addressing
    - Read latency 5, 6, 7, 8, 9, 10, 11
    - Write latency 5, 6, 7, 8
- DDR3L SO-DIMM Modules (unbuffered)
    - Raw Card B = 1 rank of x8 SDRAM
    - Raw Card C = 1 rank of x16 SDRAM
    - Raw Card F = 2 ranks of x8 SDRAM
    - ECC Raw Card C = 1 rank of x8 SDRAM
    - ECC Raw Card D = 2 ranks of x8 SDRAM
    - No mixed Raw Card support
    - Contact your Intel representative for platform supportable memory configurations and limitations based on layout and firmware initialization (MRC) requirements
- Support Trunk Clock Gating
- Supports up to two 64-bit channels
    - Channel 0 only for single channel configuration
- ECC support for 64-bit data bus
- Support early SR exit
- Support slow power down

12.2.1 System Memory Technology Support

Table 154. Supported DDR3L DRAM Devices

DRAM Density	Data Width	Banks	Bank Address	Row Address	Column Address	Page Size
1Gb	x8	8	BA[2:0]	A[13:0]	A[9:0]	1KB
2Gb	x8	8	BA[2:0]	A[14:0]	A[9:0]	1KB
4Gb	x8	8	BA[2:0]	A[15:0]	A[9:0]	1KB
2Gb	x16	8	BA[2:0]	A[13:0]	A[9:0]	2KB

Table 155. Supported DDR3L Memory Size Per Rank

Memory Size/ Rank	DRAM Chips/ Rank	DRAM Chip Density	DRAM Chip Data Width	Page Size @ 64-bit Data Bus
1GB	8	1Gb	x8	8KB = 1KB * 8 chips

Table 155. Supported DDR3L Memory Size Per Rank

Memory Size/ Rank	DRAM Chips/ Rank	DRAM Chip Density	DRAM Chip Data Width	Page Size @ 64-bit Data Bus
2GB	8	2Gb	x8	8KB = 1KB * 8 chips
4GB	8	4Gb	x8	8KB = 1KB * 8 chips
1GB	4	2Gb	x16	8KB = 2KB * 4 chips

Table 156. Supported DDR3L ECC Memory Size Per Rank

Memory Size/ Rank	DRAM Chips/ Rank	DRAM Chip Density	DRAM Chip Data Width	Page Size @ 64-bit Data Bus
2GB	8	2Gb	x8	8KB = 1KB * 8 chips
4GB	8	4Gb	x8	8KB = 1KB * 8 chips

Table 157. Supported DDR3L SO-DIMM Size

DRAM Chip Density	Module Size	# of chips needed	DRAM Chip Data Width	Data Bus Width	# of Ranks needed	# of chips /rank
1Gbit	2GB	16	x8	x64	2	8
2Gbit	1GB	4	x16	x64	1	4
2Gbit	2GB	8 (9 w/ECC)	x8	x64	1	8
2Gbit	4GB	16 (18 w/ECC)	x8	x64	2	8
4Gbit	4GB	8 (9 w/ECC)	x8	x64	1	8
4Gbit	8GB	16 (18 w/ECC)	x8	x64	2	8

The frequency of system memory is fixed based on SKU. Timing parameters (CAS latency or CL + AL for DDR3, tRAS, tRCD, tRP) must be programmed to match within a channel (Contact your Intel field representative for more information on memory reference code (MRC)). The controller supports these configurations:

— Supports 1 SO-DIMM per channel.

— Each SO-DIMM can have 1 or 2 ranks.

— If a SO-DIMM has two ranks, then both ranks must be symmetrical (same chip width, same chip density, and same total memory size per rank).

— For dual channel population, the two channels must be populated symmetrically (chip width, density, ranks).

— The maximum total memory supported by the SoC is 8GB. Contact your Intel representative for guidelines on the specific SO-DIMM Raw cards supported.

12.3 System Memory Controller (D-Unit) Message Registers

Table 158. Summary of Memory Controller Message Bus Registers—Port 0x01

Offset	Register Name (Register Symbol)	Default Value
0–0h	"DRP—Offset 0h" on page 288	00000000h
1–1h	"DTR0—Offset 1h" on page 289	43001110h
2–2h	"DTR1 (DTR1)—Offset 2h" on page 291	02690320h
3–3h	"DTR2—Offset 3h" on page 293	00845544h
4–4h	"DTR3 (DTR3)—Offset 4h" on page 294	06406255h
5–5h	"DTR4 (DTR4)—Offset 5h" on page 295	00003322h

12.3.1 DRP—Offset 0h

DRAM Rank Population

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 0h

Op Codes:
h - Read, h - Write

Default: 00000000h

Bits	Default	Field
31:24	0 0 0 0 0 0 0 0	Rsvd_31_24_DRP
23	0	ENLPDDR3
22	0	DRAMTYPE
21	0	DIMM1MIRR
20	0	DIMM0MIRR
19	0	Rsvd_19_DRP
18	0	CKECOPY
17	0	RANKREMAP
16	0	DIMMFLIP
15	0	Rsvd_15_DRP
14	0	RSIEN
13	0	Rsvd_13_DRP
12:11	0 0	DIMMDDEN1
10:9	0 0	DIMMDWID1
8	0	Rsvd_8_DRP
7:6	0 0	DIMMDDEN0
5:4	0 0	DIMMDWID0
3	0	RKEN3
2	0	RKEN2
1	0	RKEN1
0	0	RKEN0

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Rsvd_31_24_DRP:** Reserved
23	0h RW/P/L	**ENLPDDR3:** Enable LPDDR3 Mode 0 - LPDDR2 1 - LPDDR3 Note: This bit is functional only when DRP.DRAMTYPE is set to LPDDR2
22	0h RW/P/L	**DRAMTYPE:** DRAM Type 0 - DDR3 1 - LPDDR2
21	0h RW/P/L	**DIMM1MIRR:** Address mapping to DIMM1 is mirrored. BIOS writes value defined in SPD Byte 63. Used as indication to Punit to flip MRS opcode to 2nd rank on DIMM1. This bit has no functional impact on Dunit. 0 - Standard 1 - Mirrored
20	0h RW/P/L	**DIMM0MIRR:** Address mapping to DIMM0 is mirrored. BIOS writes value defined in SPD Byte 63. Used as indication to Punit to flip MRS opcode to 2nd rank on DIMM0. This bit has no functional impact on Dunit. 0 - Standard 1 - Mirrored
19	0h RO	**Rsvd_19_DRP:** Reserved
18	0h RW/P/L	**CKECOPY:** Used for doubling CKE. 0 - no CKE copy 1 - Copy CKE[0] to CKE[1] and CKE[2] to CKE[3] Note: CKE to DDRIO also depends upon RANKREMAP and state of CA Training.
17	0h RW/P/L	**RANKREMAP:** Enables mapping logical rank to physical rank. 0 - no rank remap 1 - rank is remapped If (rank[0] is enabled) Map rank[1] to rank[2] Else (If rank[0] is disabled) Map rank[3:2] to rank[1:0]

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW/P/L	**DIMMFLIP:** DIMM Flip Required. BIOS must set this bit to 1 if the total size of DIMM1 is greater than the total size of DIMM0. DIMM Flipping simplifies rank decoding in dual-DIMM configuration when the DIMMs are not equal in size by mapping the low addresses to the larger DIMM.
15	0h RO	**Rsvd_15_DRP:** Reserved
14	0h RW/P/L	**RSIEN:** Rank Select Interleave Enable. 0 - Rank Select Interleave Disabled 1 - Rank Select Interleave Enabled Note: Rank select interleave enable should be set the same for both the Dunit and Bunit.
13	0h RO	**Rsvd_13_DRP:** Reserved
12:11	0h RW/P/L	**DIMMDDEN1:** DIMM 1 Device Density. This sets the density of the DRAM devices populated in DIMM 1 (Rank 0 and Rank 1). 00 - 1Gbit 01 - 2Gbit 10 - 4Gbit 11 - 8Gbit
10:9	0h RW/P/L	**DIMMDWID1:** DIMM 1 Device Width. Indicates the width of the DRAM devices populated in DIMM 1 (Rank 0 and Rank 1). 00 - x8 01 - x16 10 - x32 11 - Reserved
8	0h RO	**Rsvd_8_DRP:** Reserved
7:6	0h RW/P/L	**DIMMDDEN0:** DIMM 0 Device Density. This sets the density of the DRAM devices populated in DIMM 0 (Rank 0 and Rank 1). 00 - 1Gbit 01 - 2Gbit 10 - 4Gbit 11 - 8Gbit
5:4	0h RW/P/L	**DIMMDWID0:** DIMM 0 Device Width. Indicates the width of the DRAM devices populated in DIMM 0 (Rank 0 and Rank 1). 00 - x8 01 - x16 10 - x32 11 - Reserved
3	0h RW/P/L	**RKEN3:** DIMM 1, Rank 1 Enabled. Should be set to 1 when DIMM1 is populated and has 2 ranks to enable the use of this rank. Otherwise, must be set to 0.
2	0h RW/P/L	**RKEN2:** DIMM 1, Rank 0 Enabled. Should be set to 1 when DIMM1 is populated to enable the use of this rank. Otherwise, must be set to 0.
1	0h RW/P/L	**RKEN1:** DIMM 0, Rank 1 Enabled. Should be set to 1 when DIMM0 is populated and has 2 ranks to enable the use of this rank. Otherwise, must be set to 0.
0	0h RW/P/L	**RKEN0:** DIMM 0, Rank 0 Enabled. Should be set to 1 when DIMM0 is populated to enable the use of this rank. Otherwise, must be set to 0.

12.3.2 DTR0—Offset 1h

DRAM Timing Register 0

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 1h

Op Codes:
h - Read, h - Write

Default: 43001110h

31:28	27:26	25:24	23	22	21	20	19	18	17	16	15	14:12	11:8	7:4	3:2	1:0
0 1 0 0	0 0	1 1	0	0	0	0	0	0	0	0	0	0 0 1	0 0 0 1	0 0 0 1	0 0	0 0
CKEDLY	Rsvd_27_26_DTR0	PMEDLY	Rsvd_23_DTR0	tZQoper	Rsvd_11	tZQCS	Rsvd_19_DTR0	tXSDLL	Rsvd_17_DTR0	tXS	Rsvd_15_DTR0	tCL	tRCD	tRP	Rsvd_3_2_DTR0	DFREQ

Bit Range	Default & Access	Field Name (ID): Description
31:28	4h RW	**CKEDLY:** Additional delay between CK/CKB start and SRX command. This delay is needed for clock to stabilize to meet JEDEC requirements. Delay is CKEDLY multiples of 256 DRAM Clocks. 0ns to 9,600ns (DDR3-800) 0ns to 7,200ns (DDR3-1066)
27:26	0h RO	**Rsvd_27_26_DTR0:** Reserved
25:24	3h RW	**PMEDLY:** The delay, in DRAM clocks, between SR Entry command and Power-Mode message to DDRIO. 0h - 6 DRAM Clocks 1h - 8 DRAM Clocks 2h - 10 DRAM Clocks 3h - 12 DRAM Clocks
23	0h RO	**Rsvd_23_DTR0:** Reserved
22	0h RW	**tZQoper:** The delay, in DRAM clocks, between ZQC-Long command to any command. Note: ZQCL command during DRAM Init flow requires longer latency which is controlled be BIOS. 0h - 256 DRAM Clocks 1h - 384 DRAM Clocks
21	0h RO	**Rsvd_11:** Reserved
20	0h RW	**tZQCS:** The delay, in DRAM clocks, between a ZQC-Short command to any command. 0h - 64 DRAM Clocks 1h - 96 DRAM Clocks
19	0h RO	**Rsvd_19_DTR0:** Reserved
18	0h RW	**tXSDLL:** The delay, in DRAM clocks, between SRX command to any command requiring locked DLL. Only ZQCL can be sent before tXSDLL is done. 0h - tXS + 256 DRAM Clocks 1h - tXS + 384 DRAM Clocks
17	0h RO	**Rsvd_17_DTR0:** Reserved
16	0h RW	**tXS:** The delay, in DRAM clocks, between SRX command to command not requiring locked DLL. The Dunit can send a ZQCL command after tXS. JEDEC defines MAX(5CK, tRFC(min)+10ns) so both values take safety margin. 0h - 256 DRAM Clocks 1h - 384 DRAM Clocks
15	0h RO	**Rsvd_15_DTR0:** Reserved
14:12	1h RW	**tCL:** CAS Latency. Specifies the delay, in DRAM clocks, between the issue of a RD command and the return of valid data on the DQ bus. 0h - 5 DRAM Clocks (DDR3-800) 1h - 6 DRAM Clocks (DDR3-800, 1066. LPDDR2-800) 2h - 7 DRAM Clocks (DDR3-1066, 1333) 3h - 8 DRAM Clocks (DDR3-1066, 1333, 1600. LPDDR2-1066) 4h - 9 DRAM Clocks (DDR3-1333, 1600) 5h - 10 DRAM Clocks (DDR3-1333, 1600. LPDDR3-1333) 6h - 11 DRAM Clocks (DDR3-1600) 7h - Reserved

Bit Range	Default & Access	Field Name (ID): Description
11:8	1h RW	**tRCD:** Activate (RAS) to CAS Delay. Specifies the delay, in DRAM clocks, between an ACT command and a RD/WR command to the same bank. 0h - 5 DRAM Clocks (DDR3-800) 1h - 6 DRAM Clocks (DDR3-800, 1066. LPDDR2-800) 2h - 7 DRAM Clocks (DDR3-1066, 1333) 3h - 8 DRAM Clocks (DDR3-1066, 1333, 1600. LPDDR2-800, 1066) 4h - 9 DRAM Clocks (DDR3-1333, 1600) 5h - 10 DRAM Clocks (DDR3-1333, 1600. LPDDR2-800, 1066. LPDDR3-1333) 6h - 11 DRAM Clocks (DDR3-1600) 7h - 12 DRAM Clocks (LPDDR3-1333) 8h - 13 DRAM Clocks (LPDDR2-1066) 9h - 14 DRAM Clocks Ah - 15 DRAM Clocks Bh - 16 DRAM Clocks (LPDDR3-1333) Others - Reserved
7:4	1h RW	**tRP:** Precharge to Activate Delay. Specifies the delay, in DRAM clocks, between a PRE command and an ACT command to the same bank. 0h - 5 DRAM Clocks (DDR3-800) 1h - 6 DRAM Clocks (DDR3-800, 1066. LPDDR2-800) 2h - 7 DRAM Clocks (DDR3-1066, 1333) 3h - 8 DRAM Clocks (DDR3-1066, 1333, 1600. LPDDR2-800, 1066) 4h - 9 DRAM Clocks (DDR3-1333, 1600) 5h - 10 DRAM Clocks (DDR3-1333, 1600. LPDDR2-800, 1066. LPDDR3-1333) 6h - 11 DRAM Clocks (DDR3-1600) 7h - 12 DRAM Clocks (LPDDR3-1333) 8h - 13 DRAM Clocks (LPDDR2-1066) 9h - 14 DRAM Clocks Ah - 15 DRAM Clocks Bh - 16 DRAM Clocks (LPDDR3-1333) Others - Reserved
3:2	0h RO	**Rsvd_3_2_DTR0:** Reserved
1:0	0h RW	**DFREQ:** DRAM Frequency. Specifies the DDR3 frequency used by Dunit for computing proper cycle to cycle timings. Note: This configuration has no impact on the actual DRAM clock. 0h - DDR3-800 1h - DDR3-1066 2h - DDR3-1333 3h - DDR3-1600

12.3.3 DTR1 (DTR1)—Offset 2h

DRAM Timing Register 1

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 2h

Op Codes:
h - Read, h - Write

Default: 02690320h

31			28				24				20				16				12				8				4				0

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Rsvd_31_19_DTR4:** Reserved
18	0h RW	**WRBODTDIS:** Disable Write ODT on non-targeted DIMM. When writing to DIMM A, ODT is asserted to the target rank of DIMM A and also to the low rank of DIMM B. This defeature bit is used to disable ODT assertion to the opposite DIMM during write.
17	0h RW	**RDODTDIS:** Disable Read ODT. When reading from DIMM A, ODT is asserted to the low rank of DIMM B. This defeature bit is used to disable ODT assertion during reads.
16	0h RW	**TRGSTRDIS:** Write target rank is not stretched. When set, stretched ODT as defined above is not applied to the write target rank and ODT command is asserted for 6 DRAM clocks. Should not be used when ODT is pulled-in.
15	0h RO	**Rsvd_15_DTR4:** Reserved
14:12	3h RW	**RDODTSTOP:** Read command to ODT de-assert delay Value should be set to: RDODTSTRT+6+(WRODTSTOP-WRODTSTRT) 0h - 6 DRAM Clocks 1h - 7 DRAM Clocks 2h - 8 DRAM Clocks 3h - 9 DRAM Clocks 4h - 10 DRAM Clocks 5h - 11 DRAM Clocks 6h - 12 DRAM Clocks 7h - 13 DRAM Clocks Other - Reserved
11	0h RO	**Rsvd_24:** Reserved
10:8	3h RW	**RDODTSTRT:** Read command to ODT assert delay. Value should be set to tCMD+tCL-tWCL-ODT_PULLIN, where ODT_PULLIN must have the same value as in WRODTSTRT. 0h - 0 DRAM Clocks 1h - 1 DRAM Clocks 2h - 2 DRAM Clocks 3h - 3 DRAM Clocks 4h - 4 DRAM Clocks 5h - 5 DRAM Clocks Other - Reserved
7	0h RO	**Rsvd_7_DTR4:** Reserved
6:4	2h RW	**WRODTSTOP:** Write command to ODT de-assert delay. WRODTSTOP 1N 2N 3N 0h WR+6 N/A N/A 1h WR+7 WR+6 N/A 2h WR+8 WR+7 WR+6 3h WR+9 WR+8 WR+7 4h WR+10 WR+9 WR+8 Other Reserved Reserved Reserved
3:2	0h RO	**Rsvd_3_2_DTR4:** Reserved
1:0	2h RW	**WRODTSTRT:** WR command to ODT assert delay. JEDEC requires ODT to be asserted on the same clock with the WR command. Dunit allows to pull-in by 1 clock in 2N mode and by 1-2 clocks in 3N mode. For most DIMM configurations, this register should be programmed to same value as tCMD. A value of tCMD - ODT_PULLIN can be used according to the table below which shows the ODT command assertion with respect to the WR command assertion. WRODTSTRT 1N 2N 3N 0h WR WR-1 WR-2 1h N/A WR WR-1 2h N/A N/A WR 3h Reserved Reserved Reserved

12.3.7 DPMC0 (DPMC0)—Offset 6h

DRAM Power Management Control 0

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 6h

Op Codes:
h - Read, h - Write

Default: 0B000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	1	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
ENCORECLKGATE	ENCKTRI	ENPHYCLKGATE	REUTCLKGTDIS	Rsvd_27_DPMC0	BLMODE	DISPWRDN	CLKGTDIS	DYNSREN	Rsvd_22_DPMC0	PREAPWDEN	PCLSWKOK	Rsvd_19_DPMC0	PCLSTO			Rsvd_15_13_DPMC0			PMOP					SREDLY							

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**ENCORECLKGATE:** Enable Core Clock Gate During SR 0h - Core clock gating is disabled. 1h - Dunit enables the generic_clkreq_fsm during Self Refresh. The Dunit will re-enables the clocks upon Self Refresh exit.
30	0h RW	**ENCKTRI:** Enable CK/CKB TriState During PowerDown 0h - Disable CK/CKB Tristate During Powerdown. 1h - Enable CK/CKB Tristate During Powerdown. Note: This is an LPDDR feature only, for DDR3 bit should be set to 0.
29	0h RW	**ENPHYCLKGATE:** Enable PHY Clock Gate During SR 0h - PHY clock gating is disabled. 1h - Dunit will drive the dun_cck_clkreq signal low to turn off the 1x and 2x clock trees from the CCK unit to the DDRO PHY during Self Refresh. The Dunit will re-enables the clocks upon Self Refresh exit.
28	0h RW	**REUTCLKGTDIS:** REUT Clock Gate Disable 0h - REUT clock is gated when DCO.PMICTL is set to 0. 1h - REUT clock is upgated, overriding the DCO.PMICTL config bit. Note: The DCO.REUTLOCK bit overrides this bit.
27	1h RO	**Rsvd_27_DPMC0:** Reserved
26	0h RW	**BLMODE:** Burst Length Mode. Selects the DDR3 Burst Length mode: 0h - BL8 Fixed 1h - BL8/BC4 On-the-Fly Note: This bit should be zero for LPDDR2 and LPDDR3.
25	1h RW	**DISPWRDN:** Disable Power Down. Setting this bit to 1 will block CKE high-)low transitions. May be used by BIOS during init flow and should be set to 0 for functional mode. 0h - The Dunit dynamically controls the CKE pins to place the DRAM device in power down mode. 1h - The Dunit constantly drives the CKE pins high.
24	1h RW	**CLKGTDIS:** Clock Gating Disabled. Setting this bit to 0 allows a large number of internal Dunit clocks to be gated when there is no activity in order to save power. When set to 1, internal clock-gating is disabled. 0h - Enable 1h - Disable
23	0h RW	**DYNSREN:** Dynamic Self-Refresh Enable. Setting this bit to 1, enables automatic SR command to DRAM and PM message to DDRIO when the PMI bus is idle, all pending requests have been served and the and PMI status is less than 2, SREDLY has timed-out, and all JEDEC requirements are satisfied. This register may be changed by BIOS/FW on-the-fly.
22	0h RO	**Rsvd_22_DPMC0:** Reserved
21	0h RW	**PREAPWDEN:** Send Precharge All Command to a Rank before PD-Enter. Setting this bit to 1 will allow sending a PREA command before PDE command. 0h - Disable 1h - Enable

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**PCLSWKOK:** Wake Allowed for Page Close Timeout. Setting this bit to 1 indicates the Dunit can send DRAM devices a PD-Exit command in order to close single bank if the page timer expired. Note: This bit applies only to cases where at least one other bank in the same rank is open but not timed-out. If all banks in the rank timed-out, a PD-Exit command will be sent regardless of this bit. Must be set to 0 during init/training mode. 0h - Disable 1h - Enable
19	0h RO	**Rsvd_19_DPMC0:** Reserved
18:16	0h RW	**PCLSTO:** Page Close Timeout Period. Specifies the time frame, in ns, from last access to a DRAM page until that page may be scheduled for closing (by sending a PRE command). 0h - Disable page close timer (init/training) 1h - Immediate page close 2h - 30-60 ns to page close 3h - 60-120 ns to page close 4h - 120-240 ns to page close 5h - 240-480 ns to page close 6h - 480-960 ns to page close 7h - 1-2 s to page close
15:13	0h RO	**Rsvd_15_13_DPMC0:** Reserved
12:8	0h RW	**PMOP:** SPID Power Mode Opcode. The PM Message ID the Dunit will send to DDRIO on ispid_pm_pm bus after SR Entry command to DRAM. This message defines the DDRIO power-mode during SR period. Value can be changed on-the-fly to allow different power modes (for example, deeper PM for S3 than for C6). Power saving and Entry/Exit latencies are described in the MODMEM HAS.
7:0	0h RW	**SREDLY:** Self-Refresh Entry delay. The delay, in core-clocks, between PMI idle (no pending requests and PMI status is less than 2) and SR Entry when Dunit is in Dynamic SR mode.

12.3.8 DPMC1 (DPMC1)—Offset 7h

DRAM Power Management Control 1

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 7h

Op Codes:

h - Read, h - Write

Default: 00000011h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1

Fields: Rsvd_31_6_DPMC1 | CMDTRIST | Rsvd_3_1_DPMC1 | CSTRIST

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RO	**Rsvd_31_6_DPMC1:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
5:4	1h RW	**CMDTRIST:** Tristate Command and Address Bus to DRAM 0h - CMD/ADDR are never tristated. 1h - CMD/ADDR are tristated only when all CKE are low. 2h - CMD/ADDR are tristated when no valid command. 3h - CMD/ADDR are tristated when no valid command but may never be tristated for less than 2 DRAM clocks. This mode is only valid when tCMD is set to 0h (1N mode).
3:1	0h RO	**Rsvd_3_1_DPMC1:** Reserved
0	1h RW	**CSTRIST:** Tristate Chip-Select 0 - Never tristate. 1 - TriState DRAM CS# pins from SRE to SRX+tXS. Note: DDRIO may tristate during SR so this adds on the boundries.

12.3.9 DRFC (DRFC)—Offset 8h

DRAM Refresh Control

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 8h

Op Codes:
h - Read, h - Write

Default: 03012CA7h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	1	0	0	1	0	1	1	0	0	1	0	1	0	0	1	1	1

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Rsvd_31_27_DRFC:** Reserved
26:24	3h RO	**CUREFRATE:** Current Refresh Rate This value is updated by the Dunit TQ Poll logic after executing a Mode Register Read Command to the DRAM Device Temperature Mode Register (MR4). 0h - 4x tREFI, Low temperature operating limit exceeded 1h - 4x tREFI 2h - 2x tREFI 3h - 1x tREFI ((= 85C) 4h - 0.5x tREFI (LPDDR3) 5h - 0.25x tREFI, do not de-rate AC timing 6h - 0.25x tREFI, de-rate AC timing 7h - 0.25x tREFI, High temperature operating limit exceeded Note: This is an LPDDR feature only.
23:22	0h RO	**Rsvd_23_22_DFRC:** Reserved
21	0h RW	**REFDBTCLR:** Clear Refresh Debit before SR Entry When this bit is set, if enough REF commands are pulled-in, Dunit will not send additional REF commands before SR Entry. 0h - Disabled 1h - Enabled
20	0h RW	**REFSKWDIS:** Refresh counters may be increased in 2 policies - skewed or simultaneously. 0h - counters are updated per rank every 1/4 tREFI period. 1h - all counters are updated every tREFI.

Bit Range	Default & Access	Field Name (ID): Description
19:18	0h RO	**Rsvd_19_18_DRFC:** Reserved
17:16	1h RW	**REFCNTMAX:** Refresh Max tREFI Interval. The maximum interval between ant two REF commands per rank. JEDEC allows a maximum of 9 x tREFI intervals. 0h - 6 x tREFI 1h - 7 x tREFI 2h - 8 x tREFI 3h - 9 x tREFI Should not be changed after initial setting.
15	0h RO	**Rsvd_15_DRFC:** Reserved
14:12	2h RW	**tREFI Refresh Period**: Specifies the average time between sending REF commands to DRAM. The Dunit will guarantee that the average time is met, but maintains a certain degree of flexibility in the exact REF scheduling in order to increase overall performance. 0h - Refresh disabled 1h - Reserved for pre-silicon simulation 2h - 3.9 μs (Extended Temperature Range, 85-95°C) 3h - 7.8 μs (Normal Temperature Range, 0-85°C).
11:8	Ch RW	**REFWMPNC:** Refresh Panic Watermark. When the refresh debit counter, per rank, is greater than this value, the Dunit will send a REF command even if there are some pending requests and regardless of the PMI status level. See DDR3 spec for Refresh Postponing/Pulling-In flexibility. May be changed to functional value after init sequence. Value should be greater than, or equal, to REFWMHI. 0h - Reserved 1h - Reserved 2h - Reserved 3h - Reserved 4h - Reserved 5h - Reserved 6h - Reserved 7h - Postpone 2 REF commands 8h - Postpone 3 REF commands 9h - Postpone 4 REF commands Ah - Postpone 5 REF commands Bh - Postpone 6 REF commands Ch - Postpone 7 REF commands Dh - Postpone 8 REF commands Others - Reserved
7:4	Ah RW	**REFWMHI:** Refresh High Watermark. When the refresh debit counter, per rank, is greater than this value, the Dunit will send a REF command even if there are some pending requests to the rank but not if the PMI status is equal to 3. See DDR3 spec for Refresh Postponing/Pulling-In flexibility. May be changed to functional value after init sequence. Value should be greater than, or equal, to REFWMLO. 0h - Reserved 1h - Reserved 2h - Reserved 3h - Reserved 4h - Reserved 5h - Reserved 6h - Reserved 7h - Postpone 2 REF commands 8h - Postpone 3 REF commands 9h - Postpone 4 REF commands Ah - Postpone 5 REF commands Bh - Postpone 6 REF commands Ch - Postpone 7 REF commands Dh - Postpone 8 REF commands Others - Reserved
3:0	7h RW	**REFWMLO:** Opportunistic Refresh Watermark. When the refresh debit counter, per rank, is greater than this value, the Dunit will send a REF command only if there are no pending requests to the rank and the PMI status is less than 3. See DDR3 spec for Refresh Postponing/Pulling-In flexibility. May be changed to functional value after init sequence. 0h - Reserved 1h - Reserved 2h - Reserved 3h - Reserved 4h - Reserved 5h - Reserved 6h - Reserved 7h - Postpone 2 REF commands 8h - Postpone 3 REF commands 9h - Postpone 4 REF commands Ah - Postpone 5 REF commands Bh - Postpone 6 REF commands Ch - Postpone 7 REF commands Dh - Postpone 8 REF commands Others - Reserved

12.3.10 DSCH (DSCH)—Offset 9h

DRAM Scheduler Control

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 9h

Op Codes:
h - Read, h - Write

Default: 00071108h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0	0	0	1	0	0	0	1	0	0	0	0	1	0	0	0

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	**Rsvd_31_19_DSCH:** Reserved
18:16	7h RW	**IPREQMAX:** Maximal number of In-Process Requests stored in the Dunit. Number of pending requests = IPREQMAX+1; Value may be changed after init/training when PMI is idle.
15:13	0h RO	**Rsvd_15_13_DSCH:** Reserved
12	1h RW	**NEWBYPDIS:** Disable New Request Bypass. Setting this bit to 0 will allow a new request to bypass the normal Dunit internal arbiter when there are no pending commands. 0h - Enable New Request Bypass. 1h - Disable New Request Bypass.
11:10	0h RO	**Rsvd_11_10_DSCH:** Reserved
9	0h RW	**OOOST3DIS:** Out-of-Order Disabled whenPMI status is 3. Valid only if OOODIS is 0; 0 - Remain OOO if status goes up to 3 1 - Disable OOO if status goes to 3 May be changed after init/training flow.
8	1h RW	**OOODIS:** Disable Out-of-Order . 0h - OOO enabled. 1h - OOO disabled. Should be disabled during init/training and can be enabled for functional mode.
7:5	0h RO	**Rsvd_7_5_DSCH:** Reserved
4:0	08h RW	**OOOAGETRH:** Out-of-Order Aging Theshold. Number of PMI requests that can bypass any pending request before OOO will be disabled. This mechanism prevents starvation of pending commands.

12.3.11 DCAL (DCAL)—Offset Ah

DRAM Calibration Control

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x01] + Ah

Op Codes:
h - Read, h - Write

Default: 00001300h

31 28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 1	0 0 1 1	0 0 0 0	0 0 0 0

MRRDATA	TQPOLLPER	TQPOLLEN	Rsvd_19_DCAL	TQPOLLRS	TQPOLLSTRT	ZQCALSTRT	ZQCALTYPE	SRXZQCL	Rsvd_11_DCAL	ZQCINT	Rsvd_7_0_DCAL

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**MRRDATA:** MRR Data This field contains the data of the last DRAM Mode Register Read (MRR) issued thru message opcode 68h or from a TQ Poll. It is over-written with each MRR command. Note: This is an LPDDR feature only.
23:21	0h RW/P	**TQPOLLPER:** TQ Poll Period 0h - 1 x the current Refresh Period 1h - 2 x the current Refresh Period 2h - 4 x the current Refresh Period 3h - 8 x the current Refresh Period 4h - 16 x the current Refresh Period 5h - 32 x the current Refresh Period 6h - 64 x the current Refresh Period 7h - 128 x the current Refresh Period Note: This is an LPDDR feature only.
20	0h RW/P	**TQPOLLEN:** TQ Poll Enable 0 - Disables periodic TQ polling 1 - Enables periodic TQ polling Note: This is an LPDDR feature only.
19	0h RO	**Rsvd_19_DCAL:** Reserved
18:17	0h RW/P	**TQPOLLRS:** TQ Poll RS This bit selects which rank to poll the LPDDR2 DRAMs internal MR4 register. The assumption is that the temperature will be similar for any rank, and thus polling only a single memory device in the package is sufficient. 00 - Select Rank 0 to poll from 01 - Select Rank 1 to poll from 10 - Select Rank 2 to poll from 11 - Select Rank 3 to poll from Note: This is an LPDDR feature only.
16	0h RW/P	**TQPOLLSTRT:** TQ Poll Start Set this bit to 1 to start a TQPoll. This bit will remain a 1 until the TQPoll process is complete, then it will return to 0. 0 - TQ Poll is done 1 - TQ Poll has started and is in progress Note: This is an LPDDR feature only.
15	0h RW/P	**ZQCALSTRT:** ZQ Calibration Start Set this bit to 1 to start the ZQ calibration sequence. This bit will remain a 1 until the ZQ calibration is complete, then it will return to 0. 0 - ZQ calibration is done 1 - ZQ calibration has started and is in progress
14	0h RW/P	**ZQCALTYPE:** ZQ Calibration Type 0 - Short Calibration 1 - Long Calibration
13:12	1h RW/P	**SRXZQCL:** ZQ Calibration Long After SR Exit Control 0h - ZQCL commands after SRX are sent in parallel. 1h - ZQCL commands are sent serially to ranks (not used). 2h - No ZQCL is sent after SR Exit (for Debug only). 3h Reserved.
11	0h RO	**Rsvd_11_DCAL:** Reserved
10:8	3h RW/P	**ZQCINT:** ZQ Calibration Short Interval. The time interval, in ms, between ZQCS commands to a DRAM device. ZQCS commands are sent to a single DRAM device and commands are distributed and non-overlapping in the interval. 0h - Disabled 1h - 62s (for pre-silicon simulation only) 2h - 31ms 3h - 63ms 4h - 126ms Others - Reserved May be changed on-the-fly in response to thermal events.
7:0	0h RO	**Rsvd_7_0_DCAL:** Reserved

12.3.12 DRMC (DRMC)—Offset Bh

DRAM Reset Management Control

Access Method

Type: Message Bus Register (Size: 32 bits)   **Offset:** [Port: 0x01] + Bh

Op Codes:

31:17	0h RO	**Rsvd_31_17_DRMC:** Reserved
16	0h RW	**COLDWAKE:** BIOS should set this bit to 1 before sending WAKE command to Dunit after Cold Reset. For S3 Exit, or any other mode in which the DRAM is in SR, this bit must be set to 0.
15:13	0h RO	**Rsvd_15_13_DRMC:** Reserved
12	0h RW	**ODTMODE:** ODT Control Mode 0h - Dunit. 1h - SW override.
11:8	0h RW	**ODTVAL:** When ODTMODE is set to 1, ODT pins to DRAM are overridden by ODTVAL. Used only during init flow by BIOS.
7:5	0h RO	**Rsvd_7_5_DRMC:** Reserved
4	0h RW	**CKEMODE:** CKE Control Mode 0h - Dunit. 1h - SW override.
3:0	0h RW	**CKEVAL:** When CKEMODE is set to 1, CKE pins to DRAM are overridden by CKEVAL. Used only during init flow by BIOS.

12.3.13 PMSTS (PMSTS)—Offset Ch

Power Management Status

Access Method

Type: Message Bus Register (Size: 32 bits)   **Offset:** [Port: 0x01] + Ch

Op Codes:
h - Read, h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	

Rsvd_31_9_PMSTS	WRO	Rsvd_7_1_PMSTS	DISR

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Rsvd_31_9_PMSTS:** Reserved
8	0h RW/P	**WRO:** Warm Reset Occurred. Set by the Punit whenever a Reset Warn is received, and cleared by powergood=0. 0h: No Warm Reset occurred. 1h: Warm Reset occurred. BIOS Requirement. BIOS can check and clear this bit whenever executing POST code. This way BIOS knows that if the bit is set, then DISR indicates whether DRAM entered Self-Refresh.
7:1	0h RO	**Rsvd_7_1_PMSTS:** Reserved
0	0h RW/P	**DISR:** DRAM In Self-Refresh. Set by Dunit hardware after Channel is placed in self refresh as a result of a Power State or a Reset Warn sequence. Cleared by Dunit hardware before starting Channel 0 self refresh exit sequence initiated by a power management exit. Cleared by the BIOS by writing 1 in a warm reset (Reset# asserted while PWROK is asserted) exit sequence. 0 - DRAM not guaranteed to be in Self-Refresh. 1 - DRAM in Self-Refresh.

12.3.14 DCO (DCO)—Offset Fh

DRAM Control Operation

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + Fh

Op Codes:
h - Read, h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	

IC	DIOIC	PMIDIS	PMICTL	Rsvd_27_9_DCO	REUTLOCK	Rsvd_7_1_DCO	DRPLOCK

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**IC:** Dunit Initialization Complete. This bit should be set by BIOS after Dunit programming is complete and Dunit is ready to accept PMI requests and perform DRAM maintenance operations.

Bit Range	Default & Access	Field Name (ID): Description
30	0h RO	**DIOIC:** Status indication that DDRIO initialization is complete. Reflects ospid_init_complete.
29	0h RW	**PMIDIS:** Disable PMI interface. When set to 1, Following PMI signals are disabled from both Bunit and REUT: PMI Request Irdy, PMI Request Trdy, PMI DataBD Irdy, PMI DataBD Trdy, PMI DataBD BE, PMI DataDB Irdy, PMI DataDB Trdy
28	0h RW	**PMICTL:** PMI Control Select. 0h - PMI is owned by Bunit 1h - PMI is owned by REUT Whenever this bit is toggled, Dunit will flush all pending DRAM requests from previous owner before it accepts requests from new owner. This bit is also used when REUT is disabled in order to gracefully flush pending request and putting DRAM into IDLE state before sending MRS commands in functional mode.
27:9	0h RO	**Rsvd_27_9_DCO:** Reserved
8	0h RW/P/L	**REUTLOCK:** After this bit is set to 1, all REUT is clock gated and locked and cannot be used. REUTLOCK can be set only once, and will only reset when powergood = 0.
7:1	0h RO	**Rsvd_7_1_DCO:** Reserved
0	0h RW/P/L	**DRPLOCK:** After this bit is set to 1, all DRP bits are locked and cannot be written again. DRPLOCK can be written only once. DRPLOCK and DRP bit values will only reset when powergood = 0.

12.3.15 DTRC (DTRC)—Offset 10h

DRAM Training Control

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 10h

Op Codes:
h - Read, h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	

Rsvd_31_23_DTRC	CATSTATUS	CATFAIL	CATMASK	CATLPCNT	Rsvd_11_DTRC	CATRS	CATSTART	Rsvd_7_6_DTRC	BLKPHASEB	BLKIPRQNF	BLKPRE	BLKACT	BLKWR	BLKRD

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	**Rsvd_31_23_DTRC:** Reserved
22:17	0h RO	**CATSTATUS:** CA Training Status
16	0h RO	**CATFAIL:** CA Training Fail 0 - No mismatch between CA and DQ 1 - Mismatch between CA and DQ

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RW/L	**CATMASK:** Command/Address Training Mask Mask data for comparison. 0h - No Mask 1h - Mask out data from byte[1] and byte[4] 2h - Mask out data from upper 32bits 3h - Mask both bytes and upper 32bits
13:12	0h RW/L	**CATLPCNT:** Command/Address Training Loop Count
11	0h RO	**Rsvd_11_DTRC:** Reserved
10:9	0h RW/L	**CATRS:** Command/Address Training Rank Select 0h - Rank 0 (DIMM0) is selected 1h - Rank 1 (DIMM0) is selected 2h - Rank 2 (DIMM1) is selected 3h - Rank 3 (DIMM1) is selected
8	0h RW/P/L	**CATSTART:** Command/Address Training Start Set this bit to 1 to start CA training. This bit will remain a 1 until CA training is complete, then it will return to 0. 0 - CA Training is done 1 - CA Training has started and is in progress Note: This is an LPDDR feature only.
7:6	0h RO	**Rsvd_7_6_DTRC:** Reserved
5	0h RW/L	**BLKPHASEB:** Block All PhaseB Commands. Dunit operates at coreclock which is half the frequency of the DRAM clock. When this bit is set, only one command can be scheduled each coreclock. This bit may be used for DFX applications.
4	0h RW/L	**BLKIPRQNF:** Block all IP Requests until Queue is Full. When this bit is set to 1, all Dunit are stalled until the IP pool is full. This bit is self-clearing, and once asserted, writing 0 has no impact. The IPREQ pool is only reopened when the number of pending requests reaches DSCH.IPREQMAX+1.
3	0h RW/L	**BLKPRE:** Block Precharge Commands to DRAM 0 - No Block 1 - Block
2	0h RW/L	**BLKACT:** Block Activate Commands to DRAM 0 - No Block 1 - Block
1	0h RW/L	**BLKWR:** Block Write Commands to DRAM 0 - No Block 1 - Block
0	0h RW/L	**BLKRD:** Block Read Commands to DRAM 0 - No Block 1 - Block

12.3.16 DCBR (DCBR)—Offset 12h

DRAM CB Register

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 12h

Op Codes:
h - Read, h - Write

Default: 00000000h

Bits	31:9	8	7:2	1	0
Default	00000000000000000000000	0	000000	0	0
Field	Rsvd_31_9_DCBR	SRXNRQDIS	Rsvd_7_2_DCBR	DMINV	PHSINV

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Rsvd_31_9_DCBR:** Reserved
8	0h RW	**SRXNRQDIS:** Disable Accepting Requests During Self Refresh Exit 0 - Load PMI requests to Dunit in SR Exit tXSDLL and ZQCoper period 1 - Load PMI requests only after tXSDLL and ZQCoper are complete
7:2	0h RO	**Rsvd_7_2_DCBR:** Reserved
1	0h RW	**DMINV:** Invert DRAM Data Mask 0 - Do not invert DRAM data mask 1 - Invert DRAM data mask
0	0h RW	**PHSINV:** Core/SPID CDC phase control invert. Backup inverter for internal phase indicator in Dunit.

12.3.17 DSTAT (DSTAT)—Offset 20h

Dunit Status

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 20h

Op Codes:
h - Read, h - Write

Default: 0000000Ah

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**Rsvd_31_DSTAT:** Reserved
30:28	0h RO	**MAXMEM:** Reflects the fus_dun_max_supported_memory fuse
27:24	0h RO	**Rsvd_27_24_DSTAT:** Reserved
23	0h RO	**REFOPR3:** Rank 3 Refresh Dept is greater than DRFC.REFWMLO
22	0h RO	**REFOPR2:** Rank 2 Refresh Dept is greater than DRFC.REFWMLO
21	0h RO	**REFOPR1:** Rank 1 Refresh Dept is greater than DRFC.REFWMLO
20	0h RO	**REFOPR0:** Rank 0 Refresh Dept is greater than DRFC.REFWMLO

Bit Range	Default & Access	Field Name (ID): Description
19	0h RO	**REFDBT3:** Rank 3 has a Refresh Dept
18	0h RO	**REFDBT2:** Rank 2 has a Refresh Dept
17	0h RO	**REFDBT1:** Rank 1 has a Refresh Dept
16	0h RO	**REFDBT0:** Rank 0 has a Refresh Dept
15	0h RO	**IPRQVLD7:** IPREQ Entry 7 contains a valid request.
14	0h RO	**IPRQVLD6:** IPREQ Entry 6 contains a valid request.
13	0h RO	**IPRQVLD5:** IPREQ Entry 5 contains a valid request.
12	0h RO	**IPRQVLD4:** IPREQ Entry 4 contains a valid request.
11	0h RO	**IPRQVLD3:** IPREQ Entry 3 contains a valid request.
10	0h RO	**IPRQVLD2:** IPREQ Entry 2 contains a valid request.
9	0h RO	**IPRQVLD1:** IPREQ Entry 1 contains a valid request.
8	0h RO	**IPRQVLD0:** IPREQ Entry 0 contains a valid request.
7:5	0h RO	**Rsvd_7_5_DSTAT:** Reserved
4:0	0Ah RO	**MNT_STATE:** Dunit Maintenance Internal State

12.3.18 PGTBL (PGTBL)—Offset 21h

DRAM Page Table Status

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 21h

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PGTBLVLD

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**PGTBLVLD:** Reflects the open page table entries (4 Ranks x 8 Banks)

12.3.19 MISRCCCLR (MISRCCCLR)—Offset 31h

MISR CMD/CTRL Clear

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 31h

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MISRCCCLR

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h WO	**MISRCCCLR (MISRCCCLR):** Writing any value to this address will reset the MISRCC Signature register value to all Fs.

12.3.20 MISRDDCLR (MISRDDCLR)—Offset 32h

MISR DM/DQ Clear

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 32h

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MISRDDCLR

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h WO	**MISRDDCLR (MISRDDCLR):** Writing any value to this address will reset the MISRDD Signature register value to all Fs.

12.3.21 MISRCCSIG (MISRCCSIG)—Offset 34h

MISR CMD/CTRL Signature

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 34h

Op Codes:
h - Read, h - Write

Default: FFFFFFFFh

31			28				24				20				16				12				8				4				0
1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
SIG																															

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RO	**SIG:** MISR Signature: CMD/CTRL

12.3.22 MISRDDSIG (MISRDDSIG)—Offset 35h

MISR DM/DQ Signature

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 35h

Op Codes:
h - Read, h - Write

Default: FFFFFFFFh

31			28				24				20				16				12				8				4				0
1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
SIG																															

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RO	**SIG:** MISR Signature: DM/DQ

12.3.23 MISRECCSIG (MISRECCSIG)—Offset 37h

MISR ECC Signature

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 37h

Op Codes:
h - Read, h - Write

Default: FFFFFFFFh

31			28				24				20				16				12				8				4				0
1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
															SIG																

Bit Range	Default & Access	Field Name (ID): Description
31:0	FFFFFFFFh RO	**SIG:** MISR Signature ECC

12.3.24 SSKPD0 (SSKPD0)—Offset 4Ah

Sticky Scratchpad 0

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 4Ah

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
															VAL																

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/P	**VAL:** General Purpose Scratchpad. May be used for BIOS for data storage. Value is preserved in warm-reset.

12.3.25 SSKPD1—Offset 4Bh

Sticky Scratchpad 1

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 4Bh

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
															VAL																

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/P	**VAL:** General Purpose Scratchpad. May be used for BIOS for data storage. Value is preserved in warm-reset.

12.3.26 BONUS0 (BONUS0)—Offset 50h

Bonus Register 0

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 50h

Op Codes:
h - Read, h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	

Rsvd_31_4_BONUS0	LPDDRCMDTRI	MRRCMDDLY	CATBUGFIX	SLOWPDXEN	PERFMONEN	DISEARLYSRX

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	**Rsvd_31_7_BONUS0 (Rsvd_31_4_BONUS0):** Reserved
6	0h RW	**LPDDRCMDTRI:** Enable LPDDR CMD Tri-Stating
5:4	0h RW	**MRRCMDDLY:** Adding addtional delay on MRR followed by read and write command
3	0h RW	**CATBUGFIX:** This is a defeature bit for CA training and should be set to 0 for normal operation.
2	0h RW	**SLOWPDXEN:** This bit is for enabling slow powerdown exit.
1	0h RW	**PERFMONEN:** This bit is for enabling performance monitor.
0	0h RW	**DISEARLYSRX:** This bit is for enabling early SR exit.

12.3.27 BONUS1—Offset 51h

Bonus Register 1

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 51h

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

BONUS1

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**BONUS1:** Bonus Register 1 (This register is reserved for ECO).

12.3.28 DECCCTRL (DECCCTRL)—Offset 60h

DECC Control Register

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 60h

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Rsvd_31_18_DECCCTRL | ENCBGEN | Rsvd_16_DECCCTRL | CBOV | CLRSBECNT | SYNSEL | CBOEN | DBEEN | SBEEN

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**Rsvd_31_18_DECCCTRL:** Reserved
17	0h RW	**ENCBGEN:** DFx: Enable Generation of ECC check bits 0 - Disable check bit generation 1 - Enable check bit generation
16	0b RO	**Rsvd_16_DECCCTRL:** Reserved
15:8	00h RW	**CBOV:** DFx: Check Bit Override (Host Defined Value)
7	00h RW	**CLRSBECNT:** DFx: Clear SERR counter 0 - Allow single bit error count to increment 1 - Clear single bit error count
6:5	00h RW	**SYNSEL:** DFx: Select syndrome bits from 256b read data path. 0h - Selects syndrome bits from read data [63:0] 1h - Selects syndrome bits from read data [127:64] 2h - Selects syndrome bits from read data [191:128] 3h - Selects syndrome bits from read data [255:192]

Bit Range	Default & Access	Field Name (ID): Description
4:2	000h RW	**CBOEN:** DFx: Enable Check Bit Override on 256b write data path 0xx Host generated check bits disabled. 0h - Reserved 1h - Reserved 2h - Reserved 3h - Reserved 4h - Assert Host generated check bits on write data [63:0] 5h - Assert Host generated check bits on write data [127:64] 6h - Assert Host generated check bits on write data [191:128] 7h - Assert Host generated check bits on write data [255:192]
1	0h RW	**DBEEN:** Enable Double Bit Error Detect 0 - Disable double bit error detect 1 - Enable double bit error detect
0	0h RW	**SBEEN:** Enable Single Bit Error Detect and Correct 0 - Disable single bit error detect and correct 1 - Enable single bit error detect and correct

12.3.29 DECCSBECNT (DECCSBECNT)—Offset 62h

DECC Single Bit Error Count Register

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 62h

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ECCSBECNT

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**ECCSBECNT:** ECC Single Bit Error Count Write a 1 to the CLRSBECNT bit in the DECCCTRL register to clear this register

12.3.30 DFUSESTAT (DFUSESTAT)—Offset 70h

Dunit fuse status register

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 70h

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FUSESTAT

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**FUSESTAT:** Dunit fuse bits are captured into this register and is available for read [0] fus_dun_ecc_dis. [3:1] fus_dun_max_supporte_memory[2:0]. [5:4] fus_dun_max_devden[1:0] [6] fus_dun_dimm2_dis [7] fus_dun_rank2_dis [8] fus_dun_ooo_dis [9] fus_dun_memx8_dis [10] fus_dun_memx16_dis [11] fus_dun_bc4_dis [12] fus_dun_1n_dis [13] fus_dun_dq_scrambler_dis [15:14] Rsvd [16] fus_dun_32bit_dram_ifc [31:17] Rsvd

12.3.31 DSCRMSEED (DSCRMSEED)—Offset 80h

Dynamic data scrambler seed register ERRATA Reading this register returns the bit fields in reverse order SCRMSEED[31:14], 13'h0, SCRMDIS[0]

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 80h

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SCRMDIS | Rsvd_30_18_SCRMSEED | SCRMSEED

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**SCRMDIS:** Scrambler Disable 0 - Enables scrambler 1 - Disables scrambler Note: This bit has no impact with Scrambler is disabled by fuse
30:18	0h RO	**Rsvd_30_18_SCRMSEED:** Reserved
17:0	0h RW	**SCRMSEED:** Holds 18 bit scrambler seed value used to feed into LFSR array matrix.

12.3.32 DSCRMLO (DSCRMLO)—Offset 81h

Dynamic data scrambler pattern low register.

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 81h

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SCRMLO

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SCRMLO:** Holds 31:0 bits of scrambler parrem value used to XOR with LFSR array output.

12.3.33 DSCRMHI (DSCRMHI)—Offset 82h

Dynamic data scrambler pattern high register.

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + 82h

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SCRMHI

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SCRMHI:** Holds 63:32 bits of scrambler parrem value used to XOR with LFSR array output.

12.3.34 PMSEL0 (PMSEL0)—Offset E0h

Performance Monitor Event Select 0

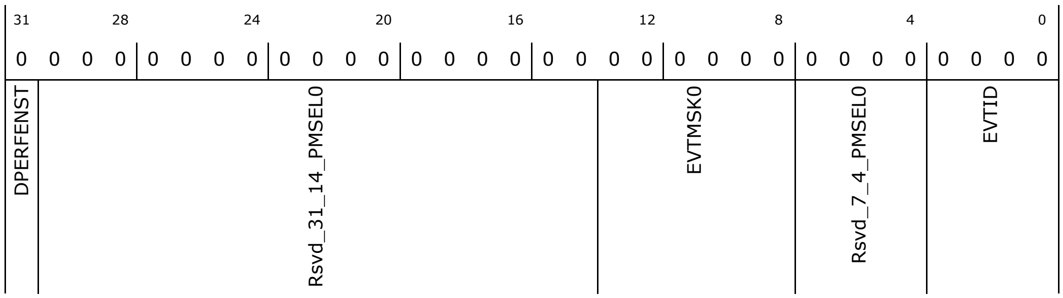
Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + E0h

Op Codes:
h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**DPERFENST:** Dunit Perfmon Enable Status. Reflects DFX Perfmon enable. 0 - Dunit perfmon is disabled. 1 - Dunit perfmon is enabled
30:14	0h RO	**Rsvd_31_14_PMSEL0:** Reserved
13:8	0h RW	**EVTMSK0:** Event Mask
7:4	0h RO	**Rsvd_7_4_PMSEL0:** Reserved
3:0	0h RW	**EVTID:** Event ID

12.3.35 PMSEL1 (PMSEL1)—Offset E1h

Performance Monitor Event Select 1

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + E1h

Op Codes:
h - Read, h - Write

Default: 00000000h

Bits	31:14	13:8	7:4	3:0
Default	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0 0 0 0 0 0	0 0 0 0	0 0 0 0
Field	Rsvd_31_14_PMSEL1	EVTMSK1	Rsvd_7_4_PMSEL1	EVTID

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Rsvd_31_14_PMSEL1:** Reserved
13:8	0h RW	**EVTMSK1:** Event Mask
7:4	0h RO	**Rsvd_7_4_PMSEL1:** Reserved
3:0	0h RW	**EVTID:** Event ID

12.3.36 PMSEL2—Offset E2h

Performance Monitor Event Select 2

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x01] + E2h

Op Codes:
h - Read, h - Write

Default: 00000000h

Bits	31:14	13:8	7:4	3:0
Default	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0 0 0 0 0 0	0 0 0 0	0 0 0 0
Field	Rsvd_31_14_PMSEL2	EVTMSK2	Rsvd_7_4_PMSEL2	EVTID

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Rsvd_31_14_PMSEL2:** Reserved
13:8	0h RW	**EVTMSK2:** Event Mask
7:4	0h RO	**Rsvd_7_4_PMSEL2:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
3:0	0h RW	**EVTID:** Event ID

12.3.37 PMSEL3—Offset E3h

Performance Monitor Event Select 3

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x01] + E3h

Op Codes:
h - Read, h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	

Rsvd_31_14_PMSEL3	EVTMSK3	Rsvd_7_4_PMSEL3	EVTID

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Rsvd_31_14_PMSEL3:** Reserved
13:8	0h RW	**EVTMSK3:** Event Mask
7:4	0h RO	**Rsvd_7_4_PMSEL3:** Reserved
3:0	0h RW	**EVTID:** Event ID

12.3.38 PMAUXMAX (PMAUXMAX)—Offset E8h

Performance Monitor Address Limit High

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x01] + E8h

Op Codes:
h - Read, h - Write

Default: 00000000h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Rsvd_31_28_PMAUXMAX				MAX																											

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Rsvd_31_28_PMAUXMAX:** Reserved
27:0	0h RW	**MAX:** Maximal address or maximal latency count. When PMSEL0.EVTID == Ch, this register should be initialized to 0h and at the end of the test bits [11:0] will contain the max latency. When PMSEL0/1/2.EVTID == 5h, this register should be initialized to the highest address the Perfmon test will cover. Bits [27:0] of this register correspond to the physical address bits [32:8].

12.3.39 PMAUXMIN—Offset E9h

Performance Monitor Address Limit Low

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x01] + E9h

Op Codes:
h - Read, h - Write

Default: 00000000h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Rsvd_31_28_PMAUXMIN				MIN																											

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	**Rsvd_31_28_PMAUXMIN:** Reserved
27:0	0h RW	**MIN:** Minimal address or minimal latency count. When PMSEL0.EVTID == Ch, this register should be initialized to FFFh and at the end of the test bits [11:0] will contain the min latency. When PMSEL0/1/2.EVTID == 5h, this register should be initialized to the lowest address the Perfmon test will cover. Bits [27:0] of this register correspond to the physical address bits [32:8].

12.3.40 PMAUX (PMAUX)—Offset EAh

Performance Monitor Aux

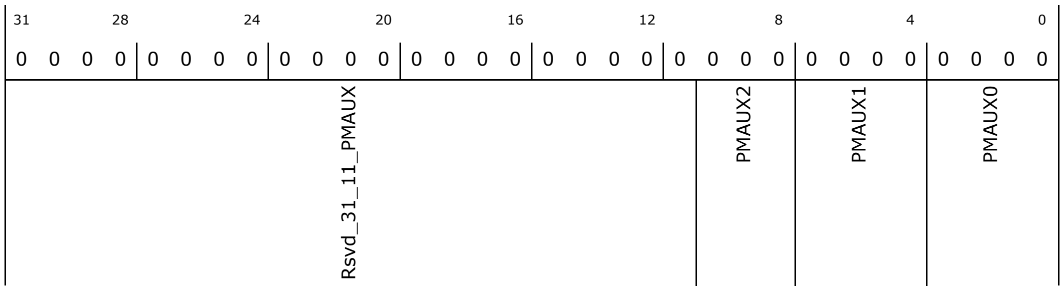
Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x01] + EAh

Op Codes:
h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**Rsvd_31_11_PMAUX:** Reserved
10:8	0h RW	**PMAUX2:** Additional mask and configuration. See Perfmon Guide.
7:4	0h RW	**PMAUX1:** Additional mask and configuration. See Perfmon Guide.
3:0	0h RW	**PMAUX0:** Additional mask and configuration. See Perfmon Guide.

13 SoC Transaction Router

The SoC Transaction Router is a central hub that routes transactions between the CPU cores, graphics controller, IO and the memory controller. In general, it handles:

- CPU Core Interface: Requests for CPU Core-initiated memory and IO read and write operations and processor-initiated message-signaled interrupt transactions
- Device MMIO and PCI configuration routing
- Buffering and memory arbitration
- PCI Config and MMIO accesses to host device (0/0/0)

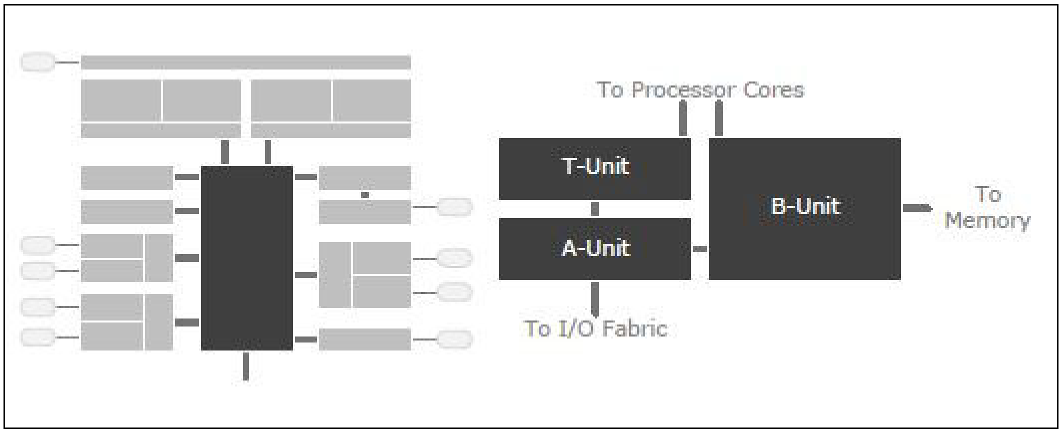


Figure 90. Soc Transaction Router Register Map

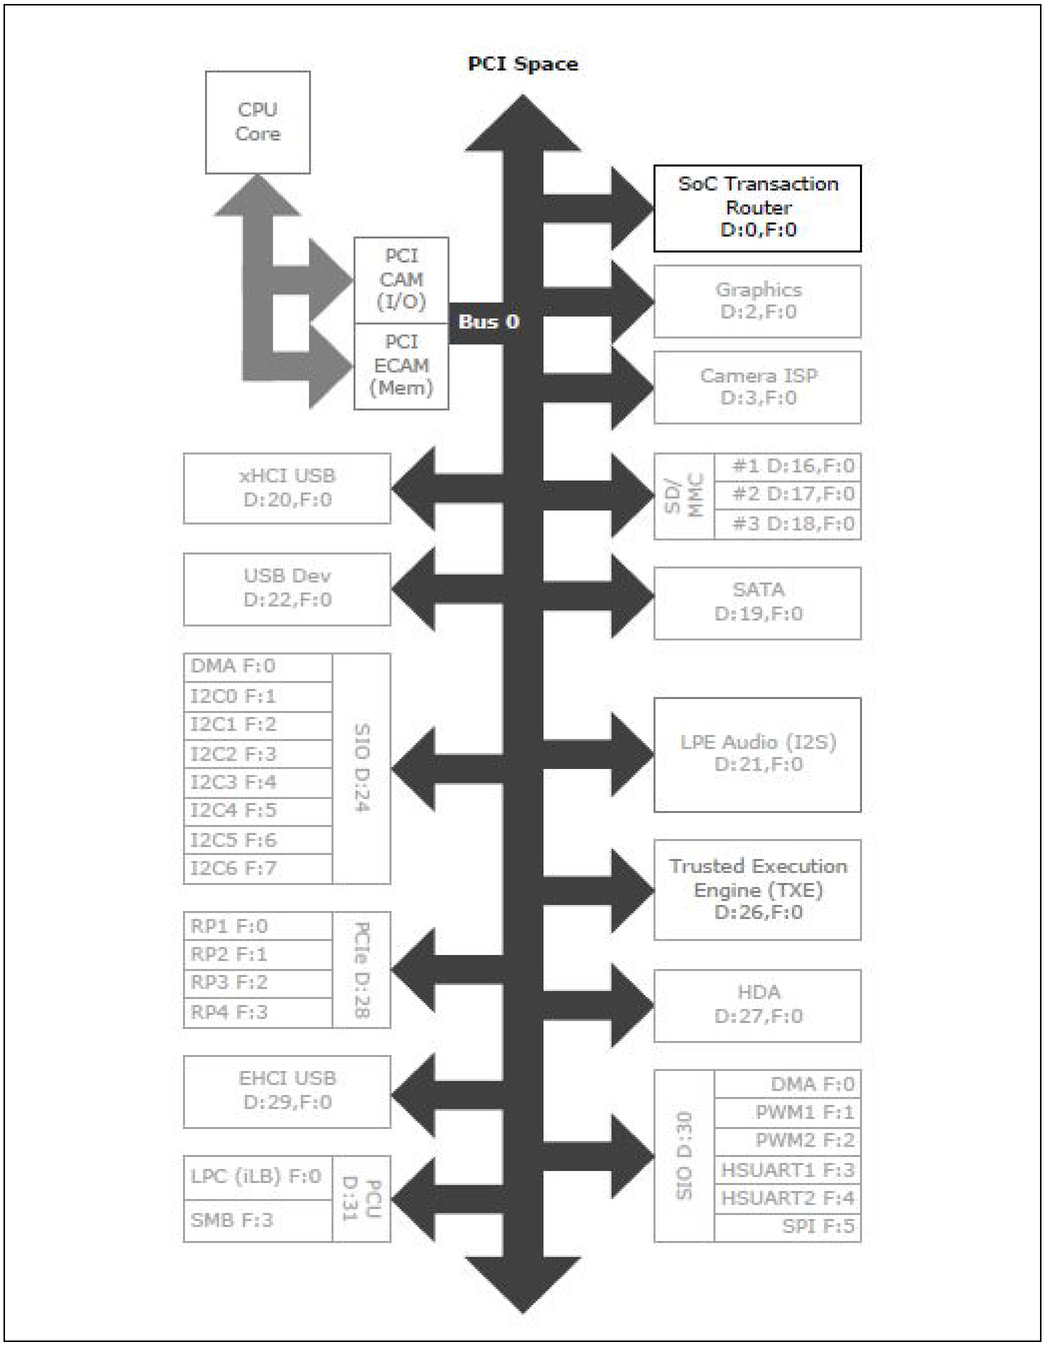

§

13.1 Transaction Router A-Unit Message Registers

Table 159. Summary of A-Unit Message Bus Registers—Port 0x00

Offset	Register Name (Register Symbol)	Default Value
10–10h	"ACF8—Offset 10h" on page 324	00000000h
52–52h	"ADBGERRLOG—Offset 52h" on page 325	00000000h

13.1.1 ACF8—Offset 10h

A-Unit Configuration CF8 Value (ACF8) The A-Unit CF8 (PCI Configuration Address Register) is made available for save/restore purposes. This register is saved and restored by the Punit during S0iX transitions in order to ensure proper handling of a possible subsequent CFC transaction after returning from standby or hibernate state. This is carried over from Aunit implementation in LNC.

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x00] + 10h

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
CFG_MAP_EN	CF8_RESERVED_0							BUS_NUM								DEVICE_NUM					FUNCTION_NUM			DBL_WD						CF8_RESERVED_1	

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**CFG_MAP_EN:** Configuration Space Mapping Enable: This bit enables Configuration Space mapping. The value set by full-dword writes to I/O address CF8
30:24	0h RW	**CF8_RESERVED_0:** Reserved. The value set by full-dword writes to I/O address CF8
23:16	0h RW	**BUS_NUM:** Bus Number: This is the target Bus Number of the resulting Configuration request. The value set by full-dword writes to I/O address CF8
15:11	0h RW	**DEVICE_NUM:** Device Number: This is the target Device Number of the resulting Configuration request. The value set by full-dword writes to I/O address CF8
10:8	0h RW	**FUNCTION_NUM:** Function Number: This is the target Function Number of the resulting Configuration request. The value set by full-dword writes to I/O address CF8
7:2	0h RW	**DBL_WD:** Double Word: This is the target dword of the resulting Configuration request. The value set by full-dword writes to I/O address CF8
1:0	0h RW	**CF8_RESERVED_1:** Reserved. This field should be always set to 2'b00. The value set by full-dword writes to I/O address CF8

13.2 SoC Transaction Router PCI Config Access IO Registers

SoC Transaction Router PCI Config Access IO Registers

Table 160. Summary of PCI Configuration Space Access I/O Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
CF8–CF8h	1	"ACF8—Offset CF8h" on page 327	00000000h
CFC–CFFh	4	"ACFC—Offset CFCh" on page 328	00000000h

13.2.1 ACF8—Offset CF8h

A-Unit Configuration CF8 Value (ACF8) The A-Unit CF8 (PCI Configuration Address Register) is made available for save/restore purposes. This register is saved and restored by the Punit during S0iX transitions in order to ensure proper handling of a possible subsequent CFC transaction after returning from standby or hibernate state. This is carried over from Aunit implementation in LNC.

Access Method

Type: I/O Register
(Size: 32 bits)

Offset: CF8h

Default: 00000000h

31 28 24 20 16 12 8 4 0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

CFG_MAP_EN | CF8_RESERVED_0 | BUS_NUM | DEVICE_NUM | FUNCTION_NUM | DBL_WD | CF8_RESERVED_1

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**CFG_MAP_EN:** Configuration Space Mapping Enable: This bit enables Configuration Space mapping. The value set by full-dword writes to I/O address CF8
30:24	0h RW	**CF8_RESERVED_0:** Reserved. The value set by full-dword writes to I/O address CF8
23:16	0h RW	**BUS_NUM:** Bus Number: This is the target Bus Number of the resulting Configuration request. The value set by full-dword writes to I/O address CF8
15:11	0h RW	**DEVICE_NUM:** Device Number: This is the target Device Number of the resulting Configuration request. The value set by full-dword writes to I/O address CF8
10:8	0h RW	**FUNCTION_NUM:** Function Number: This is the target Function Number of the resulting Configuration request. The value set by full-dword writes to I/O address CF8
7:2	0h RW	**DBL_WD:** Double Word: This is the target dword of the resulting Configuration request. The value set by full-dword writes to I/O address CF8
1:0	0h RW	**CF8_RESERVED_1:** Reserved. This field should be always set to 2'b00. The value set by full-dword writes to I/O address CF8

13.2.2 ACFC—Offset CFCh

A-Unit Configuration CFC Value (ACFC) The A-Unit CFC (PCI Configuration Data Port).

Access Method

Type: I/O Register
(Size: 32 bits)

Offset: CFCh

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CFC_VAL

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**CFC_VAL:** CFC Value: The value set by full-dword writes to I/O address CFC

13.3 Transaction Router B-Unit Message Registers

Table 161. Summary of B-Unit Message Bus Registers—Port 0x03

Offset	Register Name (Register Symbol)	Default Value
8–8h	"BBANKMASK—Offset 8h" on page 330	0000000Eh
9–9h	"BROWMASK—Offset 9h" on page 331	00FFFFFEh

3F–3Fh	"BTHMASK—Offset 3Fh" on page 343	FFFFFFFFh

13.3.1 BBANKMASK—Offset 8h

BUnit Bank Mask (BBANKMASK) The BBANKMASK register is used by the address-aware scheduling mechanism to determine the bit location of the bank bits within a 35 bit addresses. Bits 23:0 of this register are mapped to bits 35:12 of the addresses in the Bunit tag store PnP: The defaultBank mask is assuming static map select which is not available on VLV2. By default hash map is enabled for bank calculation so the default value should be set to 0 according to the HAS.

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x03] + 8h

Op Codes:
h - Read, h - Write

Default: 0000000Eh

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0

Bits 31:24	Bits 23:0
RESERVED_0	BANK_MASK

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**RESERVED_0:** Reserved
23:0	0eh RW	**BANK_MASK:** Bank_mask: Bit mask that corresponds to the location of the bank bits within bits 35:12 of a system address

13.3.2 BROWMASK—Offset 9h

BUnit Row Mask (BROWMASK) The BROWMASK register is used by the address-aware scheduling mechanism to determine the bit location of the row bits within a 35 bit addresses. Bits 23:0 of this register are mapped to bits 35:12 of the addresses in the Bunit tag store

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x03] + 9h

Op Codes:
h - Read, h - Write

Default: 00FFFFFEh

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	0

Bits 31:24	Bits 23:0
RESERVED_0	ROW_MASK

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**RESERVED_0:** Reserved
23:0	fffffeh RW	**ROW_MASK:** Row_mask: Bit mask that corresponds to the location of the row bits within bits 35:12 of a system address PnP: Value for perf and powerperf based on drp DIMMDEN0 8Gbit and x16 device which points to column in dunit HAS with rank size 4GB and width x16 (Set all the bits except column bits and we push all the bits up by 1 for system address which makes the mask from bit 14 to bit 34 of system address, hence the value 7ffffc). But VLV will support only 2 ranks so change it to 3ffffc PnP: Set the appropriate value from the Range based on rank density and device width of dram (Note: For 32Bit interfaces, for each of these, simply right shift the corresp option by 1)

13.3.3 BRANKMASK—Offset Ah

BUnit Rank Mask (BRANKMASK) The BRANKMASK register is used by the address-aware scheduling mechanism to determine the bit location of the rank bits within a 35 bit addresses. Bits 9:0 of this register are mapped to bits 35:26 of the addresses in the Bunit tag store

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x03] + Ah

Op Codes:
h - Read, h - Write

Default: 00000004h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

Bits 31:10	Bits 9:0
RESERVED_0	RANK_MASK

Bit Range	Default & Access	Field Name (ID): Description
31:10	00h RO	**RESERVED_0:** Reserved
9:0	04h RW	**RANK_MASK:** Rank_mask: Bit mask that corresponds to the location of the rank bits within bits 35:26 of a system address PnP:Set the rankmask from the range based on the rank density and device width of dram used

13.3.4 BIMRDATA—Offset 1Ah

BUnit Protected Memory Region Data Value

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x03] + 1Ah

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
LSFR_OUT	RETURN_PATTERN																														

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**LSFR_OUT:** Return LFSR Output on Range Violation : When set, the BUnit will return a stamped-down version of the output of an LFSR register instead of the data from the data return portion of this register.
30:0	0h RW	**RETURN_PATTERN:** Data Return Pattern for disallowed operations (DataPattern): This 31-bit value will be repeated along the 256-bit data bus and returned to any agent that has performed an access to the restricted access region.

13.3.5 BPMRVCTL—Offset 1Bh

BUnit Protected Memory Range Violation Control

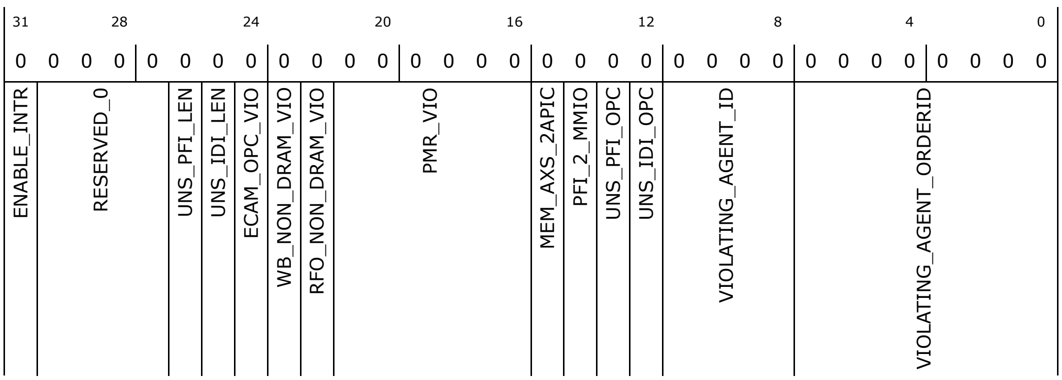
Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x03] + 1Bh

Op Codes:
h - Read, h - Write

Default: 00000000h



Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**ENABLE_INTR:** Enable Interrupt on Protected Memory Region Violation (EnablePMRInt): When set, the BUnit will latch violation information into this register and send an interrupt request (opcode 0x70) to the PUnit. This bit is cleared upon triggering and must be reset by software in order to trigger again. Memory protection is maintained even while the interrupt/capture mechanism is disabled. It is used to enable software debug of IMR errors, and is not expected to be used in end-user systems
30:27	0h RO	**RESERVED_0:** Reserved
26	0b RO	**UNS_PFI_LEN:** Unsupported PFI length.
25	0b RO	**UNS_IDI_LEN:** Unsupported IDI length.
24	0b RO	**ECAM_OPC_VIO:** ECAM opcode is not PRD or WIL.
23	0b RO	**WB_NON_DRAM_VIO:** IDI WB is not to DRAM space.
22	0b RO	**RFO_NON_DRAM_VIO:** IDI RFO is not to DRAM space.
21:16	0h RO	**PMR_VIO:** Protected Memory Range Violation : This 6-bit value indicates which region was last violated when the interrupt is enabled..
15	0h RO	**MEM_AXS_2APIC:** Memory Access to APIC region from a PFI Agent
14	0h RO	**PFI_2_MMIO:** MMIO Access from a PFI Agent
13	0h RO	**UNS_PFI_OPC:** Unsupported PFI Request Opcode

Bit Range	Default & Access	Field Name (ID): Description
12	0h RO	**UNS_IDI_OPC:** Unsupported IDI Request Opcode
11:8	0h RO	**VIOLATING_AGENT_ID:** Protect Asset Access Violation Agent ID: This 4-bit value indicates which agent caused the last access violation if the interrupt is enabled. The Agent ID values are assigned starting with the IDI Attach Points first followed by the PFI Agents. For a configuration using 1 IDI Attach point the IDI Attach Point Agent ID would be 0 and the PFI Agent IDs would start at 1. For 2 IDI Attach Points the IDI Attach Points values would be 0 or 1 and the PFI Agent IDs would start at 2.
7:0	0h RO	**VIOLATING_AGENT_ORDERID:** Protect Asset Access Violation Order ID: This value indicates the Order ID of the agent that caused the last access violation, if the interrupt is enabled. If access violation was from an IDI attach point this field latches the LPID.

13.3.6 BNOCACHE—Offset 23h

BUnit Non-Cached Region (BNOCACHE) This register defines a region of memory that, when DMA devices behind PFI agents perform an access (whether snooped or not), will not cause an IDI snoop.

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x03] + 23h

Op Codes:

h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits 31:16	Bits 15:0
UPPER_NO_SNOOP_BOUND	LOWER_NO_SNOOP_BOUND

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW	**UPPER_NO_SNOOP_BOUND:** Upper Bound (UpperNoSnoopBound): These bits are compared with bits 35:20 of the incoming address to determine the upper 1MB aligned value of the non-snoop range when EnableNoSnoop is set.
15:0	0000h RW	**LOWER_NO_SNOOP_BOUND:** Lower Bound (LowerNoSnoopBound): These bits are compared with bits 35:20 of the incoming address to determine the lower 1MB aligned value of the protected range when EnableNoSnoop is set.

13.3.7 BNOCACHECTL—Offset 24h

BUnit Non-Cached Region (BNOCACHECTL)

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x03] + 24h

Op Codes:
h - Read, h - Write

Default: 00000000h

31 28 24 20 16 12 8 4 0

RESERVED_0

ENABLE_NO_SNOOP

Bit Range	Default & Access	Field Name (ID): Description
31:1	0000h RO	**RESERVED_0:** Reserved
0	0h RW	**ENABLE_NO_SNOOP:** Enabled (EnableNoSnoop): When set, Bunit compares bits 35:20 incoming addresses to Upper and Lower NoSnoop Bounds to see if the transaction should be prevented from issuing a processor snoop operation

13.3.8 BMBOUND—Offset 25h

Bunit Memory/IO Boundary Register

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x03] + 25h

Op Codes:
h - Read, h - Write

Default: 40000000h

31			28				24				20				16				12				8				4				0
0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits 31:27	Bits 26:2	Bit 1	Bit 0
HOST_IO_BOUNDARY	RESERVED_0	SEND_ALL_ACCESS_MEM	SEND_BOOT_VECTOR_TO_DRAM

Bit Range	Default & Access	Field Name (ID): Description
31:27	008h RW	**HOST_IO_BOUNDARY:** Host IO Boundary: Bits 31:27 are compared with incoming Host Memory Request addresses to understand whether the associated transactions should be routed to memory space (DRAM) or IO space. The Host IO Boundary starts at this address and continues up to the 4GB address, 0xFFFF_FFFF.
26:2	0000000h RO	**RESERVED_0:** Reserved
1	0h RW	**SEND_ALL_ACCESS_MEM:** Send All Accesses to Memory: When set, all accesses will be sent to memory, regardless of address.
0	0h RW	**SEND_BOOT_VECTOR_TO_DRAM:** When set accesses from 0xFFFF0000-0xFFFFFFFF will be sent to memory regardless of the Host IO Boundary setting.

13.3.9 BMBOUND_HI—Offset 26h

Bunit Memory/IO HI Boundary Register

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x03] + 26h

Op Codes:
h - Read, h - Write

Default: 80000000h

31			28				24				20				16				12				8				4				0
1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

HOST_IO_BOUND_HIGH (31:24) | RESERVED_0 (23:0)

Bit Range	Default & Access	Field Name (ID): Description
31:24	80h RW	**HOST_IO_BOUND_HIGH:** Host IO Boundary High: Bits 31:24 are compared with bits 35:28 of incoming addresses of all memory accesses above 4GB to understand whether the associated transactions should be routed to memory space (Bunit) or IO space (Aunit). If bits 35:28 of the address are greater than or equal to the Host IO Boundary High register field, then the transaction is routed to the MMIO space.
23:0	0000000h RO	**RESERVED_0:** Reserved

13.3.10 BECREG—Offset 27h

Bunit Extended Configuration Space Config

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x03] + 27h

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ECBASE (31:28) | RESERVED_0 (27:1) | ECENABLE (0)

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW	**ECBASE:** EC Boundary (ECBase): Describes bits [31:28] of the range being used to access memory-mapped configuration space through the AUnit.
27:1	0000000h RO	**RESERVED_0:** Reserved
0	0h RW	**ECENABLE:** EC Enable (ECEnable): When set, causes the ECBase range to be compared to incoming Host Memory Request addresses. If bits [35:28] of a Memory access match the ECBase value, then a posted memory operation is treated as a non-posted operation by the T-unit and A-unit. Additionally, a Memory Write to Configuration Space will be serialized by T-unit and A-unit hardware as Non-Posted Writes

13.3.11 BSMMRRL—Offset 2Eh

Bunit System Management Range Register Low The SMM space is used to protect BIOS or other embedded code from corruption by the operating system. As such, the ranges below only should be set to cover memory space that is mapped into DRAM.

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x03] + 2Eh

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits 31:16	Bits 15:0
RESERVED_0	SMMSTART

Bit Range	Default & Access	Field Name (ID): Description
31:16	000h RO	**RESERVED_0:** Reserved
15:0	000h RW	**SMMSTART:** Lower Bound (SMMStart): These bits are compared with bits 35:20 of the incoming address to determine the lower 1MB aligned value of the protected range.

13.3.12 BSMMRRH—Offset 2Fh

Bunit System Management Range Register Hi The SMM space is used to protect BIOS or other embedded code from corruption by the operating system. As such, the ranges below only should be set to cover memory space that is mapped into DRAM.

Access Method

Type: Message Bus Register (Size: 32 bits) **Offset:** [Port: 0x03] + 2Fh

Op Codes:
h - Read, h - Write

Default: 00000000h

31	30	29	28:16	15:0

5	0h RW	**RANK2_ENABLE:** When set Rank2 for DIMM1 is enable Note: If Dunit DIMM Flip bit is set to 1 this field is the rank enable for rank 0.
4	0h RW	**RANK1_ENABLE:** When set Rank1 for DIMM0 is enable Note: If Dunit DIMM Flip bit is set to 1 this field is the rank enable for rank 3.
3	0h RW	**RANK0_ENABLE:** When set Rank0 for DIMM0 is enable Note: If Dunit DIMM Flip bit is set to 1 this field is the rank enable for rank 2.
2	0h RW	**MEMORY_INTERFACE_WIDTH_32B64B:** When set to 1: Configures the hashing function for 64b memory interface. When set to 0: Configures the hashing function for 32b memory interface.
1	0h RW	**RANK_INTERLEAVE_ENABLE:** When Set to 1: Enables hashing function to be used for Dunit Rank Select bits. When Set to 0: Disable the hashing function to be used for Dunit Rank Select bits. PnP: This has to match the RSIEN in DRP register in Dunit
0	0h RW	**DRAM_ADDRESS_HASH_ENABLE:** When Set to 1: Enables hashing function to be used for Dunit Bank and Rank Select bits. When Set to 0: Disable the hashing function to be used for Dunit Bank and Rank Select bits. When disabled the Dunit Bank and Rank select bits are specified using BBANKMASK And BRANKMASK configuration registers.

13.3.14 BTHCTRL—Offset 3Eh

BUnit Throttling Control (BTHCTRL)

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x03] + 3Eh

Op Codes:
h - Read, h - Write

Default: 00000001h

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 1

Fields: AGENT_THROTTLING_ENABLE (31:16), RESERVED_0 (15:11), CLEAR_BW_COUNTER_ON_READS (10), COUNT_CORE_CLOCKS (9), ENABLE_BW_COUNTER_UPDATES (8), RANK_SELECTION_MASK (7:0)

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**AGENT_THROTTLING_ENABLE:** Agent[15:0] Throttling Enable: Setting a bit in the 16 bit vector allows the BUnit to be configured to throttle Agents 0 to 15 requests in extreme conditions. /PnP: Leaving the Value for Power as ffff but will likely result in very low perf due to lower bandwidth.
15:11	0h RO	**RESERVED_0:** Reserved
10	0h RW	**CLEAR_BW_COUNTER_ON_READS:** When set clears the Bandwidth Counter when read.
9	0h RW	**COUNT_CORE_CLOCKS:** Count Core Clocks (CountCoreClocks): Debug feature used to cause the Bunit to send bandwidth usage updates based upon 1024 core-clock periods, rather than 1024 us periods. In addition, the values reported during bandwidth counter updates will represent 32-byte quantities transferred, instead of 8k byte quantities.
8	0h RW	**ENABLE_BW_COUNTER_UPDATES:** Enable Bandwidth Counter Updates (EnableBWCounterUpdates): The bandwidth counters always count the reads and writes to even and odd ranks. When updates are enabled, the Bunit will send an update message to the Punit roughly every millisecond with the current values contained in the bandwidth counters. When the message is sent, the counters are reset. When EnableBWCounterUpdates bit is clear, the counters will be reset only by the Clear Bandwidth Counters message.
7:0	01h RW	**RANK_SELECTION_MASK:** Rank Selection Mask (RankPickMask): Bit mask compared to bits [35:28] of the incoming addresses to determine whether that address maps to Rank 'A' or to Rank 'B' PnP: Needs to match RANKMASK reg Note: Dunit RANK Hashing implemented for VLV XORs several address bits to create the Rank Select. Therefore this register no longer selects the actual Rank address of the request. Recommendation is to set this value to 0 and only use EVEN BW Counters in BBWC to determine total memory bandwidth.

13.3.15 BTHMASK—Offset 3Fh

Bunit Throttling Masks (BTHMASK) The BTHMASK register contains the fields that control BUnit throttling of transactions to DRAM. If any channel is throttled 100%, by its field being set to all zeroes, then a system deadlock is possible.

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x03] + 3Fh

Op Codes:
h - Read, h - Write

Default: FFFFFFFFh

31			28				24				20				16				12				8				4				0
1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

ORWRITE_MASK	ORREAD_MASK	ERWRITE_MASK	ERREAD_MASK

Bit Range	Default & Access	Field Name (ID): Description
31:24	FFh RW	**ORWRITE_MASK:** Odd Ranks Write Mask (ORWriteMask): The Odd Rank Write mask is an eight bit value that determines the 1us time slices during which write transactions bound for these DRAM ranks will be allowed to proceed through Bunit arbitration.
23:16	FFh RW	**ORREAD_MASK:** Odd Ranks Read Mask (ORReadMask): The Odd Rank Read mask is an eight bit value that determines the 1us time slices during which read transactions bound for these DRAM ranks will be allowed to proceed through Bunit arbitration.
15:8	FFh RW	**ERWRITE_MASK:** Even Rank Write Mask (ERWriteMask): The Even Rank Write mask is an eight bit value that determines the 1us time slices during which write transactions bound for these DRAM ranks will be allowed to proceed through Bunit arbitration.
7:0	FFh RW	**ERREAD_MASK:** Even Rank Read Mask (ERReadMask): The Even Rank Read mask is an eight bit value that determines the 1us time slices during which read transactions bound for these DRAM ranks will be allowed to proceed through Bunit arbitration.

13.4 Transaction Router C-Unit PCI Registers

Table 162. Summary of C-Unit PCI Configuration Registers—0/0/0

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0–0h	1	"CUNIT_REG_DEVICEID—Offset 0h" on page 344	00008086h
4–4h	1	"CUNIT_CFG_REG_PCISTATUS—Offset 4h" on page 345	00000007h

C–Ch	1	"CUNIT_CFG_REG_HDR_TYPE—Offset Ch" on page 347	00000000h
2C–2Ch	1	"CUNIT_CFG_REG_STRAP_SSID—Offset 2Ch" on page 347	00000000h
D0–D3h	4	"CUNIT_MSG_CTRL_REG—Offset D0h" on page 348	00000000h
D4–D4h	1	"CUNIT_MSG_DATA_REG—Offset D4h" on page 348	00000000h
D8–D8h	1	"CUNIT_MSG_CTRL_REG_EXT—Offset D8h" on page 349	00000000h
F8–F8h	1	"CUNIT_MSG_CTRL_REG_EXT—Offset D8h" on page 349	00000000h

13.4.1 CUNIT_REG_DEVICEID—Offset 0h

CUnit Configuration Register Device ID/Vendor ID. Device ID and Vendor ID Strapped in from top level. Reset value to strapDID[15:3],fuse[2:0], 16'h8086 these bits can be re-written from SETIDVALUE message 1st DW data byte 2, byte 3

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:0, F:0] + 0h

Default: 00008086h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0	1	1	0

DEVICEID_VENDOR_ID | DEVICEID_BIT_22_19 | DEVICEID_BIT_18_16 | DEVICEID_BIT_15_0

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RW	**DEVICEID_VENDOR_ID:** Device ID and Vendor ID bit [15:7] are strapped in from top level. These bits can be re-written from SETIDVALUE message 1st DW data byte 2, byte 3. for VLV/VLV2, final setting of this field is from SETIDVALUE message, while for TNG it uses the strapped setting. For all SOC's, the RDL defalut is set to the strapped setting in that SOC. Please refer to the SoC documentation to determine the proper Device ID for the chip.
22:19	0h RO	**DEVICEID_bit_22_19 (DEVICEID_BIT_22_19):** Device ID [6:3] Hardwired in the design. SETIDVALUE message will not re-write this field. RDL default is set to the strapped value
18:16	0h RO	**DEVICEID_bit_18_16 (DEVICEID_BIT_18_16):** Device ID [2:0]. Strapped in from top level and tied to fuses to determine product SKU. SETIDVALUE message will not re-write this field.

Bit Range	Default & Access	Field Name (ID): Description
15:0	8086h RO	**DEVICEID_bit_15_0 (DEVICEID_BIT_15_0):** Hardwired

13.4.2 CUNIT_CFG_REG_PCISTATUS—Offset 4h

CUnit Configuration Register Device ID/Vendor ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:0, F:0] + 4h

Default: 00000007h

31			28				24				20				16				12				8				4				0

PCI_STATUS_PCI_CMD

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000007h RO	**PCI_STATUS_PCI_CMD:** PCI Status and PCI Command. Hardwired to 32'h00000007

13.4.3 CUNIT_CFG_REG_CLASSCODE—Offset 8h

CUnit Configuration register Header Type and Master Latency Time

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:0, F:0] + 8h

Default: 06000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
PCI_CLASSCODE_REVID																PCI_BIT_15_8								PCI_BIT_7_0							

Bit Range	Default & Access	Field Name (ID): Description
31:16	0600h RO	**PCI_CLASSCODE_REVID:** PCI Class Code
15:8	00h RO	**PCI_BIT_15_8:** Hardwired to 8'h00
7:0	0h RW	**PCI_BIT_7_0:** PCI revision ID. these bits can be re-written from SETIDVALUE message 1st DW data byte 0

13.4.4 CUNIT_CFG_REG_HDR_TYPE—Offset Ch

CUnit Configuration Register Device ID/Vendor ID

Access Method

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:0, F:0] + Ch

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MSTRLATENCY_HDRTYPE

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**MSTRLATENCY_HDRTYPE:** Master Latency Timer and Header Type hardwired to 0

13.4.5 CUNIT_CFG_REG_STRAP_SSID—Offset 2Ch

CUnit Configuration Register Device ID/Vendor ID

Access Method

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:0, F:0] + 2Ch

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

PCI_SUBSYSTEMID

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**PCI_SUBSYSTEMID:** PCI Subsystem ID passed in from top-level straps strapSSID[31:0]

13.4.6 CUNIT_MSG_CTRL_REG—Offset D0h

Message Control Register (MCR) - provides the message bus command fields. A write to this register issues a message on the Message Network with the fields specified by the write data. All byte enables must be enabled when writing this register. The physical registers reside in the target unit. This register does not reside in the Cunit.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:0, F:0] + D0h

Default: 00000000h

Bits	31:24	23:16	15:8	7:4	3:0
Default	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0	0 0 0 0
Field	MESSAGE_OPCODE	MESSAGE_PORT	MESSAGE_ADDRESS_OFFSET	MESSAGE_WR_BYTE_ENABLES	RESERVED

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h WO	**MESSAGE_OPCODE:** Opcode for message to be sent out on message network
23:16	00h WO	**MESSAGE_PORT:** Destination PortID for message to be sent out on message network
15:8	00h WO	**MESSAGE_ADDRESS_OFFSET:** Address offset for message to be sent out on message network
7:4	0h WO	**MESSAGE_WR_BYTE_ENABLES:** Active high byte enables which enable each of the corresponding bytes in the MDR when high.
3:0	00h WO	**RESERVED:** Reserved

13.4.7 CUNIT_MSG_DATA_REG—Offset D4h

Message Data Register (MDR) - provides the means to specify data to be written or retrieving data that was read during a message operation. For messages with a data payload, MDR must be written with the data to be sent prior to a write to MCR. For messages that return data, MDR contains the data read after the write to MCR completes.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:0, F:0] + D4h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MESSAGE_DATA_REG

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**SIDEBAND_DATA_REG (MESSAGE_DATA_REG):** Sideband Data Register (MDR)

13.4.8 CUNIT_MSG_CTRL_REG_EXT—Offset D8h

Message Control Register Extension for MCR/MDR provides bits 31:8 of the address/ offset for sideband transactions that require it. Must be written before MCR. Returns to '0 after MCR is written.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:0, F:0] +D8h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1	1	0	0	0

MSG_CTRL_REG_EXT

RESERVED

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000 RW	MSG_CTRL_REG_EXT: Message Control Register Extension for MCR/MDR
7:0	00h RO	RESERVED: Reserved

13.4.9 CUNIT_MANUFACTURING_ID—Offset F8h

CUnit Manufacturing ID Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:0, F:0] + F8h

Default: 00000000h

31:23	22:19	18:16	15:0
DEVICEID_VENDOR_ID	DEVICEID_BIT_22_19	DEVICEID_BIT_18_16	DEVICEID_BIT_15_0

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RW	**DEVICEID_VENDOR_ID:** Device ID and Vendor ID bit [15:7] are strapped in from top level. These bits can be re-written from SETIDVALUE message 1st DW data byte 2, byte 3. for VLV/VLV2, final setting of this field is from SETIDVALUE message, while for TNG it uses the strapped setting. For all SOC's, the RDL defalut is set to the strapped setting in that SOC. Please refer to the SoC documentation to determine the proper Device ID for the chip.
22:19	0h RO	**DEVICEID_bit_22_19 (DEVICEID_BIT_22_19):** Device ID [6:3] Hardwired in the design. SETIDVALUE message will not re-write this field. RDL default is set to the strapped value
18:16	0h RO	**DEVICEID_bit_18_16 (DEVICEID_BIT_18_16):** Device ID [2:0]. Strapped in from top level and tied to fuses to determine product SKU. SETIDVALUE message will not re-write this field.

Bit Range	Default & Access	Field Name (ID): Description
15:0	8086h RO	**DEVICEID_bit_15_0 (DEVICEID_BIT_15_0):** Hardwired

13.5.2 CUNIT_CFG_REG_PCISTATUS—Offset 1h

CUnit Configuration Register Device ID/Vendor ID

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x08] + 1h

Op Codes:
h - Read, h - Write

Default: 00000007h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1

PCI_STATUS_PCI_CMD

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000007h RO	**PCI_STATUS_PCI_CMD:** PCI Status and PCI Command. Hardwired to 32'h00000007

13.5.3 CUNIT_CFG_REG_CLASSCODE—Offset 2h

CUnit Configuration register Header Type and Master Latency Time

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x08] + 2h

Op Codes:
h - Read, h - Write

Default: 06000000h

31 28 24 20 16 12 8 4 0

13.6.1 THERMAL_SOC_TRIGGER—Offset 1h

Driver Software (like Burst Mode Governor) may use this register to indicate TSKIN violation.

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x04] + 1h

Op Codes:
h - Read, h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0

0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

HOTTEST_DIE_TEMP_READING	UNUSED_TSKIN_WARNING_THRESHOLD	TSKIN_TEMP_STATUS1	UNUSED_PMICRO_ICC_MAX	UNUSED_TSKIN_TEMP_STATUS	UNUSED_TSKIN_SPARE	UNUSED_TSKIN_WARNING	CPU_POWER	UNUSED_TSKIN_VIOLATION

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**HOTTEST_DIE_TEMP_READING:** Stores the hottest DTS sample of all thermal sensors in the CPU+SOC.
23:16	0h RW	**UNUSED_TSKIN_WARNING_THRESHOLD:** THIS FIELD IS UNUSED IN VLV/TNG. For platforms which implement a Tskin temperature sensor, this field can be used to specify the temperature limit above which TSKIN_WARNING will be set and Turbo operation will be disabled in the SOC.
15:12	0h RW	**TSKIN_TEMP_STATUS1:** THIS FIELD IS UNUSED IN VLV/TNG. For platforms which implement a Tskin temperature sensor, this field can be used to report the TSKIN temperature value for use by Punit firmware.
11	0h RO	**UNUSED_PMICRO_ICC_MAX:** THIS FIELD IS UNUSED IN VLV/TNG. Bit 11 is used indicate a Vcc Icc max condition. It is driven by the firmware when it gets a SVID update indicating a icc max hot condition. The firmware drives it back low when the hot condition is resolved when it gets a SVID update.
10:8	0h RW	**UNUSED_TSKIN_TEMP_STATUS:** THIS FIELD IS UNUSED IN VLV/TNG. For platforms which implement a Tskin temperature sensor, this field can be used to report the TSKIN temperature value for use by Punit firmware.
7:3	0h RW	**UNUSED_TSKIN_SPARE:** THIS FIELD IS UNUSED IN VLV/TNG. Spare for future tskin related controls
2	0h RW	**UNUSED_TSKIN_WARNING:** THIS FIELD IS UNUSED IN VLV/TNG. Early warning flag for TSKIN to be set by SCU, PUnit or platform driver to take early action to reduce power consumption...When asserted Punit will disable Turbo range of operation for CPU and GPU and limit operation to Guaranteed frequency. For systems which provide TSkin temperature punit may set this bit if Tskin exceeds TSKIN_WARNING_THRESHOLD...0 - Tskin warning is not triggered..1 - Tskin warning is triggered and CPU/GPU operation should be limited to Guaranteed frequencies.
1	0h RW	**CPU_POWER:** Reserved.
0	0h RW	**UNUSED_TSKIN_VIOLATION:** THIS FIELD IS UNUSED IN VLV/TNG. This bit can be set by the SOC or PUnit firmware to indicate that the system thermals are exceeding the TSkin spec. Setting this bit will trigger any enabled CPU thermal throttling mechanisms to take effect. Thermal throttling will remain active until this bit is cleared. For systems which provide TSkin temperature punit may set this bit if Tskin exceeds TSKIN_THROTTLE_THRESHOLD...0 tskin is not violated..1 trigger thermal throttling mechanisms to reduce platform temperature..

13.6.2 CPU_POWER_BUDGET_CONTROL—Offset 2h

TDP power budget utilization/budget for SOC; This register requires SAI security restriction.

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x04] + 2h

Op Codes:
h - Read, h - Write

Default: 00000000h

31	30:25	24	23:16	15	14:8	7:0
0	0 0 0 0 0 0 0	0	0 0 0 0 0 0 0 0	0	0 0 0 0 0 0 0	0 0 0 0 0 0 0 0
RESERVED_7	SPARE	IBC_LIMIT_ENABLE	IBC_RATIO_LIMIT	RESERVED_3	TURBOEM_FCPU_FLOOR	TURBOEM_FCPU_GAIN

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	**RESERVED_7:** reserved
30:25	0h RW	**SPARE:** Reserved.
24	0h RW	**IBC_LIMIT_ENABLE:** Enables IBC IA Pstate Limiting control. When set, the CPU frequency will be limited according to IBC_RATIO_LIMIT.
23:16	0h RW	**IBC_RATIO_LIMIT:** IBC IA Pstate Limiting control for GFX driver to limit the max CPU frequency (bounded by TURBOEM_FCPU_FLOOR and MAX_RATIO_1C). Will only take effect if IBC_LIMIT_ENABLE is set. The CPU ratio is limited to this ratio if Turbo is enabled in the system. Default value of 0 is mapped to MAX_RATIO_1C. Value of 1 is mapped to RATIO 1, etc.
15	0h RW	**RESERVED_3:** reserved
14:8	0h RW	**TURBOEM_FCPU_FLOOR:** Specifies the target ratio floor when the PL1 proportional controller or IBC_RATIO_LIMIT is in effect. Default value of 0 is mapped to GUAR_RATIO. Value of 1 is mapped to RATIO 1, etc. Note that values lower than LFM_RATIO may be clipped by hardware to LFM_RATIO.
7:0	0h RW	**TURBOEM_FCPU_GAIN:** Specifies the scaling factor for PL1 proportional controller to map CPU energy budget to ratio limit during Energy Management Turbo Mode. Target ratio = LFM_RATIO + energy_credit / (gain+1)

13.6.3 SOC_POWER_BUDGET_CONTROL—Offset 3h

Energy Credit available for SOC Turbo

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x04] + 3h

Op Codes:
h - Read, h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	

Bits 31:15	Bits 14:8	Bits 7:0
RESERVED_2	SPARE	TURBOEM_FGPU_GAIN

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**RESERVED_3 (RESERVED_2):** reserved
14:8	0h RO	**SPARE:** reserved
7:0	0h RW	**TURBOEM_FGPU_GAIN (TURBOEM_FGPU_GAIN):** Specifies the scaling factor for PL1 proportional controller to map GFX energy budget to ratio limit during Energy Management Turbo Mode. Target ratio = RPn + energy_credit / (gain+1)

13.6.4 TURBO_SOC_OVERRIDE—Offset 4h

Override CPU-SOC TDP sharing configuration in PKG_TURBO_CFG1; This register requires SAI security restriction.

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x04] + 4h

Op Codes:
h - Read, h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	

Bits 31:5	Bits 4:2	Bit 1	Bit 0
RESERVED_4	SOC_TDP_POLICY	SOC_TDP_EN	OVERRIDE_EN

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**RESERVED_4:** reserved
4:2	0h RW	**SOC_TDP_POLICY:** Overrides PKG_TURBO_CFG1[SOC_TDP_POLICY]. Refer PKG_TURBO_CFG1 register description for more info...Device Driver software may use this register to dynamically adjust power sharing configuration between CPU and SOC
1	0h RW	**SOC_TDP_EN:** Overrides PKG_TURBO_CFG1[SOC_TDP_EN]. Refer to PKG_TURBO_CFG1 register description for more info. ..Device Driver software may use this register to dynamically adjust power sharing configuration between CPU and SOC
0	0h RW	**OVERRIDE_EN:** Allows fields in this register to override corresponding Turbo MSR fields.

13.6.5 BIOS_RESET_CPL—Offset 5h

BIOS Reset Complete.

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x04] + 5h

Op Codes:
h - Read, h - Write

Default: 00000000h

31	28	24	20	16	12	8	4	0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

Bits	Field
31:9	RESERVED_8
8	PUNIT_RTOS_DONE
7:2	RESERVED_5
1	BIOS_ALL_DONE
0	BIOS_RESET_DONE

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**RESERVED_9 (RESERVED_8):** reserved
8	0h RW	**PUNIT_RTOS_DONE:** Punit will set this bit once firmware initialization of all tasks is completed. Simulation may poll this bit to hold-off code execution until Punit has safely initialized.
7:2	0h RW	**RESERVED_5:** Reserved
1	0h RW	**BIOS_ALL_DONE:** This bit indicates to the P unit that it can execute its periodic tasks.
0	0h RW	**BIOS_RESET_DONE:** This bit indicates to the P unit that the Patch loading is completed and the firmware can restart execution. Firmware will poll on this bit to be set. Note: This bit must be sticky once set and can only be cleared by a core reset.

13.6.6 BIOS_CONFIG—Offset 6h

Punit-BIOS controls

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x04] + 6h

Op Codes:
h - Read, h - Write

Default: 00000000h

31	30	29	28	27:18	17	16	15:9	8	7	6:2	1	0
ECC_EN	DUAL_CH_DIS	EFF_ECC_EN	EFF_DUAL_CH_EN	Reserved_9	BIOS_PDM	DFX_PDM_MODE	Reserved_6	DDRIO_PWRGATE	GFX_TURBO_DISABLE	Reserved_4	PCIE_PLLOFFOK_EN	USB_CACHING_EN

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**ECC_EN:** Setting this bit allows using a fused Dual Channel part as a single channel part with the second Channel being used for ECC.
30	0h RW	**DUAL_CH_DIS:** Setting this bit allows using a fused Dual Channel part as a single Channel part.
29	0h RW	**EFF_ECC_EN:** Effective ECC Status bit indicating if ECC is enabled(1) or disabled(0) based on the Fuse and the Downbin bit
28	0h RW	**EFF_DUAL_CH_EN:** Effective Dual Channel Status bit indicating if Dual Channel is enabled(1) or Single Channel is enabled(0)
27:18	0h RW	**Reserved_9:** Unused, reserved for future use.
17	0h RW	**DFX_POWERGATING (BIOS_PDM):** 0: Power Save Mode- Powergate DFX for power savings 1: PERF_MODE or PDM_MODE: Leave DFX blocks powered up BIOS must always set this bit before BIOS_RESET_CPL[1:0] bits are set. BYT-M and BYT-D segments leave DFX Powered up. BYT-T segments provide user option to leave DFX powered up or powered down. BIOS can change the DFX_Powergating bit to 0 to powergate DFX.
16	0h RW	**DFX_PDM_MODE:** This bit has effect only when DFX_Powergating (bit 17) is set. 0: PERF_MODE: Access to Performance Counters for SOCHAPs, Memory Traffic etc. 1: PDM_MODE: Memory BW counts not available but PDM debug messages are available
15:9	0h RW	**Reserved_6:** Reserved
8	0h RW	**DDRIO_PWRGATE:** Firmware sets bit 8 by default to disable ddrio powergating in S0i3. If BIOS writes to this BYTE, it must set bit 8 to avoid clobbering firmware update. DDRIO_PWRGATE is not supported on VLV. This bit is relevant only for SKUs supporting S0i3.
7	0h RW	**GFX_TURBO_DISABLE:** Setting this bit will disable GFX TURBO, even if the Fuses enable it. Setting this bit is not recommended for VLV
6:2	0h RW	**Reserved_4:** Unused, reserved for future use.

Bit Range	Default & Access	Field Name (ID): Description
1	0h RW	**PCIE_PLLOFFOK_EN:** When set, P unit will inform PCIE when the last core is entering and when the first core is exiting PC7 so that PCIE can turn off PLL
0	0h RW	**USB_CACHING_EN:** When set, P unit will inform USB when the last core is entering and first core is exiting PC7 so that USB caching can be enabled. BIOS will set this bit in synch with USB caching enable/disable setting. P unit will do the above handshake if the bit is set, or will skip the handshake if the bit is not set.

13.6.7 BIOSCFG_IPDEVTYPE—Offset 1Dh

This Punit Register controls the Device type during boot for IPS

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x04] + 1Dh

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits 31:1: RESERVED
Bit 0: IUNIT_DEVICE_TYPE

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RW	**RESERVED:** Reserved bits for future use
0	0h RW	**IUNIT_DEVICE_TYPE:** IUNIT is by default Device3 type. By setting this bit the device type of IUNIT changes to Device2.

13.6.8 PUNIT_S0i2_PREWAKE—Offset 1Eh

SB register for pre-wake periods for S0i2

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x04] + 1Eh

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0

25:24	0h RO	**MIOSSS:** MIO Subsystem Status Status0x03 indicates powered off state, 0x00 indicates powered on state. P unit will write this field to register field to reflect the status for power up or power down for the MIPI IO .Driver is expected to poll for the power up status before accessing the IP.
23:8	0h RO	**Reserved_3:** Reserved
7:2	0h RO	**Reserved_4:** Reserved
1:0	0h RW	**MIOSSC:** MIO (CSI) SubsystemControl- 0x03 indicates powered off state, 0x00 indicates powered on state. Driver will write this field to register field to request power up or power down for the MIPI controller. Note the implementation does not actually power gate, but will turn off the clock trunks and apply reset to MIO .

13.6.16 PWRGT_CNT_CTRL—Offset 60h

Active Power Gate Control Register;This register indicates the configuration of the voltage islands for the various blocks that the P unit controls. This register is updated by the software driver to request power up / power down of the various sub systems like the graphics, display et all. Each island is controlled by a 2-bit field. 00 -- no clock or power gating, 01 -- clock gating, 10 -- reset and 11 -- power gating.(Encoding is as follows: subsys 0 RENder, 1 media, 3 -Display, DPIO :subsystem 5 Common lane, subs 6-9 TX, subs 10-11 RX)

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x04] + 60h

Op Codes:
h - Read, h - Write

Default: 00000000h

11:10	0h RW	**PWRGATESTATUS_CMNLN:** Power gate status for common lane. Status0x03 indicates powered off state, 0x00 indicates powered on state. P unit will write this field to register field to reflect the status for power up or power down for the DPIO common lane
9:8	0h RW	**PWRGATESTATUS_RESERVED1:** Reserved
7:6	0h RW	**PWRGATESTATUS_DISPLAY_CTL:** Power gate status for display, Status0x03 indicates powered off state, 0x00 indicates powered on state. P unit will write this field to register field to reflect the status for power up or power down for the Display controller .Driver is expected to poll for the power up status before accessing the IP.
5:4	0h RW	**PWRGATESTATUS_RESERVED0:** Reserved
3:2	0h RW	**PWRGATESTATUS_MEDIA:** Power gate status for media Status0x03 indicates powered off state, 0x00 indicates powered on state. P unit will write this field to register field to reflect the status for power up or power down for the Media IP. The request for power up or power down for media are hardware triggered.
1:0	0h RW	**PWRGATESTATUS_RENDER:** Power gate status for RENder - Status0x03 indicates powered off state, 0x00 indicates powered on state. P unit will write this field to register field to reflect the status for power up or power down for the Render engine. The request for power up or power down for Render are hardware triggered.

13.6.18 PWRGT_INTREN—Offset 62h

Power Gate Interrupt enable;This register indicates the interrupt enables for the power islands for the various blocks that the P unit controls. The software driver sets this bit to trigger an interrupt when the particular subsystem is brought back to D0. There is one bit for each of the subsystem . At reset/powerup, all IE comes up as 0, indicating interrupts are not enabled. (Encoding is as follows: subsys 0 RENder, 1 media, 3 - Display, no control hook for DPIO)

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x04] + 62h

0	0h RW	**PWRGATEINTREN_RENDER:** power gate interrupt status for RENder

13.6.19 CPU_SOFT_STRAPS—Offset 7Ch

Register for BIOS software configurable CPU Power on Reset Configuration. This register survives CPU-only reset and SOC Warm reset. BIOS can access is register using CFC/CF8 mechanism. Accessible through MSG Bus Port 04h.

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x04] + 7Ch

Op Codes:
h - Read, h - Write

Default: 00000000h

Bits	31:11	10:8	7:1	0
Default	0000 0000 0000 0000 0000 0	000	0000 000	0
Field	RESERVED_4	POC_NUM_CORES	RESERVED_2	POC_RUN_BIST

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	**RESERVED_4:** Reserved
10:8	0h RW	**POC_NUM_CORES:** Core defeature via BIOS...000b Do not defeature IA cores...001b Only 1 Logical Core is active...010b Only 2 Logical Cores are active...011b Only 3 Logical Cores are active...1xxb Reserved (for 8 Core config).. ..Exposed to CPU microcode as CLPU_CR_RESOLVED_CORE_VECTOR, CLPU_CR_RESOLVED_CORE_VECTOR and CLPU_CR_WHO_AM_I via RESET_CONFIG_CW (CPU PMlink space)... ..Punit will determine the RESOLVED_CORE_VECTOR based on the table in HSD Issue 1214773...
7:1	0h RO	**RESERVED_2:** Reserved
0	0h RW	**POC_RUN_BIST:** Writing a 1 will cause the CPU microcode to execute BIST on the L2$ at CPU reset deassertion (CPU only reset or Warm Reset).

13.6.20 PTMC—Offset 80h

Programmable Thermtrip Management Control

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x04] + 80h

Op Codes:
h - Read, h - Write

Default: 00000000h

Bits	Field	Default
31:18	RESERVED_1	0000 0000 0000 00
17	CPU_MOD1	0
16	MOD0_THERM_EN	0
15:14	RESERVED_4	00
13	SW_TRIGGER	0
12	BW_THROT_EN	0

10	PROCHOT_THERM_EN	0
9	SVIDVR_ICC_EN	0
8	SVID_THERM_EN	0
7:4	RESERVED_11	0000
3	AUX3_THERM_EN	0
2	AUX2_THERM_EN	0
1	AUX1_THERM_EN	0
0	AUX0_THERM_EN	0

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	**RESERVED_1:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**CPU_MOD1:** CPU Module1: Indicates CPU Module0 can trigger thermal event
16	0h RW	**MOD0_THERM_EN:** CPU Module0: Indicates CPU Module0 can trigger thermal event
15:14	0h RO	**RESERVED_4:** Reserved
13	0h RW	**SW_TRIGGER:** Indicates Software can program SWT register to initiate thermal event
12	0h RW	**BW_THROT_EN:** Indicates excess memory bandwidth can trigger a thermal event
11	0h RW	**XXTTS_THERM_EN:** XXTTS (Reserved): Indicates Thermal Sensor from platform can trigger thermal event (Not supported in Valleyview)
10	0h RW	**PROCHOT_THERM_EN:** XXPROCHOT: Inidicates a Platform Prochot can cause thermal event
9	0h RW	**SVIDVR_ICC_EN:** Indicates the VR Icc Max can cause thermal event...The trip is triggered for both Vcc and Vnn
8	0h RW	**SVID_THERM_EN:** sVID(VR_Icc_Max/VR_Hot): Indicates VR status bits can cause thermal event
7:4	0h RO	**RESERVED_11:** Reserved
3	0h RW	**AUX3_THERM_EN:** AUX3: Indicates AUX3 (Hot Trip) can initiate a thermal event
2	0h RW	**AUX2_THERM_EN:** AUX2: Indicates AUX2 can intiate a thermal event
1	0h RW	**AUX1_THERM_EN:** AUX1: Indicates AUX1 can initiate a thermal event
0	0h RW	**AUX0_THERM_EN:** AUX0: Indicates AUX0 can initiate a thermal event

13.6.21 TTR0—Offset 81h

Rank 0 Bandwidth Trip Thresholds

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x04] + 81h

Op Codes:
h - Read, h - Write

Default: 00000000h

31:16	15:8	7:0
0000 0000 0000 0000	0000 0000	0000 0000
RESERVED_1	WR_THRESHOLD	RD_THRESHOLD

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED_1:** Reserved
15:8	0h RW	**WR_THRESHOLD:** Write Threshhold (W): Indicates (in absence of a thermal sensor) a threshold to initiate a trip for the throttle mechanism. This value will be compared against the total Rank0 Write count from the event counters when there is no external thermal sensor configured for DRAM protection.
7:0	0h RW	**RD_THRESHOLD:** Read Threshhold (R): Indicates (in absence of a thermal sensor) a threshold to initiate a trip for the throttle mechanism. This value will be compared against the total Rank0 Read count from the event counters when there is no external thermal sensor configured for DRAM protection

13.6.22 TTR1—Offset 82h

Rank 1 Bandwidth Trip Thresholds

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x04] + 82h

Op Codes:
h - Read, h - Write

Default: 00000000h

31:16	15:8	7:0
0000 0000 0000 0000	0000 0000	0000 0000
RESERVED_1	WR_THRESHOLD	RD_THRESHOLD

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED_1:** Reserved
15:8	0h RW	**WR_THRESHOLD:** Write Threshhold (W): Indicates (in absence of a thermal sensor) a threshold to initiate a trip for the throttle mechanism. This value will be compared against the total Rank0 Write count from the event counters when there is no external thermal sensor configured for DRAM protection.
7:0	0h RW	**RD_THRESHOLD:** Read Threshhold (R): Indicates (in absence of a thermal sensor) a threshold to initiate a trip for the throttle mechanism. This value will be compared against the total Rank0 Read count from the event counters when there is no external thermal sensor configured for DRAM protection

13.6.23 TTS—Offset 83h

VLV Bandwidth Trip Thresholds

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x04] + 83h

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

RESERVED_1 | WR_THRESHOLD | RD_THRESHOLD

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED_1:** Reserved
15:8	0h RW	**WR_THRESHOLD:** Write Threshold: Indicates a threshold to initiate a trip for the throttle mechanism. This value will be compared against the total Write count FOR BOTH RANKS from the event counters when there is no iternal thermal sensor configured for VLV protection.
7:0	0h RW	**RD_THRESHOLD:** Read Threshold: Same as Write Threshold but for Reads from BOTH RANKS.

13.6.24 TELB—Offset 84h

Thermal Enforcement Limits for Bandwidth Trips

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x04] + 84h

Op Codes:
h - Read, h - Write

Default: 00000000h

31 ... 24	23 ... 16	15 ... 8	7 ... 0
0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0
R1_WR_MASK	R1_RD_MASK	R0_WR_MASK	R0_RD_MASK

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**R1_WR_MASK:** Rank 1 Write Mask: Mask writes to Rank1
23:16	0h RW	**R1_RD_MASK:** Rank 1 Read Mask: Mask reads to Rank1
15:8	0h RW	**R0_WR_MASK:** Rank 0 Write Mask: Mask writes to Rank0
7:0	0h RW	**R0_RD_MASK:** Rank 0 Read Mask: Mask reads to Rank0

13.6.25 TELT—Offset 85h

Thermal Enforcement Limits for Thermal Trips

Access Method

Type: Message Bus Register
(Size: 32 bits)

Offset: [Port: 0x04] + 85h

Op Codes:
h - Read, h - Write

Default: 00000000h

31 ... 24	23 ... 16	15 ... 8	7 ... 0

R1_WR_MASK	R1_RD_MASK	R0_WR_MASK	R0_RD_MASK

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**R1_WR_MASK:** Rank 1 Write Mask: Mask writes to Rank1
23:16	0h RW	**R1_RD_MASK:** Rank 1 Read Mask: Mask reads to Rank1
15:8	0h RW	**R0_WR_MASK:** Rank 0 Write Mask: Mask writes to Rank0
7:0	0h RW	**R0_RD_MASK:** Rank 0 Read Mask: Mask reads to Rank0

13.6.26 TQPR—Offset 86h

Thermal Trip TQ Poll Rate Register - This register identifies the rate of TQ poll in LPDDR2 memory.

Access Method

Type: Message Bus Register (Size: 32 bits) **Offset:** [Port: 0x04] + 86h

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Reserved_1 | TQ_POLL_PERIOD

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RW	**Reserved_1:** Reserved
2:0	0h RW	**TQ_POLL_PERIOD:** Def TQ Poll Period: This sets the frequency by which the Dunit polls the DRAM mode register MR4 to determine required refresh rate when thermal event occurs. ..000 1 x the current Refresh Period ..001 2 x the current Refresh Period ..010 4 x the current Refresh Period ..011 8 x the current Refresh Period ..100 16 x the current Refresh Period ..101 32 x the current Refresh Period ..110 64 x the current Refresh Period ..111 128 x the current Refresh Period..

13.6.27 GFXT—Offset 88h

GFX Thermals Control - This register is used to enable clock (On clocks) throttling.

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x04] + 88h

Op Codes:
h - Read, h - Write

Default: 00000000h

31			28				24				20				16				12				8				4				0

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**SPARE_BITS:** Bits to be used in future
7:0	0h RW	**GFXFREQWISH:** Doorbell Register, Frequency Encoding for Frequency Requested in GFX Reg used by Render. For actual frequency encoding please refer Graphics HAS

13.6.50 PUNIT_GPU_FREQ_STS—Offset D8h

Punit GPU Frequency Status Register

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x04] + D8h

Op Codes:
h - Read, h - Write

Default: 00000000h

Bits	31:16	15:8	7:6	5	4	3:1	0
Default	0000 0000 0000 0000	0000 0000	00	0	0	000	0
Field	RESERVED_7	STATUSFREQID	CZ_CLK_FREQ	RESERVED_4	GPLLENABLE	RESERVED_2	GENFREQSTATUS

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**RESERVED_7:** Reserved for future use
15:8	0h RO	**STATUSFREQID:** Frequency Encoding for the Frequency Reached
7:6	0h RO	**CZ_CLK_FREQ:** CZ clock Freq encoding is as follows: 00 = 800, 01=1066, 10=1333, 11=Invalid
5	0h RO	**RESERVED_4:** Reserved for future use
4	0h RO	**GPLLENABLE:** 0=graphics clocks not from GPLL...1=graphics clocks from GPLL...
3:1	0h RO	**RESERVED_2:** Reserved for future use
0	0h RO	**GENFREQSTATUS:** Status Register bit to be optionally used by Graphics Driver. This bit Indicates that frequency change is in progress

13.6.51 DPTF_TELB—Offset 108h

Thermal Enforcement Limits for Bandwidth Trips. Write to this Register also triggers Punit to take action to execute. In the RTL the register is listed as MMIO_SPARE4

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x04] + 108h

Op Codes:
h - Read, h - Write

Default: 00000000h

31:24	23:16	15:8	7:0
0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0
R1_WR_MASK	R1_RD_MASK	R0_WR_MASK	R0_RD_MASK

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**R1_WR_MASK:** Rank 1 Write Mask: Mask writes to Rank1
23:16	0h RW	**R1_RD_MASK:** Rank 1 Read Mask: Mask reads to Rank1
15:8	0h RW	**R0_WR_MASK:** Rank 0 Write Mask: Mask writes to Rank0
7:0	0h RW	**R0_RD_MASK:** Rank 0 Read Mask: Mask reads to Rank0

13.6.52 DPTF_GFXT—Offset 109h

GFX Thermals Control - This register is used to enable clock (On clocks) throttling.Write to this Register also triggers Punit to take action to execute. In the RTL the register is listed as MMIO_SPARE5

Access Method

Type: Message Bus Register (Size: 32 bits)

Offset: [Port: 0x04] + 109h

Op Codes:
h - Read, h - Write

Default: 00000000h

31:16	15:8	7:3	2:0
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0	0 0 0 0 0	0 0 0

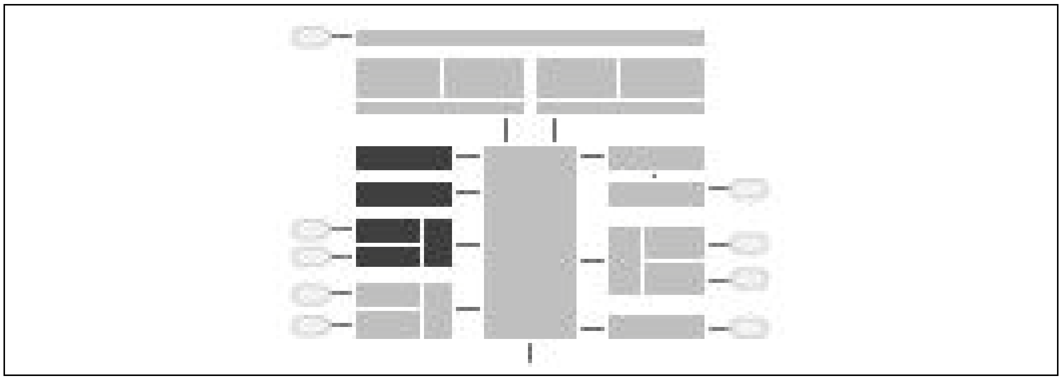
14 Graphics, Video and Display

This section provides an overview of Graphics, Video and Display features of the SoC.

This chapter and all contents in it are not applicable to E3805 SKU.

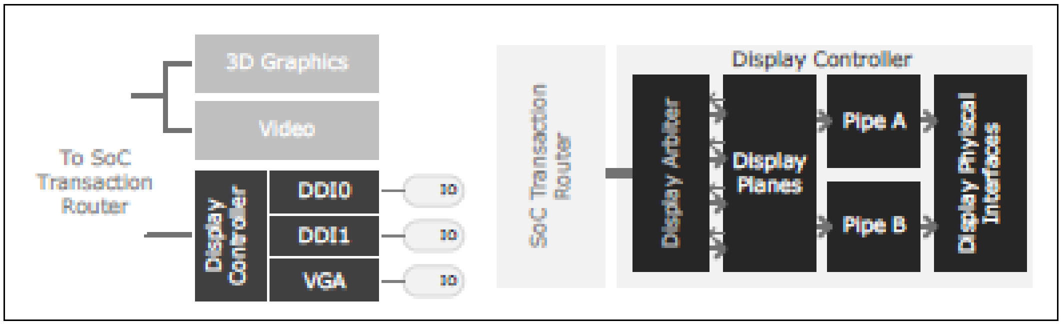


14.1 Features

The key features of the individual blocks are as follows:

- Refreshed seventh generation Intel graphics core with four Execution Units (EUs)
  - 3D graphics hardware acceleration including support for DirectX*11, OCL 1.2, OGL ES Halti/2.0/1.1, OGL 3.2
  - Video decode hardware acceleration including support for H.264, MPEG2, MVC, VC-1, WMV9, JPEG/MJPEG and VP8 formats
  - Video encode hardware acceleration including support for H.264 and MPEG2
  - Display controller, incorporating the display planes, pipes and physical interfaces
  - Four planes available per pipe - 1x Primary, 2x Video Sprite and 1x Cursor- plus a single legacy VGA plane
  - A single Analog Display physical interface, implementing VGA support
  - Two multi-purpose Digital Display Interface (DDI) PHYs implementing HDMI, DVI, DisplayPort (DP) or Embedded DisplayPort (eDP) support

14.2 SoC Graphics Display



The Processor Graphics controller display pipe can be broken down into three components:

- Display Planes
- Display Pipes
- Display Physical Interfaces

A display plane is a single displayed surface in memory and contains one image (desktop, cursor, overlay). It is the portion of the display hardware logic that defines the format and location of a rectangular region of memory that can be displayed on a display output device and delivers that data to a display pipe. This is clocked by the Core Display Clock.

14.2.1 Primary Planes A and B

Planes A and B are the main display planes and are associated with Pipes A and B respectively. Each plane supports per-pixel alpha blending.

14.2.2 Video Sprite Planes A, B, C and D

Video Sprite Planes A, B, C and D are planes optimized for video decode. Planes A and B are associated with Pipe A and Planes C and D are associated with Pipe B.

14.2.3 Cursors A and B

Cursors A and B are small, fixed-sized planes dedicated for mouse cursor acceleration, and are associated with Planes A and B respectively.

14.2.4 VGA

VGA is used for boot, safe mode, legacy games, etc. It can be changed by an application without OS/driver notification, due to legacy requirements.

14.3 Display Pipes

The display pipe blends and synchronizes pixel data received from one or more display planes and adds the timing of the display output device upon which the image is displayed.

The display pipes A and B operate independently of each other at the rate of one pixel per clock. They can attach to any of the display interfaces.

14.4 Display Physical Interfaces

The display physical interfaces consist of output logic and pins that transmit the display data to the associated encoding logic and send the data to the display device. These interfaces can be subdivided into analog (VGA) and digital (DisplayPort*, Embedded DisplayPort*, DVI and HDMI*) interfaces.

14.4.1 Analog Display Physical Interface

The analog port provides a RGB signal output along with a HSYNC and VSYNC signal. There is an associated Display Data Channel (DDC) signal pair dedicated to the analog port. The intended target device is for a monitor with a VGA connector. Display devices such as LCD panels with analog inputs may work satisfactorily but no functionality is added to the signals to enhance that capability.

14.4.1.1 Signal Descriptions

Please see Chapter 2, “Physical Interfaces” for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal’s function.

Table 165. Analog Display Interface Signals

Signal Name	Direction Plat. Power	Description
VGA_BLUE	O VVGA_GPIO	**Blue Analog Video Output:** This signal is a VGA Analog video output from the internal color palette DAC.
VGA_GREEN	O VVGA_GPIO	**Green Analog Video Output:** This signal is a VGA Analog video output from the internal color palette DAC.
VGA_RED	O VVGA_GPIO	**Red Analog Video Output:** This signal is a VGA Analog video output from the internal color palette DAC.
VGA_HSYNC	O VVGA_GPIO	**VGA Horizontal Synchronization:** This signal is used as the horizontal sync (polarity is programmable) or “sync interval”.

Table 165. Analog Display Interface Signals

Signal Name	Direction Plat. Power	Description
VGA_VSYNC	O VVGA_GPIO	**VGA Vertical Synchronization:** This signal is used as the horizontal sync (polarity is programmable) or "sync interval".
VGA_DDCCLK	I/O VVGA_GPIO	**VGA DDC Clock:** EDID support for an external VGA display
VGA_DDCDATA	I/O VVGA_GPIO	**VGA DDC Data:** EDID support for an external VGA display
VGA_IREF	I	**Resistor Set:** Set point resistor for the internal color palette DAC. A 357ohm+/-0.5% precision resistor is required between VGA_IREF and motherboard ground.
VGA_IRTN	O	This signal is the complement video signal output from the internal color palette DAC channels and this signal connects directly to the ground plane of the board.
LPC_RCOMP	-	VGA Impedance Compensation.

14.4.1.2 Features

Table 166 lists the characteristics of the analog port.

Table 166. Analog Port Characteristics

Signal	Port Characteristics	Support
RGB	Voltage range	0.7 Vp-p nominal only
	CRT/Monitor sense	Analog compare
	Analog copy protection	No
	Sync on green	No
HSYNC VSYNC	Voltage	3.3 V
	Enable/Disable	Port control
	Polarity adjust	VGA or port control
	Composite sync support	No
	Special flat panel sync	No
	Stereo sync	No
DDC	Voltage	External buffered to 5 V
	Control	Through GPIO interface

14.4.1.2.1 Integrated RAMDAC

The display function contains a RAM-based Digital-to-Analog Converter (RAMDAC) that transforms the digital data from the graphics and video subsystems to analog data for the VGA monitor. The SoC integrated 320 MHz RAMDAC supports resolutions up to 2560x1600 at 60 Hz. Three 8-bit DACs provide the R, G, and B signals to the monitor.

14.4.1.2.2 Sync Signals

HSYNC and VSYNC signals are digital and conform to TTL signal levels at the connector. Since these levels cannot be generated internal to the device, external level shifting buffers are required. These signals can be polarity adjusted and individually disabled in one of the two possible states. The sync signals should power up disabled in the high state. No composite sync or special flat panel sync support are included.

14.4.1.2.3 VESA/VGA Mode

VESA/VGA mode provides compatibility for pre-existing software that set the display mode using the VGA CRTC registers. Timings are generated based on the VGA register values and the timing generator registers are not used.

14.4.1.2.4 Display Data Channel (DDC)

DDC is a standard defined by VESA. Its purpose is to allow communication between the host system and display. Both configuration and control information can be exchanged allowing plug-and-play systems to be realized. Support for DDC 1 and 2 is implemented. The SoC uses the VGA_DDCCLK and VGA_DDCDATA signals to communicate with the analog monitor. The SoC does not generate these signals at 5 V so external pull-up resistors and level shifting circuitry should be implemented on the board.

14.4.2 Digital Display Interfaces

14.4.2.1 Signal Descriptions

See Chapter 2, "Physical Interfaces" for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal's function

Table 167. Display Physical Interfaces Signal Names (Sheet 1 of 2)

Signal Name	Direction	Description	
		HDMI / DVI	DP / eDP
DDI[1,0]_TXP[0] DDI[1,0]_TXP[1] DDI[1,0]_TXP[2] DDI[1,0]_TXP[3]	O	**Ports 1,0: Transmit Signals**	
		TMDS[1,0]_DATAP[2] TMDS[1,0]_DATAP[1] TMDS[1,0]_DATAP[0] TMDS[1,0]_CLKP	DP[1,0]_MAINP[0] DP[1,0]_MAINP[1] DP[1,0]_MAINP[2] DP[1,0]_MAINP[3]

Table 167. Display Physical Interfaces Signal Names (Sheet 2 of 2)

Signal Name	Direction	Description	
		HDMI / DVI	**DP / eDP**
DDI[1,0]_TXN[0] DDI[1,0]_TXN[1] DDI[1,0]_TXN[2] DDI[1,0]_TXN[3]	O	**Ports 1,0: Transmit Complement Signals**	
		TMDS[1,0]_DATAN[2] TMDS[1,0]_DATAN[1] TMDS[1,0]_DATAN[0] TMDS[1,0]_CLKN	DP[1,0]_MAINN[0] DP[1,0]_MAINN[1] DP[1,0]_MAINN[2] DP[1,0]_MAINN[3]
DDI[1,0]_AUXP	I/O	**Ports 1,0: Display Port Auxiliary Channel**	
		Unused	DP[1,0]_AUXP
DDI[1,0]_AUXN	I/O	**Ports 1,0: Display Port Auxiliary Channel Complement**	
		Unused	DP[1,0]_AUXN
DDI[1,0]_HPD	I	**Ports 1,0: Hot Plug Detect**	
		TMDS[1,0]_HPD	DP[1,0]_HPD
DDI[1,0]_DDCCLK	I/O	**Ports 1,0: DDC Clock**	
		TMDS[1,0]_DDCCLK	Unused
DDI[1,0]_DDCDATA	I/O	**Ports 1,0: DDC Data**	
		TMDS[1,0]_DDCDATA	DP[1,0]_EN - Port 0 Enable Strap
DDI[1,0]_BKLTCTL	O	**Ports 1,0: Panel Backlight Brightness Control**	
		HDMI / DVI / DP	**eDP Only**
		Unused	EDP[1,0]_BKLTCTL
DDI[1,0]_BKLTEN	O	**Ports 1,0: Panel Backlight Enable**	
		HDMI / DVI / DP	**eDP Only**
		Unused	EDP[1,0]_BKLTEN
DDI[1,0]_VDDEN	O	**Ports 1,0: Panel Power Enable**	
		HDMI / DVI / DP	**eDP Only**
		Unused	EDP[1,0]_VDDEN
DDI_RCOMP_P/N	I/O	**DDI RCOMP** This signal is used for pre-driver slew rate compensation. An external precision resistor of 402 Ω ±1% should be connected between DDI_RCOMP_P and DDI_RCOMP_N.	

14.4.2.2 Features

14.4.2.3 High Definition Multimedia Interface

The High-Definition Multimedia Interface (HDMI) is provided for transmitting digital audio and video signals from DVD players, set-top boxes and other audiovisual sources to television sets, projectors and other video displays. It can carry high quality multi-channel audio data and all standard and high-definition consumer electronics video formats. HDMI display interface connecting the SoC and display devices utilizes transition minimized differential signaling (TMDS) to carry audiovisual information through the same HDMI cable.

HDMI includes three separate communications channels: TMDS, DDC, and the optional CEC (consumer electronics control) (not supported by the SoC). As shown in Figure 91 the HDMI cable carries four differential pairs that make up the TMDS data and clock channels. These channels are used to carry video, audio, and auxiliary data. In addition, HDMI carries a VESA DDC. The DDC is used by an HDMI Source to determine the capabilities and characteristics of the sink.

Audio, video and auxiliary (control/status) data is transmitted across the three TMDS data channels. The video pixel clock is transmitted on the TMDS clock channel and is used by the receiver for data recovery on the three data channels. The digital display data signals driven natively through the SoC are AC coupled and needs level shifting to convert the AC coupled signals to the HDMI compliant digital signals.

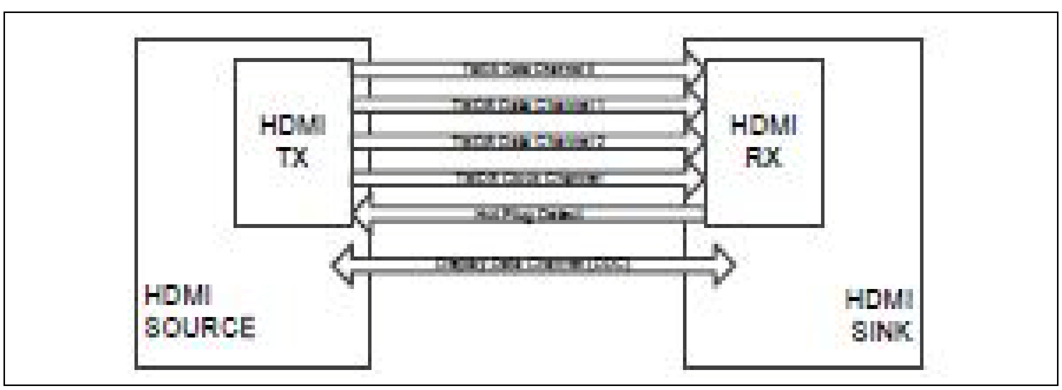
The SoC HDMI interface is designed as per the High-Definition Multimedia Interface Specification 1.4. The SoC supports High-Definition Multimedia Interface Compliance Test Specification 1.4.

14.4.2.3.1 Stereoscopic Support on HDMI

SoC display supports HDMI 1.4 3D video formats. If the HDMI panel is detected to support 3D video format then the SW driver will program Pipe2dB for the correct pipe timing parameters.

The left and right frames can be loaded from independent frame buffers in the main memory. Depending on the input S3D format, the display controller can be enabled do perform frame repositioning, image scaling, line interleaving.

Figure 91. HDMI Overview



14.4.2.4 Digital Video Interface (DVI)

The Digital Ports can be configured to drive DVI-D. DVI uses TMDS for transmitting data from the transmitter to the receiver which is similar to the HDMI protocol but without the audio and CEC. Refer to the HDMI section for more information on the signals and data transmission. To drive DVI-I through the back panel the VGA DDC signals are connected along with the digital data and clock signals from one of the Digital Ports. When a system has support for a DVI-I port, then either VGA or the DVI-D through a single DVI-I connector can be driven but not both simultaneously.

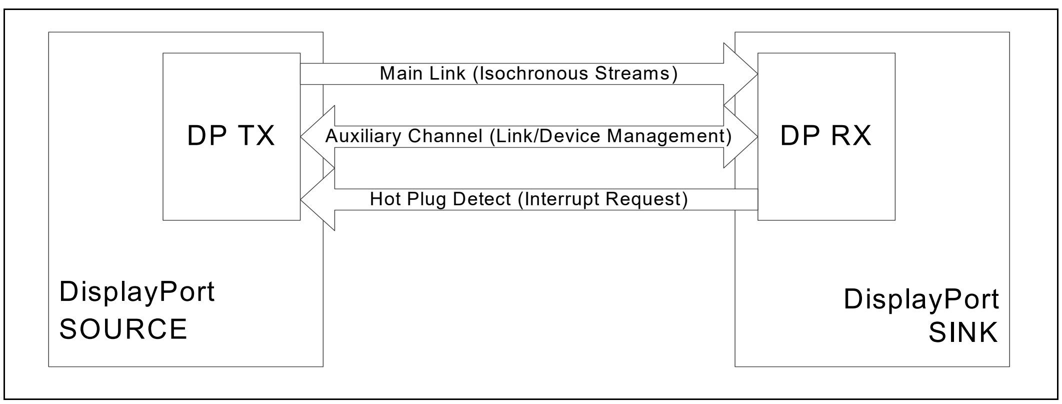
14.4.2.5 Display Port

Display Port is a digital communication interface that utilizes differential signalling to achieve a high bandwidth bus interface designed to support connections between PCs and monitors, projectors, and TV displays. Display Port is also suitable for display connections between consumer electronics devices such as high definition optical disc players, set top boxes, and TV displays.

A Display Port consists of a Main Link, Auxiliary channel, and a Hot Plug Detect signal. The Main Link is a uni-directional, high-bandwidth, and low latency channel used for transport of isochronous data streams such as uncompressed video and audio. The Auxiliary Channel (AUX CH) is a half-duplex bidirectional channel used for link management and device control. The Hot Plug Detect (HPD) signal serves as an interrupt request for the sink device.

The SoC supports DisplayPort Standard Version 1.1.

Figure 92. DisplayPort* Overview



14.4.2.6 Embedded DisplayPort (eDP)

Embedded DisplayPort (eDP) is a embedded version of the DisplayPort standard oriented towards applications such as notebook and All-In-One PCs. eDP is supported only on Digital Display Interfaces 0 and/or 1. Like DisplayPort, Embedded DisplayPort also consists of a Main Link, Auxiliary channel, and a optional Hot Plug Detect signal.

Each eDP port can be configured for up-to 4 lanes.

The SoC supports Embedded DisplayPort Standard Version 1.3.

14.4.2.6.1 DisplayPort Auxiliary Channel

A bidirectional AC coupled AUX channel interface replaces the I^2C for EDID read, link management and device control. I^2C-to-Aux bridges are required to connect legacy display devices.

14.4.2.6.2 Hot-Plug Detect (HPD)

The SoC supports HPD for Hot-Plug sink events on the HDMI and DisplayPort interfaces.

14.4.2.6.3 Integrated Audio over HDMI and DisplayPort

SoC can support two audio streams on DP/HDMI ports. Each stream can be programmable to either DDI port. HDMI/DP audio streams can be sent with video streams as follows.

LPE mode: In this mode the uncompressed or compressed audio sample buffers are generated either by OS the audio stack or by audio Lower Power Engine (LPE) and stored in system memory.The display controller fetches audio samples from these buffers, forms an SPDIF frame with VUCP and preamble (if needed), then sends out with video packets.

14.4.2.6.4 High-Bandwidth Digital Content Protection (HDCP)

HDCP is the technology for protecting high definition content against unauthorized copy or unreceptive between a source (computer, digital set top boxes, etc.) and the sink (panels, monitor, and TV). The SoC supports HDCP 1.4 for content protection over wired displays (HDMI, DisplayPort and Embedded DisplayPort).

14.5 References

- VESA DisplayPort Standard, Version 1.1
- VESA Embedded DisplayPort Standard, Version 1.3

14.6 3D Graphics and Video

The SoC implements a derivative of the Generation 7 graphics engine which consists of rendering engine and bit stream encoder/decoder engine. The rendering engine is used for 3D rendering, media compositing and video encoding. The Graphics engine is built around four execution units (EUs).

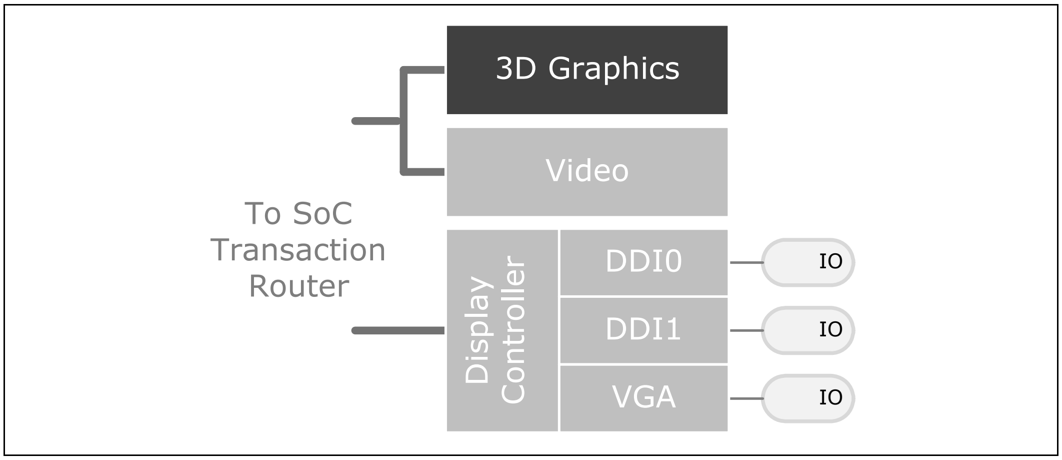

Figure 93. 3D Graphics Block Diagram

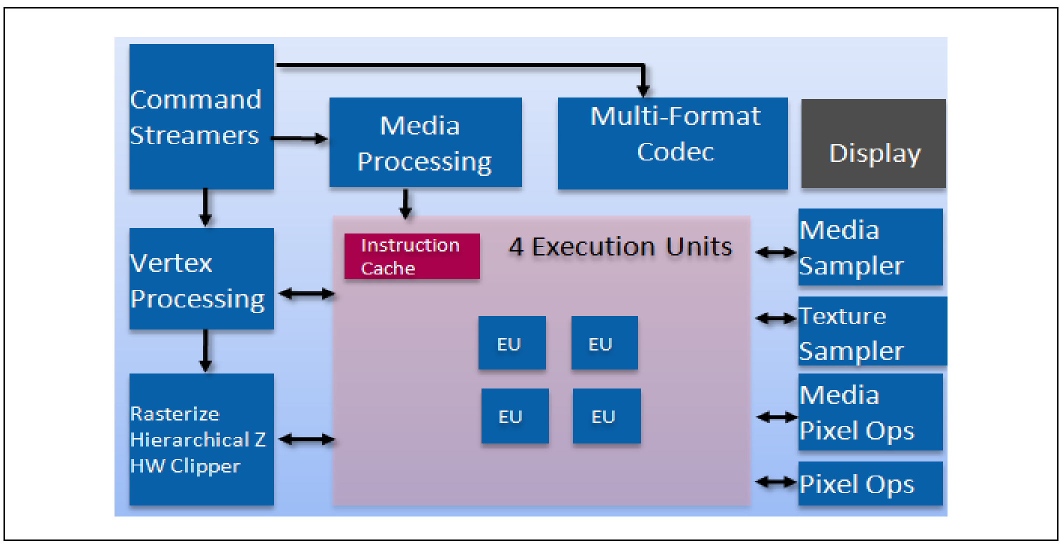


14.7 Features

The 3D graphics pipeline architecture simultaneously operates on different primitives or on different portions of the same primitive. All the cores are fully programmable, increasing the versatility of the 3D Engine. The Gen 7.0 3D engine provides the following performance and power-management enhancements:

- Hierarchal-Z
- Video quality enhancements

14.7.1 3D Engine Execution Units

- The EUs perform 128-bit wide execution per clock.
- Support SIMD8 instructions for vertex processing and SIMD16 instructions for pixel processing.

14.7.2 3D Pipeline

14.7.2.1 Vertex Fetch (VF) Stage

The VF stage executes 3DPRIMITIVE commands. Some enhancements have been included to better support legacy D3D APIs as well as SGI OpenGL*.

14.7.2.2 Vertex Shader (VS) Stage

The VS stage performs shading of vertices output by the VF function. The VS unit produces an output vertex reference for every input vertex reference received from the VF unit, in the order received.

14.7.2.3 Geometry Shader (GS) Stage

The GS stage receives inputs from the VS stage. Compiled application-provided GS programs, specifying an algorithm to convert the vertices of an input object into some output primitives. For example, a GS shader may convert lines of a line strip into polygons representing a corresponding segment of a blade of grass centered on the line. Or it could use adjacency information to detect silhouette edges of triangles and output polygons extruding out from the edges.

14.7.2.4 Clip Stage

The Clip stage performs general processing on incoming 3D objects. However, it also includes specialized logic to perform a Clip Test function on incoming objects. The Clip Test optimizes generalized 3D Clipping. The Clip unit examines the position of incoming vertices, and accepts/rejects 3D objects based on its Clip algorithm.

14.7.2.5 Strips and Fans (SF) Stage

The SF stage performs setup operations required to rasterize 3D objects. The outputs from the SF stage to the Windower stage contain implementation-specific information required for the rasterization of objects and also supports clipping of primitives to some extent.

14.7.2.6 Windower/IZ (WIZ) Stage

The WIZ unit performs an early depth test, which removes failing pixels and eliminates unnecessary processing overhead.

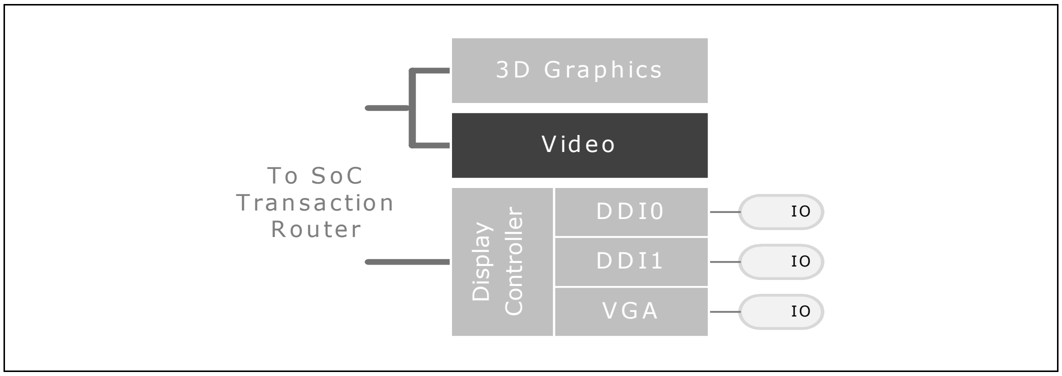
The Windower uses the parameters provided by the SF unit in the object-specific rasterization algorithms. The WIZ unit rasterizes objects into the corresponding set of pixels. The Windower is also capable of performing dithering, whereby the illusion of a higher resolution when using low-bpp channels in color buffers is possible. Color dithering diffuses the sharp color bands seen on smooth-shaded objects.

14.7.3 Video Engine

The video engine is part of the Intel Processor Graphics for image processing, play-back and transcode of Video applications. Processor Graphics video engine has a dedicated fixed hardware pipe-line for high quality decode and encode of media content. This engine supports Full HW acceleration for decode of H.264, MPEG -2, MVC, VC-1, WMV9, JPEG/MJPEG contents along with encode of H.264 apart from various video processing features. The new Processor Graphics Video engine adds support for processing features such as frame rate conversion, image stabilization and gamut conversion.

14.8 VED (Video Encode/Decode)

Note: The video engine is part of the Intel Processor Graphics for image processing, play-back and transcode of Video applications. Processor Graphics video engine has a dedicated fixed hardware pipe-line for high quality decode and encode of media content. SoC Video Encode Decode block incorporates VXD 392 video decode core.



14.8.1 Features

The features for the Video decode hardware accelerator in SoC are:

- VED core can be configured on a time division multiplex basis to handle single, dual and multi-stream HD decoding.
- VED provides full hardware acceleration support

Table 170. Hardware Accelerated Video Decode Codec Support

Category	Codec Format
Media decode rate	Upto 1080p@60fps and 3x 4kx2k @30fps (H.264/JPEG/ MJPEG/MVC/MPEG-2 /WMV9/VC1)
Media encode rate	Upto 1080p@60fps and 1x 4kx2k @30fps (H.264)

14.9 PCI Configuration Registers

Table 171. Summary of Graphics, Video and Display PCI Configuration Registers—0/2/0

Offset	Size	Register ID—Description	Default Value
0h	4	"DID—Offset 0h" on page 426	0F318086h

FCh	4	"ASLS—Offset FCh" on page 448	00000000h

14.9.1 DID—Offset 0h

PCI Device ID and Vendor ID Register

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

DID: [B:0, D:2, F:0] + 0h

Power Well: Core

Default: 0F318086h

Bits	31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
Value	0 0 0 0	1 1 1 1	0 0 1 1	0 0 0 1	1 0 0 0	0 0 0 0	1 0 0 0	0 1 1 0
Field	DEVICEID_0				VENDORID_1			

Bit Range	Default & Access	Description
31:16	0F31h RO	**DEVICEID (DEVICEID_0):** DID: Identifier assigned to the dev2 PCI
15:0	8086h RO	**VENDORID (VENDORID_1):** VID: PCI standard identification for Intel

14.9.2 PCICMD_STS—Offset 4h

PCI Command Register and Status Register

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

PCICMD_STS: [B:0, D:2, F:0] + 4h

Power Well: Core

Default: 00100000h

Bits	31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
Value	0 0 0 0	0 0 0 0	0 0 0 1	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0

Bits	31:21	20	19	18:16	15:11	10	9:3	2	1	0
Field	RSVD_6	CAPABILITY_LIST_7	INTERRUPT_STATUS_8	RSVD_9	RSVD_0	INTERRUPT_DISABLE_1	RSVD_2	BUS_MASTER_ENABLE_3	MEMORY_SPACE_ENABLE_4	IO_SPACE_ENABLE_5

Bit Range	Default & Access	Description
31:21	000h RO	**RSVD (RSVD_6):** Reserved

Bit Range	Default & Access	Description
20	1b RO	**CAPABILITY_LIST (CAPABILITY_LIST_7):** CAP: CAPPOINT register at 34h provides an offset
19	0b RO	**INTERRUPT_STATUS (INTERRUPT_STATUS_8):** IS: 1= Determined by IIR and IER memory interface register, 0=no interrupt pending
18:16	000b RO	**RSVD (RSVD_9):** Reserved
15:11	00h RO	**RSVD (RSVD_0):** Reserved
10	0b RW	**INTERRUPT_DISABLE (INTERRUPT_DISABLE_1):** ID: 0= Interrupt message enabled, 1= disabled
9:3	00h RO	**RSVD (RSVD_2):** Reserved
2	0b RW	**BUS_MASTER_ENABLE (BUS_MASTER_ENABLE_3):** BME: 0= Blocks the sending of MSI interrupts, 1= permits
1	0b RW	**MEMORY_SPACE_ENABLE (MEMORY_SPACE_ENABLE_4):** MSE: 0= Memory space disabled, 1= enabled
0	0b RW	**IO_SPACE_ENABLE (IO_SPACE_ENABLE_5):** IOSE: 0= I/O space is disabled, 1=enabled

14.9.3 RID_CC—Offset 8h

Revision Identification and Class code registerSOXi Context Save/Restore: Yes

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

RID_CC: [B:0, D:2, F:0] + 8h

Power Well: Core

Default: 03000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
BASE_CLASS_CODE_1								SUB_CLASS_CODE_2								PROGRAMMING_INTERFACE_3								REVISION_ID_0							

Bit Range	Default & Access	Description
31:24	00000011b RO	**BASE_CLASS_CODE (BASE_CLASS_CODE_1):** BCC: MGGC0[VAMEN]=0, 03h else 04h

Bit Range	Default & Access	Description
23:16	00000000b RO	**SUB_CLASS_CODE (SUB_CLASS_CODE_2):** MGGC0[VAMEN]= 1, 80h, MGGC0[VAMEN]=0,determined based on GGC register, GMS and IVD
15:8	00h RO	**PROGRAMMING_INTERFACE (PROGRAMMING_INTERFACE_3):** MGGC0[VAMEN]= 0, 00h display controller, =1, 00h NOP
7:0	00000000b RO	**REVISION_ID (REVISION_ID_0):** RID: value of strapRID[7:0] input pin to GVD

14.9.4 HDR—Offset Ch

Header Type

Access Method

Type: PCI Configuration Register (Size: 32 bits)

HDR: [B:0, D:2, F:0] + Ch

Power Well: Core

Default: 00000000h

31 28 24 20 16 12 8 4 0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

RSVD_0

MULTI_FUNCTION_STATUS_1

HEADER_CODE_2

RSVD_3

Bit Range	Default & Access	Description
31:24	00h RO	**RSVD (RSVD_0):** Reserved
23	0b RO	**MULTI_FUNCTION_STATUS (MULTI_FUNCTION_STATUS_1):** MFUNC: Integrated graphics is a single function
22:16	00h RO	**HEADER_CODE (HEADER_CODE_2):** HDR: Indicates a type 0 configuration space header format
15:0	0000h RO	**RSVD (RSVD_3):** Reserved

14.9.5 GTTMMADR_LSB—Offset 10h

Gfx Memory Mapped Address Range. This is the base address for all memory mapped registers and GTT table. SOXi Context Save/Restore : Yes This register requests allocation for the combined Graphics Translation Table Modification Range and Memory Mapped Range. The range requires 4 MB combined for MMIO and Global GTT aperture, with 512K of that used by MMIO and 2MB used by GTT. GTTADR will begin at (GTTMMADR + 2 MB) while the MMIO base address will be the same as GTTMMADR. For the Global GTT, this range is defined as a memory BAR in graphics device config space. It is an alias into which software is required to write Page Table Entry values (PTEs). Software may read PTE values from the global Graphics Translation Table (GTT). PTEs cannot be written directly into the global GTT memory area. The allocation is for 4MB and the base address is defined by bits [35:22].

Access Method

Type: PCI Configuration Register (Size: 32 bits) **GTTMMADR_LSB:** [B:0, D:2, F:0] + 10h

Power Well: Core

Default: 00000000h

31 28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0

31:22	21:4	3	2:1	0
MBA_LSB_0	RSVD_1	RSVD_2	MEMTYP_3	RSVD_4

Bit Range	Default & Access	Description
31:22	000h RW	**MBA_LSB (MBA_LSB_0):** Memory Base Address (MBA): Set by the OS, these bits correspond to address signals [35:22]. 4MB combined for MMIO and Global GTT table aperture (2MB for MMIO and 2 MB for GTT).
21:4	00000h RO	**RSVD (RSVD_1):** RSVD: Hardwired to 0 to indicate at least 4MB address range.
3	0b RO	**RSVD (RSVD_2):** Prefetchable Memory (PREFMEM): Hardwired to 0to prevent prefetching.
2:1	00b RO	**MEMTYP (MEMTYP_3):** Memory Type (MEMTYP): 00 : To indicate 32 bit base address 01: Reserved 10 : To indicate 64 bit base address 11: Reserved
0	0b RO	**RSVD (RSVD_4):** Memory/IO Space (MIOS): Hardwired to 0 to indicate memory space.

14.9.6 GTTMMADR_MSB—Offset 14h

Access Method

Type: PCI Configuration Register (Size: 32 bits) **GTTMMADR_MSB:** [B:0, D:2, F:0] + 14h

Power Well: Core

Default: 00000000h

31 28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0

31:4	3:0
RSVD_0	MBA_MSB_1

Bit Range	Default & Access	Description
31:4	00000000h RO	**RSVD (RSVD_0):** Reserved for Memory Base Address (RSVD): Must be set to 0 since addressing above 64GB is not supported.
3:0	0h RO	**MBA_MSB (MBA_MSB_1):** Memory Base Address (MBA): Set by the OS, these bits correspond to address signals [35:22]. 4MB combined for MMIO and Global GTT table aperture (2MB for MMIO and 2 MB for GTT).

14.9.7 GMADR_LSB—Offset 18h

Gfx Aperture location. SOXi Context Save/Restore : Yes GMADR is a Prefetchable range in order to apply USWC attribute (from the processor point of view) to that range. The USWC attribute is used by the processor for write combining. Accesses to this range will be translated to DRAM Physical memory addresses. Fence registers may be used to sub-divide this range and allow tiled surfaces (determined by fence registers). The following sizes are supported : 128MB, 256MB, 512MB. (Determined by the MSAC register)

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GMADR_LSB: [B:0, D:2, F:0] + 18h

Power Well: Core

Default: 00000008h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
RSVD_0			ADMSK512_1	ADMSK256_2	RSVD_3																							PREFMEM_4	MEMTYP_5		RSVD_6

Bit Range	Default & Access	Description
31:29	000b RO	**RSVD (RSVD_0):** Memory Base Address (MBA): Memory Base Address (MBA): Set by the OS, these bits correspond to address signals [35:29].
28	0b RW/L	**ADMSK512 (ADMSK512_1):** 512MB Address Mask (ADMSK512): This bit is either part of the Memory Base Address (R/W) or part of the Address Mask (RO), depending on the value of MSAC[2:1]. See MSAC (Dev2, Func 0, offset 62h) for details.
27	0b RW/L	**ADMSK256 (ADMSK256_2):** 256MB Address Mask (ADMSK256): This bit is either part of the Memory Base Address (R/W) or part of the Address Mask (RO), depending on the value of MSAC[2:1]. See MSAC (Dev 2, Func 0, offset 62h) for details.
26:4	0000000h RO	**RSVD (RSVD_3):** Address Mask (ADM): Hardwired to 0s to indicate at least 128MB address range.
3	1b RO	**PREFMEM (PREFMEM_4):** Prefetchable Memory (PREFMEM): Hardwired to 1 to enable prefetching.
2:1	00b RO	**MEMTYP (MEMTYP_5):** Memory Type (MEMTYP): 00 : To indicate 32 bit base address 01: Reserved 10 : To indicate 64 bit base address 11: Reserved
0	0b RO	**RSVD (RSVD_6):** Memory/IO Space (MIOS): Hardwired to 0 to indicate memory space.

14.9.8 GMADR_MSB—Offset 1Ch

Access Method

Type: PCI Configuration Register (Size: 32 bits) **GMADR_MSB:** [B:0, D:2, F:0] + 1Ch

Power Well: Core

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

RSVD_0 MBA_1

Bit Range	Default & Access	Description
31:4	0000000h RO	**RSVD (RSVD_0):** Memory Base Address (MBA2): Set by the OS, these bits correspond to address signals [63:36].
3:0	0h RO	**MBA (MBA_1):** Memory Base Address (MBA)Set by the OS, these bits correspond to address signals [35:32]

14.9.9 IOBAR—Offset 20h

I/O Base Address. This is used only by SBIOS. This register is the base address for the MMIO_INDEX and MMIO_DATA registers SOXi Context Save/Restore : Yes NOTE : This was at 14h for CDV. This register provides the Base offset of the I/O registers within Device #2. Access to the 8Bs of IO space is allowed in PM state D0 when IO Enable (PCICMD bit 0) set. Access is disallowed : 1)in PM states D1-D3 or 2)if IO Enable is clear or 3)if Device #2 is turned off or 4)if Internal graphics is disabled thru the fuse or fuse override mechanisms. Note that access to this IO BAR is independent of VGA functionality within Device #2. If accesses to this IO bar is allowed then the GMCH claims all 8, 16 or 32 bit IO cycles from the CPU that falls within the 8B claimed.

Access Method

Type: PCI Configuration Register (Size: 32 bits) **IOBAR:** [B:0, D:2, F:0] + 20h

Power Well: Core

Default: 00000001h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

RSVD_0 BASE_ADDRESS_1 RSVD_2 RESOURCE_TYPE_RTE_3

Bit Range	Default & Access	Description

15:3	0000h RW	**BASE_ADDRESS (BASE_ADDRESS_1):** BA: Set by the OS, these bits correspond to address signals [15:6].IOBAR is to be used for both GTLC register programming and GTT table programming. This is an indirect access method.
2:1	00b RO	**RSVD (RSVD_2):** Reserved
0	1b RO	**RESOURCE_TYPE_RTE (RESOURCE_TYPE_RTE_3):** Indicates a request for I/O space

14.9.10 SSID_SID—Offset 2Ch

This register is used to uniquely identify the subsystem where the PCI device resides.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

SSID_SID: [B:0, D:2, F:0] + 2Ch

Power Well: Core

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

31:16	15:0
SUBID_1	SUBVID_0

Bit Range	Default & Access	Description
31:16	0000h RW/O	**SUBID (SUBID_1):** This value is used to identify the vendor of the subsystem. This register should be programmed by BIOS during boot-up. Once written, this register becomes Read_Only. This register can only be cleared by a Reset.
15:0	0000h RW/O	**SUBVID (SUBVID_0):** This value is used to identify the vendor of the subsystem. This register should be programmed by BIOS during boot-up. Once written, this register becomes Read_Only. This register can only be cleared by a Reset.

14.9.11 CAPPOINT—Offset 34h

This register points to a linked list of capabilities implemented by this device.For VV, the capability linked list is expected to be : (Head-34, PMCAP-D0, MSI-90, VID-B0, ..End)Old : (Head-34, PMCAP-D0, MSI-90, AFLC-A4, VID-B0, .. End)

Access Method

Type: PCI Configuration Register (Size: 32 bits)

CAPPOINT: [B:0, D:2, F:0] + 34h

Power Well: Core

Default: 000000D0h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RSVD_0																								CAPABILITIES_POINTER_1							

Bit Range	Default & Access	Description
31:8	000000h RO	**RSVD (RSVD_0):** Reserved
7:0	D0h RW/O	**CAPABILITIES_POINTER (CAPABILITIES_POINTER_1):** The first item in the capabilities list is at address D0h (PMCS). This register should be programmed by BIOS during boot-up. Once written, this register becomes Read_Only. This register can only be cleared by a Reset.

14.9.12 INTRLINE—Offset 3Ch

3C - Interrupt. This register is programmed by SBIOS. It is not used by the graphics/display driver. This 8-bit register is used to communicate interrupt line routing information. It is read/write and must be implemented by the device. POST software will write the routing information into this register as it initializes and configures the system. SOXi Context Save/Restore : Yes The value in this register tells which input of the system interrupt controller(s) the device?s interrupt pin is connected to. The device itself does not use this value, rather it is used by device drivers and operating systems to determine priority and vector information. 3D - Interrupt. This register is programmed by SBIOS. It is not used by the graphics/display driver SOXi Context Save/Restore : Not required

Access Method

Type: PCI Configuration Register (Size: 32 bits)

INTRLINE: [B:0, D:2, F:0] + 3Ch

Default: 00000100h

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

15	0b RO	**RSVD (RSVD_0):** Reserved
14	0b RW/L	**VAMEN (VAMEN_1):** Enables the use of the iGFX engines for Versatile Acceleration. 1 - iGFX engines are in Versatile Acceleration Mode. Device 2 Class Code is 048000h. 0 - iGFX engines are in iGFX Mode. Device 2 Class Code is 030000h.
13:10	0h RO	**RSVD (RSVD_2):** Reserved
9:8	00b RW/L	**GGMS (GGMS_3):** GTT Graphics Memory Size (GGMS): This field is used to select the amount of Main Memory that is pre-allocated to support the Internal Graphics Translation Table. The BIOS ensures that memory is pre-allocated only when Internal graphics is enabled. GSM is assumed to be a contiguous physical DRAM space with DSM, and BIOS needs to allocate a contiguous memory chunk. Hardware will drive the base of GSM from DSM only using the GSM size programmed in the register. 0h: No memory pre-allocated. GTT cycles (Mem and IO) are not claimed. 1h: 1 MB of memory pre-allocated for GTT. 2h: 2 MB of memory pre-allocated for GTT. 3h: Reserved. All unspecified encodings of this register field are reserved, hardware functionality is not guaranteed if used.

Bit Range	Default & Access	Description
7:3	00101b RW/L	**GMS (GMS_4):** Graphics Mode Select (GMS). This field is used to select the amount of Main Memory that is pre-allocated to support the Internal Graphics device in VGA (non-linear) and Native (linear) modes. The BIOS ensures that memory is pre-allocated only when Internal graphics is enabled. Hardware does not clear or set any of these bits automatically based on IGD being disabled/enabled. BIOS Requirement: BIOS must not set this field to 0h if IVD (bit 1 of this register) is 0. 0h = 0MB 10h = 512MB 1h = 32MB 2h = 64MB 3h = 96MB 4h = 128MB 5h = 160MB 6h = 192MB 7h = 224MB 8h = 256MB 9h = 288MB Ah = 320MB Bh = 352MB Ch = 384MB Dh = 416MB Eh = 448MB Fh = 480MB Other = Reserved When GMS != 000 (and VD=0): Address[31:0] is compared with VGA memory range. (The VGA memory range is A_0000h to B_FFFFh.). If there is a match and MSE = 1 and MEMRD or MEMWR, the access will route as a Rmdwvgamemen_cr cycle on the RMbus. If the RMbus returns a hit the GVD will select the command. As well, when 0 the GVD will check if scldown3_address[15:0] is one of the VGA IO register range. (The VGA IO range is 03B0h - 03BBh and 03C0h - 03DFh.) If there is a match and IOSE = 1 and the SCL command is either an IORD or IOWR, the GVD will intiate a (VGA) register cycle on the RMbus. If the RMbus returns a hit the GVD will select the command When GMS == 000 : No address compare will occur against VGA memory range or the VGA IO register range. Also, CC[15:8] is changed to 8?h80 from 8'h00
2	0b RO	**RSVD (RSVD_5):** Reserved
1	0b RW/L	**VGA_DISABLE (VGA_DISABLE_6):** VGA Disable (VD): 0: Enable. Device 2 (IGD) claims VGA memory and IO cycles, the Sub-Class Code within Device 2 Class Code register is 00. 1: Disable. Device 2 (IGD) does not claim VGA cycles (Mem and IO), and the Sub- Class Code field within Device 2 function 0 Class Code register is 80. BIOS Requirement: BIOS must not set this bit to 0 if the GMS field pre-allocates no memory. This bit MUST be set to 1 if Device 2 is disabled either via a fuse or fuse override (CAPID0[38] = 1) or via a register (DEVEN[3] = 0).
0	0b RW/L	**GGCLCK (GGCLCK_7):** When set to 1b, this bit will lock all bits in this register.

14.9.14 BDSM—Offset 5Ch

This register contains the base address of Graphics Data Stolen DRAM memory. Note : IVB located this register in device 0, 0xB0. Mirrored into device 2, 0x5C.Graphics Stolen Memory is within DRAM space. The base of stolen memory will always be below 4G.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

BDSM: [B:0, D:2, F:0] + 5Ch

Power Well: Core

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits 31:20	Bits 19:1	Bit 0
BDSM_0	RSVD_1	BDSM_LOCK_2

Bit Range	Default & Access	Description
31:20	000h RW/L	**BDSM (BDSM_0):** BDSM: BASE_OF_Data_STOLEN_MEMORY. This register contains bits 31 to 20 of the base address of Data stolen DRAM memory. For certain GTLC generated accesses, this base register will be added to the GTLC provided offset address, forming the full physical address for the PFI fabric. This is also used as a base for VGA paged accesses. The display engine also uses the register. Signal : gvd_dsp_cfg_BSM_zcznfwh[31:20].
19:1	00000h RO	**RSVD (RSVD_1):** Reserved
0	0b RW/L	**BDSM_LOCK (BDSM_LOCK_2):** This bit will lock all writeable settings in this register, including itself.

14.9.15 MSAC—Offset 60h

This register determines the size of the graphics memory aperture. Only the system BIOS will write this register based on pre- boot address allocation efforts. Graphics may read this register to determine the correct aperture size. System BIOS needs to save this value on boot so that it can reset it correctly during S3 resume. SOXi Context Save/Restore : Yes. The size of the aperture must not be modified by software after its location is written into GMADR (offset 18h).

Access Method

Type: PCI Configuration Register (Size: 32 bits)

MSAC: [B:0, D:2, F:0] + 60h

Power Well: Core

Default: 00020000h

Bits	31:19	18:17	16:0
Default value	0 0 0 0 0 0 0 0 0 0 0 0 0	0 1	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit Range	Default & Access	Description
31:19	0000h RO	**RSVD (RSVD_0):** Reserved
18:17	01b RW	**LHSAS (LHSAS_1):** Untrusted Aperture Size (LHSAS): 00 : bits [28:27] of GMADR register are made R/W allowing 128MB of GMADR. 01 : bit [28] of GMADR is made R/W and bit [27] of GMADR is forced to zero allowing 256MB of GMADR. 10 : Illegal programming. 11: bits [28:27] of GMADR register are made Read only and forced to zero, allowing only 512MB of GMADR.
16:0	00000h RO	**RSVD (RSVD_2):** Reserved

14.9.16 BGSM—Offset 70h

Base of GTT table in Gfx Stolen Memory SOXi Context Save/Restore : Yes. Note : IVB located this register in device 0, 0xB4. Mirrored into Device 2. The GTT table is located within Graphics Stolen Memory in DRAM space. The base of stolen memory will always be below 4G.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

BGSM: [B:0, D:2, F:0] + 70h

Power Well: Core

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

BGSM_0 (bits 31:20) | RSVD_1 (bits 19:1) | BGSM_LOCK_2 (bit 0)

Bit Range	Default & Access	Description
31:20	000h RW/L	**BGSM (BGSM_0):** BGSM: Gfx Base of GTT Stolen Memory. This register contains bits 31 to 20 of the base address of GTT Table in stolen DRAM memory. BIOS determines the base of GTT stolen memory by subtracting the GTT graphics stolen memory size (PCI Device 2 offset 50 bits 9:8) from the Graphics Base of Data Stolen Memory (PCI Device 2 offset 5C bits 31:20). Signal : gvd_dsp_Cspgtbladdr_dczfwohdczfwoh[31:20].Note : was 4KB aligned on CDV ie. [31:12]
19:1	00000h RO	**RSVD (RSVD_1):** Reserved
0	0b RW/L	**BGSM_LOCK (BGSM_LOCK_2):** This bit will lock all writeable settings in this register including itself

14.9.17 PAVPC—Offset 74h

Protected Audio Video Control. Similar to IVB, BIOS will program this register for Valleyview (not the Gfx Driver). SOXi Context Save/Restore : Yes. For Valleyview, device 2 configuration accesses to 0x74 and Gfx MMIO accesses to 0x1082C0 will both alias to the same register. This register will be located within Gunit.WOPCMBASE is derived from : BDSMbase + GMS size - WOPCMSZ. Note : IVB currently derives from : TOLUD + WOPCMSZ

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PAVPC: [B:0, D:2, F:0] + 74h

Power Well: Core

Default: 00000000h

31	28	24	20	16	12	8	4	0

Bits 31:20	Bits 19:18	Bits 17:6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0 0 0 0 0 0 0 0 0 0 0 0	0 0	0 0 0 0 0 0 0 0 0 0 0 0	0	0	0	0	0	0
RSVD_0	RSVD_1	RSVD_2	WOPCMSZ_3	OVTATTACK_4	HVYMODSEL_5	PAVPLOCK_6	PAVPE_7	PCME_8

Bit Range	Default & Access	Description
31:20	000h RO	**RSVD (RSVD_0):** Reserved. This field is used to set the base of Protected Content Memory. This corresponds to bits 31:20 of the system memory address range, giving a 1MB granularity. This value MUST be at least 1MB above the base and below the top of stolen memory. This register is locked (becomes read-only) when PAVPLOCK = 1b.
19:18	00b RO	**RSVD (RSVD_1):** Reserved. Note : IVB provided 256KB granularity, so these 2 bits were RW to support that size option. However, VV will only support 1MB so Gunit will tie bits 19:18 to '00'.
17:6	000h RO	**RSVD (RSVD_2):** Reserved
5	0b RO	**WOPCMSZ (WOPCMSZ_3):** 0b ? 1MB Note : IVB had this as a RW bit with value '1' indicating size 256KB support. Since VV only supports 1MB size, this register is RO for VV. These are the only sizes supported for IVB. The IVB is going to run PAVP3 Mode Serpent applications using per-App selection. Therefore, the size chosen should always be 1MB configuration even if Lite mode is chosen using PAVPC register (bit_3 = 0) for PAVP2 Mode Applications. This is because CB^2 code needs to be always loaded, since an App. Which opts for per-App Serpent mode will also execute the CB^2 code). The driver may consider it a BIOS programming error, if PAVPC Serpent Mode is selected with only 256KB of WOPCM size. However PAVPC Lite Mode with 1M WOPCM size is acceptable and not an error, as this may involve per-App selected Serpent Mode.
4	0b RW/L	**OVTATTACK (OVTATTACK_4):** Override of Unsolicited Connection State Attack and Terminate. 0b Disable Override. Attack Terminate allowed. 1b Enable Override. Attack Terminate disallowed. This register bit is locked (becomes read-only) when PAVPLOCK = 1b
3	0b RW/L	**HVYMODSEL (HVYMODSEL_5):** In IVB, this bit is a care only for PAVP2 mode of operation (and a chicken bit is also set). For IVB PAVP2 mode: 0 : Lite Mode (Non-Serpent Mode) 1: Serpent Mode For PAVP3 mode of operation, this bit_3 is a care, only if the per-App Memory Config is disabled due to the clearing of an additional Chicken bit_9 in IVB Crypto Function Control_1 Reg (@ address 0x320F0h). For chicken bit enabled IVB PAVP3 mode, this one type boot time programming has been replaced by per-Media App. Programming (through the Media Crypto Copy command). Note that IVB PAVP2 or PAVP3 Mode selection is done by programming bit_8 of MFX_MODE ? Video Mode Register. (Note again, that when in PAVP3 Mode, the per-App Memory Config. (Serpent/Lite) feature for enabling, requires the further setting of a global one time chicken bit to be set (bit_9 = ?1/mask_bit_25 = ?1) in the IVB Crypto Function Control_1 Register @ address 0x320F0h). Note : Valleyview does not support PAVP2 mode. Only PAVP3 mode is supported (a superset of PAVP2).
2	0b RW/L	**PAVPLOCK (PAVPLOCK_6):** This bit will lock all writeable contents in this register when set(including itself).Only a hw reset can unlock the register again. This Lock bit if PAVP is enabled (PAVPE = 1)
1	0b RW/L	**PAVPE (PAVPE_7):** 0: PAVP functionality is disabled. 1: enabled. This register is locked when PAVPLOCK=1
0	0b RW/L	**PCME (PCME_8):** PCME = Protected Content Memory Enable This field enables Protected Content Memory within Graphics Stolen Memory. This memory is the same as the WOPCM area. The size of the WOPCM area is defined by bit_5 of this register. WOPCM is the only remaining flavor of range protected memory. 0: WOPCM protection disabled. 1 : WOPCM protection enabled. This bit must be programmed to 1 when PAVP is enabled. With per-App Memory configuration support in IVB, the range check for the WOPCM memory area should always happen when this bit is set, irrespective of Lite or AES mode programming, or PAVP2 or PAVP3 Mode programming.

14.9.18 MSI_CAPID_MC—Offset 90h

Message Signaled Interrupts Capability ID.SOXi Context Save/Restore : Yes. Message Signaled Control Register. SOXi Context Save/Restore : Yes

Access Method

Bit Range	Default & Access	Description
18:16	010b RO	**VERSION (VERSION_8):** Verion compliance with revision 1.1 of PCI PM spec
15:8	90h RW/O	**NEXT_POINTER (NEXT_POINTER_0):** Indicates the next item in the capabilities list.This register should be programmed by BIOS during boot-up. Once written, this register becomes Read_Only. This register can only be cleared by a Reset. Write once allowing changing of the capabilities list.
7:0	01h RO	**CAPABILITIES_ID (CAPABILITIES_ID_1):** CAPID: SIG defines this ID is 01h for PM

14.9.27 PMCS—Offset D4h

Power Management Control/Status. Driver doesn't use this register. SBIOS doesn't use this register SOXi Context Save/Restore : Yes.

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PMCS: [B:0, D:2, F:0] + D4h

Power Well: Core

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

RSVD_0

POWER_STATE_PS_1

Bit Range	Default & Access	Description
31:2	00000000h RO	**RSVD (RSVD_0):** Reserved
1:0	00b RW	**POWER_STATE_PS (POWER_STATE_PS_1):** This field indicates the current power state of the IGD and can be used to set the IGD into a new power state. If software attempts to write an unsupported state to this field, write operation must complete normally on the bus, but the data is discarded and no state change occurs. On a transition from D3 to D0 the graphics controller is optionally reset to initial values. Behavior of the graphics controller in supported states is detailed in the power management section of the Bspec. Bits[1:0] Power state 00: D0 Default 01: D1 Not Supported 10: D2 Not Supported 11: D3 Signal : gvd_dsp_power_state_d3_znczfwoh output to 2D.

14.9.28 SWSMISCI—Offset E0h

Software SMI or SCI.To generate a SW SMI event, software should program bit 15:0 and trigger SMI. Note : ILK/SNB/IVB had SCI and SMI separated (E0 and E8) As long as there is the potential that DVO port legacy drivers exist which expect this register at this address, this must be reserved for this register. The SCI mechanism for driver / BIOS communication. SMI is a system wide lock interrupt (halts the all the cores) as opposed to SCI. Vista and Win7 recommend to use the SCI. The SMI is slowly being phased out. This register serves 2 purposes: 1) Support selection of SMI or SCI event source (SMISCISEL - bit15) 2) Event trigger (bit 0). To generate a SW SCI event, software (System BIOS/Graphics driver) should program bit 15 (SMISCISEL) to 1. This is typically programmed once (assuming SMIs are never triggered). On a ?0? to ?1? subsequent transition in bit 0 of this register (caused by a software write operation), GMCH sends a single SCI message. The SCI will set the DMISCI bit in its TCO1_STS register and TCOSCI_STS bit in its GPE0 register upon receiving this message from DMI. Once written as 1, software must write a ?0? to this bit to clear it, and all other write transitions (1-)0, 0-)0, 1-)1) or if bit 15 is ?0? will not cause GMCH to send SCI message to DMI link. To generate a SW SMI event, software should program bit 15 to 0 and trigger an SMI.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

SWSMISCI: [B:0, D:2, F:0] + E0h

Power Well: Core

Default: 00000000h

14.10.1 CRX (CRX_MDA)—Offset 3B4h

CRT Controller Index Register

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [GTTMMADR_LSB + 180000h] + 3B4h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
RESERVED	CRT_CONTROLLER_INDEX						

Bit Range	Default & Access	Field Name (ID): Description
7	0b RW	**RESERVED:** Read as 0.
6:0	0b RW	**CRT_CONTROLLER_INDEX:** These 7 bits are used to select any one of the CRT controller registers to be accessed via the data port at I/O location 3B5h or 3D5h, depending upon whether the graphics system is configured for MDA or CGA emulation. The data port memory address offsets are 3B5h/3D5h.

14.10.2 CR (CR_MDA)—Offset 3B5h

CR index registers

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [GTTMMADR_LSB + 180000h] + 3B5h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0

14.10.5 SRX—Offset 3C4h

Sequencer Index

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

Offset: [GTTMMADR_LSB + 180000h] + 3C4h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
RESERVED					SEQUENCER_INDEX		

Bit Range	Default & Access	Field Name (ID): Description
7:3	0b RW	**RESERVED:** Read as 0s.
2:0	0b RW	**SEQUENCER_INDEX:** This field contains a 3-bit Sequencer Index value used to access sequencer data re gisters at indices 0 through 7. Notes: SR02 is referred to in the VGA standard as the Map Mask Register. However, the word map is used with multiple meanings in the VGA standard and was, therefore, deemed too confusing; hence, the reason for calling it the Plane Mask Register. SR07 is a standard VGA register that was not documented by IBM. It is not a graphics controller extension.

14.10.6 SR—Offset 3C5h

SR index registers

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [GTTMMADR_LSB + 180000h] + 3C5h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
SR_REGISTER_DESCRIPTIONS

7:0	0b RW	**SR_REGISTER_DESCRIPTIONS:** SR indexed register descriptions

14.10.7 DACMASK—Offset 3C6h

Pixel Data Mask Register

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [GTTMMADR_LSB + 180000h] + 3C6h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
PIXEL_DATA_MASK							

Bit Range	Default & Access	Field Name (ID): Description
7:0	0b RW	**PIXEL_DATA_MASK:** In indexed-color mode, the 8 bits of this register are logically ANDed with the 8 bits of pixel data received from the frame buffer for each pixel. The result of this ANDing process becomes the actual index used to select color data positions within the palette. This has the effect of limiting the choice of color data positions that may be specified by the incoming 8-bit data. 0 = Corresponding bit in the resulting 8-bit index being forced to 0. 1 = Allows the corresponding bit in the resulting index to reflect the actual value of the corresponding bit in the incoming 8-bit pixel data.

14.10.8 DACWX—Offset 3C8h

Palette Write Index Register

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [GTTMMADR_LSB + 180000h] + 3C8h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
PALETTE_WRITE_INDEX							

Bit Range	Default & Access	Field Name (ID): Description
7:0	0b WO	**PALETTE_WRITE_INDEX:** The 8-bit index value programmed into this register chooses which of 256 standard color data positions within the palette are to be made accessible for being written via the Palette Data Register (DACDATA). The index value held in this register is automatically incremented when all three bytes of the color data position selected by the current index have been written. This register allows access to the palette even when running non-VGA display modes.

14.10.9 DACDATA—Offset 3C9h

Palette Data Register

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [GTTMMADR_LSB + 180000h] + 3C9h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
PALETTE_DATA							

Bit Range	Default & Access	Field Name (ID): Description
7:0	0b RW	**PALETTE_DATA:** This byte-wide data port provides read or write access to the three bytes of data of each color data position selected using the Palette Read Index Register (DACRX) or the Palette Write Index Register (DACWX). The three bytes in each color data position are read or written in three successive read or write operations. The first byte read or written specifies the intensity of the red component of the color specified in the selected color data position. The second byte is for the green component, and the third byte is for the blue component. When writing data to a color data position, all three bytes must be written before the hardware will actually update the three bytes of the selected color data position. When reading or writing to a color data position, ensure that neither the Palette Read Index Register (DACRX) or the Palette Write Index Register (DACWX) are written to before all three bytes are read or written. A write to either of these two registers causes the circuitry that automatically cycles through providing access to the bytes for red, green and blue components to be reset such that the byte for the red component is the one that will be accessed by the next read or write operation via this register. This register allows access to the palette even when running non-VGA display modes. Writes to the palette can cause sparkle if not done during inactive video periods. This sparkle is caused by an attempt to write and read the same address on the same cycle. Anti-sparkle circuits will substitute the previous pixel value for the read output.

14.10.10 FCR (FCR_Read)—Offset 3CAh

Feature Control

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

Offset: [GTTMMADR_LSB + 180000h] + 3CAh

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00h

7:4	0b RW	**RESERVED:** Read as 0.

Bit Range	Default & Access	Field Name (ID): Description
3	0b RW	**VSYNC_CONTROL:** This bit is provided for compatibility only and has no other function. Reads and writes to this bit have no effect other than to change the value of this bit. The previous definition of this bit selected the output on the VSYNC pin. 0 = Was used to set VSYNC out put on the VSYNC pin (default). 1 = Was used to set the log i cal 'OR' of VSYNC and Display Ena ble output on the VSYNC pin. This capability was not typically very useful..
2:0	0b RW	**RESERVED_1:** Read as 0.

14.10.11 MSR (MSR_READ)—Offset 3CCh

Miscellaneous Output

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [GTTMMADR_LSB + 180000h] + 3CCh

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
CRT_VSYNC_POLARITY	CRT_HSYNC_POLA_RITY	PAGE_SELECT	RESERVED	CLOCK_SELECT		A0000_BFFFFH_MEMORY_ACCESS_ENABLE	I_O_ADDRESS_SELECT

Bit Range	Default & Access	Field Name (ID): Description
7	0b RW	**CRT_VSYNC_POLARITY:** This is a legacy function that is used in native VGA modes. For most cases, sync polarity will be controlled by the port control bits. The VGA settings can be optionally selected for compatibility with the original VGA when used in the VGA native mode. Sync polarity was used in VGA to signal the monitor how many lines of active display are being generated. 0 = Positive Polarity (default). 1 = Negative Polarity.
6	0b RW	**CRT_HSYNC_POLA_RITY:** This is a legacy function that is used in native VGA modes. For most cases, sync polarity will be controlled by the port control bits. The VGA settings can be optionally selected for compatibility with the original VGA when used in the VGA native mode. 0 = Positive Polarity (default). 1 = Negative Polarity

Bit Range	Default & Access	Field Name (ID): Description
5	0b RW	**PAGE_SELECT:** In Odd/Even Memory Map Mode 1 (GR6), this bit selects the upper or lower 64 KB page in dis play mem ory for CPU access: 0 = Upper page (default) 1 = Lower page. Selects between two 64KB pages of frame buffer memory during standard VGA odd/ even modes (modes 0h through 5h). Bit 1 of register GR06 can also program this bit in other modes. Note that this bit is would normally set to 1 by the software.
4	0b RW	**RESERVED:** Read as 0.
3:2	0b RW	**CLOCK_SELECT:** These bits can select the dot clock source for the CRT interface. The bits should be used to select the dot clock in standard native VGA modes only. When in the centering or upper left corner modes, these bits should be set to have no effect on the clock rate. The actual frequencies that these bits select, if they have any affect at all, is programmable through the DPLL registers that default to the standard values used for VGA. 00 = CLK0, 25.175 MHz (for standard VGA modes with 640 pixel (8-dot) horizontal resolution) (default) 01 = CLK1, 28.322 MHz. (for standard VGA modes with 720 pixel (9-dot) horizontal resolution) 10 = Was used to select an external clock (now unused) 11 = Reserved
1	0b RW	**A0000_BFFFFH_MEMORY_ACCESS_ENABLE:** VGA Compatibility bit enables access to local video memory (frame buffer) at A0000(BFFFFh. When disabled, accesses to VGA memory are blocked in this region. This bit is independent of and does not block CPU access to the video linear frame buffer at other addresses. Note that it is typical for AGP chipsets to shadow this register to allow proper steering of memory accesses to the proper bus. 0 = Prevent CPU access to memory/registers/ROM through the A0000-BFFFF VGA memory aperture (default). 1 = Allow CPU access to memory/registers/ROM through the A0000-BFFFF VGA memory aperture. This memory must be mapped as UC by the CPU; see VGA Host Access Memory Munging in Display and Overlay Functions.
0	0b RW	**I_O_ADDRESS_SELECT:** This bit selects 3Bxh or 3Dxh as the I/O address for the CRT Controller re gisters, the Feature Control Register (FCR), and Input Status Register 1 (ST01). Presently ignored (whole range is claimed), but will ignore 3Bx for color configuration or 3Dx for monochrome. Note that it is typical in AGP chipsets to shadow this bit and properly steer I/O cycles to the proper bus for operation where a MDA exists on another bus such as ISA. 0 = Select 3Bxh I/O address (MDA emulation) (default). 1 = Select 3Dxh I/O address (CGA emulation).

The value that will appear on the pin is defined by what is in the register for the GPIO Clock DATA VALUE bit. 0 = Pin is configured as an input and the output driver is set to tri-state (default) 1 = Pin is configured as an output.
0	0b WO	**GPIO_CLOCK_DIRECTION_MASK_WO:** This is a mask bit to determine whether the GPIO Clock DIRECTION VALUE bit should be written into the register. This value is not stored and when read returns 0. 0 = Do NOT update the GPIO Clock Direction Value bit on a write (default). 1 = Update the GPIO Clock Direction Value bit. on a write operation to this register. AccessType: Write Only

14.10.20 GPIOCTL_4—Offset 5020h

GPIO Control Registers GPIO I2C register (gmbus_register.v reg_gpio0, reg_gpio1, reg_gpio2. reg_gpio3, reg_gpio4)

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 5020h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)

GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000808h

Bits	31:13	12	11	10	9	8	7:5	4	3	2	1	0
Default	0000 0000 0000 0000 000	0	1	0	0	0	000	0	1	0	0	0
Field	RESERVED	GPIO_DATA_IN_RO	GPIO_DATA_VALUE_R_W	GPIO_DATA_MASK_WO	GPIO_DATA_DIRECTION_VALUE_R_W	GPIO_DATA_DIRECTION_MASK_WO	RESERVED_1	GPIO_CLOCK_DATA_IN_RO	GPIO_CLOCK_DATA_VALUE_R_W	GPIO_CLOCK_DATA_MASK_WO	GPIO_CLOCK_DIRECTION_VALUE_R_W	GPIO_CLOCK_DIRECTION_MASK_WO

Bit Range	Default & Access	Field Name (ID): Description
31:13	0b RW	**RESERVED:** Reserved.
12	0b RO	**GPIO_DATA_IN_RO:** This is the value that is sampled on the GPIO_Data pin as an input. This input is synchronized to the Core Clock domain. Because the default setting is this buffer is an input, this bit is undefined at reset. AccessType: Read Only
11	1b RW	**GPIO_DATA_VALUE_R_W:** This is the value that should be place on the GPIO Data pin as an output. This value is only written into the register if GPIO DATA MASK is also asserted. The value will appear on the pin if this data value is actually written to this register and the GPIO Data DIRECTION VALUE contains a value that will configure the pin as an output. Default = 1. The GPIO default clock data value is programmed to 1 in hardware. The hardware drives a default of 1 since the I2C interface defaults to a 1 . (this mimics the I2C external pull-ups on the bus)
10	0b WO	**GPIO_DATA_MASK_WO:** This is a mask bit to determine whether the GPIO DATA VALUE bit should be written into the register. This value is not stored and when read returns 0. 0 = Do NOT write GPIO Data Value bit (default). 1 = Write GPIO Data Value bit. AccessType: Write Only
9	0b RW	**GPIO_DATA_DIRECTION_VALUE_R_W:** This is the value that should be used to define the output enable of the GPIO Data pin. This value is only written into the register if GPIO Data DIRECTION MASK is also asserted. The value that will appear on the pin is defined by what is in the register for the GPIO DATA VALUE bit. 0 = Pin is configured as an input (default) 1 = Pin is configured as an output.
8	0b WO	**GPIO_DATA_DIRECTION_MASK_WO:** This is a mask bit to determine whether the GPIO DIRECTION VALUE bit should be written into the register. This value is not stored and when read always returns 0. 0 = Do NOT write GPIO Data Direction Value bit (default). 1 = Write GPIO Data Direction Value bit. AccessType: Write Only
7:5	0b RW	**RESERVED_1:** must be written with zeros.
4	0b RO	**GPIO_CLOCK_DATA_IN_RO:** This is the value that is sampled on the GPIO Clock pin as an input. This input is synchronized to the Core Clock domain. Because the default setting is this buffer is an input, this bit is undefined at reset. AccessType: Read Only
3	1b RW	**GPIO_CLOCK_DATA_VALUE_R_W:** This is the value that should be place on the GPIO Clk pin as an output. This value is only written into the register if GPIO Clock DATA MASK is also asserted. The value will appear on the pin if this data value is actually written to this register and the GPIO Clock DIRECTION VALUE contains a value that will configure the pin as an output. Default = 1. The GPIO default clock data value is programmed to 1 in hardware. The hardware drives a default of 1 since the I2C interface defaults to a 1 . (this mimics the I2C external pull-ups on the bus)
2	0b WO	**GPIO_CLOCK_DATA_MASK_WO:** This is a mask bit to determine whether the GPIO Clock DATA VALUE bit should be written into the register. This value is not stored and when read always returns 0. 0 = Do NOT write GPIO Clock Data Value bit (default). 1 = Write GPIO Clock Data Value bit. AccessType: Write Only
1	0b RW	**GPIO_CLOCK_DIRECTION_VALUE_R_W:** This is the value that should be used to define the output enable of the GPIO Clock pin. This value is only written into the register if GPIO Clock DIRECTION MASK is also asserted. The value that will appear on the pin is defined by what is in the register for the GPIO Clock DATA VALUE bit. 0 = Pin is configured as an input and the output driver is set to tri-state (default) 1 = Pin is configured as an output.

Bit Range	Default & Access	Field Name (ID): Description
0	0b WO	**GPIO_CLOCK_DIRECTION_MASK_WO:** This is a mask bit to determine whether the GPIO Clock DIRECTION VALUE bit should be written into the register. This value is not stored and when read returns 0. 0 = Do NOT update the GPIO Clock Direction Value bit on a write (default). 1 = Update the GPIO Clock Direction Value bit. on a write operation to this register. AccessType: Write Only

GMBUS Command and Status gmbus command and status (gmbus_register.v reg_gmbus1)

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 5104h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

Bits	Default	Field
31	0	SOFTWARE_CLEAR_INTERRUPT_SW_CLR_INT
30	0	SOFTWARE_READY_SW_RDY
29	0	ENABLE_TIMEOUT_ENT
28	0	RESERVED
27:25	000	BUS_CYCLE_SELECT
24:16	000000000	TOTAL_BYTE_COUNT
15:8	00000000	_8_BIT_GMBUS_SLAVE_REGISTER_INDEX_INDEX
7:1	0000000	_7_BIT_GMBUS_SLAVE_ADDRESS_SADDR
0	0	SLAVE_DIRECTION_BIT

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**SOFTWARE_CLEAR_INTERRUPT_SW_CLR_INT:** This bit must be clear for normal operation. Setting the bit , then clearing it acts as local reset to the GMBUS controller. This bit is commonly used by software to clear a BUS_ERROR when a slave device delivers a NACK. 0 = If this bit is written as a zero when its current state is a one, will clear the HW_RDY bit and allows register writes to be accepted to the GMBUS registers (Write Protect Off). This bit is cleared to zero when an event causes the HW_RDY bit transition to occur. 1 = Asserted by software after servicing the GMBUS interrupt. Setting this bit causes the INT status bit to be cleared. Setting (1) this bit also asserts the HW_RDY bit (until this bit is written with a 0). When this bit is set, no writes to GMBUS registers will cause the contents to change with the exception of this bit which can be written.
30	0b RW	**SOFTWARE_READY_SW_RDY:** Data handshake bit used in conjunction with HW_RDY bit. 0 = De-asserted via the assertion event for HW_RDY bit 1 = When asserted by software, results in de-assertion of HW_RDY bit
29	0b RW	**ENABLE_TIMEOUT_ENT:** Enables timeout for slave response. When this bit is enabled and the slave device response has exceeded the timeout period, the GMBUS Slave Stall Timeout Error interrupt bit is set. 0 = disable timeout counter 1 = enable timeout counter
28	0b RW	**RESERVED:** Reserved.
27:25	0b RW	**BUS_CYCLE_SELECT:** 000 = No GMBUS cycle is generated. 001 = GMBUS cycle is generated without an INDEX, with no STOP, and ends with a WAIT 010 = Reserved 011 = GMBUS cycle is generated with an INDEX, with no STOP, and ends with a WAIT 100 = Generates a STOP if currently in a WAIT or after the completion of the current byte if active. 101 = GMBUS cycle is generated without an INDEX and with a STOP 110 = Reserved 111 = GMBUS cycle is generated with an INDEX and with a STOP GMBUS cycle will always consist of a START followed by Slave Address, followed by an optional read or write data phase. A read cycle with an index will consist of a START followed by a Slave Address a WRITE indication and the INDEX and then a RESTART with a Slave Address and an optional read data phase. The GMBUS cycle will terminate either with a STOP or by entering a wait state. The WAIT state is exited by generating a STOP or by starting another GMBUS cycle. This can only cause a STOP to be generated if a GMBUS cycle is generated, the GMBUS is currently in a data phase, or it is in a WAIT phase: Note that the three bits can be decoded as follows: 27 = STOP generated 26 = INDEX used 25 = cycle ends in a WAIT
24:16	0b RW	**TOTAL_BYTE_COUNT:** (9-bits). This determines the total number of bytes to be transferred during the DATA phase of a GMBUS cycle. The DATA phase can be prematurely terminated by generating a STOP while in the DATA phase (see Bus Cycle Select). Do not change the value of this field during GMBUS cycles transactions.
15:8	0b RW	**_8_BIT_GMBUS_SLAVE_REGISTER_INDEX_INDEX:** This field specifies the 8-bits of index to be used for the generated bus write transaction or the index used for the WRITE portion of the WRITE/READ pair. It only has an effect if the enable Index bit is set. Do not change this field during a GMBUS transaction.

Bit Range	Default & Access	Field Name (ID): Description
7:1	0b RW	**_7_BIT_GMBUS_SLAVE_ADDRESS_SADDR:** When a GMBUS cycle is to be generated using the Bus Cycle Select field, this field specifies the value of the slave address that is to be sent out. For use with 10-bit slave address devices, set this value to 11110XXb (where the last two bits (xx) are the two MSBs of the 10-bit address) and the slave direction bit to a write. This is followed by the first data byte being the 8 LSBs of the 10-bit slave address. Special Slave Addresses 0000 000R = General Call Address 0000 000W = Start byte 0000 001x = CBUS Address 0000 010x = Reserved 0000 011x = Reserved 0000 1xxx = Reserved 1111 1xxx = Reserved 1111 0xxx = 10-Bit addressing
0	0b RW	**SLAVE_DIRECTION_BIT:** When a GMBUS cycle is to be generated based on the Bus Cycle Select, this bit determines if the operation will be a read or a write. A read operation with the index enabled will perform a write with just the index followed by a re-start and a read. 1 = Indicates that a Read from the slave device operation is to be performed. 0 = Indicates that a Write to slave device operation is to be performed.

RESERVED																INUSE	HARDWARE_WAIT_PHASE_HW_WAIT_PHASE_READ_ONLY	SLAVE_STALL_TIMEOUT_ERROR_READ_ONLY	GMBUS_INTERRUPT_STATUS_READ_ONLY	HARDWARE_READY_HW_RDY_READ_ONLY	NAK_INDICATOR_READ_ONLY	GMBUS_ACTIVE_GA_READ_ONLY	CURRENT_BYTE_COUNT_READ_ONLY								

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RW	**RESERVED:** Reserved.
15	0b RW/1C	**INUSE:** 0 = read operation that contains a zero in this bit position indicates that the GMBUS engine is now acquired and the subsequent reads of this register will now have this bit set. Writing a 0 to this bit has no effect. 1 = read operation that contains a one for this bit indicates that the GMBUS is currently allocated to someone else and In use . Once set, a write of a 1 to this bit indicates that the software has relinquished the GMBUS resource and will reset the value of this bit to a 0. Software wishing to arbitrate for the GMBUS resource can poll this bit until it reads a zero and will then own usage of the GMBUS controller. This bit has no effect on the hardware, and is only used as semaphore among various independent software threads that don t know how to synchronize their use of this resource that may need to use the GMBUS logic. Writing a one to this bit is software s indication that the software use of this resource is now terminated and it is available for other clients. AccessType: One to clear
14	0b RO	**HARDWARE_WAIT_PHASE_HW_WAIT_PHASE_READ_ONLY:** 0 = The GMBUS engine is not in a wait phase. 1 = Set when GMBUS engine is in wait phase. Wait phase is entered at the end of the current transaction when that transaction is selected not to terminate with a STOP. Once in a WAIT_PHASE, the software can now choose to generate a STOP cycle or a repeated start (RESTART) cycle followed by another GMBUS transaction on the GMBUS. AccessType: Read Only
13	0b RO	**SLAVE_STALL_TIMEOUT_ERROR_READ_ONLY:** This bit indicates that a slave stall timeout has occurred. It is tied to the Enable Timeout (ENT) bit. 0 = No slave timeout has occurred. 1 = A slave acknowledge timeout has occurred AccessType: Read Only

Bit Range	Default & Access	Field Name (ID): Description
12	0b RO	**GMBUS_INTERRUPT_STATUS_READ_ONLY:** This bit indicates that an event that causes a GMBUS interrupt has occurred. 0 = The conditions that could cause a GMBUS interrupt have not occurred or this bit has been cleared by software assertion of the SW_CLR_INT bit. 1 = GMBUS interrupt event occurred. This interrupt must have been one of the types enabled in the GMBUS4 register. [DevCDV, DevCTG]: Reserved AccessType: Read Only
11	1b RO	**HARDWARE_READY_HW_RDY_READ_ONLY:** This provides a method of detecting when the current software client routine can proceed with the next step in a sequence of GMBUS operations. This data handshake bit is used in conjunction with the SW_RDY bit. When this bit is changed to asserted by the GMBUS controller, it results in the de-assertion of the SW_RDY bit. 0 = Condition required for assertion has not occurred or when this bit was a one and: SW_RDY bit has been asserted. During a GMBUS read transaction, after the each read of the data register. During a GMBUS write transaction, after each write of the data register. SW_CLR_INT bit has been cleared. 1 = This bit is asserted under the following conditions: After a reset or when the transaction is aborted by the setting of the SW_CLR_INT bit. When an active GMBUS cycle has terminated with a STOP. When during a GMBUS write transaction, the data register needs and can accept another four bytes of data. During a GMBUS read transaction, this bit is asserted when the data register has four bytes of new data or the read transaction DATA phase is complete and the data register contains the last few bytes of the read data. This bit resumes to normal operation when the SW_CLR_INT bit is written to a 0. AccessType: Read Only
10	0b RO	**NAK_INDICATOR_READ_ONLY:** Was previously called Slave Acknowledge Timeout Error SATOER. 0 = No bus error has been detected or SW_CLR_INT has been written as a zero since the last bus error. 1 = Set by hardware if any expected device acknowledge is not received from the slave within the timeout. AccessType: Read Only
9	0b RO	**GMBUS_ACTIVE_GA_READ_ONLY:** This is a status bit that indicates whether the GMBUS controller is in an IDLE state or not. 0 = The GMBUS controller is currently IDLE. 1 = This indicates that the bus is in START, ADDRESS, INDEX, DATA, WAIT, or STOP Phase. Set when GMBUS hardware is not IDLE. AccessType: Read Only
8:0	0b RO	**CURRENT_BYTE_COUNT_READ_ONLY:** Can be used to determine the number of bytes currently transmitted/received by the GMBUS controller hardware. Set to zero at the start of a GMBUS transaction data transfer and incremented after the completion of each byte of the data phase. Note that because reads have internal storage, the byte count on a read operation may be ahead of the data that has been accepted from the data register. AccessType: Read Only

14.10.41 GCI_CONTROL—Offset 650Ch

GCI Control Register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 650Ch

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00004000h

Bits	31:28	27	26:25	24	23:15	14	13:4	3	2	1	0
Default	0 0 0 0	0	0 0	0	0 0 0 0 0 0 0 0 0	1	0 0 0 0 0 0 0 0 0 0	0	0	0	0
Field	PFI_CREDIT_INFO_TO_BE_SENT_TO_PONDICHERRY_PFI	FORCE_PFI_CREDIT_RESEND_TO_SSA	RESERVED	AES_CLK_GATING_DISABLE	RESERVED_1	VGA_FAST_MODE_DISABLE	REQUEST_LATENCY_OVERRIDE	REQUEST_LATENCY_OVERRIDE_ENABLE	AES_DECRYPTION_BYPASS_ENABLE	FORCE_AES_SESSION_KEYS_RESEND_TO_AES_BLOCK	HP_ARBITRATION_MODE

Bit Range	Default & Access	Field Name (ID): Description
31:28	0b RW	**PFI_CREDIT_INFO_TO_BE_SENT_TO_PONDICHERRY_PFI:** Others = reserved 0111 = 15 credits 0110 = 14 credits 0101 = 13 credits 0100 = 12 credits 0011 = 11 credits 0010 = 10 credits 0001 = 9 credits 0000 = 8 credits available to PND (default) Based on the czclk/cdclk ratio, display driver has to determine the appropriate PFI credits to be used
27	0b RW	**FORCE PFI CREDIT RESEND TO SSA (FORCE_PFI_CREDIT_RESEND_TO_SSA):** 0 = Disable PFI credit to resend to SSA. Hardware is responsible to clear this bit after the PFI credit initialization request is sent. 1 = Enable PFI credit to resend to SSA. When driver sets this bit, Display PFI request engine will resend the new PFI credit bit [31:28] to SSA. Hardware is responsible to clear this bit after the PFI credit initialization request is sent.
26:25	0b RW	**RESERVED:** Reserved.
24	0b RW	**AES_CLK_GATING_DISABLE:** 0 = Enable clock gating for AES clock (default) 1 = Disable clock gating for AES clock
23:15	0b RW	**RESERVED_1:** Reserved.
14	1b RW	**VGA_FAST_MODE_DISABLE:** 0 = Fast Mode enabled. The Gfx mem arbiter can accept a vga display read request every clock. Note that the HP Address (G_HP_CONTROL[28:24]) and ID (G_HP_CONTROL[21:16]) FIFO depths must be set to a value greater than 1 when Fast Mode is enabled. 1 = Fast Mode disabled. (default) The Gfx mem arbiter can accept a vga display read request every other clock Programming note: VGA FAST MODE is not supported in VLVP.

Bit Range	Default & Access	Field Name (ID): Description
13:4	0b RW	**REQUEST_LATENCY_OVERRIDE:** If bit 3 of this register is set, the 10-btt Request Latency Override value programmed here is used as the latency offset from the global timer for requests that win arbitration. If bit 3 is not set, normal request latency from streamers is used. Programming note: This value should not be larger than the actual required request latency. Otherwise, it will cause underrun. The guidline is to use latency corresponds to low watermark level or even smaller. When this field is used, the actual request latency is defeatured, either zero or a small value is used but still not causing underrun.
3	0b RW	**REQUEST_LATENCY_OVERRIDE_ENABLE:** 1 = Request Latency Override values in bit[13:4] is used as the latency offset from global timer 0 = Request Latency Override values is disabled. Normal request latency from streamer is used. (default)
2	0b RW	**AES_DECRYPTION_BYPASS_ENABLE:** 0 = AES decryption engine is enabled (Default) 1 = AES decryption engine is bypassed
1	0b RW	**FORCE_AES_SESSION_KEYS_RESEND_TO_AES_BLOCK:** 0 = Disable sending AES session keys to AES when going from Panel Self Refresh (PSR) inactive to PSR active mode (Default). Hardware is responsible to clear this bit after this bit is set to resend the session keys. 1 = Enable sending AES session keys to AES engine when going from PSR inactive to PSR active mode. When driver sets this bit, PAVP engine will resend the session keys to AES engine. Hardware is responsible to clear this bit after the session keys are sent.
0	0b RW	**HP_ARBITRATION_MODE:** 0 = Select hierarchical arbiter 1 = Select backup round robin arbiter

14.10.42 GMBUSFREQ—Offset 6510h

GMBUS frequency binary encoding GMBUS Frequency Binary Encoding Register.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**TEARING_EFFECT:** Set to indicate that tearing effect trigger message is Received
30	0b RW	**SPL_PKT_SENT_INTERRUPT:** Set to confirm the transmission of the DPI event specific commands set in the dpi control and dpi data register
29	0b RW	**GEN_READ_DATA_AVAIL:** Set to indicate that the requested data for a Generic Read request is available in the buffer i.e., generic read response data is available in the read FIFO
28	0b RW	**LP_GENERIC_WR_FIFO_FULL:** Set to indicate that the LP generic write fifo is full

Bit Range	Default & Access	Field Name (ID): Description
27	0b RW	**HS_GENERIC_WR_FIFO_FULL:** Set to indicate that the HS generic write fifo is full
26	0b RW	**RX_PROT_VIOLATION:** Set if DSI protocol violation error is reported in the acknowledge packet by the display device
25	0b RW	**RX_INVALID_TX_LENGTH:** Set if invalid transmission length error is reported in the acknowledge packet by the display device
24	0b RW	**ACK_WITH_NO_ERROR:** Set if acknowledge trigger message is received with out any error
23	0b RW	**TURN_AROUND_ACK_TIMEOUT:** Set if a turn around acknowledgement sequence is not received from the display device
22	0b RW	**LP_RX_TIMEOUT:** Set if a low power reception count expires this interrupt is generated
21	0b RW	**HS_TX_TIMEOUT:** Set if a high speed transmission prevails for more than the expected count value this interrupt is raised
20	0b RW	**DPI_FIFO_UNDERRUN:** Set to '1' if there is no data in the dpi fifo to make a in time delivery of the pixel data to the DSI receiver
19	0b RW	**LOW_CONTENTION:** Set to '1' if a LP low fault is registered by at the D-PHY contention detector
18	0b RW	**HIGH_CONTENTION:** Set to '1' if a LP high fault is registered by at the D-PHY contention detector
17	0b RW	**TXDSI_VC_ID_INVALID:** Set to '1' if the received virtual channel ID is invalid
16	0b RW	**TXDSI_DATA_TYPE_NOT_RECOGNISED:** Set to '1' if the received data type is not recognised
15	0b RW	**TXCHECKSUM_ERROR:** Set to '1' if the computed CRC differs from the received CRC value during the reception of packets by Arasan_DSI host.
14	0b RW	**TXECC_MULTIBIT_ERROR:** Set to '1' if there is no ECC correction for the packet or there are more than 2 bit errors in the packet received by Arasan_DSI_host
13	0b RW	**TXECC_SINGLE_BIT_ERROR:** Set to '1' if ECC syndrome was computed and is corrected for one bit error during the reception of packets by the Arasan_DSI_host
12	0b RW	**TXFALSE_CONTROL_ERROR:** Set to '1' if a control error is observed on the lanes by the Arasan_DSI_host
11	0b RW	**RXDSI_VC_ID_INVALID:** Set to '1' if the virtual channel ID is invalid by the display device is reported in the Acknowledge packet by the display device
10	0b RW	**RXDSI_DATA_TYPE_NOT_RECOGNISED:** Set to '1' if the data type is not recognised by the display device is reported in the Acknowledge packet by the display device
9	0b RW	**RXCHECKSUM_ERROR:** Set to '1' if the computed CRC differs from the received CRC value and is reported in the Acknowledge packet by the display device
8	0b RW	**RXECC_MULTIBIT_ERROR:** Set to '1' if there is no ECC correction for the packet or there are more than 2 bit errors in the packet is reported in the Acknowledge packet by the display device
7	0b RW	**RXECC_SINGLE_BIT_ERROR:** Set to '1' if ECC syndrome was computed and corrected for one bit error is reported in the Acknowledge packet by the display device
6	0b RW	**RXFALSE_CONTROL_ERROR:** Set to '1' if a control error is reported in the Acknowledge packet by the display device

Bit Range	Default & Access	Field Name (ID): Description
5	0b RW	**RXHS_RECEIVE_TIMEOUT_ERROR:** Set to '1' if the high speed receive timer value expires and data transfer lasts on the data lane is reported in the Acknowledge packet by the display device
4	0b RW	**RX_LP_TX_SYNC_ERROR:** Set to '1' if Low power transmission sync error occurs in the display device and is reported in the Acknowledge packet by the display device
3	0b RW	**RXESCAPE_MODE_ENTRY_ERROR:** Set to '1' if Escape Mode Entry command is not understandable by the display device and is reported in the Acknowledge packet by the display device
2	0b RW	**RXEOTSYNCERROR:** RX eot sync Error
1	0b RW	**RXSOTSYNCERROR:** Set to '1' if a start of transmission synchronisation error is reported in the Acknowledge packet by the display device
0	0b RW	**RXSOTERROR:** Set to '1' if a start of transmission error is reported in the Acknowledge packet by the display device

18	0b RW	**HIGH_CONTENTION:** Set to enable a LP high fault interrupt
17	0b RW	**TXDSI_VC_ID_INVALID:** Set to enable the interrupt if the received packets virtual channel ID is invalid
16	0b RW	**TXDSI_DATA_TYPE_NOT_RECOGNISED:** Set to enable the interrupt if the received packets data type is not recognised
15	0b RW	**TXCHECKSUM_ERROR:** Set to enable the interrupt if the computed CRC differs from the received CRC value for the received packets
14	0b RW	**TXECC_MULTIBIT_ERROR:** Set to enable the interrupt if there is no ECC correction for the packet or there are more than 2 bit errors in the packet received by Arasan DSI host
13	0b RW	**TXECC_SINGLE_BIT_ERROR:** Set to enable the interrupt if ECC syndrome was computed and is corrected for one bit error during the reception of packets by the Arasan DSIhost
12	0b RW	**TXFALSE_CONTROL_ERROR:** Set to enable the interrupt for the control error.,observed on the lanes by the Arasan_DSI_host
11	0b RW	**RXDSI_VC_ID_INVALID:** Set to enable the interrupt for invalid virtual channel ID in the acknowledgment packet reports
10	0b RW	**RXDSI_DATA_TYPE_NOT_RECOGNISED:** Set to enable the interrupt for the un recognised data type in the acknowledgment packet reports
9	0b RW	**RXCHECKSUM_ERROR:** Set to enable the interrupt for the computed CRC differs from the received CRC value in the acknowledgment packet reports
8	0b RW	**RXECC_MULTIBIT_ERROR:** Set to enable the interrupt for no ECC correction for the packet or there are more than 2 bit errors reported in the acknowledgment packet

Bit Range	Default & Access	Field Name (ID): Description
7	0b RW	**RXECC_SINGLE_BIT_ERROR:** Set to enable the interrupt for ECC syndrome computation and one bit error correction for the acknowledgment packet
6	0b RW	**RXFALSE_CONTROL_ERROR:** Set to enable the interrupt for control error in the acknowledgment packet reports
5	0b RW	**RXHS_RECEIVE_TIMEOUT_ERROR:** Set to enable the interrupt for the high speed receive timeout Error in the acknowledgment packet reports
4	0b RW	**RX_LP_TX_SYNC_ERROR:** Set to enable the interrupt for Low power transmission sync error in the acknowledgment packet reports
3	0b RW	**RXESCAPE_MODE_ENTRY_ERROR:** Set to enable the interrupt for Escape Mode Entry command error in the acknowledgment packet reports
2	0b RW	**RXEOTSYNC_ERROR:** Set to enable the interrupt for End of transmission synchronisation Error in the acknowledgement packet reports
1	0b RW	**RXSOTSYNC_ERROR:** Set to enable the interrupt for start of transmission synchronisation error in the acknowledgement packet reports
0	0b RW	**RXSOT_ERROR:** Set to enable the interrupt for start of transmission error in the acknowledgment packet reports

14.10.48 MIPIA_DSI_FUNC_PRG__REG—Offset B00Ch

mipi pipe A dsi function program register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + B00Ch

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000001h

Bits	Value	Field
31:16	0000 0000 0000 0000	RESERVED
15:13	000	SUPPORTED_DATA_WIDTH_IN_COMMAND_MODE

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RW	**RESERVED:** Reserved.
15:13	0b RW	**SUPPORTED_DATA_WIDTH_IN_COMMAND_MODE:** 000 --) Reserved, 001 --) 16 bit data , 010 --) 9 bit data , 011 --) 8 bit data , 100 --) option 1 : 101 --) option 2 : 110 to 111 --) Reserved
12:11	0b RW	**RESERVED_1:** Reserved.
10:7	0b RW	**SUPPORTED_FORMAT_IN_VIDEO_MODE:** Supported colour format, 0001 --) RGB565, 0010 --) RGB666, 0011 --) RGB 666 loosely packed format, 0100 --) RGB888
6:5	0b RW	**CHANNEL_NUMBER_FOR_COMMAND_MODE:** Virtual channel number for command mode is programmed by the processor
4:3	0b RW	**CHANNEL_NUMBER_FOR_VIDEO_MODE:** Virtual channel number for command mode is programmed by the processor
2:0	001b RW	**DATA_LANES_PRG_R_EG:** Number of data lanes to be supported is programmed by the processor

14.10.49 MIPIA_HS_TX_TIMEOUT_REG—Offset B010h

mipi piepe A HS TX timout register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + B010h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: RESERVED (bits 31:24); HIGH_SPEED_TX_TIMEOUT_COUNTER (bits 23:0)

Bit Range	Default & Access	Field Name (ID): Description
31:24	0b RW	**RESERVED:** Reserved.
23:0	0b RW	**HIGH_SPEED_TX_TIMEOUT_COUNTER:** The maximum duration allowed for the DSI host ,to remain in high speed mode for a transmission. If the counter expires, HS mode is terminated with EOT and the lanes enter stop state

14.10.50 MIPIA_LP_RX_TIMEOUT_REG—Offset B014h

mipi pipe A LP RX timeout register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + B014h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

Bits	31:24	23:0
Default	0000 0000	0000 0000 0000 0000 0000 0000
Field	RESERVED	LOW_POWER_RECEPTION_TIMEOUT_COUNTER

Bit Range	Default & Access	Field Name (ID): Description
31:24	0b RW	**RESERVED:** Reserved.
23:0	0b RW	**LOW_POWER_RECEPTION_TIMEOUT_COUNTER:** Timeout value to be checked for received short packets .If the timer expires the DSI Host enters stop state

14.10.51 MIPIA_TURN_AROUND_TIMEOUT_REG—Offset B018h

mipi pipe A turn around timeout register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + B018h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0b RW	**RESERVED:** Reserved.
4	0b RW	**RANDOM_DPI_DISPLAY_RESOLUTION_DEFEATURE:** Set by the processor to support random DPI display resolution 0 - random DPI display resolution support disabled. 1 - random DPI display resolution support enabled.
3	0b RW	**MIPIA_DISABLE_VIDEO_BTA:** Set by the processor to inform the DSI controller to disable the BTA sent at the last blanking line of VFP. By default, this bit is set to 0.0 BTA sending at the last blanking line of VFP is enabled. 1 BTA sentding at teh last blanking line of VFP is disabeld.
2	0b RW	**IP_TG_CONFIG:** Set by the processor to inform that the DSI controller should discontinue the DPI transfer after the last line of the VFP after ip_tg_enable deassertion. By default, this bit is set to 0. 0 - After ip_tg_enable deassertion, DSI Tx controller stops the DPI transfer immediately after the current packet is transmitted. 1 - After ip_tg_enable deassertion, DSI Tx controller discontinues the DPI transfer after the last line of the VFP
1:0	0b RW	**VIDEO_MODE_FMT:** Sets the Video mode format (packet sequence) to be supported in DSI. In Non Burst Mode, in addition to programming this register the horizontal active area count register value should also be programmed equal to RGB word count value In Burst Mode, in addition to programming this register the horizontal active area count register value should also be programmed greater than the RGB word count value, leaving more time during a scan line for LP mode (saving power) or for multiplexing other transmissions onto the DSI link. 00 Reserved 01 - Non Burst Mode with Sync Pulse 10 - Non Burst Mode with Sync events 11 - Burst Mode

14.10.68 MIPIA_EOT_DISABLE_REGISTER—Offset B05Ch

mipi A eot disable register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + B05Ch

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

Bits	31:8	7	6	5	4	3	2	1	0
Default	000000000000000000000000	0	0	0	0	0	0	0	0
Field	RESERVED	LP_RX_TIMEOUT_ERROR_RECOVERY_DISABLE	HS_TX_TIMEOUT_ERROR_RECOVERY_DISABLE	LOW_CONTENTION_RECOVERY_DISABLE	HIGH_CONTENTION_RECOVERY_DISABLE	TXDSI_TYPE_NOT_RECOGNISED_ERROR_RECOVERY_DISABLE	TXECC_MULTIBIT_ERR_RECOVERY_DISABLE	CLOCKSTOP	EOT_DIS

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	**RESERVED:** Reserved.
7	0b RW	**LP_RX_TIMEOUT_ERROR_RECOVERY_DISABLE:** Set by the processor to enable or disable the LP_Rx_timeout error recovery if the processor clears LP_Rx_timeout error interrupt. 0 - LP_Rx_timeout error recovery action will be taken by the DSI Tx controller if the processor clears the LP_Rx_timeout error interrupt. 1 - If the processor clears the LP_Rx_timeout error interrupt, LP_Rx_timeout error recovery action will not happen in DSI Tx contorller. LP Rx timeout error interrupt will act as an informative interrupt
6	0b RW	**HS_TX_TIMEOUT_ERROR_RECOVERY_DISABLE:** Set by the processor to enable or disable the HS_Tx_timeout error recovery if the processor clears HS_Tx_timeout interrupt. 0 - HS_Tx_timeout error recovery action will be taken by the DSI Tx controller if the processor clears the HS_Tx_timeout error interrupt. 1 - If the processor clears the HS_Tx_timeout error interrupt, HS_Tx_timeout error recovery action will not happen in DSI Tx contorller. HS Tx timeout error interrupt will act as an informative interrupt

Bit Range	Default & Access	Field Name (ID): Description
5	0b RW	**LOW_CONTENTION_RECOVERY_DISABLE:** Set by the processor to enable or disable the contention recovery procedure if the processor clears Low contention interrupt. 0 - Contention recovery will happen if the processor clears Low contention interrupt. 1 - If the processor clears the low contention interrupt, contention recovery procedure will not be initiated by the DSI Tx contorller. Low contention interrupt will act as an informative interrupt
4	0b RW	**HIGH_CONTENTION_RECOVERY_DISABLE:** Set by the processor to enable or disable the contention recovery procedure if the processor clears High contention interrupt. 0 - Contention recovery will happen if the processor clears High contention interrupt. 1 - If the processor clears the high contention interrupt, contention recovery procedure will not be initiated by the DSI Tx contorller. Ignore the High Contention Interrupt in MIPI_INTR_STAT_REG
3	0b RW	**TXDSI_TYPE_NOT_RECOGNISED_ERROR_RECOVERY_DISABLE:** Set by the processor to enable or disable the error recovery action to be taken by the DSI Tx controller if TxDSI data type not recognised error interrupt is cleared by the processor. 0 - Error recovery action will be taken if TxDSI data type not recognised error interrupt is cleared by the processor. 1 - If TxDSI data type not recognised error interrupt is cleared by the processor, error recovery action will not be taken by the DSI TX controller. Tx DSI data type not recognized error interrupt will act as an informative interrupt
2	0b RW	**TXECC_MULTIBIT_ERR_RECOVERY_DISABLE:** Set by the processor to enable or disable the error recovery action to be taken by the DSI Tx controller if Tx ECC multibit error interrupt is cleared by the processor. 0 - Error recovery action will be taken if Tx ECC multibit error interrupt is cleared by the processor. 1 - If Tx ECC multibit error interrupt is cleared by the processor, error recovery action will not be taken by the DSI TX controller. Tx multibit error interrupt will act as an informative interrupt
1	0b RW	**CLOCKSTOP:** Set by the processor to enable or disable clock stopping feature during BLLP timing in a DPI transfer in dual channel mode or during DPI only mode and also when there is no traffic in the DBI interface in DBI only enabled mode. By default this register value is 0. 0 - clock stopping disabled 1 - clock stopping enabled
0	0b RW	**EOT_DIS:** Set by the processor to enable or disable EOT short packet transmission. By default this register value is 0. For backward comapatibility of earlier DSI systems, EOT short packet transmission can be disabled. 0 - EOT short packet transmission enabled 1 - EOT short packet transmission disabled

14.10.69 MIPIA_LP_BYTECLK_REGISTER—Offset B060h

mipi A LP bytclk register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + B060h

VAL	STATUS	OPTION	FREQ	RESERVED	OVERRIDE	OVERRIDE_COUNTER

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**VAL:** 0= disable DBI TYPE-C interface (default) 1= enable DBI TYPE-C interface Driver to make sure that the command and data buffers are cleared before this bit is changed
30	0b RW	**STATUS:** command and data buffer empty and link completed sending out all serialized data and IDLE 0 = IDLE 1 = work in progress
29:28	0b RW	**OPTION:** TYPE-C option selection 00 option 1 01 option 2 10 option 3 11 no defined functionality
27:24	0b RW	**FREQ:** Type-C clock frequency ; A counter based onczclk is used to generate the TYPE-C Clock. So based on the czclk, a frequency close to the specified below will be generated. Not the exact frequency. 0000 1Mhz (default) 0001 1Mhz 0010 2Mhz 1111 15Mhz
23:9	0b RW	**RESERVED:** Reserved.
8	0b RW	**OVERRIDE:** Use override counter value to derive the TYPE-C clock frequency
7:0	0b RW	**OVERRIDE_COUNTER:** Override counter value to generate the TYPE-C clock

14.10.84 MIPIA_CTRL—Offset B104h

MIPI adapter has a control register with options to control width of the dbi bus and the divide value of the clock that needs to be supplied to the Clocks module so that a 2x divided clock can be provided to the MIPI D-PHY IP. Self refresh capability is in DCS commands. The other 3 controls bits (SD, CM and back light control) are now moved to MIPI IP registers.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + B104h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)

14.10.89 MIPIA_RD_DATA_RETURN0—Offset B118h

In addition to the command and data registers, adapter provides 8 read only registers for S/W to read the return data from the panel. At this time the usage case for the read path from the panel is for configuration reads only. Hence, more than 4 bytes of read are not allowed. Maximum read return size in the MIPI IP should be no greater than 32 bytes.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + B118h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**TEARING_EFFECT (RESERVED):** Set to eanble tearing effect
30	0b RW	**SPL_PKT_SENT_INTERRUPT:** Set to enable the confirmation of transmission of the DPI event specific commands set in the dpi control and dpi data register

Bit Range	Default & Access	Field Name (ID): Description
29	0b RW	**GEN_READ_DATA_AVAIL:** Set to enable Generic Read available interrupt
28	0b RW	**LP_GENERIC_WR_FIFO_FULL:** Set to indicate that the LP generic write fifo is full
27	0b RW	**HS_GENERIC_WR_FIFO_FULL:** Set to indicate that the HS generic write fifo is full
26	0b RW	**RX_PROT_VIOLATION:** Set to enable protocol violation error
25	0b RW	**RX_INVALID_TX_LENGTH:** Set to enable invalid transmission length error
24	0b RW	**ACK_WITH_NO_ERROR:** Set to enable acknowledge trigger message reception with out any error
23	0b RW	**TURN_AROUND_ACK_TIMEOUT:** Set to enable turn around acknowledgement ,sequence timeout
22	0b RW	**LP_RX_TIMEOUT:** Set to enable low power reception count timeouts
21	0b RW	**HS_TX_TIMEOUT:** Set to enable a high speed transmission timeout
20	0b RW	**DPI_FIFO_UNDERRUN:** Set to enable if there is no data in the dpi fifo to make a in time delivery of the pixel data to the DSI receiver
19	0b RW	**LOW_CONTENTION:** Set to enable a LP low fault interrupt
18	0b RW	**HIGH_CONTENTION:** Set to enable a LP high fault interrupt
17	0b RW	**TXDSI_VC_ID_INVALID:** Set to enable the interrupt if the received packets virtual channel ID is invalid
16	0b RW	**TXDSI_DATA_TYPE_NOT_RECOGNISED:** Set to enable the interrupt if the received packets data type is not recognised
15	0b RW	**TXCHECKSUM_ERROR:** Set to enable the interrupt if the computed CRC differs from the received CRC value for the received packets
14	0b RW	**TXECC_MULTIBIT_ERROR:** Set to enable the interrupt if there is no ECC correction for the packet or there are more than 2 bit errors in the packet received by Arasan DSI host
13	0b RW	**TXECC_SINGLE_BIT_ERROR:** Set to enable the interrupt if ECC syndrome was computed and is corrected for one bit error during the reception of packets by the Arasan DSIhost
12	0b RW	**TXFALSE_CONTROL_ERROR:** Set to enable the interrupt for the control error.,observed on the lanes by the Arasan_DSI_host
11	0b RW	**RXDSI_VC_ID_INVALID:** Set to enable the interrupt for invalid virtual channel ID in the acknowledgment packet reports
10	0b RW	**RXDSI_DATA_TYPE_NOT_RECOGNISED:** Set to enable the interrupt for the un recognised data type in the acknowledgment packet reports
9	0b RW	**RXCHECKSUM_ERROR:** Set to enable the interrupt for the computed CRC differs from the received CRC value in the acknowledgment packet reports
8	0b RW	**RXECC_MULTIBIT_ERROR:** Set to enable the interrupt for no ECC correction for the packet or there are more than 2 bit errors reported in the acknowledgment packet

Bit Range	Default & Access	Field Name (ID): Description
7	0b RW	**RXECC_SINGLE_BIT_ERROR:** Set to enable the interrupt for ECC syndrome computation and one bit error correction for the acknowledgment packet
6	0b RW	**RXFALSE_CONTROL_ERROR:** Set to enable the interrupt for control error in the acknowledgment packet reports
5	0b RW	**RXHS_RECEIVE_TIMEOUT_ERROR:** Set to enable the interrupt for the high speed receive timeout Error in the acknowledgment packet reports
4	0b RW	**RX_LP_TX_SYNC_ERROR:** Set to enable the interrupt for Low power transmission sync error in the acknowledgment packet reports
3	0b RW	**RXESCAPE_MODE_ENTRY_ERROR:** Set to enable the interrupt for Escape Mode Entry command error in the acknowledgment packet reports
2	0b RW	**RXEOTSYNC_ERROR:** Set to enable the interrupt for End of transmission synchronisation Error in the acknowledgement packet reports
1	0b RW	**RXSOTSYNC_ERROR:** Set to enable the interrupt for start of transmission synchronisation error in the acknowledgement packet reports
0	0b RW	**RXSOT_ERROR:** Set to enable the interrupt for start of transmission error in the acknowledgment packet reports

Bits 31:5	Bit 4	Bit 3	Bit 2	Bits 1:0
RESERVED	RANDOM_DPI_DISPLAY_RESOLUTION_DEFEATURE	MIPIC_DISABLE_VIDEO_BTA	IP_TG_CONFIG	VIDEO_MODE_FMT

Bit Range	Default & Access	Field Name (ID): Description
31:5	0b RW	**RESERVED:** Reserved.
4	0b RW	**RANDOM_DPI_DISPLAY_RESOLUTION_DEFEATURE:** Set by the processor to support random DPI display resolution 0 - random DPI display resolution support disabled. 1 - random DPI display resolution support enabled.
3	0b RW	**MIPIC_DISABLE_VIDEO_BTA:** Set by the processor to inform the DSI controller to disable the BTA sent at the last blanking line of VFP. By default, this bit is set to 0. 0- BTA sending at the last blanking line of VFP is enabled. 1 - BTA sentding at teh last blanking line of VFP is disabeld.
2	0b RW	**IP_TG_CONFIG:** Set by the processor to inform that the DSI controller should discontinue the DPI transfer after the last line of the VFP after ip_tg_enable deassertion. By default, this bit is set to 0. 0 - After ip_tg_enable deassertion, DSI Tx controller stops the DPI transfer immediately after the current packet is transmitted. 1 - After ip_tg_enable deassertion, DSI Tx controller discontinues the DPI transfer after the last line of the VFP
1:0	0b RW	**VIDEO_MODE_FMT:** Sets the Video mode format (packet sequence) to be supported in DSI. In Non Burst Mode, in addition to programming this register the horizontal active area count register value should also be programmed equal to RGB word count value In Burst Mode, in addition to programming this register the horizontal active area count register value should also be programmed greater than the RGB word count value, leaving more time during a scan line for LP mode (saving power) or for multiplexing other transmissions onto the DSI link. 00 Reserved 01 - Non Burst Mode with Sync Pulse 10 - Non Burst Mode with Sync events 11 - Burst Mode

14.10.121 MIPIC_EOT_DISABLE_REGISTER—Offset B85Ch

mipi C EOT disable register

Access Method

Offset: [GTTMMADR_LSB + 180000h] + B88Ch

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)

GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Field	RESERVED																								MIPIC_STOP_STATE_STALL_COUNTER							

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	**RESERVED:** reserved
7:0	0b RW	**MIPIC_STOP_STATE_STALL_COUNTER:** Delay between (stall the stop state signal) the data transfer is increased based on this counter value. This counter is calculated from txclkesc. Note: If processor programs this register then it needs to reprogram the high_low_ switch counter in B844h and lp_equivalent_byteclk reg in B860h to compensate this delay. High_low_switch_count B844h: High to low switch counter = Actual High to low switch + stop_sta_stall_reg value * Low power clock equivalence value in terms of byte clock LP equivalent byteclk register B860h: LP equivalent byteclk value = txclkesc time/ txbyteclk time * (105 + stop_sta_stall_reg value) / 105 Minimum time of Low Power short packet transfer = 105 txclkesc

14.10.134 MIPIC_INTR_STAT_REG_1—Offset B890h

mipi C intrrupt stat register 1

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + B890h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

Bits	31:1	0
Default	0000 0000 0000 0000 0000 0000 0000 000	0
Field	RESERVED	MIPIC_RX_CONNECTION_DETECTED

Bit Range	Default & Access	Field Name (ID): Description
31:1	0b RW	**RESERVED:** reserved
0	0b RW	**MIPIC_RX_CONNECTION_DETECTED:** Set to 1'b1 if the contention detected in the display device and is reported in the Acknowledge packet by the display device

14.10.135 MIPIC_INTR_EN_REG_1—Offset B894h

mipic interrupt enable register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + B894h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0b RW	**RESERVED:** Reserved.
7:0	0b RW	**READ_DATA_VALID:** Each bit corresponds to presence of valid data in the registers above. When data is returned from the panel, H/W will write into these registers in sequence, and set the corresponding valid bit. When S/W issues a write '1 to the registers, this bit is cleared

14.10.150 HTOTAL_A—Offset 60000h

Pipe A Horizontal Total Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 60000h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RESERVED			PIPE_A_HORIZONTAL_TOTAL_DISPLAY_CLOCKS													RESERVED_1			PIPE_A_HORIZONTAL_ACTIVE_DISPLAY_END_PIXELS												

Bit Range	Default & Access	Field Name (ID): Description
31:29	0b RW	**RESERVED:** Write as zero.
28:16	0b RW	**PIPE_A_HORIZONTAL_TOTAL_DISPLAY_CLOCKS:** This 13-bit field provides Horizontal Total up to 8192 pixels encompassing the Horizontal Active Display period, front/back border and retrace period. Any pending event (HSYNC, ACTIVE, HBLANK) is reset at HTOTAL and the programmed sequence begins again. This field is programmed to the number of clocks desired minus one. This number of clocks needs to be a multiple of two when driving data out the digital port out the LVDS port in two channel mode. This value should always be equal or greater to the sum of the horizontal active and the horizontal blank, and border region sizes.

Bit Range	Default & Access	Field Name (ID): Description
15:12	0b RW	**RESERVED_1:** Write as zero.
11:0	0b RW	**PIPE_A_HORIZONTAL_ACTIVE_DISPLAY_END_PIXELS:** This 12-bit field provides Horizontal Active Display resolutions up to 4096 pixels. Note that the first horizontal active display pixel is considered pixel number 0. The value programmed should be the (active pixels/line 1). The number of active pixels will be limited to multiples of two pixels when driving the integrated LVDS port in two channel mode. For proper results during VGA centering mode this value needs to be large enough to fit the largest VGA mode supported, this should be at least 720/1440 pixels for standard VGA type modes or 640/1280 pixels if the nine-dot disable bit in the VGA control register is set. When using the internal panel fitting logic, the minimum horizontal size allowed will be three pixels.

14.10.151 HBLANK_A—Offset 60004h

Pipe A Horizontal Blank Register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 60004h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

31 28 24 20 16 12 8 4 0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

RESERVED | PIPE_A_HORIZONTAL_BLANK_END | RESERVED_1 | PIPE_A_HORIZONTAL_BLANK_START

Bit Range	Default & Access	Field Name (ID): Description
31:29	0b RW	**RESERVED:** Read Only.

Bit Range	Default & Access	Field Name (ID): Description
28:16	0b RW	**PIPE_A_HORIZONTAL_BLANK_END:** This 13-bit field specifies the position of Horizontal Blank End expressed in terms of the absolute pixel number relative to the horizontal active display start. The value programmed should be the HBLANK End pixel position, where the first active pixel is considered position 0; the second active pixel is considered position 1, etc. Horizontal blank ending at the same point as the horizontal total indicates that there is no left hand border area. HBLANK size has a minimum value of 32 clocks. The number of clocks within blank needs to be a multiple of two when driving data out LVDS in two channel mode. The value loaded in the register would be equal to RightBorder+Active+HBlank-1. If this pipe is connected to the TVout port or Panel Fitter 2 the border must be zero. In that case this register is programmed to the same value as the HTOTAL register.
15:13	0b RW	**RESERVED_1:** Read Only.
12:0	0b RW	**PIPE_A_HORIZONTAL_BLANK_START:** This 13-bit field specifies the Horizontal Blank Start position expressed in terms of the absolute pixel number relative to the horizontal active display start. The value programmed should be the HBLANK Start pixel position, where the first active pixel is considered position 0; the second active pixel is considered position 1, etc. The number of clocks for both left and right borders need to be a multiple of two when driving data out the LVDS port in two channel mode. Horizontal blank should only start after the end of the horizontal active region. The value loaded in the register would be equal to RightBorder+Active-1. If this pipe is connected to the TVout port or Panel Fitter 2 the border must be zero. In that case this register is programmed to the same value as the HACTIVE register.

14.10.152 HSYNC_A—Offset 60008h

Pipe A Horizontal Sync Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 60008h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)

GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits 31:29	Bits 28:16	Bits 15:13	Bits 12:0
RESERVED	PIPE_A_HORIZONTAL_SYNC_END	RESERVED_1	PIPE_A_HORIZONTAL_SYNC_START

Bit Range	Default & Access	Field Name (ID): Description
31:29	0b RW	**RESERVED:** Write as zero.
28:16	0b RW	**PIPE_A_HORIZONTAL_SYNC_END:** This 13-bit field specifies the horizontal Sync End position expressed in terms of the absolute pixel number relative to the horizontal active display start. The value programmed should be the HSYNC End pixel position, where the first active pixel is considered position 0; the second active pixel is considered position 1, etc. The number of clocks in the sync period needs to be a multiple of two when driving data out the LVDS port in two channel mode. This value should be greater than the horizontal sync start position and would be loaded with the Active+RightBorder+FrontPorch+Sync-1.
15:13	0b RW	**RESERVED_1:** Read Only.
12:0	0b RW	**PIPE_A_HORIZONTAL_SYNC_START:** This 13-bit field specifies the horizontal Sync Start position expressed in terms of the absolute pixel number relative to the horizontal active display start. The value programmed should be the HSYNC Start pixel position, where the first active pixel is considered position 0; the second active pixel is considered position 1, etc. Note that when HSYNC Start is programmed equal to HBLANK Start, both HSYNC and HBLANK will be asserted on the same pixel clock. It should never be programmed to less than HBLANK start. The number of cycles from the beginning of the line needs to be a multiple of two when driving data out the LVDS port in two channel mode. This register should not be less than the horizontal active end. This register should be loaded with the Active+RightBorder+FrontPorch-1.

14.10.153 VTOTAL_A—Offset 6000Ch

Pipe A Vertical Total Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 6000Ch

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)

GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

31 28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0

RESERVED	PIPE_A_VERTICAL_TOTAL_DISPLAY_LINES	RESERVED_1	PIPE_A_VERTICAL_ACTIVE_DISPLAY_LINES

Bit Range	Default & Access	Field Name (ID): Description
31:29	0b RW	**RESERVED:** Read Only.
28:16	0b RW	**PIPE_A_VERTICAL_TOTAL_DISPLAY_LINES:** This 13 bit field provides Vertical Total up to 8192 lines encompassing the Vertical Active Display Lines, top/bottom border and retrace period. The value programmed should be the number of lines required minus one. Vertical total needs to be large enough to be greater than the sum of the vertical active, vertical border, and the vertical blank regions. The vertical counter is incremented on the leading edge of the horizontal sync. For interlaced display modes, this indicates the total number of lines in both fields. In interlaced modes, hardware automatically divides this number by 2 to get the number of lines in each field.
15:12	0b RW	**RESERVED_1:** Read Only.
11:0	0b RW	**PIPE_A_VERTICAL_ACTIVE_DISPLAY_LINES:** This 12-bit field provides vertical active display resolutions up to 4096 lines. It should be programmed with the desired number of lines minus one. When using the internal panel fitting logic, the minimum vertical active area must be three lines. For interlaced display modes, this indicates the total number of lines in both fields. In interlaced modes, hardware automatically divides this number by 2 to get the number of lines in each field.

14.10.154 VBLANK_A—Offset 60010h

Pipe A Vertical Blank Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 60010h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0
0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	

RESERVED	PIPE_A_VERTICAL_BLANK_END	RESERVED_1	PIPE_A_VERTICAL_BLANK_START

Bit Range	Default & Access	Field Name (ID): Description
31:29	0b RW	**RESERVED:** Read Only.

Bit Range	Default & Access	Field Name (ID): Description
28:16	0b RW	**PIPE_A_VERTICAL_BLANK_END:** This 13-bit field specifies the Vertical Blank End position expressed in terms of the absolute Line number relative to the vertical active display start. The value programmed should be the VBLANK End line position, where the first active line is considered line 0, the second active line is considered line 1, etc. The end of vertical blank should be after the start of vertical blank and before or equal to the vertical total. This register should be loaded with the Vactive+BottomBorder+VBlank-1. For interlaced display modes, hardware automatically divides this number by 2 to get the vertical blank end in each field. It does not count the two half lines that get added when operating in modes with half lines. If this pipe is connected to the TVout port or Panel Fitter 2 the border must be zero. In that case this register is programmed to the same value as the VTOTAL register.
15:13	0b RW	**RESERVED_1:** Read Only.
12:0	0b RW	**PIPE_A_VERTICAL_BLANK_START:** This 13-bit field specifies the Vertical Blank Start expressed in terms of the absolute line number relative to the vertical active display start. The value programmed should be the VBLANK Start line position, where the first active line is considered line 0, the second active line is considered line 1, etc. Minimum vertical blank size is required to be at least three lines. Blank should start after the end of active. This register is loaded with the Vactive+BottomBorder-1. For interlaced display modes, hardware automatically divides this number by 2 to get the vertical blank start in each field. It does not count the two half lines that get added when operating in modes with half lines. If this pipe is connected to the TVout port or Panel Fitter 2 the border must be zero. In that case this register is programmed to the same value as the VACTIVE register.

14.10.155 VSYNC_A—Offset 60014h

Pipe A Vertical Sync Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

RESERVED				PIPE_A_HORIZONTAL_SOURCE_IMAGE_SIZE												RESERVED_1				PIPE_A_VERTICAL_SOURCE_IMAGE_SIZE											

Bit Range	Default & Access	Field Name (ID): Description
31:28	0b RW	**RESERVED:** Write as zero

Bit Range	Default & Access	Field Name (ID): Description
27:16	0b RW	**PIPE_A_HORIZONTAL_SOURCE_IMAGE_SIZE:** This 12-bit field specifies Horizontal source image size up to 4096. This determines the size of the image created by the display planes sent to the blender. The value programmed should be the source image size minus one. The actual source size must be two times the programmed value in the pixel multiply mode. It must represent a size that is a multiple of two (even numbers) when driving the LVDS port in two channel mode. This implies that for this mode, the value programmed will always be an odd number. Except in the case of panel fitting internal or in an external device, this register field would be programmed to a value identical to the horizontal active. This is the only register of the timing registers that is allowed to be programmed while the pipe is enabled.
15:12	0b RW	**RESERVED_1:** Write as zero
11:0	0b RW	**PIPE_A_VERTICAL_SOURCE_IMAGE_SIZE:** This 12-bit field specifies the vertical source image size up to 4096 lines. This determines the size of the image created by the display planes sent to the blender. The value programmed should be the source image size minus one. Note that the actual number of lines needs to be at least twice the planes programmed value when in the pixel multiply mode. Except in the case of panel fitting internal or in an external device, this register field would be programmed to a value identical to the vertical active. For interlaced display modes, hardware automatically divides this number by 2 to get the vertical source image size in each field.

RESERVED (bits 31:13)

PIPE_A_SECOND_FIELD_VERTICAL_SYNC_SHIFT (bits 12:0)

Bit Range	Default & Access	Field Name (ID): Description
31:13	0b RW	**RESERVED:** Write as zero.

Bit Range	Default & Access	Field Name (ID): Description
12:0	0b RW	**PIPE_A_SECOND_FIELD_VERTICAL_SYNC_SHIFT:** This value specifies the vertical sync alignment for the start of the interlaced second field expressed in terms of the absolute pixel number relative to the horizontal active display start. This value will only be used if the PIPEACONF is programmed to an interlaced mode using vsync shift. Otherwise a legacy value of floor[htotal / 2] will be used. Typically, the interlaced second field vertical sync should start one pixel after the point halfway between successive horizontal syncs, so the value of this register should be programmed to: (horizontal sync start - floor[horizontal total / 2]) (use the actual horizontal sync start and horizontal total values and not the minus one values programmed into registers). This vertical sync shift only occurs during the interlaced second field. In all other cases the vertical sync start position is aligned with horizontal sync start.

RESERVED | IDENTICAL_FRAME_THRESHOLD | DPLLA_POWER_DOWN_DELAY | DOUBLE_FRAMES_IN_PSR_ACTIVE_ENTRY | SOURCE_TRANSMITTER_STATE_IN_PSR_ACTIVE | PSR_ACTIVE_ENTRY | PSR_SINGLE_FRAME_UPDATE | RESERVED_1 | PSR_MODE | PSR_RESET | PSR_ENABLE

Bit Range	Default & Access	Field Name (ID): Description
31:24	0b RW	**RESERVED:** Reserved.
23:16	0b RW	**IDENTICAL_FRAME_THRESHOLD:** : Number of identical frames that display controller needs to exceed in order to transition to PSR active state in HW timer mode
15:11	0b RW	**DPLLA_POWER_DOWN_DELAY:** programmable delay from main link powerdown to DPLLA powerdown. The delay is in number of cdclk clocks.
10	0b RW	**DOUBLE_FRAMES_IN_PSR_ACTIVE_ENTRY:** . If asserted, HW will send two frames with same SDP active setting when entry PSR active state. This bit is set if the vertical blanking time is less than 330us.
9	0b RW	**SOURCE_TRANSMITTER_STATE_IN_PSR_ACTIVE:** . If asserted, HW will keep transmitter active during PSR active state and sends only idle symbols. If deasserted, HW will turn off transmitter during PSR active state. Display driver will keep this bit consistent with Source transmitter state in PSR active bit in DPCD register of the sink.
8	0b RW	**PSR_ACTIVE_ENTRY:** This bit is only valid in PSR_mode is SW timer mode. If it is asserted, HW will transition into PSR_active state. If it is deasserted, HW will transition to PSR_inactive state. SW should not set or clear this bit more than once within one vblank period.
7	0b RW	**PSR_SINGLE_FRAME_UPDATE:** In PSR persistent mode, SW set this bit before writing registers for a flip. After HW finishes signle frame update, it goes back to PSR active ? no RFB state. SW driver may send new single frame update request. Programming note: Reading this bit is updated at the next vblank. Writing this bit to 1 will cause PSR FSM to perform single frame update automatically, no vblank is required. When single frame update is done, it will automatically go back to PSR active ? no RFB update. 60094[2:0] = 3b011.
6:5	0b RW	**RESERVED_1:** Reserved.
4:2	0b RW	**PSR_MODE:** b011-111: reserved. b010: PSR with HW timer. HW timer decides PSR active entry point. PSR active state exits upon MMIO write registers that may change the frame buffer. b001: PSR with SW timer. In this mode, SW will keep track of idle frames and buffer modification in the driver and explicitly specify the entry and exit PSR active state point. b000: PSR manual (debug) mode. All of PSR state transitions and SDP content is managed by SW driver. SW is responsible to change SDP content for every frame with appropriate values to keep PSR panel in synchronized states.

Bit Range	Default & Access	Field Name (ID): Description
1	0b RW	**PSR_RESET:** If assert all PSR functions are reset back to PSR inactive state. When it needs to resynchronize source and sync, SW writes 0x2 to DPCD register 600h and to this bit to get system back to PSR active states. This bit is self clear.
0	0b RW	**PSR_ENABLE:** Panel Self-refresh is enabled. When it is asserted PSR is enabled and operate in one of the mode that specified by PSR mode.

14.10.182 PIPEAWIDEGAMUTCOLORCORRECTIONC01_C00COEFFICIENTS—Offset 600B0h

When color correction matrix enable bit is set in PIPEACONF register, each of pixels in the pipe is multiplied with this matrix. Color matrix is used to convert pixels from one RGB color space to another RGB color space. There are many applications for the use of this matrix like gamut mapping between 72 percent color gamut to 92 percent color gamut. Each coefficient is a 12-bit signed fixed-point number. The application of coefficients are as follows:

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**ENABLE_GRAPHICS_DATA_ISLAND_PACKET:** mode (bit #9 of port control register) overrides this behavior.
30:29	01b RW	**PORT_SELECT:** Project: All Default Value: 01b Digital Port B This selects which port is to transmit the data island. This field must not be changed while data island transmission is enabled. Value Name Description Project 00b Reserved Reserved All 01b Digital Port B Digital Port B (Default) All 10b Digital Port C Digital Port C All 11b Reserved Reserved All
28:26	0b RW	**RESERVED:** Project: All Format:
25	0b RW	**GCP_DIP_ENABLE:** Project: All Default Value: 0b This bit enables the output of the General Control Packet. GCP is different from other DIPs in that much of the payload is automatically reflected in the packet, and therefore a DIP buffer for GCP is not needed. Please refer to the GCP payload register for payload details. Writes to this bit take effect immediately. This bit should not be enabled for 8bpc mode if at least one of the other HDMI ports is enabled in 12bpc mode. Value Name Description Project 0b Disable GCP DIP disabled All 1b Enable GCP DIP enabled All
24:21	0001b RW	**DATA_ISLAND_PACKET_TYPE_ENABLE:** Project: All Default Value: 0001b Enable AVI DIP These bits enable the output of a given data island packet (DIP) type. It can be updated while the port is enabled and is immediately updated (not double-buffered). Within 2 vblank periods, the DIP is guaranteed to have been transmitted. Value Name Description Project XXX1b Enable AVI Enable AVI DIP (Default = enabled) All XX1Xb Enable Vendor Enable Vendor-specific DIP (Default = disabled) All X1XXb Enable Gamut Enable Gamut Metadata Packet (Default = disabled) All 1XXXb Enable Source Enable Source Product Description DIP (Default = disabled) All

Bit Range	Default & Access	Field Name (ID): Description
20:19	0b RW	**DIP_BUFFER_INDEX:** Project: All Default Value: 00b This field is used during programming of different DIPs. These bits are used as an index to their respective DIP buffers. The transmission frequency must also be written when programming the buffer. Value Name Description Project 00b AVI AVI DIP (31 bytes of space available) All 01b Vendor-specific Vendor-specific DIP All 10b Reserved Reserved All 11b Source Product Source Product Description DIP All
18	0b RW	**RESERVED_1:** Project: All Format:
17:16	0b RW	**VIDEO_DIP_TRANSMISSION_FREQUENCY:** Project: All Default Value: 00b These bits dictate the frequency of Video DIP transmission for the DIP buffer index designated in bits 20:19. When writing Video DIP data, this value is also latched when the first DW of the Video DIP is written. When read, this value reflects the Video DIP transmission frequency for the Video DIP buffer designated in bits 20:19. This field shall be ignored for Gamut Metadata Packet transmission. Value Name Description Project 00b Send Once Send Once All 01b Every VSync Send Every VSync (Default for AVI) All 10b Every Other Vsync Send at least every other VSync All 11b Reserved Reserved All
15:12	0b RW	**RESERVED_2:** Project: All Format: MBZ
11:8	1001b RO	**VIDEO_DIP_BUFFER_SIZE:** Project: All AccessType: Read Only Default Value: ;1001b This reflects the buffer size in dwords available for the type of Video DIP being indexed by bits 20:19 of this register, including the header. It is hardwired to the maximum size of a Video DIP, 36 bytes. Please note that this count includes ECC bytes, which are not writable by software. These bits are immediately valid after write of the DIP index.
7:4	0b RW	**RESERVED_3:** Project: All Format: MBZ
3:0	0b RO	**VIDEO_DIP_RAM_ACCESS_ADDRESS:** Project: All AccessType: Read Only Selects the DWORD address for access to the Video DIP buffers. This value is automatically incremented after each read or write of the Video DIP Data Register. The value wraps back to zero when it autoincrements past the max address value of 0xF. This field change takes effect immediately after being written. The read value indicates the current access address.

RESERVED																			PIPE_B_SECOND_FIELD_VERTICAL_SYNC_SHIFT												

Bit Range	Default & Access	Field Name (ID): Description
31:13	0b RW	**RESERVED:** Write as zero.
12:0	0b RW	**PIPE_B_SECOND_FIELD_VERTICAL_SYNC_SHIFT:** This value specifies the vertical sync alignment for the start of the interlaced second field expressed in terms of the absolute pixel number relative to the horizontal active display start. This value will only be used if the PIPEBCONF is programmed to an interlaced mode using vsync shift. Otherwise a legacy value of floor[htotal / 2] will be used. Typically, the interlaced second field vertical sync should start one pixel after the point halfway between successive horizontal syncs, so the value of this register should be programmed to: (horizontal sync start - floor[horizontal total / 2]) (use the actual horizontal sync start and horizontal total values and not the minus one values programmed into registers). This vertical sync shift only occurs during the interlaced second field. In all other cases the vertical sync start position is aligned with horizontal sync start.

RESERVED									COLOR_CHANNEL_CRC_RESULT_VALUE																						

Bit Range	Default & Access	Field Name (ID): Description
31:23	0b RO	**RESERVED:** Read only

Bit Range	Default & Access	Field Name (ID): Description
22:0	0b RO	**COLOR_CHANNEL_CRC_RESULT_VALUE:** This field contains the resultant CRC value for the Color Channel at the end of a frame. A status bit can be used as an indication that the data is the valid result of a CRC calculation. The result of a CRC on an empty frame will be 7FFFFFh.

14.11.11 PSRCTLB—Offset 61090h

Pipe B Panel Self Refresh Control

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 61090h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

RESERVED | IDENTICAL_FRAME_THRESHOLD | DPLLB_POWER_DOWN_DELAY | DOUBLE_FRAMES_IN_PSR_ACTIVE_ENTRY | SOURCE_TRANSMITTER_STATE_IN_PSR_ACTIVE | PSR_ACTIVE_ENTRY | PSR_SINGLE_FRAME_UPDATE | RESERVED_1 | PSR_MODE | PSR_RESET | PSR_ENABLE

Bit Range	Default & Access	Field Name (ID): Description
31:24	0b RW	**RESERVED:** Reserved.
23:16	0b RW	**IDENTICAL_FRAME_THRESHOLD:** : Number of identical frames that display controller needs to exceed in order to transition to PSR active state in HW timer mode
15:11	0b RW	**DPLLB_POWER_DOWN_DELAY:** programmable delay from main link powerdown to DPLLB powerdown. The delay is in number of cdclk clocks.
10	0b RW	**DOUBLE_FRAMES_IN_PSR_ACTIVE_ENTRY:** . If asserted, HW will send two frames with same SDP active setting when entry PSR active state. This bit is set if the vertical blanking time is less than 330us.
9	0b RW	**SOURCE_TRANSMITTER_STATE_IN_PSR_ACTIVE:** . If asserted, HW will keep transmitter active during PSR active state and sends only idle symbols. If deasserted, HW will turn off transmitter during PSR active state. Display driver will keep this bit consistent with Source transmitter state in PSR active bit in DPCD register of the sink.

Bit Range	Default & Access	Field Name (ID): Description
8	0b RW	**PSR_ACTIVE_ENTRY:** This bit is only valid in PSR_mode is SW timer mode. If it is asserted, HW will transition into PSR_active state. If it is deasserted, HW will transition to PSR_inactive state. SW should not set or clear this bit more than once within one vblank period.
7	0b RW	**PSR_SINGLE_FRAME_UPDATE:** In PSR SW or HW mode, SW set this bit before writing registers for a flip. After HW finishes signle frame update, it goes back to PSR active ? no RFB state. SW driver may send new single frame update request. Programming note: Reading this bit is updated at the next vblank. Writing this bit to 1 will cause PSR FSM to perform single frame update automatically, no vblank is required. When single frame update is done, it will automatically go back to PSR active ? no RFB update. 61094[2:0] = 3b011.
6:5	0b RW	**RESERVED_1:** Reserved.
4:2	0b RW	**PSR_MODE:** b011-111: reserved. b010: PSR with HW timer. HW timer decides PSR active entry point. PSR active state exits upon MMIO write registers that may change the frame buffer. b001: PSR with SW timer. In this mode, SW will keep track of idle frames and buffer modification in the driver and explicitly specify the entry and exit PSR active state point. b000: PSR manual (debug) mode. All of PSR state transitions and SDP content is managed by SW driver. SW is responsible to change SDP content for every frame with appropriate values to keep PSR panel in synchronized states.
1	0b RW	**PSR_RESET:** If assert all PSR functions are reset back to PSR inactive state. When it needs to resynchronize source and sync, SW writes 0x2 to DPCD register 600h and to this bit to get system back to PSR active states. This bit is self clear.
0	0b RW	**PSR_ENABLE:** Panel Self-refresh is enabled. When it is asserted PSR is enabled and operate in one of the mode that specified by PSR mode.

14.11.16 PIPEBWIDEGAMUTCOLORCORRECTIONC01_C00COEFFICIENTS—Offset 610B0h

When color correction matrix enable bit is set in PIPEBCONF register, each of pixels in the pipe is multiplied with this matrix. Color matrix is used to convert pixels from one RGB color space to another RGB color space. There are many applications for the use of this matrix like gamut mapping between 72 percent color gamut to 92 percent color gamut. Each coefficient is a 12-bit signed fixed-point number. The application of coefficients are as follows:

31:30	0b RW	**RESERVED:** mbz
29	0b RW	**DISPLAYPORT_HDMI_B_HOT_PLUG_INTERRUPT_DETECT_ENABLE:** [DevCDV, DevCTG, DevELK] This will enable the consideration of the hot plug interrupt status bit for DisplayPort B in the Port Hotplug Status register, offset 61114h. Please note that software must set this bit at boot in order to detect the HPD input buffer live state. Since setting this bit may generate an interrupt, it must not be cleared and reset as part of interrupt processing. 0 = DisplayPort or HDMIB Hot Plug Detect Disabled (Default) 1 = DisplayPort or HDMIB Hot Plug Detect Enabled
28	0b RW	**DISPLAYPORT_HDMI_C_HOT_PLUG_INTERRUPT_DETECT_ENABLE:** [DevCDV, DevCTG, DevELK] This will enable the consideration of the hot plug interrupt status bit for DisplayPort C in the Port Hotplug Status register, offset 61114h. Please note that software must set this bit at boot in order to detect the HPD input buffer live state. Since setting this bit may generate an interrupt, it must not be cleared and reset as part of interrupt processing. 0 = DisplayPort or HDMIC Hot Plug Detect Disabled (Default) 1 = DisplayPort or HDMIC Hot Plug Detect Enabled
27	0b RW	**DISPLAYPORT_HDMI_D_HOT_PLUG_INTERRUPT_DETECT_ENABLE:** [DevCTG] This will enable the consideration of the hot plug interrupt status bit for DisplayPort D in the Port Hotplug Status register, offset 61114h. Please note that software must set this bit at boot in order to detect the HPD input buffer live state. Since setting this bit may generate an interrupt, it must not be cleared and reset as part of interrupt processing. 0 = DisplayPort or HDMID Hot Plug Detect Disabled (Default) 1 = DisplayPort or HDMID Hot Plug Detect Enabled
26	0b RW	**SDVOB_HOT_PLUG_INTERRUPT_DETECT_ENABLE:** [DevCTG] This will enable the consideration of the hot plug interrupt status bit in the Port Hotplug Status register, offset 61114h. This bit enables detection on the SDVOB interrupt input pin pair. 0 = SDVOB Hot Plug Detect Disabled (Default) 1 = SDVOB Hot Plug Detect Enabled

Bit Range	Default & Access	Field Name (ID): Description
25	0b RW	**SDVOC_HOT_PLUG_INTERRUPT_DETECT_ENABLE:** [DevCTG] This will enable the consideration of the hot plug interrupt status bit in the Port Hotplug Status register, offset 61114h. This bit enables detection on the SDVOC interrupt input pin pair. 0 = SDVOC Hot Plug Detect Disabled (Default) 1 = SDVOC Hot Plug Detect Enabled
24	0b RW	**PIPE_A_AUDIO_INTERRUPT_DETECT_ENABLE:** [DevCDV, DevCL, DevCTG, DevVLVP] This bit enables consideration of the pipe A audio interrupt status bit in the Port Hotplug Status Register, offset 61114h. It relates to the HDMI port that has audio enabled and can only be used in combination with TMDS encoding. This bit is only to be used for integrated HDMI. 0 = Audio interrupt detect disabled (Default) 1 = Audio interrupt detect enabled
23	0b RW	**PIPE_B_AUDIO_INTERRUPT_DETECT_ENABLE:** [DevVLVP] This bit enables consideration of the pipe B audio interrupt status bit in the Port Hotplug Status Register, offset 61114h. It relates to the HDMI port that has audio enabled and can only be used in combination with TMDS encoding. This bit is only to be used for integrated HDMI. 0 = Audio interrupt detect disabled (Default) 1 = Audio interrupt detect enabled
22:19	0b RW	**RESERVED_1:** mbz
18	0b RW	**RESERVED_2:** [DevVLVP] MBZ TV Hot Plug Detect Interrupt Enable: [DevCL, DevCTG] This will enable the consideration of the TV hot plug interrupt status bit. 0 = TV Hot Plug Detect Disabled (bit 10 of the port hotplug status register no longer detects interrupts, Default) 1 = TV Hot Plug Detect Enabled
17:16	0b RW	**DP_HOTPLUG_SHORT_PULSE_DURATION:** [DevCDV, DevCTG, DevELK] These bits define the duration of the pulse defined as a short pulse for DisplayPort ports. Pulse less than this value is detected short pulse. Pulse larger than this value is detected long pulse. For DP, this shall use 2ms as threshold. 00 = 2mS (Default) 01 = 4.5mS 10 = 6mS 11 = 100mS
15:10	0b RW	**RESERVED_3:** mbz
9	0b RW	**RESERVED_4:** [DevVLVP] MBZ. This bit is the same as bit 23 in 61100h [DevCDV, DevCTG, DevBW, DevCL, DevBLC] CRT Hot plug Interrupt Enable: Hotplug detection is used to cause an interrupt or status bit based on the connection or disconnection of a CRT to the analog video connection. 0 = No hot plug interrupt is enabled (Default) 1 = Hot plug detection is enabled
8	0b RW	**RESERVED_5:** [DevVLVP] MBZ. This bit is the same as bit 22 in 61100h [DevCDV, DevCTG] CRT Hot plug Circuit Activation Period: This bit sets the activation period for the CRT hot plug circuit detection. Setting this bit to 1 is required for the correct operation of CRT DAC detection. 0 = 32 cdclk periods (Default) 1 = 64 cdclk periods
7	0b RW	**RESERVED_6:** [DevVLVP] MBZ. This bit is the same as bit 21 in 61100h [DevCDV, DevCTG, DevBW, DevCL, DevBLC] CRT DAC on time Value: Powerup time for 0 = CRT DAC requires 2M cdclks for warmup (Default) 1 = CRT DAC requires 4M cdclks for warmup

Bit Range	Default & Access	Field Name (ID): Description
6:5	01b RW	**RESERVED_7:** [DevVLVP] MBZ. This bit is the same as bit 19:18 in 61100h [DevCDV, DevCTG, DevBW, DevCL, DevBLC] CRT Hot plug Voltage Compare Value: Compare value for CRT hotplug detect Vref to determine whether the analog port is connected to a CRT. The voltage is forced at the beginning of the active region of the screen every 2 seconds. 00 = A0, 01 = B0, (Default) 10 = C0 11 = D0
4	0b RW	**RESERVED_8:** [DevVLVP] MBZ. This bit is the same as bit 20 in 61100h [DevCDV, DevCTG, DevBW, DevCL, DevBLC] CRT Hot Plug Detect Delay: This bit determines the length of time between polling periods when the DAC/pipe are disabled 0 = 1G cdclks (default) 1 = 2G cdclks
3	0b RW	**RESERVED_9:** [DevVLVP] MBZ [DevCDV, DevCTG, DevBW, DevCL, DevBLC] Force CRT detect trigger: Triggers a CRT hotplug/unplug detection cycle independent of the interrupt enable bit. Bits 5:8 of this register must be correctly programmed when forcing a trigger. This bit is automatically cleared after the detection is completed. The result of this trigger is reflected in bits 9:8 of the port hotplug interrupt status register. The CRT interrupt status bit #11 in the hot plug status register (61114) will get set the first time Force CRC detect trigger is used after reset. Software must reset status after a force CRT detect trigger. 0 = No trigger (Default) 1 = Trigger
2	0b RW	**RESERVED_10:** [DevVLVP] MBZ. This bit is the same as bit 17 in 61100h [DevCTG-B] CRT DAC hot plug detection reference voltage selection: 0 = 325mv, bits[6:5] should be set to 01 (Default) 1 = 475mv, bits[6:5] should be set to 11
1:0	0b RW	**RESERVED_11:** mbz

31:30	0b RW	**RESERVED:** mbz
29	0b RO	**DISPLAYPORT_HDMIB_HOT_PLUG_INPUT_BUFFER_LIVE_STATE:** [DevCDV, DevCTG, DevELK] This bit is read-only. It reflects the real-time state of the of the hot plug input (HPD pin) on DisplayPort or HDMI B when bit 29 of the hotplug enable register, offset 61110h is set. This pin signal is active high. This does not feed into the first line interrupt status register. This bit should be read to confirm cable connection prior to attempting EDID read. 1 = HPD detected active 0 = HPD detected inactive AccessType: Read Only
28	0b RO	**DISPLAYPORT_HDMIC_HOT_PLUG_INPUT_BUFFER_LIVE_STATE:** [DevCDV, DevCTG, DevELK] This bit is read-only. It reflects the real-time state of the of the hot plug input (HPD pin) on DisplayPortC when bit of this register is set. This pin signal is active high. This does not feed into the first line interrupt status register. This bit should be read to confirm cable connection prior to attempting EDID read. 1 = HPD detected high 0 = HPD detected low AccessType: Read Only
27	0b RO	**DISPLAYPORTD_HOT_PLUG_INPUT_BUFFER_LIVE_STATE:** [DevCTG] This bit is read-only. It reflects the real-time state of the of the hot plug input (HPD pin) on DisplayPortD when bit of this register is set. This pin signal is active high. This does not feed into the first line interrupt status register. Please note that port D is intended for LFP use and therefore HPD may not be present. Bit 2 of the DPD control register must therefore be read to determine whether DPD is used in the system. 1 = HPD detected high 0 = HPD detected low AccessType: Read Only
26:24	0b RW	**RESERVED_1:** mbz

Bit Range	Default & Access	Field Name (ID): Description
23	0b RO	**PIPE_B_AUDIO_INTERRUPT_LIVE_STATE:** [DevVLVP] This read-only bit is used only in ports that use TMDS encoding. It reflects the state of the pipe B audio interrupt request for HDCP when bit 1 of this register is set. This pin signal is active high. It does not feed into the first line interrupt status register. 1 = HDCP invocation requested from audio 0 = HDCP disable requested from audio AccessType: Read Only
22:21	0b RW/1C	**DISPLAYPORT_D_HOT_PLUG_INTERRUPT_DETECT_STATUS:** [DevCTG] This reflects hot plug interrupt status on DisplayPort D. Graphics software must write a one to these bits to clear the status. This bit is used for either monitor hotplug/unplug or for notification of a sink event. This bit feeds into the first line interrupt status register when bit 27 of the hotplug enable status register is set. 00 = DisplayPort D Hot Plug event not detected 1x = DisplayPort D long pulse Hot Plug event detected X1 = DisplayPort D short pulse Hot Plug event detected AccessType: One to Clear
20:19	0b RW/1C	**DISPLAYPORT_C_HOT_PLUG_INTERRUPT_DETECT_STATUS:** [DevCDV, DevCTG, DevELK] This reflects hot plug interrupt status on DisplayPort or HDMI C. Graphics software must write a one to these bits to clear the status. This bit is used for either monitor hotplug/unplug or for notification of a sink event. This bit feeds into the first line interrupt status register when bit 28 of the hotplug enable status register is set. Please note that these bits should be considered in conjunction with bit 28, the hot plug input buffer live state, when determining further action: if bit 28 = 0, the bits should be cleared and the port must be disabled. 00 = DisplayPort/HDMI C Hot Plug event not detected 1x = DisplayPort/HDMI C long pulse Hot Plug event detected X1 = DisplayPort C short pulse Hot Plug event detected AccessType: One to Clear
18:17	0b RW/1C	**DISPLAYPORT_B_HOT_PLUG_INTERRUPT_DETECT_STATUS:** [DevCDV, DevCTG, DevELK] This reflects hot plug interrupt status on DisplayPort B. Graphics software must write a one to these bits to clear the status. This bit is used for either monitor hotplug/unplug or for notification of a sink event. This bit feeds into the first line interrupt status register when bit 29 of the hotplug enable status register is set. Please note that these bits should be considered in conjunction with bit 29, the hot plug input buffer live state, when determining further action: if bit 29 = 0, the bits should be cleared and the port must be disabled. 00 = DisplayPort/HDMI B Hot Plug event not detected 1x = DisplayPort/HDMI B long pulse Hot Plug event detected X1 = DisplayPort B short pulse Hot Plug event detected AccessType: One to Clear
16	0b RO	**PIPE_A_AUDIO_INTERRUPT_LIVE_STATE:** [DevCDV, DevCTG, DevCL] This read-only bit is used only in ports that use TMDS encoding. It reflects the state of the pipe A audio interrupt request for HDCP when bit 1 of this register is set. This pin signal is active high. It does not feed into the first line interrupt status register. 1 = HDCP invocation requested from audio 0 = HDCP disable requested from audio AccessType: Read Only
15	0b RO	**DIGITAL_PORT_B_AUDIO_REQUEST_LIVE_STATE:** [DevCDV, DevCTG, DevCL] This read-only bit is only used on ports using audio. It reflects the state of audio HDCP request when bit 17 of this register is set if audio is enabled on this port. This pin signal is active high. This does not feed into the first line interrupt status register. 1 = HDCP invocation requested from audio 0 = HDCP disable requested from audio AccessType: Read Only
14	0b RO	**DIGITAL_PORT_C_AUDIO_REQUEST_LIVE_STATE:** [DevCDV, DevCTG, DevCL] This read-only bit is only used on ports using audio. It reflects the state of audio HDCP request when bit 19 of this register is set if audio is enabled on this port. This pin signal is active high. This does not feed into the first line interrupt status register. 1 = HDCP invocation requested from audio 0 = HDCP disable requested from audio AccessType: Read Only
13:12	0b RW	**RESERVED_2:** mbz

Bit Range	Default & Access	Field Name (ID): Description
11	0b RW/1C	**CRT_HOT_PLUG_INTERRUPT_STATUS:** [DevCDV, DevCTG, DevBW, DevCL, DevBLC] This bit is set when a CRT hot plug or unplug event has been detected. A hot plug or unplug event is defined as the change in connection state of the CRT as determined by the hardware CRT detect sequence which is enabled through bit #9 (CRT hot plug interrupt enable) or bit #3 (Force CRT detect trigger) in the Port_HotPlug_En register 0x61110. After reset, the CRT is considered unconnected even if physically connected until the first detect sequence occurs. Physically plugging or unplugging the CRT device will also be detected as a change of connection state. Writing a 1 to this bit clears it. 0 =CRT Interrupt has not occurred 1 = CRT Interrupt has occurred AccessType: One to Clear
10	0b RW/1C	**TV_HOT_PLUG_INTERRUPT_STATUS:** [DevCTG, DevBW, DevCL, DevBLC] This bit is set when a TV hot plug or unplug event has been detected. Reflects the state of bit 31 of the TV DAC state register, offset 68004-68007h. Software must write a one to these bits to clear the status. 0 =TV Interrupt has not occurred 1 = TV Interrupt has occurred AccessType: One to Clear
9:8	0b RW/1C	**RESERVED_3:** [DevVLVP] MBZ. These info are recorded in 61100h ADPA register[25:24] [DevCDV, DevCTG, DevBW, DevCL, DevBLC] CRT Hot Plug Detection Status (read only): These bits are set when a CRT hot plug or unplug event has been detected. 00 = No channels attached (default) 01 = Blue channel only is attached 10 = Green channel only is attached 11 = Both blue and green channel attached AccessType: One to Clear
7	0b RW	**RESERVED_4:** mbz
6	0b RW/1C	**DISPLAYPORT_D_AUX_INTERRUPT_STATUS:** [DevCTG] This bit is set when a transaction on AUX channel D has completed or timed out. This bit feeds into the first line interrupt status register when bit 29 of the AUX channel D control register is set. Writing a 1 to this bit clears it. 0 = AUX channel D Interrupt has not occurred 1 = AUX channel D Interrupt has occurred AccessType: One to Clear
5	0b RW/1C	**DISPLAYPORT_C_AUX_INTERRUPT_STATUS:** [DevCTG, DevCDV] This bit is set when a transaction on AUX channel C has completed or timed out. This bit feeds into the first line interrupt status register when bit 29 of the AUX channel C control register is set. Writing a 1 to this bit clears it. 0 = AUX channel C Interrupt has not occurred 1 = AUX channel C Interrupt has occurred AccessType: One to Clear
4	0b RW/1C	**DISPLAYPORT_B_AUX_INTERRUPT_STATUS:** [DevCTG, DevCDV] This bit is set when a transaction on AUX channel B has completed or timed out. This bit feeds into the first line interrupt status register when bit 29 of the AUX channel B control register is set. Writing a 1 to this bit clears it. 0 = AUX channel B Interrupt has not occurred 1 = AUX channel B Interrupt has occurred AccessType: One to Clear
3	0b RW/1C	**SDVO_C_HOT_PLUG_INTERRUPT_DETECT_STATUS:** [DevCTG, DevCDV] This reflects hot plug interrupt status on SDVO port C. Graphics software must write a one to these bits to clear the status. This bit is used for either monitor hotplug/unplug or for notification of an HDCP state change request from the audio driver over SDVO only. This bit feeds into the first line interrupt status register when bit 25 of the hotplug enable status register is set. 0 = SDVO Hot Plug event not detected 1 = SDVO Hot Plug event detected AccessType: One to Clear

Bit Range	Default & Access	Field Name (ID): Description
2	0b RW/1C	**SDVO_B_HOT_PLUG_INTERRUPT_DETECT_STATUS:** [DevCTG, DevCDV] This reflects hot plug interrupt status on SDVO port B. Graphics software must write a one to these bits to clear the status. This bit is used for either monitor hotplug/unplug or for notification of an HDCP state change request from the audio driver over SDVO only. This bit feeds into the first line interrupt status register when bit 26 of the hotplug enable status register is set. 0 = SDVO Hot Plug event not detected 1 = SDVO Hot Plug event detected AccessType: One to Clear
1	0b RW/1C	**PIPE_A_AUDIO_INTERRUPT_DETECT_STATUS:** [DevCTG, DevCDV, DevCL] This reflects a request for integrated HDCP state change set by audio driver and propagated through the audio hardware. The graphics software must write a one to this bit to clear the status. Upon clearing this bit, the audio ready bit is cleared in the audio registers. The graphics software then must reset audio ready bit 14 in the audio control register, offset 620B4h to 1 when the HDCP interrupt has been serviced. This bit feeds into the first line interrupt status register when bit 24 of the hotplug enable status register is set 0 = Audio interrupt event not detected 1 = Audio interrupt event detected AccessType: One to Clear
0	0b RW/1C	**PIPE_B_AUDIO_INTERRUPT_DETECT_STATUS:** [DevCTG, DevCDV, DevCL] This reflects a request for integrated HDCP state change set by audio driver and propagated through the audio hardware. The graphics software must write a one to this bit to clear the status. Upon clearing this bit, the audio ready bit is cleared in the audio registers. The graphics software then must reset audio ready bit 14 in the audio control register, offset 620B4h to 1 when the HDCP interrupt has been serviced. This bit feeds into the first line interrupt status register when bit 23 of the hotplug enable status register is set 0 = Audio interrupt event not detected 1 = Audio interrupt event detected AccessType: One to Clear

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**SDVO_HDMIB_ENABLE_DIGITAL_DISPLAY_PORT_B_ENABLE:** Disabling this port will put it in its lowest power state. Port enable takes place on the Vblank after being written. Both this bit and bit 6 of this register must be enabled to send audio over this port. This port must not be enabled simultaneously with DisplayPort B. [DevIBX] When disabling the port, software must temporarily enable the port with transcoder select (bit #30) cleared to 0 after disabling the port. This is workaround for hardware issue where the transcoder select set to 1 will prevent DisplayPortB from being enabled on transcoder A. [DevIBX] Software must write this bit twice when enabling the port (setting to 1) as a workaround for hardware issue that may result in first write getting masked. [DevIBX] Toggle this bit off then on at the end of mode set sequence when enabling HDMI 12-bit per color with pixel repeat 1 = Enable. This bit enables the Digital Display Port B interface for HDMI or SDVO modes. 0 = Disable and tristates the Digital Display Port B interface for HDMI or SDVO modes.
30	0b RW	**PIPE_SELECT:** This bit determines from which display pipe the source data will originate. This only applies to devices with dual display pipes. Pipe selection takes place on the Vblank after being written 0 = Pipe A 1 = Pipe B
29	0b RW	**RESERVED:** [DevCDV]: [DevCTG, DevBW, DevCL, DevBLC] Stall Select: This bit selects stall for external scaling functionality only on SDVO. Programming notes: It is only valid to have a single stall indication to a particular pipe. In cases where two ports are being driven from a single pipe, one of the ports must set this bit to 0. Only sDVOB or sDVOC can select the stall function, as only a single stall input is available between the two interfaces. Set the stall input to unused before programming the external device creating the stall. 0 = Stall input signal is unused on this port 1 = Stall input signal is used to stall the pipe attached to this port

Bit Range	Default & Access	Field Name (ID): Description
28:26	0b RW	**COLOR_FORMAT:** This field selects the number of bits per color sent to a receiver device connected to this port. Color format takes place on the Vblank after being written. Color format change must be done as a part of mode set since different color depths require different pixel clock settings. Selecting a pixel color depth higher or lower than the pixel color depth of the frame buffer results in dithering the output stream. 000 = 8 bits per color (Default, x3 mode) 001 = RESERVED for 10 bits per color 010 = RESERVED for 6 bits per color 011 = RESERVED 1xx = RESERVED
25:19	0b RW	**RESERVED_1:** Reserved.
18	0b RW	**SDVO_HDMIB_CLOCK_OUTPUT_INVERSION_TEST_MODE:** Please note that this applies to all modes and is instantly updated. 1 = sDVO/HDMIB Clock output is inverted 0 = sDVO/HDMIB Clock output is NOT inverted (DEFAULT)
17:16	0b RW	**SYMBOL_CLOCK_DUTY_CYCLE:** [DevCDV, DevCTG, DevCL] These bits control the output clock duty cycle to enable EMI mitigation on the external UDI link. 10/90 cycle has been measured to have ~13dB EMI improvement over a 50/50 duty cycle. 00 = (Default) 50/50 duty cycle: Clock output is 0000011111 01 = 10/90 duty cycle: Clock output is 0111111111 followed by 0000000001 10 = 20/80 duty cycle: Clock output is 0011111111 followed by 0000000011 11 = Reserved
15	0b RW	**RESERVED_2:** [DevCDV, DevVLVP]: [DevBW, DevCL, DevBLC] Port Lane Reversal: This bit reverses the order of the 4 lanes within the port. Port lane reversal takes place on the Vblank after being written. It is an OEM configurable feature. 0 = (Default) Not reversed 1 = Reversed
14	0b RW	**RESERVED_3:** Reserved.
13	0b RW	**RESERVED_4:** [DevCDV, DevVLVP]: [DevBW, DevCL, DevBLC] Clock Output Disable: This bit disables the clock output on the digital output port. For 8b/10b modes the clock output should be disabled. 0 = (Default) Clock output enabled 1 = Clock output disabled
12	0b RW	**RESERVED_5:** [DevCDV, DevVLVP]: [DevBW, DevCL, DevBLC, DevCDV] Scrambling enable: This bit enables scrambling for UDI-related modes using ANSI 8b/10b or TMDS encoding. It is not used with SDVO encoding. Software must set this bit appropriately when enabling the port. Scrambling is reset at the beginning of horizontal sync. 0 = Scrambling disabled (Default) 1 = Scrambling enabled
11:10	0b RW	**ENCODING:** [DevCDV, DevCTG, DevCL] These bits select among encoding types. It is set as part of the display detection process. Control codes for ANSI 8b/10b and TMDS encoding must be programmed using these bits. Please note that ANSI 8b/10b and TMDS encoding can only be enabled on one port at a time, as only one HPD pin is available for use between ports B and C. 00 = Reserved 01 = Reserved 10 = TMDS encoding ([DevCL, DevCTG, DevCDV, DevVLVP] external link and HDMI only) See the HDMI specification for control codes. In this mode, the external HPD pin is used to generate hotplug. In fixed frequency mode, start of fill and end of fill values for TMDS must be programmed using register 6114C. 11 = Reserved

Bit Range	Default & Access	Field Name (ID): Description
9	0b RW	**NULL_PACKETS_ENABLED_DURING_VSYNC:** This bit enables a null packet (32 bytes of a value of 0) to be sent when Vsync=1 on this port, required for HDMI operation. It also enables preambles and guardbands prior to the null packets, in accordance with the HDMI specification. It is only valid for modes that use TMDS encoding. 0 = Disable null infoframe packets when Vsync=1 on this port. (Default) 1 = Enable null infoframe packets when Vsync=1 on this port.
8	0b RW	**COLOR_RANGE_SELECT:** [DevCDV, DevCTG, DevCL] This bit is used to select the color range of RBG outputs in HDMI mode. It is only valid when using TMDS encoding and 8 bit per color mode. 0 = Apply full 0-255 color range to the output (Default) 1 = Apply 16-235 color range to the output
7	0b RW	**RESERVED_6:** [DevCDV]: [DevCTG, DevBW, DevCL, DevBLC] sDVOB Border Enable: This bit determines if the border data from native VGA or the timing generator is to be considered valid pixel data at the external component. 1 = Border to the sDVOB encoder is enabled. Blank# is used to generate the DE output (used in all cases except when the external scaler is used in a DVI panel, over SDVO) . 0 = Border to the sDVOB encoder is disabled. DE (Display Enable) is used
6	0b RW	**AUDIO_OUTPUT_ENABLE:** [DevCDV, DevCTG, DevCL] This bit directs audio to this port. When enabled and audio data is available, the audio data will be combined with the video data and sent over this port. The audio unit uses the status of this bit to indicate presence of the HDMI output to the audio driver. 0 = (Default) No audio output on this port 1 = Enable audio on this port
5	0b RW	**HDCP_PORT_SELECT:** [DevCDV, DevCTG, DevCL] This bit directs HDCP to this port. When enabled, the information sent on this port will be encrypted using HDCP. Please note that this bit does not enable encryption on its own, but must be used in conjunction with HDCP registers. 0 = (Default) No HDCP encryption on this port 1 = Enable HDCP on this port
4:3	11b RW	**SYNC_POLARITY:** Please note that sync polarity does not apply to ANSI coding. Indicates the polarity of Hsync and Vsync. Inverted polarity is transmitted as SYNC-BLANK-SYNC and standard polarity is transmitted as BLANK-SYNC-BLANK. For example, if Vsync is not inverted and Hsync is inverted, an Hsync period transmitted during Vsync would be transmitted as BLANK+VS+HS BLANK+VS BLANK+VS+HS. Please note that in native VGA modes, these bits have no effect. In native VGA modes, sync polarity is determined by VRshr3c2d76b[7:6], the VGA polarity bits in VGA control. 00 = VS and HS are active low (inverted) 01 = VS is active low (inverted), HS is active high 10 = VS is active high, HS is active low (inverted) 11 = (Default) VS and HS are active high
2	0b RO	**DIGITAL_PORT_B_DETECTED:** Read-only bit indicating whether a digital port B was detected during initialization. It signifies the level of the GMBUS port 4 (sDVO B/C) data line at boot. This bit is valid regardless of whether the port is enabled. 0 = Digital Port B not detected during initialization 1 = Digital Port B detected during initialization AccessType: Read Only

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**SDVO_HDMIC_ENABLE_DIGITAL_DISPLAY_PORT_C_ENABLE:** Disabling this port will put it in its lowest power state. Port enable takes place on the Vblank after being written. Both this bit and bit 6 of this register must be enabled to send audio over this port in HDMI. This port must not be enabled simultaneously with DisplayPort C. [DevIBX] When disabling the port, software must temporarily enable the port with transcoder select (bit #30) cleared to 0 after disabling the port. This is workaround for hardware issue where the transcoder select set to 1 will prevent DPC from being enabled on transcoder A. [DevIBX] Software must write this bit twice when enabling the port (setting to 1) as a workaround for hardware issue that may result in first write getting masked. [DevIBX] Toggle this bit off then on at the end of mode set sequence when enabling HDMI 12-bit per color with pixel repeat. 1 = Enable. This bit enables the Digital Display Port C interface for HDMI or DVI modes. 0 = Disable and tristates the Digital Display Port C interface for HDMI or DVI modes.
30	0b RW	**PIPE_SELECT:** This bit determines from which display pipe the source data will originate. This only applies to devices with dual display pipes. Pipe selection takes place on the Vblank after being written 0 = Pipe A 1 = Pipe B
29	0b RW	**RESERVED:** [DevCDV]: stall Select: This bit selects stall for external scaling functionality only on SDVO. Programming notes: It is only valid to have a single stall indication to a particular pipe. In cases where two ports are being driven from a single pipe, one of the ports must set this bit to 0. Only sDVOB or sDVOC can select the stall function, as only a single stall input is available between the two interfaces. Set the stall input to unused before programming the external device creating the stall. 0 = Stall input signal is unused on this port 1 = Stall input signal is used to stall the pipe attached to this port

Bit Range	Default & Access	Field Name (ID): Description
28:26	0b RW	**COLOR_FORMAT:** This field selects the number of bits per color sent to a receiver device connected to this port. Color format takes place on the Vblank after being written. Color format change must be done as a part of mode set since different color depths require different pixel clock settings. Selecting a pixel color depth higher or lower than the pixel color depth of the frame buffer results in dithering the output stream. 000 = 8 bits per color (Default) 001 = RESERVED for 10 bits per color 010 = RESERVED for 6 bits per color 011 = RESERVED 1xx = RESERVED
25:19	0b RW	**RESERVED_1:** Reserved.
18	0b RW	**SDVO_HDMIC_CLOCK_OUTPUT_INVERSION_TEST_MODE:** Please note that this applies to all modes and is instantly updated. 1 = sDVO/HDMIB Clock output is inverted 0 = sDVO/HDMIB Clock output is NOT inverted (DEFAULT)
17:16	0b RW	**SYMBOL_CLOCK_DUTY_CYCLE:** These bits control the output clock duty cycle to enable EMI mitigation on the external HDMI link. 10/90 cycle has been measured to have ~13dB EMI improvement over a 50/50 duty cycle. 00 = (Default) 50/50 duty cycle: Clock output is 0000011111 01 = 10/90 duty cycle: Clock output is 0111111111 followed by 0000000001 ([DevCL, DevCTG, DevCDV] HDMI only) 10 = 20/80 duty cycle: Clock output is 0011111111 followed by 0000000011 ([DevCL, DevCTG, DevCDV] HDMI only) 11 = Reserved
15	0b RW	**RESERVED_2:** [DevCTG, DevCDV, DevVLVP] Port Lane Reversal: This bit reverses the order of the 4 lanes within the port. Port lane reversal takes place on the Vblank after being written. It is an OEM configurable feature. 0 = (Default) Not reversed 1 = Reversed
14	0b RW	**RESERVED_3:** Reserved.
13	0b RW	**RESERVED_4:** [DevCTG, DevCDV, DevVLVP] Clock Output Disable: This bit disables the clock output on the digital output port. For 8b/10b modes the clock output should be disabled. 0 = (Default) Clock output enabled 1 = Clock output disabled ([DevCL] only)
12	0b RW	**RESERVED_5:** [DevCTG, DevCDV, DevVLVP]: Scrambling enable: This bit enables scrambling for UDI-related modes using ANSI 8b/10b or TMDS encoding. It is not used with SDVO encoding. Software must set this bit appropriately when enabling the port. Scrambling is reset at the beginning of horizontal sync. 0 Scrambling disabled (Default) 1 = Scrambling enabled ([DevCL] only)
11:10	0b RW	**ENCODING:** These bits select among encoding types. It is set as part of the display detection process. Control codes for ANSI 8b/10b and TMDS encoding must be programmed using these bits. Please note that ANSI 8b/10b and TMDS encoding can only be enabled on one port at a time, as only one HPD pin is available for use between ports B and C. 00 = Reserved 01 = Reserved 10 = TMDS encoding ([DevCL, DevCTG, DevCDV, DevVLVP] external link and HDMI only) See the HDMI specification for control codes. In this mode, the external HPD pin is used to generate hotplug. In fixed frequency mode, start of fill and end of fill values for TMDS must be programmed using register 6114C. 11 = Reserved

PANEL_POWER_ON_STATUS	REQUIRE_ASSET_STATUS	POWER_SEQUENCE_PROGRESS	POWER_CYCLE_DELAY_ACTIVE	RESERVED	INTERNAL_SEQUENCE_STATE_FOR_TEST_DEBUG

Bit Range	Default & Access	Field Name (ID): Description
31	0b RO	**PANEL_POWER_ON_STATUS:** 0 = Indicates that the panel power down sequencing has completed. A power cycle delay may be currently active. It is safe and allowed to program pipe timing and DPLL registers. If this bit is not a zero, it activates the register write protect and writes to those registers will be ignored unless the write protect key value is set in the panel sequencing control register. 1 = In conjunction with bits Power Sequence Progress field and Power Cycle Delay Active, this bit set to a one indicates that the panel is currently powered up or is currently in the power down sequence and it is unsafe to change the pipe timing and DPLL registers for the pipe that is assigned to the embedded panel output. If the embedded panel port is selected as the target for the panel control, Software is responsible for enabling the LCD display by writing a 1 to the port enable bit only after all pipe timing, DPLL registers are properly programmed, and the PLL has locked to the reference signal. This bit is cleared (set to 0) only after the panel power down sequencing is completed.

Bit Range	Default & Access	Field Name (ID): Description
30	0b RO	**REQUIRE_ASSET_STATUS:** This bit indicates the status of programming of the display PLL and the selected display port. This a power on cycle will not be allowed unless this status indicates that the required assets are programmed and ready for use. 0 = All required assets are not properly programmed. 1 = All required assets are ready for the driving of a panel. The following conditions determine that the assets are ready: 1) Display Pipe PLL Enabled and frequency locked (bit-31 of DPLL Control Register for the pipe attached to the embedded panel port). 2) Display Pipe Enabled (bit-31 of PIPECONF Pipe Configuration Register. For the pipe attached to the embedded panel port) 3) Embedded Panel Port is Programmed Enabled
29:28	0b RO	**POWER_SEQUENCE_PROGRESS:** 00 = Indicates that the panel is not in a power sequence 01 = Indicates that the panel is in a power up sequence (may include power cycle delay) 10 = Indicates that the panel is in a power down sequence 11 = Reserved
27	1b RO	**POWER_CYCLE_DELAY_ACTIVE:** Power cycle delays occur after a panel power down sequence or after a hardware reset. On reset, a power cycle delay will occur using the default value for the timing. 0 = A power cycle delay is not currently active 1 = A power cycle delay (T4) is currently active
26:4	0b RO	**RESERVED:** Reserved.

3	0b RW	**EDP_PANEL_VDD_ENABLE:** [DevCDV]: Enabling this bit enables the panel vdd if the embedded panel is DisplayPort, as indicated in bits 31:30 of the panel power on sequencing. Software must enable this bit for eDP link training. After eDP link training is done, software must disable it and let the normal panel power sequencing to take control. 0 = eDP panel Vdd disabled 1 = eDP panel Vdd enabled [DevCLN] Reserved
2	0b RW	**BACKLIGHT_ENABLE:** [DevCTG, DevCDV]: Enabling this bit enables the panel backlight if the embedded panel is DisplayPort, as indicated in bits 31:30 of the panel power on sequencing. Software must enable this bit after training the link, and disable it when disabling the panel power state target. 0 = Backlight disabled 1 = Backlight enabled [DevCL] Reserved

Bit Range	Default & Access	Field Name (ID): Description
1	0b RW	**POWER_DOWN_ON_RESET:** Enabling this bit causes the panel to power down when a reset warning comes to the GMCH from the ICH. When system reset is initiated, the embedded panel port automatically begins the panel power down sequence. If the panel is not on during a reset event, this bit is ignored. 0 = Do not run panel power down sequence when reset is detected 1 = Run panel power down sequence when system is reset
0	0b RW	**POWER_STATE_TARGET:** Writing this bit can occur any time, it will only be used at the completion of any current power cycle. 0 = The panel power state target is off, if the panel is either on or in a power on sequence, a power off sequence is started as soon as the panel reaches the power on state. This may include a power cycle delay. If the panel is currently off, there is no change of the power state or sequencing done. 1= The panel power state target is on, if the panel is in either the off state or a power off sequence, if all pre-conditions are met, a power on sequence is started as soon as the panel reaches the power off state. This may include a power cycle delay. If the panel is currently off, there is no change of the power state or sequencing done. While the panel is on or in a power on sequence, the register write lock will be enabled.

REFERENCE_DIVIDER | RESERVED | POWER_CYCLE_DELAY

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000000010011100001111b RW	**REFERENCE_DIVIDER:** This field provides the value of the divider used for the creation of the panel timer reference clock. The output of the divider is used as the fastest of the three time bases (100us) for all other timers. The other time bases are divided from this frequency. The value of zero should not be used. When it is desired to divide by N, the actual value to be programmed is (N/2)-1. The value should be (100*RefinMHz/2)-1. The default value assumes the default value for the display core clock that is for [DevCL and DevCTG] a 200MHz reference value. The following are examples for other memory speeds. Display Core Frequency Value of Field 233MHz 2D81h 200MHz 270Fh 133MHz 19F9h
7:5	0b RW	**RESERVED:** Reserved.
4:0	00100b RW	**POWER_CYCLE_DELAY:** Programmable value of time panel must remain in a powered down state after powering down. For devices coming out of reset, the default values will define how much time must pass before a power on sequence can be started. This field uses the .1 S time base unit from the divider. If the panel power on sequence is attempted during this delay, the power on sequence will commence once the power cycle delay is complete. Writing a value of 0 selects no delay or is used to abort the delay if it is active. During the initial power up reset, a D3 cold power cycle, or a user instigated system reset, the timer will be set to the default value and the count down will begin after the de-assertion of reset. Writing this field to a zero while the count is active will abort this portion of the sequence. This corresponds to the T4 of the SPWG specification. Note: Even if the panel is not enabled, the T4 count happens after reset. This register needs to be programmed to a +1 value. For instance for meeting the SPWG specification of 400mS, program 5 to achieve at least 400mS delay prior to powerup.

PWM_ENABLE	RESERVED__MBZ	RESERVED_	BACKLIGHT_POLARITY	RESERVED	PHASE_IN_INTERRUPT_STATUS	PHASE_IN_ENABLE	PHASE_IN_INTERRUPT_ENABLE	PHASE_IN_TIME_BASE								PHASE_IN_COUNT								PHASE_IN_INCREMENT							

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**PWM_ENABLE:** This bit enables the PWM counter logic 0 = PWM disabled (drives 0 always) 1 = PWM enabled
30	0b RW	**RESERVED__MBZ:** Reserved.
29	0b RW	**RESERVED_:** Reserved.
28	0b RW	**BACKLIGHT_POLARITY:** This field controls the polarity of the PWM signal. 0 = Active High 1 = Active Low
27	0b RW	**RESERVED:** MBZ
26	0b RW/1C	**PHASE_IN_INTERRUPT_STATUS:** This bit will be set by hardware when a Phase-In interrupt has occurred. Software will clear this bit by writing a 1 , which will reset the interrupt generation. [DevCL-A,B] Reserved AccessType: One to Clear
25	0b RW	**PHASE_IN_ENABLE:** Setting this bit enables a PWM phase in based on the programming of the Phase In registers below. This bit clears itself when the phase in is completed.

Bit Range	Default & Access	Field Name (ID): Description
24	0b RW	**PHASE_IN_INTERRUPT_ENABLE:** Setting this bit enables an interrupt to be generated when the PWM phase in is completed.
23:16	0b RW	**PHASE_IN_TIME_BASE:** This field determines the number of VBLANK events that pass before one increment occurs. 0 = invalid 1 = 1 vblank 2 = 2 vblanks etc.
15:8	0b RW	**PHASE_IN_COUNT:** This field determines the number of increment events in this phase in. Writes to this register should only occur when hardware-phase-ins are disabled. Reads to this register can occur any time, where the value in this field indicates the number of increment events remaining to fully apply a phase-in request as hardware automatically decrements this value. A value of 0 is invalid. In order to write the same value to this field for the second time, one must write a dummy value to this field, for example, 0 , before writing the real value for the second time.
7:0	0b RW	**PHASE_IN_INCREMENT:** This field indicates the amount to adjust the PWM duty cycle register on each increment event. This is a two s complement number.

31	0b RO	**PANEL_POWER_ON_STATUS:** 0 = Indicates that the panel power down sequencing has completed. A power cycle delay may be currently active. It is safe and allowed to program pipe timing and DPLL registers. If this bit is not a zero, it activates the register write protect and writes to those registers will be ignored unless the write protect key value is set in the panel sequencing control register. 1 = In conjunction with bits Power Sequence Progress field and Power Cycle Delay Active, this bit set to a one indicates that the panel is currently powered up or is currently in the power down sequence and it is unsafe to change the pipe timing and DPLL registers for the pipe that is assigned to the embedded panel output. If the embedded panel port is selected as the target for the panel control, Software is responsible for enabling the LCD display by writing a 1 to the port enable bit only after all pipe timing, DPLL registers are properly programmed, and the PLL has locked to the reference signal. This bit is cleared (set to 0) only after the panel power down sequencing is completed.
30	0b RO	**REQUIRE_ASSET_STATUS:** This bit indicates the status of programming of the display PLL and the selected display port. This a power on cycle will not be allowed unless this status indicates that the required assets are programmed and ready for use. 0 = All required assets are not properly programmed. 1 = All required assets are ready for the driving of a panel. The following conditions determine that the assets are ready: 1) Display Pipe PLL Enabled and frequency locked (bit-31 of DPLL Control Register for the pipe attached to the embedded panel port). 2) Display Pipe Enabled (bit-31 of PIPECONF Pipe Configuration Register. For the pipe attached to the embedded panel port) 3) Embedded Panel Port is Programmed Enabled
29:28	0b RO	**POWER_SEQUENCE_PROGRESS:** 00 = Indicates that the panel is not in a power sequence 01 = Indicates that the panel is in a power up sequence (may include power cycle delay) 10 = Indicates that the panel is in a power down sequence 11 = Reserved
27	1b RO	**POWER_CYCLE_DELAY_ACTIVE:** Power cycle delays occur after a panel power down sequence or after a hardware reset. On reset, a power cycle delay will occur using the default value for the timing. 0 = A power cycle delay is not currently active 1 = A power cycle delay (T4) is currently active

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 61304h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

Bits	31:16	15:4	3	2	1	0
Default	0000000000000000	000000000000	0	0	0	0
Field	WRITE_PROTECT_KEY	RESERVED	EDP_PANEL_VDD_ENABLE	BACKLIGHT_ENABLE	POWER_DOWN_ON_RESET	POWER_STATE_TARGET

Bit Range	Default & Access	Field Name (ID): Description
31:16	0b RW	**WRITE_PROTECT_KEY:** ABCD Write protect off When this field is programmed to anything except the write protect off setting and the panel is either powered up or in the process of a power up sequence, a set of registers involved in generation of panel timing or control become write protected. Any write cycles to those write protected registers, while they will complete as normal, will not change the value of the register when write protected. When this register field contains the write protect off key value, write protect will be unconditionally disabled. In situations where the embedded panel port is unused, the port should remain powered down and the write protect will be inactive. This field in normal operation should be left to all zeros and never programmed with the key value. It exists only to allow testing and workarounds. List of Write protected registers: (Panel sequencing Registers): Pipe B Panel power on sequencing delays - Address: 61308-6130Bh Pipe B Panel power off sequencing delays Address: 6130Ch 6130Fh Pipe B Panel power cycle delay and Reference Divisor Address: 61310h 61313 (DPLL registers): DPLL Control Registers FPA0 DPLL Divisor Register FPA1 DPLL Divisor Register 1 FPB0 DPLL Divisor Register FPB1 DPLL Divisor Register 1 (Display Pipe timing registers except source size) HTOTAL Horizontal Total Register HBLANK Horizontal Blank Register HSYNC_ Horizontal Sync Register VTOTAL_ Vertical Total Register VBLANK_ Vertical Blank Register VSYNC_ Vertical Sync Register
15:4	0b RW	**RESERVED:** Reserved.
3	0b RW	**EDP_PANEL_VDD_ENABLE:** [DevCDV]: Enabling this bit enables the panel vdd if the embedded panel is DisplayPort, as indicated in bits 31:30 of the panel power on sequencing. Software must enable this bit for eDP link training. After eDP link training is done, software must disable it and let the normal panel power sequencing to take control. 0 = eDP panel Vdd disabled 1 = eDP panel Vdd enabled [DevCLN] Reserved
2	0b RW	**BACKLIGHT_ENABLE:** [DevCTG, DevCDV]: Enabling this bit enables the panel backlight if the embedded panel is DisplayPort, as indicated in bits 31:30 of the panel power on sequencing. Software must enable this bit after training the link, and disable it when disabling the panel power state target. 0 = Backlight disabled 1 = Backlight enabled [DevCL] Reserved
1	0b RW	**POWER_DOWN_ON_RESET:** Enabling this bit causes the panel to power down when a reset warning comes to the GMCH from the ICH. When system reset is initiated, the embedded panel port automatically begins the panel power down sequence. If the panel is not on during a reset event, this bit is ignored. 0 = Do not run panel power down sequence when reset is detected 1 = Run panel power down sequence when system is reset
0	0b RW	**POWER_STATE_TARGET:** Writing this bit can occur any time, it will only be used at the completion of any current power cycle. 0 = The panel power state target is off, if the panel is either on or in a power on sequence, a power off sequence is started as soon as the panel reaches the power on state. This may include a power cycle delay. If the panel is currently off, there is no change of the power state or sequencing done. 1= The panel power state target is on, if the panel is in either the off state or a power off sequence, if all pre-conditions are met, a power on sequence is started as soon as the panel reaches the power off state. This may include a power cycle delay. If the panel is currently off, there is no change of the power state or sequencing done. While the panel is on or in a power on sequence, the register write lock will be enabled.

0	0	0	0	0	0	0	0	0	0	1	0	0	1	1	1	0	0	0	0	1	1	1	1	0	0	0	0	0	1	0	0

Bits 31:8	Bits 7:5	Bits 4:0
REFERENCE_DIVIDER	RESERVED	POWER_CYCLE_DELAY

Bit Range	Default & Access	Field Name (ID): Description
31:8	000000000010011100001111b RW	**REFERENCE_DIVIDER:** This field provides the value of the divider used for the creation of the panel timer reference clock. The output of the divider is used as the fastest of the three time bases (100us) for all other timers. The other time bases are divided from this frequency. The value of zero should not be used. When it is desired to divide by N, the actual value to be programmed is (N/2)-1. The value should be (100*RefinMHz/2)-1. The default value assumes the default value for the display core clock that is for [DevCL and DevCTG] a 200MHz reference value. The following are examples for other memory speeds. Display Core Frequency Value of Field 233MHz 2D81h 200MHz 270Fh 133MHz 19F9h
7:5	0b RW	**RESERVED:** Reserved.
4:0	00100b RW	**POWER_CYCLE_DELAY:** Programmable value of time panel must remain in a powered down state after powering down. For devices coming out of reset, the default values will define how much time must pass before a power on sequence can be started. This field uses the .1 S time base unit from the divider. If the panel power on sequence is attempted during this delay, the power on sequence will commence once the power cycle delay is complete. Writing a value of 0 selects no delay or is used to abort the delay if it is active. During the initial power up reset, a D3 cold power cycle, or a user instigated system reset, the timer will be set to the default value and the count down will begin after the de-assertion of reset. Writing this field to a zero while the count is active will abort this portion of the sequence. This corresponds to the T4 of the SPWG specification. Note: Even if the panel is not enabled, the T4 count happens after reset. This register needs to be programmed to a +1 value. For instance for meeting the SPWG specification of 400mS, program 5 to achieve at least 400mS delay prior to powerup.

PWM_ENABLE	RESERVED	RESERVED_1	BACKLIGHT_POLARITY	RESERVED_2	PHASE_IN_INTERRUPT_STATUS	PHASE_IN_ENABLE	PHASE_IN_INTERRUPT_ENABLE	PHASE_IN_TIME_BASE	PHASE_IN_COUNT	PHASE_IN_INCREMENT

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**PWM_ENABLE:** This bit enables the PWM counter logic 0 = PWM disabled (drives 0 always) 1 = PWM enabled
30	0b RW	**RESERVED:** MBZ
29	0b RW	**RESERVED_1:** Reserved.
28	0b RW	**BACKLIGHT_POLARITY:** This field controls the polarity of the PWM signal. 0 = Active High 1 = Active Low
27	0b RW	**RESERVED_2:** MBZ
26	0b RW/1C	**PHASE_IN_INTERRUPT_STATUS:** This bit will be set by hardware when a Phase-In interrupt has occurred. Software will clear this bit by writing a 1 , which will reset the interrupt generation. [DevCL-A,B] Reserved AccessType: One to Clear
25	0b RW	**PHASE_IN_ENABLE:** Setting this bit enables a PWM phase in based on the programming of the Phase In registers below. This bit clears itself when the phase in is completed.
24	0b RW	**PHASE_IN_INTERRUPT_ENABLE:** Setting this bit enables an interrupt to be generated when the PWM phase in is completed.

Bit Range	Default & Access	Field Name (ID): Description
23:16	0b RW	**PHASE_IN_TIME_BASE:** This field determines the number of VBLANK events that pass before one increment occurs. 0 = invalid 1 = 1 vblank 2 = 2 vblanks etc.
15:8	0b RW	**PHASE_IN_COUNT:** This field determines the number of increment events in this phase in. Writes to this register should only occur when hardware-phase-ins are disabled. Reads to this register can occur any time, where the value in this field indicates the number of increment events remaining to fully apply a phase-in request as hardware automatically decrements this value. A value of 0 is invalid. In order to write the same value to this field for the second time, one must write a dummy value to this field, for example, 0 , before writing the real value for the second time.
7:0	0b RW	**PHASE_IN_INCREMENT:** This field indicates the amount to adjust the PWM duty cycle register on each increment event. This is a two s complement number.

Bit Range	Default & Access	Field Name (ID): Description
29	0b RW	**N_VALUE_INDEX:** Project: All Default Value: 0b Value Name Description Project 0b HDMI N value read on bits 27:20 and 15:4 reflects HDMI N value. Bits 27:20 and 15:4 are is programmable to any N value - default h7FA6. All 1b DP N value read on bits 27:20 and 15:4 reflects DP N value. Set this bit to 1 before programming N value register. When this is set to 1, 27:20 and 15:4 will reflect the current N value default h8000. All
28	0b RW	**N_PROGRAMMING_ENABLE_TESTMODE:** Project: All Security: Test This bit enables programming of N values for non-CEA modes. Please note that the Pipe to which audio is attached must be disabled when changing this field.
27:20	0b RW	**UPPER_N_VALUE_TESTMODE:** Project: All Security: Test These are bits [19:12] of programmable N values for non-CEA modes. Bit 25 of this register must also be written in order to enable programming. Please note that the Pipe to which audio is attached must be disabled when changing this field. This register can also be used to program N value for DP for a specific Port. Default value on this register when bit 29 is set to 1 is h7FA6
19:16	0b RW	**PIXEL_CLOCK_HDMI:** Project: All Default Value: 0b This is the target frequency of the CEA/HDMI video mdoe to which the audio stream is added. This value is used for generating N_CTS packets. This refers to only HDMI Pixel clock and does not refer to DP Link clock. DP Link clock does not require this programming. Note: The Pipe on which audio is attached must be disabled when changing this field. Value Name Description Project 0000b 25.2 / 1.001 MHz 25.2 / 1.001 MHz All 0001b 25.2 MHz 25.2 MHz Program this value for pixel clocks not listed in this field All 0010b 27 MHz 27 MHz All 0011b 27 * 1.001 MHz 27 * 1.001 MHz All 0100b 54 MHz 54 MHz All 0101b 54 * 1.001 MHz 54 * 1.001 MHz All 0110b 74.25 / 1.001 MHz 74.25 / 1.001 MHz All 0111b 74.25 MHz 74.25 MHz All 1000b 148.5 / 1.001 MHz 148.5 / 1.001 MHz All 1001b 148.5 MHz 148.5 MHz All Others Reserved Reserved All
15:4	0b RW	**LOWER_N_VALUE_TESTMODE:** Project: All Security: Test These are bits [11:0] of programmable N values for non-CEA modes. Bit 25 of this register must also be written in order to enable programming. Please note that the Pipe to which audio is attached must be disabled when changing this field. This register can also be used to program N value for DP for a specific Port. Default value on this register when bit 29 is set to 1 is h7FA6
3	0b RW	**DISABLE_NCTS:** Project: All Set this bit to disable N and CTS or M generation for CTM modes. This is to enable prediction of CRC in CTM modes.
2:0	0b RW	**RESERVED_1:** Project: All Format:

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**RESERVED:** Project: All Format: MBZ
30:29	0b RO	**DIP_PORT_SELECT:** Project: All AccessType: Read Only Default Value: 00b This read-only bit reflects which port is used to transmit the DIP data. This can only change when DIP is disabled. If one or more audio-related DIP packets is enabled and audio is enabled on a digital port, these bits will reflect the digital port to which audio is directed. Value Name Description Project 00b Reserved Reserved All 01b Digital Port B Digital Port B All 10b Digital Port C Digital Port C All 11b Digital Port D Digital Port D All
28:25	0b RW	**RESERVED_1:** Project: All Format: MBZ
24:21	0b RO	**DIP_TYPE_ENABLE_STATUS:** Project: All AccessType: Read Only Default Value: 0000b These bits reflect the DIP types enabled. It can be updated while the port is enabled. Within 2 vblank periods, the DIP is guaranteed to have been transmitted. Disabling a DIP type results in setting the contents of that DIP buffer to zero. A reserved setting reflects a disabled DIP. Value Name Description Project XXX0b Disable Audio DIP disabled All XXX1b Enable Audio DIP enabled All XX0Xb Disable Generic 1 (ACP) DIP disabled All XX1Xb Enable Generic 1 (ACP) DIP enabled All X0XXb Disable Generic 2 DIP disabled All X1XXb Enable Generic 2 DIP enabled, can be used by ISRC1 or ISRC2 All 1XXXb Reserved Reserved All
20:18	0b RW	**DIP_BUFFER_INDEX:** Project: All Default Value: 0000b This field is used during read of different DIPs, and during read or write of ELD data. These bits are used as an index to their respective DIP or ELD buffers. When the index is not valid, the contents of the DIP will return all 0s. Value Name Description Project 000b Audio Audio DIP (31 bytes of address space, 31 bytes of data) All 001b Gen 1 Generic 1 (ACP) Data Island Packet (31 bytes of address space, 31 bytes of data) All 010b Gen 2 Generic 2 (ISRC1) Data Island Packet (31 bytes of address space, 31 bytes of data) All 011b Gen 3 Generic 3 (ISRC2) Data Island Packet (31 bytes of address space, 31 bytes of data) All 1XXb Reserved Reserved All
17:16	0b RO	**DIP_TRANSMISSION_FREQUENCY:** Project: All AccessType: Read Only Default Value: 00b These bits reflect the frequency of DIP transmission for the DIP buffer type designated in bits 20:18. When writing DIP data, this value is also latched when the first DW of the DIP is written. When read, this value reflects the DIP transmission frequency for the DIP buffer designated in bits 20:18. Value Name Description Project 00b Disable Disabled All 01b Reserved Reserved All 10b Send Once Send Once All 11b Best Effort Best effort (Send at least every other vsync) All
15	0b RW	**RESERVED_2:** Project: All Format: MBZ
14:10	10101b RO	**ELD_BUFFER_SIZE:** Project: All AccessType: Read only 10101 = This field reflects the size of the ELD buffer in DWORDs (84 Bytes of ELD)

Bit Range	Default & Access	Field Name (ID): Description
9:5	0b RW	**ELD_ACCESS_ADDRESS:** Project: All Selects the DWORD address for access to the ELD buffer (84 bytes). The value wraps back to zero when incremented past the max addressing value 0x1F. This field change takes effect immediately after being written. The read value indicates the current access address.
4	0b RO	**ELD_ACK:** Project: All AccessType: Read Only Acknowledgement from the audio driver that ELD read has been completed
3:0	0b RO	**DIP_RAM_ACCESS_ADDRESS:** Project: All AccessType: Read Only Selects the DWORD address for access to the DIP buffers. The value wraps back to zero when it incremented past the max addressing value of 0xF. This field change takes effect immediately after being written. The read value indicates the current access address.

14.11.80 AUD_CNTL_ST2—Offset 620C0h

Audio Control State 2

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 620C0h

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**DISPLAYPORT_B_ENABLE:** Disabling this port will put it in its lowest power state. Port enable takes place on the Vblank after being written. 1 = Enable. This bit enables the Display Port B interface. 0 = Disable and tristates the Display Port B interface.
30	0b RW	**PIPE_SELECT:** This bit determines from which display pipe the source data will originate. Pipe selection takes place on the Vblank after being written 0 = Pipe A 1 = Pipe B
29:28	0b RW	**LINK_TRAINING_PATTERN_ENABLE:** These bits are used for link initialization as defined in the DisplayPort specification. Please note that the link must first be configured prior to sending training patterns. 00 Pattern 1 enabled: Repetition of D10.2 characters Default. 01 Pattern 2 enabled: Repetition of K28.5, D11.6, K28.5, D11.6, D10.2, D10.2, D10.2, D10.2, D10.2, D10.2. Please note that the entire pattern must complete before another pattern is sent. Scrambling initialization and disparity init commence at the end of the last iteration of pattern 2. 10 Idle Pattern enabled: Transmit BS followed by VB-ID with NoVideoStream_flag set to 1, five times 11 Link not in training: Send normal pixels
27:25	0b RW	**RESERVED:** [DevCDV]: Voltage swing level set: [DevCTG]: These bits are used for setting the voltage swing for pattern 1, defined as Vdiff_pp in the DisplayPort specification. They mirror registers in the PCI express configuration (At CDV moved to register at the DPIO) 000 0.4V (DEFAULT) 001 0.6V 010 0.8V 011 1.2V RESERVED 1xx RESERVED
24:22	0b RW	**RESERVED_1:** [DevCDV]: Pre-emphasis level set [DevCTG]: These bits are used for setting link pre-emphasis for pattern 2, as defined in the DisplayPort specification. They mirror registers in the PCI express configuration. At CDV this field move to register in the DPIO. 000 no pre-emphasis (default) 001 3.5dB pre-emphasis (1.5x) 010 6dB pre-emphasis (2x) 011 9.5dB pre-emphasis (3x) RESERVED 1xx RESERVED

Bit Range	Default & Access	Field Name (ID): Description
21:19	0b RW	**PORT_WIDTH_SELECTION:** This bit selects the number of lanes to be enabled on the DisplayPort link. Port width selection takes place on the Vblank after being written. Port width change must be done as a part of mode set. 000 = x1 Mode (Default) 001 = x2 Mode. 010 = RESERVED 011 = x4 Mode. 1xx = RESERVED
18	0b RW	**ENHANCED_FRAMING_ENABLE:** This bit selects enhanced framing. It must be set when HDCP will be used invoked. 0 (Default) Enhanced framing disabled 1 Enhanced framing enabled. Locked once port is enabled. Updates when the port is disabled then re-enabled
17:16	0b RW	**RESERVED_2:** MBZ
15	0b RW	**RESERVED_3:** [DevCDV]: Port reversal [DevCTG]: Locked once port is enabled. Updates when the port is disabled then re-enabled
14:9	0b RW	**RESERVED_4:** MBZ
8	0b RW	**ASR_ENABLE:** [DevVLV2]: this bit enables the Alternate Scrammbler Reset capability for eDP port to use alternate scrambler reset value of FFFEh 1 - ASR enable 0 ASR disable
7	0b RW	**SCRAMBLING_DISABLE:** [DevCTG, B-step only, DevCDV]: This bit disables scrambling for this port. 0 = Scrambling enabled (Default) 1 = Scrambling disabled, no SR after initialization at loop 2 of training
6	0b RW	**AUDIO_OUTPUT_ENABLE:** This bit enables audio on this output port. It may be enabled or disabled only when the link training is complete and set to Normal 0 = Audio output disabled 1 = Audio output enabled
5	0b RW	**HDCP_PORT_SELECT:** This bit directs HDCP to this port. When enabled, the information sent on this port will be encrypted using HDCP. Please note that this bit does not enable encryption on its own, but must be used in conjunction with HDCP registers. 0 = (Default) No HDCP encryption on this port 1 = Enable HDCP on this port
4:3	11b RW	**SYNC_POLARITY:** Indicates the polarity of Hsync and Vsync. Please note that in native VGA modes, these bits have no effect. In native VGA modes, sync polarity is determined by VRshr3c2d76b[7:6], the VGA polarity bits in VGA control. 00 = VS and HS are active low (inverted) 01 = VS is active low (inverted), HS is active high 10 = VS is active high, HS is active low (inverted) 11 = (Default) VS and HS are active high
2	0b RO	**DIGITAL_DISPLAY_B_DETECTED:** Read-only bit indicating whether a digital display was detected during initialization. It signifies the level of the GMBUS port 4 (port B) data line at boot. 0 = digital display not detected during initialization (Default) 1 = digital display detected during initialization AccessType: Read Only
1	0b RW	**RESERVED_5:** MBZ
0	0b RW	**DISABLE_FRAMESTART_STALL:** This bit, when set, will disable the framestart window to stall DP AV mixer from sending audio samples before framestart. This applies to BOTH pipes. 0 = Enable framestart window to stall audio samples. (default) 1 = Disable framestart window to stall audio samples.

14.11.116 DPB_AUX_CH_CTL—Offset 64110h

Display Port B AUX Channel Control [DevCDV] AuxB control (dprrega_b0.v auxb_ctl_rdback)

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 64110h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00050000h

Bits	31	30	29	28	27:26	25	24:20	19:16	15	14	13	12	11	10:0
Default	0	0	0	0	0 0	0	0 0 0 0 0	0 1 0 1	0	0	0	0	0	0 0 0 0 0 0 0 0 0 0 0
Field	SEND_BUSY	DONE	INTERRUPT_ON_DONE	TIME_OUT_ERROR	TIME_OUT_TIMER_VALUE	RECEIVE_ERROR	MESSAGE_SIZE	PRECHARGE_TIME	AUX_AKSV_BUFFER_SELECT	INVERT_MANCHESTER_TEST_MODE	SYNC_ONLY_CLOCK_RECOVERY_TEST_MODE	DISABLE_DE_GLITCH_TEST_MODE	DOUBLE_PRECHARGE_TEST_MODE	_2X_BIT_CLOCK_DIVIDER

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**SEND_BUSY:** Setting this bit to a one initiates the transaction, when read this bit will be a 1 until the transmission completes. The transaction is completed when the response is received or when a timeout occurs. Do not write a 1 again until transaction completes. Writes of 0 will be ignored.
30	0b RW/1C	**DONE:** A sticky bit that indicates the transaction has completed. SW must write a 1 to this bit to clear the event. AccessType: One to Clear
29	0b RW	**INTERRUPT_ON_DONE:** Enable an interrupt in the hotplug status register when the transaction completes or times out.
28	0b RW/1C	**TIME_OUT_ERROR:** A sticky bit that indicates the transaction has timed out. SW must write a 1 to this bit to clear the event. AccessType: One to Clear
27:26	0b RW	**TIME_OUT_TIMER_VALUE:** 00: 400us (default) 01: 600us 10: 800us 11: 1600us The time count depends on the 2X bit clock divider (bits 10:0) being programmed for 2MHz.
25	0b RW/1C	**RECEIVE_ERROR:** A sticky bit that indicates that the data received was corrupted, not in multiples of a full byte, or more than 20 bytes. SW must write a 1 to this bit to clear the event. AccessType: One to Clear

Bit Range	Default & Access	Field Name (ID): Description
24:20	0b RW	**MESSAGE_SIZE:** This field is used to indicate the total number bytes to transmit (including the header). It also indicates the number of bytes received in a transaction (including the header). This field is valid only only when the done bit is set and timeout or receive error has not occurred. Sync/Stop are not part of the message or the message size. Reads of this field will give the response message size. The read value will not be valid while Busy bit 31 is asserted. Message sizes of 0 or)20 are not allowed.
19:16	0101b RW	**PRECHARGE_TIME:** Used to determine the precharge time for the Aux Channel drivers. The value is the number of microseconds times 2. This depends on the 2X bit clock divider (bits 10:0) being programmed for 2MHz. Default is 5 decimal which gives 10us of precharge. Example: For 12us precharge, program 6 (12us/2us).
15	0b RW	**AUX_AKSV_BUFFER_SELECT:** This bit selects whether some of the data to be written over Display Port AUX comes from the Aksv buffer for HDCP authentication, or all from the AUX Data registers. Set this bit before initiating a transaction to write Aksv to the Display Port sink. All AUX protocol must be followed and Message Size set to 9 bytes. The first DWord transmitted will be from the AUX Data Register 1 for the header, then the DP_AUX_CH_AKSV_HI, then the last byte from DP_AUX_CH_AKSV_LO. The sink response is read back as usual from the AUX Data registers. More than one AUX channel can select to use the Aksv buffer simultaneously. 0 (Default) Use AUX Data registers for regular data transmission 1 Use Aksv Buffer for part of the data transmission.
14	0b RW	**INVERT_MANCHESTER_TEST_MODE:** 1 = Manchester code rising edge mid-clk signifies one (test mode) 0 = Manchester code rising edge mid-clk signifies zero (default)
13	0b RW	**SYNC_ONLY_CLOCK_RECOVERY_TEST_MODE:** 1 = Only recover clock during sync pattern (test mode) 0 = Recover clock during sync pattern and data phase (default)
12	0b RW	**DISABLE_DE_GLITCH_TEST_MODE:** 1 = Disable serial input de-glitch logic (test mode) 0 = Enable serial input de-glitch logic (default)
11	0b RW	**DOUBLE_PRECHARGE_TEST_MODE:** 1 = Precharge time is doubled 0 = Precharge time is as programmed
10:0	0b RW	**_2X_BIT_CLOCK_DIVIDER:** Used to determine the 2X bit clock the Aux Channel logic runs on. This value divides the input clock frequency down to 2X bit clock rate. The 2X bit clock rate is ideally 2MHz (0.5us). [DevCTG-A] the input clock is cdclk. [DevCTG-B, DevCDV] the input clock is hrawclk (200MHz) Example: For 300MHz input clock and desired 2MHz 2X bit clock, program 150 (300MHz/2MHz).

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**DPB_AUX_BUFFER_LOOPBACK_TEST_ENABLE:** Project: All Default Value: 0b Enables test for the DPB-AUX I/O buffer. A 16 cycle clock pattern is output to the I/O buffer and compared against the looped back buffer output. The input clock is cdclk. With input clock at 512MHz the pattern will bea 1 MHz clock. It scales down with lower clock frequencies. The result is found in DP-AUX Buffer Loopback Test Result after DP-AUX Buffer Loopback Test Done is set. Clear this bit to 0 after test is done to return DP-AUX to normal operation. Loopback Test can be run simultaneously on all AUX buffers. Do not enable DP-AUX Buffer Loopback Test and DP-AUX Full Test simultaneously. Value Name Description Project 0b Disable Test disabled All 1b Enable Enable test. All
30	0b RO	**DPB_AUX_BUFFER_LOOPBACK_TEST_DONE:** Project: All Default Value: 0b AccessType: Read Only DPB-AUX Buffer Loopback Test has been run and completed. This is not the done for the DP-AUX Full Test. Value Name Description Project 0b Not Done Test not done. DP-AUX Buffer Loopback Test Result is not valid All 1b Done Test done. DP-AUX Buffer Loopback Test Result is now valid All

Bit Range	Default & Access	Field Name (ID): Description
29	0b RO	**DPB_AUX_BUFFER_LOOPBACK_TEST_RESULT:** Project: All Default Value: 0b AccessType: Read Only Result of the DPB-AUX Buffer Loopback Test. Value is only valid after a DP-AUX Loopback Test Done is 1. This is not the result of the DP-AUX Full Test. Value Name Description Project 0b Pass Pass All 1b Fail All
28	0b RW	**DPB_AUX_FULL_TEST_ENABLE:** Project: All Default Value: 0b Enables test for the DPB-AUX core logic transmit and receive functions through the DPB-AUX and DPC-AUX buffers. DPB-AUX and DPC-AUX are interconnected through I/O buffer loopbacks. DPB-AUX is programmed as source to output a 20 byte test pattern. DPC-AUX is programmed as sink to receive the test pattern and reply with a different 20 byte test pattern. Test pattern 1 = 0xA55CC33E E770080C 0E0F0F8F CFEFF81C 3E77E3C8 Test pattern 2 = 0X183C7EE7 C381FF7F 3F1F0F07 030100EE 77CC33A5 Programming sequence: 1. Set DPB-AUX Full Test Enable to 1. 2. Program DPB_AUX_CH_DATA[1-5] with test pattern 1 to transmit as the source. 3. Program DPC_AUX_CH_DATA[1-5] with test pattern 2 to reply with as the sink. 4. Program all DPC_AUX_CH_CTL fields and set Send to 1. 5. Program all DPB_AUX_CH_CTL fields and set Send to 1. Then the test will start. Results checking sequence: 1. Poll DPB_AUX_CH_CTL for Done. To pass, Done must be set within 500us. 2. Read DPB_AUX_CH_CTL register. To pass, Timeout Error and Receive Error must be 0. 3. Read DPC_AUX_CH_CTL register. To pass, Receive Error must be 0. 4. Read DPB_AUX_CH_DATA[1-5] registers. To pass, they must contain test pattern 2. 5. Read DPC_AUX_CH_DATA[1-5] registers. To pass, they must contain test pattern 1. Clear this bit to 0 after test is done to return DP-AUX to normal operation. Test must be repeated with and without lane reversal to verify DPB-AUX buffer combinations. Only enable one DP-AUX Full Test at a time. To abort a test in progress, write the AUX_CH_CTL Send bits to 0 and Full Test Enable to 0. Value Name Description Project 0b Disable Test disabled All 1b Enable Enable test All

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**DISPLAYPORT_C_ENABLE:** Disabling this port will put it in its lowest power state. Port enable takes place on the Vblank after being written. Both this bit and bit 6 of this register must be enabled to send audio over this port. 1 = Enable. This bit enables the Display Port C interface. 0 = Disable and tristates the Display Port C interface.
30	0b RW	**PIPE_SELECT:** This bit determines from which display pipe the source data will originate. Pipe selection takes place on the Vblank after being written 0 = Pipe A 1 = Pipe B

Bit Range	Default & Access	Field Name (ID): Description
29:28	0b RW	**LINK_TRAINING_PATTERN_ENABLE:** These bits are used for link initialization as defined in the DisplayPort specification. Please note that the link must first be configured prior to sending training patterns. 00 Pattern 1 enabled: Repetition of D10.2 characters Default. 01 Pattern 2 enabled: Repetition of K28.5, D11.6, K28.5, D11.6, D10.2, D10.2, D10.2, D10.2, D10.2, D10.2. Please note that the entire pattern must complete before another pattern is sent. Scrambling initialization and disparity init commence at the end of the last iteration of pattern 2. 10 Idle Pattern enabled: Transmit BS followed by VB-ID with NoVideoStream_flag set to 1, five times 11 Link not in training: Send normal pixels
27:25	0b RW	**RESERVED:** [DevCDV]: Voltage swing level set [DevCTG]: These bits are used for setting the voltage swing for pattern 1, defined as Vdiff_pp in the DisplayPort specification. They mirror registers in the PCI express configuration. 000 0.4V (DEFAULT) 001 0.6V 010 0.8V 011 1.2V RESERVED 1xx RESERVED
24:22	0b RW	**RESERVED_1:** [DevCDV]: Pre-emphasis level set [DevCTG]: These bits are used for setting link pre-emphasis for pattern 2, as defined in the DisplayPort specification. They mirror registers in the PCI express configuration. 000 no pre-emphasis (default) 001 3.5dB pre-emphasis (1.5x) 010 6dB pre-emphasis (2x) 011 9.5dB pre-emphasis (3x) RESERVED 1xx RESERVED
21:19	0b RW	**PORT_WIDTH_SELECTION:** This bit selects the number of lanes to be enabled on the DisplayPort link. Port width selection takes place on the Vblank after being written. Port width change must be done as a part of mode set. 000 = x1 Mode (Default) 001 = x2 Mode. 010 = RESERVED 011 = x4 Mode. 1xx = RESERVED
18	0b RW	**ENHANCED_FRAMING_ENABLE:** This bit selects enhanced framing. It must be set when HDCP will be used invoked. 0 (Default) Enhanced framing disabled 1 Enhanced framing enabled. Locked once port is enabled. Updates when the port is disabled then re-enabled
17:16	0b RW	**RESERVED_2:** MBZ
15	0b RW	**RESERVED_3:** [DevCDV]: Port reversal [DevCTG]: Locked once port is enabled. Updates when the port is disabled then re-enabled
14:9	0b RW	**RESERVED_4:** MBZ
8	0b RW	**ASR_ENABLE:** [DevVLV2]: this bit enables the Alternate Scrammbler Reset capability for eDP port to use alternate scrambler reset value of FFFEh 1 - ASR enable 0 ASR disable
7	0b RW	**SCRAMBLING_DISABLE:** [DevCTG, B-step only, DevCDV]: This bit disables scrambling for this port. 0 = Scrambling enabled (Default) 1 = Scrambling disabled, no SR after initialization at loop 2 of training
6	0b RW	**AUDIO_OUTPUT_ENABLE:** This bit enables audio on this output port. It may be enabled or disabled only when the link training is complete and set to Normal 0 = Audio output disabled 1 = Audio output enabled

Bit Range	Default & Access	Field Name (ID): Description
5	0b RW	**HDCP_PORT_SELECT:** This bit directs HDCP to this port. When enabled, the information sent on this port will be encrypted using HDCP. Please note that this bit does not enable encryption on its own, but must be used in conjunction with HDCP registers. 0 = (Default) No HDCP encryption on this port 1 = Enable HDCP on this port
4:3	11b RW	**SYNC_POLARITY:** Indicates the polarity of Hsync and Vsync. Please note that in native VGA modes, these bits have no effect. In native VGA modes, sync polarity is determined by VRshr3c2d76b[7:6], the VGA polarity bits in VGA control. 00 = VS and HS are active low (inverted) 01 = VS is active low (inverted), HS is active high 10 = VS is active high, HS is active low (inverted) 11 = (Default) VS and HS are active high
2	0b RO	**DIGITAL_DISPLAY_C_DETECTED:** Read-only bit indicating whether a digital display was detected during initialization. It signifies the level of the GMBUS port (sDVO B/C) data line at boot. 0 = digital display not detected during initialization (Default) 1 = digital display detected during initialization AccessType: Read only
1:0	0b RW	**RESERVED_5:** MBZ

INVERT_MANCHESTER_TEST_MODE
SYNC_ONLY_CLOCK_RECOVERY_TEST_MODE
DISABLE_DE_GLITCH_TEST_MODE
DOUBLE_PRECHARGE_TEST_MODE
_2X_BIT_CLOCK_DIVIDER

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**SEND_BUSY:** Setting this bit to a one initiates the transaction, when read this bit will be a 1 until the transmission completes. The transaction is completed when the response is received or when a timeout occurs. Do not write a 1 again until transaction completes. Writes of 0 will be ignored.
30	0b RW/1C	**DONE:** A sticky bit that indicates the transaction has completed. SW must write a 1 to this bit to clear the event. AccessType: One to Clear
29	0b RW	**INTERRUPT_ON_DONE:** Enable an interrupt in the hotplug status register when the transaction completes or times out.
28	0b RW/1C	**TIME_OUT_ERROR:** A sticky bit that indicates the transaction has timed out. SW must write a 1 to this bit to clear the event. AccessType: One to Clear
27:26	0b RW	**TIME_OUT_TIMER_VALUE:** 00: 400us (default) 01: 600us 10: 800us 11: 1600us The time count depends on the 2X bit clock divider (bits 10:0) being programmed for 2MHz.
25	0b RW/1C	**RECEIVE_ERROR:** A sticky bit that indicates that the data received was corrupted, not in multiples of a full byte, or more than 20 bytes. SW must write a 1 to this bit to clear the event. AccessType: One to Clear
24:20	0b RW	**MESSAGE_SIZE:** This field is used to indicate the total number bytes to transmit (including the header). It also indicates the number of bytes received in a transaction (including the header). This field is valid only only when the done bit is set and timeout or receive error has not occurred. Sync/Stop are not part of the message or the message size. Reads of this field will give the response message size. The read value will not be valid while Busy bit 31 is asserted. Message sizes of 0 or)20 are not allowed.
19:16	0101b RW	**PRECHARGE_TIME:** Used to determine the precharge time for the Aux Channel drivers. The value is the number of microseconds times 2. This depends on the 2X bit clock divider (bits 10:0) being programmed for 2MHz. Default is 5 decimal which gives 10us of precharge. Example: For 12us precharge, program 6 (12us/2us).
15	0b RW	**AUX_AKSV_BUFFER_SELECT:** This bit selects whether some of the data to be written over Display Port AUX comes from the Aksv buffer for HDCP authentication, or all from the AUX Data registers. Set this bit before initiating a transaction to write Aksv to the Display Port sink. All AUX protocol must be followed and Message Size set to 9 bytes. The first DWord transmitted will be from the AUX Data Register 1 for the header, then the DP_AUX_CH_AKSV_HI, then the last byte from DP_AUX_CH_AKSV_LO. The sink response is read back as usual from the AUX Data registers. More than one AUX channel can select to use the Aksv buffer simultaneously. 0 (Default) Use AUX Data registers for regular data transmission 1 Use Aksv Buffer for part of the data transmission.
14	0b RW	**INVERT_MANCHESTER_TEST_MODE:** 1 = Manchester code rising edge mid-clk signifies one (test mode) 0 = Manchester code rising edge mid-clk signifies zero (default)
13	0b RW	**SYNC_ONLY_CLOCK_RECOVERY_TEST_MODE:** 1 = Only recover clock during sync pattern (test mode) 0 = Recover clock during sync pattern and data phase (default)
12	0b RW	**DISABLE_DE_GLITCH_TEST_MODE:** 1 = Disable serial input de-glitch logic (test mode) 0 = Enable serial input de-glitch logic (default)
11	0b RW	**DOUBLE_PRECHARGE_TEST_MODE:** 1 = Precharge time is doubled 0 = Precharge time is as programmed

Bit Range	Default & Access	Field Name (ID): Description
10:0	0b RW	**_2X_BIT_CLOCK_DIVIDER:** Used to determine the 2X bit clock the Aux Channel logic runs on. This value divides the input clock frequency down to 2X bit clock rate. The 2X bit clock rate is ideally 2MHz (0.5us). [DevCTG-A] the input clock is cdclk. [DevCTG-B] the input clock is hrawclk. Example: For 300MHz input clock and desired 2MHz 2X bit clock, program 150 (300MHz/2MHz).

6:4	0 0 0	NUM_AUDIO_CHANNELS
3:2	0 0	FORMAT
1	0	LAYOUT
0	0	AUDIO_ENABLE

Bit Range	Default & Access	Field Name (ID): Description
31:17	0b RW	**RESERVED:** Reserved.
16	0b RW	**LPE_STREAM_A_PAUSE_RESUME:** DMA pause fetching at the boundary of buffers when this bit is set, and resume fetching when this bit is cleared. 1- DMA stop requesting more audio sample from buffer A,B,C,D after reading and depleting all data from current buffer 0- DMA resume requesting data from the next available buffer (A,B,C,D). Programming note: this bit should not be used by SW driver. When SW driver wants to pause audio, it shall invalidate the two newest allocated audio buffers. When the current audio buffers are processed, silent stream is sent automatically
15	0b RW	**LPE_HDMI_DP_MODE_ON_STREAM_A:** 1 = DP mode 0 = HDMI mode (default)
14	0b RW	**BOGUS_SAMPLE_DISABLE_FOR_ODD_CHANNEL:** When number of channels in a sample is odd (3, 5, or 7) source application may pad a bogus sample to the next even number of channels. If this bit is set there is no padding in input buffer1= No bogus sample present in buffer for odd number of channels 0= Bogus sample present in buffer for odd number of channels (default)
13	0b RW	**LEFT_ALIGNMENT:** When input buffer is in 32-bit container mode. If this bit is set the MSB of audio sample is aligned bit 31 of the container if this bit is clear MSB of audio sample is aligned with bit 23 of the container.1= MSB is bit 31 of 32-bit container 0= MSB is bit 23 of 32-bit container (default)

Bit Range	Default & Access	Field Name (ID): Description
12	0b RW	**_16_BIT_CONTAINER:** When this bit is set 16-bit sample is stored in 16-bit container format. When it is clear container is 32-bit for each sample regardless of valid bits (default)1= 16-bit container 0= 32-bit container
11	0b RW	**UNDERRUN_PACKET_BIT_SILENT_STREAM_ENABLE:** Set this bit will enble HW to send valid zero-filled packet with Sample flat bit set when no sample buffer is available, NCTS packets (or Timesstamp packet) are sent to keep sink in sync even no audio sound will heard.1= send underrun packets (silent stream) 0= send null packets (default) Programming note: SW driver shall always set silent stream bit. When SW driver wants to pause audio, it shall invalidate the two newest allocated audio buffers. When the current audio buffers are processed, silent stream is sent automatically.
10	0b RW	**USER_BIT_U:** HW will clear this bit ineach sub-frames it sends, But this bit allows to overwrite hardware setting for special operation like debug or testing for compliance 1= sey U bit in sub-frame 0= clear U bit in sub-frame (default)
9	1b RW	**VALIDITY_BIT_V:** HW will set this bit in both each sub-frames it sends. But this bit allows to overwrite hardware setting for special operation like debug or testing for compliance 1= Set V bit in sub-frame (default) 0= clear V bit in sub-frame. For debug or testing
8	0b RW	**SAMPLE_FLAT_BIT:** When set the sample flat bit will be set in all HDMI sub-packets. 1= flat bit is set for valid sample 0= flat bit is not set for valid sample (default)
7	1b RW	**SET_BLOCK_BEGIN_FOR_ALL_SUB_PACKETS:** Controls the B bit in the header of only the first Audio Packet /frame of a 192 frame 60958 block in Layout 1 mode. This bit only applies to LPE HDMI mode. 0: The B bit will be set only for sub-packet 0 1: The B bit in the Audio sample packet header will be set for all valid sub-packets. (default)
6:4	0b RW	**NUM_AUDIO_CHANNELS:** 000: 2 channels (stereo) 001: 3 channels 010: 4 channels 011: 5 channels 100: 6 channels 101: 7 channels 110: 8 channels Note: When disable_bogus sample bit is clear HW will always treat odd number of channels similar to the next higher even number. Thus 3 is similar to 4, 5 to 6 and 7 to 8. This is because SW ensures that an even number of samples are packed in the audio buffers. Programming note: Bit 6 of of this field is a write only bit. When reads back, it always returns zero. Ensure to write bit 6 to 1?b1 when programming for 6/7/8 audio channels.
3:2	0b RW	**FORMAT:** 00: L-PCM or IEC 61937 01: High Bit Rate IEC 61937 stream packet (not supported) 10: One Bit Audio Sample packet (not supported) 11: DST Audio Sample packet (not supported)
1	0b RW	**LAYOUT:** 0: Layout 0 (2-ch) 1: Layout 1 (3-8 ch) Note: Layout bit doesn t matter for HBR
0	0b RW	**AUDIO_ENABLE:** Controls generation of N/CTS and transmission of audio sample packets. 0: Audio sample packets are not transmitted, CTS calculation/transmission is disabled 1: Audio sample packets are transmitted and CTS calculation is enabled When enable audio unit will wait until the next vertical blank period before sending out the audio packets. When disable, audio unit may continue to send audio packet until the end of current active video frame before stopping.

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**RESERVED:** Reserved.
30:29	0b RW	**RESERVED_1:** Reserved.
28:25	0b RW	**RESERVED_:** for later DIP type if needed: Must be 0.
24:21	0b RW	**DIP_TYPE_ENABLE_STATUS_READ_ONLY:** These bits reflects the DIP types enabled. It can be updated while the port is enabled. Within 2 vblank periods, the DIP is guaranteed to have been transmitted. Disabling an DIP type results in setting the contents of that DIP buffer to zero. A reserved setting reflects a disabled DIP. XXX1 = Audio DIP enable status (Default = disabled) XX1X = Generic 1 (ACP) DIP enable status (Default = disabled) X1XX = Generic 2 DIP enable status, can be used by ISRC1 or ISRC2 (Default = disabled) 1XXX = Reserved
20:18	0b RW	**DIP_BUFFER_INDEX_R_W:** This field is used during read or write of different DIPs, and during read or write of ELD data. These bits are used as an index to their respective DIP or ELD buffers. When the index is not valid, the contents of the DIP will return all 0 s. 000 = (Default) Audio DIP (31 bytes of address space, 13 bytes of data) 001 = Generic 1 (ACP) Data Island Packet (31 bytes of address space, 11 bytes of data) 010 = Generic 2 (ISRC1) Data Island Packet (31 bytes of address space, 31 bytes of data) 011 = Generic 3 (ISRC2) Data Island Packet (31 bytes of address space, 31 bytes of data) 1XX = reserved

Bit Range	Default & Access	Field Name (ID): Description
17:16	0b RW	**DIP_TRANSMISSION_FREQUENCY_R_W:** These bits reflect the frequency of DIP transmission for the DIP buffer type designated in bits 20:18. When writing DIP data, this value is also latched when the first DW of the DIP is written.When read, this value reflects the DIP transmission frequency for the DIP buffer designated in bits 20:18. 00 = Disabled (Default) 01 = once per frame 10 = Send once 11 = Best effort (Send at least every other vsync)
15	0b RW	**CP_READY:** This R/W bit reflects the state of CP request from the audio unit. When an audio CP request has been serviced, it must be reset to 1 by the video software to indicate that the CP request has been serviced. 0 = CP request pending or not ready to receive requests (default) 1 = CP request ready CP_ready bit is programmable through Bit 14 for [DevCL, DevBLC]. CP_ready bit is programmable through Bit 15 for [DevCTG]. Bit 15 Reserved for [DevCL, DevBLC].
14	0b RW	**RESERVED_R_W:** ELD valid: This bit reflects the state of the ELD data written to the ELD RAM. After writing the ELD data, the video software must set this bit to 1 to indicate that the ELD data is valid. At audio codec initialization, or on a hotplug event, this bit is set to 0 by the video software. This bit is reflected in the audio pin complex widget as the ELD valid status bit.0 = ELD data invalid (default, when writing ELD data, set 0 by software) 1 = ELD data valid (Set by video software only) ELD bit is programmable through Bit 13 for [DevCL, DevBLC]. ELD bit is programmable through Bit 14 for [DevCTG].
13:9	0b RW	**RESERVED_2:** ELD buffer size (read only)10000 = This field reflects the size of the ELD buffer in DWORDs 13:9 reflects ELD buffer size for [DevCTG]. 12:9 reflects ELD buffer size for [DevCL, DevBLC].
8:5	0b RW	**RESERVED__1:** ELD access address (R/W): Selects the DWORD address for access to the ELD buffer (48 bytes). The value wraps back to zero when incremented past the max addressing value 0xF. This field change takes effect immediately after being written. The read value indicates the current access address.
4	0b RW	**RESERVED_3:** ELD ACK: Acknowledgement from the audio driver that ELD read has been completed
3:0	0b RW	**DIP_RAM_ACCESS_ADDRESS_R_W:** Selects the DWORD address for access to the DIP buffers. The value wraps back to zero when it incremented past the max addressing value of 0xF. This field change takes effect immediately after being written. The read value indicates the current access address.

14.11.149 STREAM_A_LPE_AUD_HDMI_STATUS—Offset 65064h

LPE Audio Status

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 65064h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

31 28 24 20 16 12 8 4 0

SAMPLE_BUFFER_UNDERRUN	AUDIO_BANDWIDTH_UNDERRUN_DEBUG	LPE_AUDIO_BUFFER_DONE_STATUS	RESERVED	NUMBER_OF_SAMPLES_BEHIND_DEBUG	SAMPLE_BUFFER_UNDERRUN_INTERRUPT_ENABLE	AUDIO_BANDWIDTH_UNDERRUN_INTERRUPT_ENABLE	RESERVED_1	AZALIA_COMPATIBLE_MODE	AUDIO_SAMPLE_RUN_RATE_DEBUG	FUNCTION_RESET_R_W_ONLY

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW/1C	**SAMPLE_BUFFER_UNDERRUN:** This bit indicates an underrun in the sample buffer to HDMI controller when it needs to send. This bit is set at the last line of active video when there are no more sample in any valid buffers and HDMI audio unit has not satisfied number of audio samples intended in that video frame. Clearing this status bit is accomplished by writing a 1 to this bit through MMIO. AccessType: One to Clear
30	0b RW/1C	**AUDIO_BANDWIDTH_UNDERRUN_DEBUG:** This bit indicates an underrun of audio samples at HDMI audio packet assembly even there is still available sample buffers. Audio bandwidth underrun should not happen in normal functionality but it may happen when audio setting is unappropriate and/or memory bus was blocked by other clients, etc... This bit is set at the last line of active video when there is valid samples in a valid buffer and HDMI audio unit has not satisfied number of audio samples intended in that video frame Clearing this status bit is accomplished by writing a 1 to this bit through MMIO. AccessType: One to Clear
29	0b RW/1C	**LPE_AUDIO_BUFFER_DONE_STATUS:** This bit is set when a LPE audio buffer is completed transferred all of its data to LPE audio unit. This bit is clear when write 1 to it AccessType: One to Clear
28:24	0b RW	**RESERVED:** Reserved.
23:16	0b RO	**NUMBER_OF_SAMPLES_BEHIND_DEBUG:** This field is read only to get the number of audio samples that controller needs to load and send at the time of reading. AccessType: Read Only
15	0b RW	**SAMPLE_BUFFER_UNDERRUN_INTERRUPT_ENABLE:** This bit is to enable the first line buffer underrun interrupt when sample buffer underrun status is detected 0 = LPE sample Buffer Underrun Interrupt Disabled 1 = LPE sample Buffer Underrun Interrupt Enabled
14	0b RW	**AUDIO_BANDWIDTH_UNDERRUN_INTERRUPT_ENABLE:** This bit is to enable the first line bandwidth underrun interrupt when bandwidth underrun status is detected 0 = LPE Bandwidth Underrun Interrupt Disabled 1 = LPE Bandwidth Underrun Interrupt Enabled
13:3	0b RW	**RESERVED_1:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2	0b RW	**AZALIA_COMPATIBLE_MODE:** This bit is to enable the vucp, PR, ECC to be generated in the Azalia way 0 = Disable Azalia compatible mode on vucp, PR, ECC 1 = Enable Azalia compatible mode on vucp, PR, ECC
1	0b RW	**AUDIO_SAMPLE_RUN_RATE_DEBUG:** When set it allows to fetch sample 128 times than the real sample rate to allow a faster drain of sample bufferes.
0	0b RW	**FUNCTION_RESET_R_W_ONLY:** Write 1 to this bit will reset hardware within audio unit without needs of reset the full display controller. The FIFO and pointers will be reset and audio registers will be reset to default values. Write 0 will put the unit back to idle and ready to be programmed again.

14.11.150 STREAM_A_LPE_AUD_HDMIW_INFOFR—Offset 65068h

Audio HDMI Data Island Packet Data

Access Method

Type: Memory Mapped I/O Register

7	SET_BLOCK_BEGIN_FOR_ALL_SUB_PACKETS
6:4	NUM
3:2	FORMAT
1	LAYOUT
0	AUDIO_ENABLE

Bit Range	Default & Access	Field Name (ID): Description
31:17	0b RW	**RESERVED:** Reserved.
16	0b RW	**LPE_STREAM_B_PAUSE_RESUME:** DMA pause fetching at the boundary of buffers when this bit is set, and resume fetching when this bit is cleared. 1- DMA stop requesting more audio sample from buffer A,B,C,D after reading and depleting all data from current buffer 0- DMA resume requesting data from the next available buffer (A,B,C,D). Programming note: this bit should not be used by SW driver. When SW driver wants to pause audio, it shall invalidate the two newest allocated audio buffers. When the current audio buffers are processed, silent stream is sent automatically.
15	0b RW	**LPE_HDMI_DP_MODE_ON_STREAM_B:** 1= DP mode 0 = HDMI mode (default)
14	0b RW	**BOGUS_SAMPLE_DISABLE_FOR_ODD_CHANNEL:** When number of channels in a sample is odd (3, 5, or 7) source application may pad a bogus sample to the next even number of channels. If this bit is set there is no padding in input buffer1= No bogus sample present in buffer for odd number of channels 0= Bogus sample present in buffer for odd number of channels (default)
13	0b RW	**LEFT_ALIGNMENT:** When input buffer is in 32-bit container mode. If this bit is set the MSB of audio sample is aligned bit 31 of the container if this bit is clear MSB of audio sample is aligned with bit 23 of the container.1= MSB is bit 31 of 32-bit container 0= MSB is bit 23 of 32-bit container (default)

Bit Range	Default & Access	Field Name (ID): Description
12	0b RW	**_16_BIT_CONTAINER:** When this bit is set 16-bit sample is stored in 16-bit container format. When it is clear container is 32-bit for each sample regardless of valid bits (default)1= 16-bit container 0= 32-bit container
11	0b RW	**UNDERRUN_PACKET_BIT_SILENT_STREAM_ENABLE:** Set this bit will enble HW to send valid zero-filled packet with Sample flat bit set when no sample buffer is available, NCTS packets (or Timesstamp packet) are sent to keep sink in sync even no audio sound will heard.1= send underrun packets (silent stream) 0= send null packets (default) Programming note: SW driver shall always set silent stream bit. When SW driver wants to pause audio, it shall invalidate the two newest allocated audio buffers. When the current audio buffers are processed, silent stream is sent automatically.
10	0b RW	**USER_BIT_U:** HW will clear this bit ineach sub-frames it sends, But this bit allows to overwrite hardware setting for special operation like debug or testing for compliance 1= sey U bit in sub-frame 0= clear U bit in sub-frame (default)
9	1b RW	**VALIDITY_BIT_V:** HW will set this bit in both each sub-frames it sends. But this bit allows to overwrite hardware setting for special operation like debug or testing for compliance 1= Set V bit in sub-frame (default) 0= clear V bit in sub-frame. For debug or testing
8	0b RW	**SAMPLE_FLAT_BIT:** When set the sample flat bit will be set in all HDMI sub-packets. 1= flat bit is set for valid sample 0= flat bit is not set for valid sample (default)
7	1b RW	**SET_BLOCK_BEGIN_FOR_ALL_SUB_PACKETS:** Controls the B bit in the header of only the first Audio Packet /frame of a 192 frame 60958 block in Layout 1 mode. This bit only applies to LPE HDMI mode. 0: The B bit will be set only for sub-packet 0 1: The B bit in the Audio sample packet header will be set for all valid sub-packets. (default)
6:4	0b RW	**NUM:** audio Channels 000: 2 channels (stereo) 001: 3 channels 010: 4 channels 011: 5 channels 100: 6 channels 101: 7 channels 110: 8 channels Note: When disable_bogus sample bit is clear HW will always treat odd number of channels similar to the next higher even number. Thus 3 is similar to 4, 5 to 6 and 7 to 8. This is because SW ensures that an even number of samples are packed in the audio buffers. Programming note: Bit 6 of of this field is a write only bit. When reads back, it always returns zero. Ensure to write bit 6 to 1?b1 when programming for 6/7/8 audio channels.
3:2	0b RW	**FORMAT:** 00: L-PCM or IEC 61937 01: High Bit Rate IEC 61937 stream packet (not supported) 10: One Bit Audio Sample packet (not supported) 11: DST Audio Sample packet (not supported)
1	0b RW	**LAYOUT:** 0: Layout 0 (2-ch) 1: Layout 1 (3-8 ch) Note: Layout bit doesn t matter for HBR
0	0b RW	**AUDIO_ENABLE:** Controls generation of N/CTS and transmission of audio sample packets. 0: Audio sample packets are not transmitted, CTS calculation/transmission is disabled 1: Audio sample packets are transmitted and CTS calculation is enabled When enable audio unit will wait until the next vertical blank period before sending out the audio packets. When disable, audio unit may continue to send audio packet until the end of current active video frame before stopping.

8:5	0 0 0 0	RESERVED_
4	0	RESERVED_4
3:0	0 0 0 0	DIP_RAM_ACCESS_ADDRESS_R_W

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**RESERVED:** Reserved.
30:29	0b RW	**RESERVED_1:** Reserved.
28:25	0b RW	**RESERVED_FOR_LATER_DIP_TYPE_IF_NEEDED:** Must be 0.
24:21	0b RO	**DIP_TYPE_ENABLE_STATUS_READ_ONLY:** These bits reflects the DIP types enabled. It can be updated while the port is enabled. Within 2 vblank periods, the DIP is guaranteed to have been transmitted. Disabling an DIP type results in setting the contents of that DIP buffer to zero. A reserved setting reflects a disabled DIP. XXX1 = Audio DIP enable status (Default = disabled) XX1X = Generic 1 (ACP) DIP enable status (Default = disabled) X1XX = Generic 2 DIP enable status, can be used by ISRC1 or ISRC2 (Default = disabled) 1XXX = Reserved AccessType: Read Only

Bit Range	Default & Access	Field Name (ID): Description
20:18	0b RW	**DIP_BUFFER_INDEX_R_W:** This field is used during read or write of different DIPs, and during read or write of ELD data. These bits are used as an index to their respective DIP or ELD buffers. When the index is not valid, the contents of the DIP will return all 0 s. 000 = (Default) Audio DIP (31 bytes of address space, 13 bytes of data) 001 = Generic 1 (ACP) Data Island Packet (31 bytes of address space, 11 bytes of data) 010 = Generic 2 (ISRC1) Data Island Packet (31 bytes of address space, 31 bytes of data) 011 = Generic 3 (ISRC2) Data Island Packet (31 bytes of address space, 31 bytes of data) 1XX = reserved
17:16	0b RW	**DIP_TRANSMISSION_FREQUENCY_R_W:** These bits reflect the frequency of DIP transmission for the DIP buffer type designated in bits 20:18. When writing DIP data, this value is also latched when the first DW of the DIP is written.When read, this value reflects the DIP transmission frequency for the DIP buffer designated in bits 20:18. 00 = Disabled (Default) 01 = once per frame 10 = Send once 11 = Best effort (Send at least every other vsync)
15	0b RW	**CP_READY:** This R/W bit reflects the state of CP request from the audio unit. When an audio CP request has been serviced, it must be reset to 1 by the video software to indicate that the CP request has been serviced. 0 = CP request pending or not ready to receive requests (default) 1 = CP request ready CP_ready bit is programmable through Bit 14 for [DevCL, DevBLC]. CP_ready bit is programmable through Bit 15 for [DevCTG]. Bit 15 Reserved for [DevCL, DevBLC].
14	0b RW	**RESERVED_2:** ELD valid: This R/W bit reflects the state of the ELD data written to the ELD RAM. After writing the ELD data, the video software must set this bit to 1 to indicate that the ELD data is valid. At audio codec initialization, or on a hotplug event, this bit is set to 0 by the video software. This bit is reflected in the audio pin complex widget as the ELD valid status bit. 0 = ELD data invalid (default, when writing ELD data, set 0 by software) 1 = ELD data valid (Set by video software only) ELD bit is programmable through Bit 13 for [DevCL, DevBLC]. ELD bit is programmable through Bit 14 for [DevCTG].
13:9	0b RW	**RESERVED_3:** ELD buffer size (read only)10000 = This field reflects the size of the ELD buffer in DWORDs 13:9 reflects ELD buffer size for [DevCTG]. 12:9 reflects ELD buffer size for [DevCL, DevBLC].
8:5	0b RW	**RESERVED_:** ELD access address (R/W): Selects the DWORD address for access to the ELD buffer (48 bytes). The value wraps back to zero when incremented past the max addressing value 0xF. This field change takes effect immediately after being written. The read value indicates the current access address.
4	0b RW	**RESERVED_4:** ELD ACK: Acknowledgement from the audio driver that ELD read has been completed
3:0	0b RW	**DIP_RAM_ACCESS_ADDRESS_R_W:** Selects the DWORD address for access to the DIP buffers. The value wraps back to zero when it incremented past the max addressing value of 0xF. This field change takes effect immediately after being written. The read value indicates the current access address.

14.11.167 STREAM_B_LPE_AUD_HDMI_STATUS—Offset 65864h

LPE Audio Status

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 65864h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

Bits	Default	Field
31	0	SAMPLE_BUFFER_UNDERRUN_STATUS
30	0	AUDIO_BANDWIDTH_UNDERRUN_DEBUG_STATUS
29	0	LPE_AUDIO_BUFFER_DONE_STATUS
28:24	0 0 0 0 0	RESERVED

15	0	SAMPLE_BUFFER_UNDERRUN_INTERRUPT_ENABLE
14	0	AUDIO_BANDWIDTH_UNDERRUN_INTERRUPT_ENABLE
13:3	0 0 0 0 0 0 0 0 0 0 0	RESERVED_1
2	0	AZALIA_COMPATIBLE_MODE
1	0	AUDIO_SAMPLE_RUN_RATE_DEBUG
0	0	FUNCTION_RESET_R_W_ONLY

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW/1C	**SAMPLE_BUFFER_UNDERRUN_STATUS:** This bit indicates an underrun in the sample buffer to HDMI/DP controller when it needs to send. This bit is set at the last line of active video when there are no more sample in any valid buffers and HDMI/DP audio unit has not satisfied number of audio samples intended in that video frame. Clearing this status bit is accomplished by writing a 1 to this bit through MMIO. AccessType: One to Clear
30	0b RW/1C	**AUDIO_BANDWIDTH_UNDERRUN_DEBUG_STATUS:** This bit indicates an underrun of audio samples at HDMI audio packet assembly even there is still available sample buffers. Audio bandwidth underrun should not happen in normal functionality but it may happen when audio setting is unappropriate and/or memory bus was blocked by other clients, etc... This bit is set at the last line of active video when there is valid samples in a valid buffer and HDMI audio unit has not satisfied number of audio samples intended in that video frame Clearing this status bit is accomplished by writing a 1 to this bit through MMIO. AccessType: One to Clear
29	0b RW/1C	**LPE_AUDIO_BUFFER_DONE_STATUS:** This bit is set when a LPE audio buffer is completed transferred all of its data to LPE audio unit. This bit is clear when write 1 to it AccessType: One to Clear
28:24	0b RW	**RESERVED:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
23:16	0b RO	**NUMBER_OF_SAMPLES_BEHIND_DEBUG:** This field is read only to get the number of audio samples that controller needs to load and send at the time of reading. AccessType: Read Only
15	0b RW	**SAMPLE_BUFFER_UNDERRUN_INTERRUPT_ENABLE:** This bit is to enable the first line buffer underrun interrupt when sample buffer underrun status is detected 0 = LPE sample Buffer Underrun Interrupt Disabled 1 = LPE sample Buffer Underrun Interrupt Enabled
14	0b RW	**AUDIO_BANDWIDTH_UNDERRUN_INTERRUPT_ENABLE:** This bit is to enable the first line bandwidth underrun interrupt when bandwidth underrun status is detected 0 = LPE Bandwidth Underrun Interrupt Disabled 1 = LPE Bandwidth Underrun Interrupt Enabled
13:3	0b RW	**RESERVED_1:** Reserved.
2	0b RW	**AZALIA_COMPATIBLE_MODE:** This bit is to enable the vucp, PR, ECC to be generated in the Azalia way 0 = Disable Azalia compatible mode on vucp, PR, ECC 1 = Enable Azalia compatible mode on vucp, PR, ECC
1	0b RW	**AUDIO_SAMPLE_RUN_RATE_DEBUG:** When set it allows to fetch sample 128 times than the real sample rate to allow a faster drain of sample bufferes.
0	0b RW	**FUNCTION_RESET_R_W_ONLY:** Write 1 to this bit will reset hardware within audio unit without needs of reset the full display controller. The FIFO and pointers will be reset and audio registers will be reset to default values. Write 0 will put the unit back to idle and ready to be programmed again.

0	0	RESERVED_1

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**PIPE_A_ENABLE:** Setting this bit to the value of one, turns on pipe A. This must be done before any planes are enabled on this pipe. Changing it to a zero should only be done when all planes that are assigned to this pipe have been disabled. Turning the pipe enable bit off disables the timing generator in this pipe. Plane disable occurs after the next VBLANK event after the plane is disabled. Synchronization pulses to the display are not maintained if the timing generator is disabled. Power consumption will be at it s lowest state when disabled. A separate bit controls the DPLL enable for this pipe. Pipe timing registers should contain valid values before this bit is enabled. 0 = Disable 1 = Enable
30	0b RO	**PIPE_STATE:** This bit indicates the actual state of the pipe. Since there can be some delay between disabling the pipe and the pipe actually shutting off, this bit indicates the true current state of the pipe. 0 = Disabled 1 = Enabled AccessType: Read Only
29	0b RO	**DSI_PLL_LOCK_LOCK:** This bit indicates the clocks from DSI PLL are locked. 0 = Unlocked 1 = Locked AccessType: Read only
28:27	0b RW	**FRAME_START_DELAY:** (TEST MODE) Used to delay the frame start signal that is sent to the display planes. Normal operation uses the default 00 value and test modes can use the delayed frame start to shorten the test time. Care must be taken to insure that there are enough lines during VBLANK to support this setting. 00 = Frame Start occurs on the first HBLANK after the start of VBLANK 01 = Frame Start occurs on the second HBLANK after the start of VBLANK 10 = Frame Start occurs on the third HBLANK after the start of VBLANK 11 = Frame Start occurs on the forth HBLANK after the start of VBLANK
26	0b RW	**DISPLAY_PORT_AUDIO_ONLY_MODE:** [DevVLVP] Setting this bit to 1 indicates the DisplayPort will output audio only. 0 = DisplayPort will output Video or Video and Audio 1 = DisplayPort will output Audio only
25	0b RW	**FORCE_BORDER:** : (TEST MODE)0 = Normal Operation 1 = Color information is ignored and border color is substituted during active region
24	0b RW	**PIPE_A_GAMMA_UNIT_MODE:** This bit selects which mode the pipe gamma correction logic works in. In the palette mode, it behaves as a 3X256x8 RAM lookup. VGA and indexed mode operation should use the palette in 8-bit mode. In the 10-bit gamma mode, it will act as a piecewise linear interpolation. Other gamma units such as in the overlay or sprite are unaffected by this bit. 0 = 8-bit Palette Mode 1 = 10-bit Gamma Mode
23:21	0b RW	**INTERLACED_MODE:** These bits are used for software control of interlaced behavior. They are updated immediately if the pipe is off, or in the vertical blank after programming if pipe is enabled. 0xx = Progressive 100 = Interlaced embedded panel using programmable vertical sync shift. (2x) 101 = Interlaced using vertical sync shift. Backup option to 110 setting. (2x) 110 = Interlaced with VSYNC/HSYNC Field Indication using legacy vertical sync shift. Used for SDVO. 111 = Interlaced with Field 0 Only using legacy vertical sync shift. Not used Note: VGA display modes, sDVO line stall, and Panel fitting do not work while in interlaced modes Setting the Interlaced embedded panel mode causes hardware to automatically modify the output to match the specifications of panels that support interlaced mode.
20	0b RW	**MIPI_DISPLAY_SELF_REFRESH_MODE_FOR_MIPI_A_REFRESH:** 0 = Normal Operation, display controller generate timing and refresh display panel at refresh rate 1 = Display self-refresh mode. Display controller update frame buffer in display module on demand only

Bit Range	Default & Access	Field Name (ID): Description
19	0b RW	**DISPLAY_OVERLAY_PLANES_OFF:** This bit when set will cause all enabled Display and overlay planes that are assigned to this pipe to be disabled by overriding the current setting of the plane enable bit, at the next VBLANK. Timing signals continue as they were but the screen becomes blank. Setting the bit back to a zero will then allow the display and overlay planes to resume on the following VBLANK. 0 = Normal Operation 1 = Planes assigned to this pipe are disabled.
18	0b RW	**CURSOR_PLANES_OFF:** This bit when set will cause all enabled cursor planes that are assigned to this pipe to be disabled by overriding the current setting of the plane enable bit, at the next VBLANK. Timing signals continue as they were but the cursor(s) no longer appear on the screen. Setting the bit back to a zero will then allow the cursor planes to resume on the following VBLANK. 0 = Normal Operation 1 = Planes assigned to this pipe are disabled.
17:16	0b RW	**REFRESH_RATE_CXSR_MODE_ASSOCIATION:** These bits select how refresh rates are tied to big FIFO mode on pipe A. When they are set to anything other than 00, bits 23:21 of this register must be programmed to 0xx. Switching between 01 and 10 settings directly is not allowed. Software must program this field to 00 before switching. Software is responsible for enabling this mode only for integrated dispay panels that support corresponding mode. 00 Default no dynamic refresh rate change enabled. Software control only. 01 Progressive-to-progressive refresh rate change enabled and tied to big FIFO mode. Pixel clock values set in FPA0/FPA1 settings in the DPLLA control register and FPA0/FPA1 divider registers. FPA0 is tied to non-big-FIFO mode 10 Progressive-to-interlaced refresh rate change enabled and tied to big FIFO mode. Pixel clock value does not change in this case. Scaling must be disabled in this mode. Uses programmable VS shift 11 Reserved
15	0b RW	**COLOR_CORRECTION_MATRIX_ENABLE_ON_PIPE_A_1_COLOR_CORRECTION_COEFFICIENTS_ARE_ENABLED_TO_PERFORM_COLOR_CORRECTION_0_COLOR_CORRECTION_COEFFICIENTS_ARE_DISABLED_:** • 1 = Color Correction Coefficients are enabled to perform color correction • 0 = Color Correction Coefficients are disabled
14	0b RW	**DISPLAYPORT_POWER_MODE_SWITCH_DEVVLVP:** This bit selects the software controlled progressive to progressive power saving mode (software controlled DRRS). Hardware Controlled Refresh Rate Select must be disabled when enabling this. Link and data M/N 1 values are used for normal settings, M/N 2 values are used for low power settings. 0 Normal progressive refresh rate (default) 1 Low Power progressive refresh rate
13	0b RW	**COLOR_RANGE_SELECT:** [DevVLVP]: This bit is used to select the color range of RBG outputs. 0 = Apply full 0-255 color range to the output (Default) 1 = Apply 16-235 color range to the output
12	0b RW	**S3D_SPRITE_ORDER:** This bit controls the blending order of the sprite planes for S3D support: 0 = Sprite A first. The first line or pixel comes from Sprite A (default) 1 = Sprite B first. The first line or pixel comes from Sprite B
11:10	0b RW	**S3D_SPRITE_INTERLEAVING_FORMAT:** These bits control the Sprite A/B interleaving format in S3D mode 00 = No interleaving 01 = Line interleaving 10 = Pixel interleaving 11 = Reserved
9:8	0b RW	**RESERVED:** [DevCDV, DevVLVP] MBZ Scrambling enable [DevCTG]: This bit enables scrambling for DisplayPort. Software must set this bit appropriately when enabling a DisplayPort output. 00 = Scrambling disabled (Default) 01 = Scrambling enabled, no SR after initialization at loop 2 of training 10 - RESERVED 11 = Scrambling and SR enabled. Scrambling is reset every 512 BS symbols.

Bit Range	Default & Access	Field Name (ID): Description
7:5	0b RW	**BITS_PER_COLOR:** [DevCTG, DevCDV, DevVLVP]: This field selects the number of bits per color sent to a receiver device connected to this port. Color format takes place on the Vblank after being written. Color format change can be done independent of a pixel clock change in DisplayPort. Selecting a pixel color depth higher or lower than the pixel color depth of the frame buffer results in dithering the output stream. For further details on Display Port fixed frequency programming to accommodate these formats refer to DP Frequency Programming in DPLL section of Bspec. 000 = 8 bits per color (Default) 001 = 10 bits per color 010 = 6 bits per color 011 = RESERVED 1xx = RESERVED
4	0b RW	**DITHERING_ENABLE:** [DevCTG, DevCDV]: This bit enables dithering for DisplayPort 6bpc or 8bpc modes 0 Dithering disabled (Default) 1 Dithering enabled Programming note: Dithering should only be enabled for 8 bpc or 6 bpc.
3:2	0b RW	**DITHERING_TYPE:** [DevCTG, DevCDV]: This bit selects dithering type for DisplayPort 6bpc or 8bpc modes 00 - Spatial only (default) 01- Spatio-Temporal 1 10- Spatio-Temporal 2 (testmode) 11- Temporal only (testmode)
1	0b RW	**DDA_RESET_TEST_MODE:** [DevCTG, DevCDV]: 0 Do not reset DDA 1 Reset DDA every 8th display frame
0	0b RW	**RESERVED_1:** Write as zero

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW/1C	**FIFO_A_UNDER_RUN_STATUS:** Set when a pipe A FIFO under-run occurs, cleared by a write of a 1. An underrun has occurred on an attempt to pop an empty FIFO. This does not feed into the first line interrupt status register. This will occur naturally during mode changes, to be useful, it should be cleared after a mode change has occurred. This bit is only valid after Pipe A has been completely configured. 1 = FIFO A Underflow occurred 0 = FIFO A Underflow did not occur AccessType: One to Clear
30	0b RW	**SPRITE_B_FLIP_DONE_INTERRUPT_ENABLE:** This will enable the consideration of the Sprite B flip done interrupt status bit in the first line interrupt logic 0 = Sprite B Flip Done Interrupt Disabled 1 = Sprite B Flip Done Interrupt Enabled
29	0b RW	**CRC_ERROR_ENABLE:** This will enable the consideration of the CRC error status bit in the first line interrupt/status logic. 0 = CRC Error Detect Disabled 1 = CRC Error Detect Enabled
28	0b RW	**CRC_DONE_ENABLE:** This will enable the consideration of the CRC error status bit in the first line interrupt/status logic. 0 = CRC Done Detect Disabled 1 = CRC Done Detect Enabled
27	0b RW	**GMBUS_EVENT_ENABLE:** This will enable the use of the GMBUS interrupt status bit in the first line interrupt/status logic. 0 = No GMBUS event enabled 1 = GMBUS event enabled
26	0b RW	**PLANE_A_FLIP_DONE_INTERRUPT_ENABLE:** This will enable the consideration of the Plane A flip done interrupt status bit in the first line interrupt logic 0 = Plane A flip done Interrupt/Status Disabled 1 = Plane A flip done Interrupt/Status Enabled
25	0b RW	**VERTICAL_SYNC_INTERRUPT_ENABLE:** This will enable the consideration of the vertical sync interrupt status bit in the first line interrupt logic. 0 = Vertical Sync Interrupt/Status Disabled 1 = Vertical Sync Interrupt/Status Enabled
24	0b RW	**DISPLAY_LINE_COMPARE_ENABLE:** This will enable the consideration of the line compare interrupt status bit in the first line interrupt/status logic. 0 = Display Line Compare Interrupt/Status Disabled 1 = Display Line Compare Interrupt/Status Enabled

Bit Range	Default & Access	Field Name (ID): Description
23	0b RW	**DPST_EVENT_ENABLE:** [DevCL, DevCTG, DevCDV]: This interrupt is generated by the DPST logic. 0 = No DPST event enabled 1 = DPST event enabled
22	0b RW	**SPRITE_A_FLIP_DONE_INTERRUPT_ENABLE:** This will enable the consideration of the Sprite A flip done interrupt status bit in the first line interrupt logic 0 = Sprite A Flip Done Interrupt Disabled 1 = Sprite A Flip Done Interrupt Enabled
21	0b RW	**ODD_FIELD_INTERRUPT_EVENT_ENABLE:** This bit should only be used when this pipe is in an interlaced display timing. 0 = Odd Field Event disable 1 = Odd Field Event enable
20	0b RW	**EVEN_FIELD_INTERRUPT_EVENT_ENABLE:** This bit should only be used when this pipe is in an interlaced display timing. 0 = Even field Event disable 1 = Even field Event enable
19	0b RW	**PERFORMANCE_COUNTER_EVENT_ENABLE:** perfomance counter event enable
18	0b RW	**START_OF_VERTICAL_BLANK_INTERRUPT_ENABLE:** This will enable the consideration of the start of vertical blank interrupt status bit in the first line interrupt/ status logic. 0 = Start of Vertical Blank Interrupt/Status Disabled 1 = Start of Vertical Blank Interrupt/Status Enabled
17	0b RW	**FRAMESTART_INTERRUPT_ENABLE:** This will enable the consideration of the vertical blank interrupt status bit in the first line interrupt/status logic. 0 = Vertical Blank Interrupt/Status Disabled 1 = Vertical Blank Interrupt/Status Enabled
16	0b RW	**PIPE_A_HORIZONTAL_BLANK_INTERRUPT_ENABLE:** : This will enable the consideration of the start of horizontal blank interrupt status bit in the first line interrupt/status logic0 = Start of Horizontal Blank Interrupt/Status Disabled 1 = Start of Horizontal Blank Interrupt/Status Enabled
15	0b RW/1C	**SPRITE_B_FLIP_DONE_INTERRUPT_STATUS:** MMIO Flip Event is completed on Sprite B 0 = Sprite B Flip Not Done 1 = Sprite B Flip Done AccessType: One to Clear
14	0b RW/1C	**SPRITE_A_FLIP_DONE_INTERRUPT_STATUS:** MMIO Flip Event is completed on Sprite A 0 = Sprite A Flip Not Done 1 = Sprite A Flip Done AccessType: One to Clear
13	0b RW/1C	**CRC_ERROR_INTERRUPT_STATUS:** This sticky status bit is set when a Pipe A CRC error is detected. It is cleared by a write of a one. For this bit to be meaningful, the pipe and pixel clock should be enabled and running. 0 = No CRC error has occurred 1 = CRC Error Detected AccessType: One to Clear
12	0b RW/1C	**CRC_DONE_INTERRUPT_STATUS:** This sticky status bit is set when Pipe A CRC calculation and compare are complete. It is cleared by a write of a one. For this bit to be meaningful, the pipe and pixel clock should be enabled and running. 0 = CRC Not Done 1 = CRC Done AccessType: One to Clear
11	0b RW/1C	**GMBUS_INTERRUPT_STATUS:** This status bit will be set on a GMBUS event. To use this bit in a polling manner, clear the bit by writing a one to it followed by the polling loop waiting for it to become set. 0 = GMBUS event has not occurred 1 = GMBUS event has occurred AccessType: One to Clear

Bit Range	Default & Access	Field Name (ID): Description
10	0b RW/1C	**PLANE_A_FLIP_DONE_INTERRUPT_STATUS:** Async/Sync Flip Event is completed on Display Plane A 0 = Plane A Flip Not Done 1 = Plane A Flip Done AccessType: One to Clear
9	0b RW/1C	**VERTICAL_SYNC_INTERRUPT_STATUS:** This bit provides a sticky status that is set when a pipe A vertical sync occurs, cleared by a write of a 1. For interlaced timing modes, this occurs once per field, when in progressive, it occurs once per frame. For this bit to be meaningful, the pipe and pixel clock should be enabled and running. 0 = Vertical Sync has not occurred 1 = Vertical Sync has occurred AccessType: One to Clear
8	0b RW/1C	**DISPLAY_LINE_COMPARE_INTERRUPT_STATUS:** Set when a pipe A compare match occurs, cleared by a write of a 1. 0 = Display Line Compare has not been satisfied 1 = Display Line Compare has been satisfied AccessType: One to Clear
7	0b RW/1C	**DPST_EVENT_STATUS:** [DevCL, DevCTG, DevCDV]: This bit is cleared when a write to this register occurs with this bit as a one. Writes with this bit as a zero has no effect on the value of the bit. Multiple DPST events (Histogram or Phase In) can cause this bit to be asserted, determination of which event occurred is done in the DPST registers. 0 = DPST Interrupt has not occurred on pipe A 1 = DPST Interrupt has occurred on pipe A AccessType: One to Clear
6	0b RW/1C	**PIPE_A_PANEL_SELF_REFRESH_STATUS:** This bit indicates interrupt is generated by the PSR controller and intends to send interrupt to SW driver when the PSR interrupt enable bit (70028h bit 22) is set. This is cleared when a write to this register occurs with this bit as a one. Write with this bit as a zero has no effect on the value of the bit. 0 = PSR Interrupt has not occurred on pipe A 1 = PSR interrupt has occurred on pipe A AccessType: One to Clear
5	0b RW/1C	**ODD_FIELD_INTERRUPT_STATUS:** This status bit will be set on a Odd field VBLANK event. This bit should only be used when this pipe is in an interlaced display timing. For synchronization with register updates, the actual event will occur one line after the start of VBLANK. To use this bit in a polling manner, clear the bit by writing a one to it followed by the polling loop waiting for it to become set. Note: This bit will not be set when pipe is in Interlaced with Field 0 Only using legacy vertical sync shift mode. 0 = Odd Field Vertical Blank has not occurred 1 = Odd Field Vertical Blank has occurred AccessType: One to Clear
4	0b RW/1C	**EVEN_FIELD_INTERRUPT_STATUS:** This status bit will be set on a even field VBLANK event. This bit should only be used when this pipe is in an interlaced display timing. For synchronization with register updates, the actual event will occur one line after the start of VBLANK. To use this bit in a polling manner, clear the bit by writing a one to it followed by the polling loop waiting for it to become set. Note: This bit will not be set when pipe is in Interlaced with Field 0 Only using legacy vertical sync shift mode. 0 = Even Field Vertical Blank has not occurred 1 = Even Field Vertical Blank has occurred AccessType: One to Clear
3	0b RW/1C	**PERFORMANCE_MONITOR_EVENT_INTERRUPT:** AccessType: One to Clear
2	0b RW/1C	**START_OF_VERTICAL_BLANK_INTERRUPT_STATUS:** This status bit will be set at the beginning of a VBLANK event. At this point, the double buffered display registers flip, taking their new values. To use this bit in a polling manner, clear the bit by writing a one to it followed by the polling loop waiting for it to become set. In MIPI DSR mode, GPIO TE trigger sets the Vblank Interrupt status 0 = Start of Vertical Blank has not occurred 1 = Start of Vertical Blank has occurred AccessType: One to Clear

Bit Range	Default & Access	Field Name (ID): Description
1	0b RW/1C	**FRAMESTART_INTERRUPT_STATUS:** This status bit will be set on a VBLANK event, when the frame start occurs. The display registers are updated at the start of vertical blank, but the new register data is not utilized by the display pipeline until the point in the vertical blank period when the frame start occurs, which is the event that triggers this bit. To use this bit in a polling manner, clear the bit by writing a one to it followed by the polling loop waiting for it to become set. 0 = Vertical Blank has not occurred 1 = Vertical Blank has occurred AccessType: One to Clear
0	0b RW/1C	**PIPE_A_HORIZONTAL_BLANK_STATUS:** 0 = Pipe A Horizontal Blank has not occurred 1 = Pipe A Horizontal Blank has occurred AccessType: One to Clear

Bit Range	Default & Access	Field Name (ID): Description
31:30	0b RW	**RESERVED:** Write as zero.
29:28	0b RW	**PIPE_SELECT:** [DevBW, DevCL, DevCDV] A state machine handles the synchronization of the switch to both vertical blank signals. So as far as the software is concerned, when both display pipes are being used, it can be switched at any time; the hardware will synchronize the switch. 00 = HW cursor is attached to Display Pipe A. This is the default after reset. 01 = HW cursor is attached to Display Pipe B. 10 = Reserved for pipe C 11 = Reserved for pipe D [DevBLC] and [DevCTG] Reserved: Write as zero.
27	0b RW	**POPUP_CURSOR_ENABLED:** . This bit should be turned on when using Cursor A as a popup cursor. When in popup mode, hardware interprets the cursor base address as a physical address instead of a graphics address.0 = Cursor A is hi-res 1 = Cursor A is popup
26	0b RW	**CURSOR_GAMMA_ENABLE:** This bit only has an effect when using the cursor in a non-VGA mode. In VGA pop-up operation, the cursor data will always bypass the gamma (palette) unit. 0 = Cursor pixel data bypasses gamma correction or palette (default). 1 = Cursor pixel data is gamma to be corrected in the pipe.
25:16	0b RW	**RESERVED_1:** Write as zero
15	0b RW	**_180ROTATION:** This mode causes the cursor to be rotated 180 . In addition to setting this bit, software must also set the base address to the lower right corner of the unrotated image. Only 32 bits per pixel cursors can be rotated. This field must be zero when the cursor format is 2 bits per pixel. 0 = No rotation 1 = 180 Rotation of 32 bit per pixel cursors
14:6	0b RW	**RESERVED_2:** Reserved.
5	0b RW	**CURSOR_MODE_SELECT_BIT:** See following table.
4	0b RW	**RESERVED_3:** Reserved.
3	0b RW	**RESERVED_4:** Reserved.
2:0	0b RW	**CURSOR_MODE_SELECT:** These three bits together with bit 5 select the mode for cursor as shown in the following table.

14.11.195 CURABASE—Offset 70084h

Cursor A Base Address Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 70084h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CURSOR_BASE_ADDRESS | RESERVED | DECRYPTION_REQUEST | POPUP_CURSOR_BASE_ADDRESS_MSBS

Bit Range	Default & Access	Field Name (ID): Description
31:6	0b RW	**CURSOR_BASE_ADDRESS:** . This field specifies bits 31:6 of the graphics address of the base of the cursor. On [DevBW] and [DevCL] if the cursor is a popup, this field specifies bits 31:6 of the physical address of the base of the cursor, and bits 35:32 of the address are specified in the LSBs of this register. Popup cursor mode is selected within the CURACNTR register.The cursor surface address must be 4K byte aligned. The cursor must be in linear memory, it cannot be tiled. When performing 180 rotation, this offset must be the difference between the last pixel of the last line of the cursor data in its unrotated orientation and the cursor surface address. A write to this register also acts as a trigger event to force the update of active registers from the staging registers on the next display event. Each cursor register is double-buffered. The CPU writes to a set of holding registers. The active registers are updated from the holding registers following the leading edge of the vertical blank pulse. The update is postponed until the next vblank if a write cycle is active to any of the cursor registers at the time of the vblank. The update is also postponed if a write sequence is in progress. It is assumed that if the cursor mode is changed, the cursor image will also be changed. To prevent the cursor from appearing when it is only partially programmed, the active registers will not be updated until both the cursor control and base address registers have been programmed. If the cursor control register is written, the cursor base address must also be written before the change will be effective. However, the base address register may be changed (e.g., to change the shape of the cursor) without also writing to the control register. If both are to be written, the control register must be written first.
5	0b RW	**RESERVED:** MBZ
4	0b RW	**DECRYPTION_REQUEST:** This bit requests decryption to be enabled for this plane. This request will be qualified with the separate decryption allow message in order to create the decryption enable. This bit is only allowed to change on a synchronous flip, but once set with a synchronous flip, the bit can remain set while using asynchronous flips. This value is loaded into the surface base address register of the associated plane. Usage must conform to the rules outlined in the plane surface base address register. 0 = Decryption request disabled (default) 1 = Decryption request enabled
3:0	0b RW	**POPUP_CURSOR_BASE_ADDRESS_MSBS:** ([DevBW] and [DevCL] Only). This field specifies bits 35:32 of the popup cursor physical address. If popup mode is not selected, this field is ignored.

Fields (bit 31 to bit 0): RESERVED, PIPE_SELECT, RESERVED_1, CURSOR_GAMMA_ENABLE, RESERVED_2, _180ROTATION, RESERVED_3, CURSOR_MODE_SELECT_BIT, RESERVED_4, CURSOR_MODE_SELECT

Bit Range	Default & Access	Field Name (ID): Description
31:30	0b RW	**RESERVED:** Write as zero.
29:28	0b RW	**PIPE_SELECT:** [DevBW, DevCL, DevCDV]: A state machine handles the synchronization of the switch to both vertical blank signals. So as far as the software is concerned, when both display pipes are being used, it can be switched at any time; the hardware will synchronize the switch. 00 = HW cursor is attached to Display Pipe A. This is the default after reset. 01 = HW cursor is attached to Display Pipe B. 10 = Reserved for to Display Pipe C. 11 = Reserved for to Display Pipe D. Reserved [DevBLC] and [DevCTG]: Write as zero.
27	0b RW	**RESERVED_1:** Write as zero.

Bit Range	Default & Access	Field Name (ID): Description
26	0b RW	**CURSOR_GAMMA_ENABLE:** 0 = Cursor pixel data bypasses gamma correction (default). 1 = Cursor pixel data is gamma to be corrected.
25:16	0b RW	**RESERVED_2:** Reserved.
15	0b RW	**_180ROTATION:** This mode causes the cursor to be rotated 180 . In addition to setting this bit, software must also set the base address to the lower right corner of the unrotated image. Only 32 bits per pixel cursors can be rotated. This field must be zero when the cursor format is 2 bits per pixel. 0 = No rotation 1 = 180 Rotation of 32 bit per pixel cursors
14:6	0b RW	**RESERVED_3:** Write as zero
5	0b RW	**CURSOR_MODE_SELECT_BIT:** See following table.
4:3	0b RW	**RESERVED_4:** reserved
2:0	0b RW	**CURSOR_MODE_SELECT:** These three bits together with bit 5 select the mode for cursor as shown in the following table.

14.11.203 CURBBASE—Offset 700C4h

Cursor B Base Address Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 700C4h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

Bits	Default	Field
31:6	0000 0000 0000 0000 0000 0000 00	CURSOR_BASE_ADDRESS
5	0	RESERVED
4	0	DECRYPTION_REQUEST_THIS_BIT_REQUESTS_DECRYPTION_TO_BE_ENABLED_FOR_THIS_PLANE
3:0	0000	POPUP_CURSOR_BASE_ADDRESS_MSBS

Bit Range	Default & Access	Field Name (ID): Description
31:6	0b RW	**CURSOR_BASE_ADDRESS:** This register specifies the graphics address of the entire cursor. It also acts as a trigger event to force the update of active registers on the next display event. The cursor surface address must be 4K byte aligned. The cursor must be in linear memory, it cannot be tiled. When performing 180 rotation, this offset must be the difference between the last pixel of the last line of the cursor data in its unrotated orientation and the cursor surface address. A write to this register also acts as a trigger event to force the update of active registers from the staging registers on the next display event. Each cursor register is double-buffered. The CPU writes to a set of holding registers. The active registers are updated from the holding registers following the leading edge of the vertical blank pulse. The update is postponed until the next vblank if a write cycle is active to any of the cursor registers at the time of the vblank. The update is also postponed if a write sequence is in progress. It is assumed that if the cursor mode is changed, the cursor image will also be changed. To prevent the cursor from appearing when it is only partially programmed, the active registers will not be updated until both the cursor control and base address registers have been programmed. If the cursor control register is written, the cursor base address must also be written before the change will be effective. However, the base address register may be changed (e.g., to change the shape of the cursor) without also writing to the control register. If both are to be written, the control register must be written first.
5	0b RW	**RESERVED:** MBZ
4	0b RW	**DECRYPTION_REQUEST_THIS_BIT_REQUESTS_DECRYPTION_TO_BE_ENABLED_FOR_THIS_PLANE:** This request will be qualified with the separate decryption allow message in order to create the decryption enable. This bit is only allowed to change on a synchronous flip, but once set with a synchronous flip, the bit can remain set while using asynchronous flips. This value is loaded into the surface base address register of the associated plane. Usage must conform to the rules outlined in the plane surface base address register. 0 = Decryption request disabled (default) 1 = Decryption request enabled
3:0	0b RW	**POPUP_CURSOR_BASE_ADDRESS_MSBS:** ([DevBW] and [DevCL] Only). This field specifies bits 35:32 of the popup cursor physical address. If popup mode is not selected, this field is ignored.

Bit Range	Default & Access	Field Name (ID): Description
31:6	0b RO	**CURSOR_B_LIVE_BASE_ADDRESS:** This gives the live value of the surface base address as being currently used for Cursor B plane.
5	0b RO	**RESERVED:** MBZ

Bit Range	Default & Access	Field Name (ID): Description
4	0b RO	**DECRYPTION_REQUEST_THIS_BIT_REQUESTS_DECRYPTION_TO_BE_ENABLED_FOR_THIS_PLANE:** This request will be qualified with the separate decryption allow message in order to create the decryption enable. This bit is only allowed to change on a synchronous flip, but once set with a synchronous flip, the bit can remain set while using asynchronous flips. This value is loaded into the surface base address register of the associated plane. Usage must conform to the rules outlined in the plane surface base address register. 0 = Decryption request disabled (default) 1 = Decryption request enabled
3:0	0b RO	**POPUP_CURSOR_BASE_ADDRESS_MSBS:** ([DevBW] and [DevCL] Only). This field specifies bits 35:32 of the popup cursor physical address. If popup mode is not selected, this field is ignored.

14.11.210 DSPAADDR—Offset 7017Ch

Display A Async flip Start Address Register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 7017Ch

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

Bits	31:12	11:4	3	2	1:0
Default	0000 0000 0000 0000 0000	0000 0000	0	0	00
Field	DISPLAY_A_START_ADDRESS_BITS	RESERVED	FLIP_SOURCE	DECRYPTION_REQUEST	RESERVED_1

Bit Range	Default & Access	Field Name (ID): Description
31:12	0b RW	**DISPLAY_A_START_ADDRESS_BITS:** This register provides the start address of the display A plane or the first eye when running in stereo mode. This address must be at least pixel aligned. This register can be written directly through software or by command packets in the command stream. It represents an offset from the graphics memory aperture base and is mapped to physical pages through the global GTT. This address must be 4K aligned. When performing asynchronous flips and the display surface is in tiled memory, this address must be 256K aligned. This register can be written directly through software or by command packets in the command stream. It represents an offset from the graphics memory aperture base and is mapped to physical pages through the global GTT. If the device supports trusted operation and this plane is not marked trusted, the memory pages must not be marked NoDMA . Write to this register triggers async flip. The async flip address is written into the Display A Base Address register 0x7019C

Bit Range	Default & Access	Field Name (ID): Description
11:4	0b RW	**RESERVED:** MBZ
3	0b RW	**FLIP_SOURCE:** Project: All Default Value: 0b This bit indicates if the source of the flip is CS or BCS so display can send the flip done response to the appropriate destination. ValueNameDescriptionProject 0b CS Flip source is CS All 1b BCS Flip source is BCS All
2	0b RW	**DECRYPTION_REQUEST:** Project: All Default Value: 0b This bit requests decryption to be enabled for this plane. This request will be qualified with the separate decryption allow message in order to create the decryption enable. This bit is only allowed to change on a synchronous flip, but once set with a synchronous flip, the bit can remain set while using asynchronous flips. This value is loaded into the surface base address register of the associated plane. Usage must conform to the rules outlined in the plane surface base address register.

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**DISPLAY_PLANE_A_PRIMARY_A_ENABLE:** When this bit is set, the primary plane will generate pixels for display. When set to zero, display plane A memory fetches cease and display is blanked (from this plane) at the next VBLANK event from the pipe that display A is assigned. The display pipe must be enabled to enable this plane. There is an override for the enable of this plane in the Pipe Configuration register. 1 = Enable 0 = Disable
30	0b RW	**DISPLAY_A_GAMMA_ENABLE:** This bit should only be changed after the plane has been disabled. It controls the bypassing of the display pipe gamma unit for this display plane s pixel data only. For 8-bit indexed display data, this bit should be set to a one. 0 = Display A pixel data bypasses the display pipe gamma correction logic (default). 1 = Display A pixel data is gamma corrected in the display pipe gamma correction logic.
29:26	0b RW	**DISPLAY_A_SOURCE_PIXEL_FORMAT:** These bits should only be changed after the plane has been disabled. Pixel formats with an alpha channel (8:8:8:8) should not use source keying. Pixel format of 8-bit indexed uses the palette. Before entering the blender, each source format is converted to 10 bits per pixel (details are described in the intermediate precision for the blender section of the Display Functions chapter). 000x = Reserved. 0010 = 8-bpp Indexed. 0011 = Reserved. 0100 = Reserved. 0101 = 16-bit BGRX (5:6:5:0) pixel format (XGA compatible). 0110 = 32-bit BGRX (8:8:8:8) pixel format. Ignore alpha. 0111 = 32-bit BGRA (8:8:8:8) pixel format. (with pre-multiplied alpha color format) 1000 = 32-bit RGBX (10:10:10:2) pixel format. Ignore alpha. 1001 = 32-bit RGBA (10:10:10:2) pixel format. (with pre-multiplied alpha color format) 1010 = 32-bit BGRX (10:10:10:2) pixel format Ignore alpha 1011 = 32-bit BGRA (10:10:10:2) pixel format (with pre-multiplied alpha color format) 1100 = 64-bit RGBX (16:16:16:16) 16 bit floating point pixel format. Ignore alpha. 1101 = 64-bit RGBA (16:16:16:16) 16-bit floating point pixel format (with pre-multiplied color format) 1110 = 32-bit RGBX (8:8:8:8) pixel format. Ignore alpha. 1111 = 32-bit RGBA (8:8:8:8) pixel format (with pre-multiplied color format)
25:24	0b RO	**PIPE_SELECT:** Plane A always ties to Pipe A. AccessType: Read Only Reserved

Bit Range	Default & Access	Field Name (ID): Description
23	0b RW	**KEY_WINDOW_ENABLE:** . This bit applies only to devices with a display plane C. This bit is set to one when the color key is used as a destination key for display C. Display plane C must be enabled on the same pipe and it s Z-order should be programmed to be behind display A for this to be set to a one.0 = Source Key applies to entire display plane A 1 = Source Key applies to only pixels within the intersection between Display A and Display C [DevBLC] and [DevCTG]: Reserved
22	0b RW	**KEY_ENABLE:** . This bit enables source keying for display A. Source keying allows a plane that is behind (below) this plane to show through where the display A key matches the display A data. This function is overloaded to provide display C destination keying when combined with the key window enable bit. Setting this bit is not allowed when the display pixel format includes an alpha channel.0 = Source key is disabled 1 = Source key is enabled [DevBLC] and [DevCTG]: Reserved In destination keying, primary plane pixel will be made transparent when blending with sprite pixel as the destination if the primary src key matches with the primary pixel value.
21:20	0b RW	**PIXEL_MULTIPLY:** This cause the display plane to duplicate lines and pixels sent to the assigned pipe. In the pixel multiply mode, the horizontal pixels are doubled and lines are sent twice. Asynchronous flips are not used in this mode. Programming Notes: Asynchronous flips are not permitted when pixel multiply is enabled. 00 = No duplication 01 = Line/pixel Doubling 10 = Reserved 11 = Pixel Doubling only
19	0b RW	**RESERVED:** Software must preserve the contents of this bit.
18	0b RW	**RESERVED_1:** Write as zero
17:16	0b RW	**RESERVED_2:** Software must preserve the contents of this bit.
15	0b RW	**_180DISPLAY_ROTATION:** This mode causes the display plane to be rotated 180 . In addition to setting this bit, software must also set the base address to the lower right corner of the unrotated image. [DevCL] Do not enable 180 rotation together with Frame Buffer Compression0 = No rotation 1 = 180 rotation
14	0b RW	**RESERVED_3:** [DevBW, DevCL, DevCDV]: [DevBLC] and [DevCTG] Display A Trickle Feed Enable: 0 = Trickle Feed Enabled - Display A data requests are sent whenever there is space in the Display Data Buffer. 1 = Trickle Feed Disabled - Display A data requests are sent in bursts. Note: On mobile products this bit will be ignored such that Trickle Feed is always disabled. [DevELK] Must always be programmed disabled
13	0b RW	**RESERVED_4:** [DevBW, DevCL, DevCDV]: [DevBLC] and [DevCTG] Display A Data Buffer Partitioning Control: 0 = Display A Data Buffer will encompass Sprite A buffer space when Sprite A is disabled. 1 = Display A Data Buffer will not use Sprite A buffer space when Sprite A is disabled. Note: When in C3xR Max FIFO mode, this bit will be ignored.
12:11	0b RW	**RESERVED_5:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
10	0b RW	**TILED_SURFACE:** . This bit indicates that the display A surface data is in tiled memory. The tile pitch is specified in bytes in the DSPASTRIDE register. Only X tiling is supported for display surfaces.When this bit is set, it affects the hardware interpretation of the DSPATILEOFF, DSPALINOFF, and DSPASURF registers. 0 = Display A surface uses linear memory 1 = Display A surface uses X-tiled memory
9	0b RW	**RESERVED_6:** [DevBW, DevCL, DevCDV] Write as zero [DevBLC, DevCTG] Asynchronous Surface Address Update Enable: This bit will enable asynchronous updates of the surface address when written by MMIO. The surface address will change with the next TLB request or when start of vertical blank is reached. Updates during vertical blank may not complete until after the first few active lines are displayed. Restrictions: No command streamer initiated surface address updates are allowed when this bit is enabled. Only one asynchronous update may be made per frame. Must wait for vertical blank before again writing the surface address register. 0 = DSPASURF MMIO writes will update synchronous to start of vertical blank (default) 1 = DSPASURF MMIO writes will update asynchronously
8:1	0b RW	**RESERVED_7:** Write as zero
0	0b RW	**S3D_FORCE_DISPLAY_A_BOTTOM:** This bit will force the display A plane to be on the bottom of any sprite planes in the Z order. 0 = Display A Z-order is determined by the other control bits in pipe A 1 = Display A is forced to be on the bottom of any sprite planes in Z-order in pipe A

14.11.212 DSPALINOFF—Offset 70184h

Display A Linear Offset Register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

DISPLAY_A_OFFSET

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	**DISPLAY_A_OFFSET:** This register provides the panning offset into the display A plane. This value is added to the surface address to get the graphics address of the first pixel to be displayed. This offset must be at least pixel aligned. This offset is the difference between the address of the upper left pixel to be displayed and the display surface address. When performing 180 rotation, this offset must be the difference between the last pixel of the last line of the display data in its unrotated orientation and the display surface address.

14.11.213 DSPASTRIDE—Offset 70188h

Display A Stride Register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 70188h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)

DISPLAY_A_STRIDE	RSVD0

Bit Range	Default & Access	Field Name (ID): Description
31:6	0b RW	**DISPLAY_A_STRIDE:** This is the stride for display A in bytes. When using linear memory, this must be 64 byte aligned. When using tiled memory, this must be 512 byte aligned. This value is used to determine the line to line increment for the display. This register is updated either through a command packet passed through the command stream or writes to this register. When it is desired to update both this and the start register, the stride register must be written first because the write to the start register is the trigger that causes the update of both registers on the next VBLANK event. When using tiled memory, the actual memory buffer stride is limited to a maximum of 16K bytes. [DevBW, DevCL, DevCDV] The display stride must be power of 2 when doing Asynch Flips. [DevBW, DevCL, DevCDV] The display stride must be 8KB or greater when doing Asynch Flips together with 180 rotation. The value in this register is updated through the command streamer during a synchronous flip.

20	0b RW	**HPD_INPUT_PIN_DISABLE (HPD_INPUT_ENABLE):** [DevVLVP]: this bit is used to disable HPD detection in the Display core from using HPD input pin pin 0 = HPD Input pin is enabled to detect HPD detection by Display core (default) 1 = HPD input is pin is disabled to detect HPD detection by Display core
19	0b RW	**CR12_WRITE_COUNTER_RESET:** 0 = Disable CR12 write counter reset 1 = Enable CR12 write counter reset
18	0b RW	**RESERVED_2:** Reserved.
17	0b RW	**MONITOR_DETECTION:** This bit is used to test the monitor detection. Do not program unless directed.
16	0b RW	**INVERT_DPO_FIELD:** Invert DPO interlaced field output. This bit is used to invert the field sense input to the planes from DPO.
15	0b RW	**RESERVED_3:** Reserved.
14	0b RW	**HPD_TEST_MODE:** load programmable value for filter and long pulse value of HPD register 0x70408.
13	0b RW	**SDVOC_SELECT:** sdvoc deglitch logic output select
12	0b RW	**SDVOB_SELECT:** sdvob deglitch logic output select

Bit Range	Default & Access	Field Name (ID): Description
11	0b RW	**VGA_STALL:** Stall native mode VGA when frequency is over 50 MHz. This bit is only used during VGA native mode.
10	0b RW	**RESERVED_4:** to prevent async flip failures.
9	0b RW	**PIXEL_SIZE:** This bit changes the VGA pixel width and height calculations.
8	0b RW	**IMMEDIATE_ASYNCHRONOUS_FLIPS:** This bit causes asynchronous flips to complete immediately upon the start of the vertical blank period. When enabling this feature, frame start should also be moved to the end of the vertical blank period by setting the frame start position bit.
7	0b RW	**PIPE_B_FRAME_START_POSITION:** This bit changes the position of frame start on pipe B. This feature is used in conjunction with the immediate asynchronous flips bit to enable fast asynchronous flips during vertical blanking. 0 = frame start occurs at start of the vertical blank period 1 = frame start occurs at end of the vertical blank period Default: 1, causing frame start to occur at the end of vertical blank
6	0b RW	**PIPE_B_PALETTE_WRITE_ENABLE:** Disables anti-collision logic in the palette during non-blanking periods on pipe B.
5	0b RW	**PIPE_A_PALETTE_WRITE_ENABLE:** Disables anti-collision logic in the palette during non-blanking periods on pipe A
4	0b RW	**VRD_FONT_FIFO_REQUEST_DELAY_ENABLE:** This bit enable VRD font read request delay in VGA mode
3	0b RW	**PIPE_A_FRAME_START_POSITION:** This bit changes the position of frame start on pipe A. This feature is used in conjunction with the immediate asynchronous flips bit to enable fast asynchronous flips during vertical blanking. 0 = frame start occurs at start of the vertical blank period 1 = frame start occurs at end of the vertical blank period Default: 1, causing frame start to occur at the end of vertical blank
2	0b RW	**RESERVED_6:** Reserved.
1	0b RW	**PLLB_SAFE_SHUTDOWN_OVERRIDE:** This bit disables the dependency for pipe B to be disabled before the PLL is shut down
0	0b RW	**PLLA_SAFE_SHUTDOWN_OVERRIDE:** This bit disables the dependency for pipe A to be disabled before the PLL is shut down

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**DPRDDB_VGAENRST_DIS:** Enable rise and fall detection of DPRvgadis for DDB reset (dprddb_vgaenrst_dis)
30:28	0b RW	**RESERVED:** Reserved.
27	0b RW	**DCN_447625:** : - x8 support for hybrid gfx, Kwasi requested (dpr_dpio_x8_conc_sel)
26	0b RW	**DPIOMB0UNIT:** ignoring EDP logic when enabling Lanes by the dptc_otxoenb [DevVLVP]: Reserved
25	0b RW	**DPSEL_OVERRIDE:** when this chicken bit is set override the selects to 0 (dpsel_override) timeslice_sync_rst_b = DPRVGAdis | mrchicken2_Q[25]
24	0b RW	**DITHERING_ENHANCE_DISABLE:** Anh need for dithering enhace (dithering_enhance_disable)
23	0b RW	**EDGE:** edgeA/Bvblank, edgeDPSA/Bvblank, curA/Bedgevblank,
22	0b RW	**DPRAUDM_EARLY_HDE_DISABLE:** Chicken bit to Audio unit to disable early RAM FIFO read in 2-channel mode (DPRAUDM_early_hde_disable)
21	0b RW	**DPLRUNIT:** Selects cdclk for pwm logic, pwm logic, uses hrawclk by default (select cdclk in scan mode or by setting a chicken bit) [DevVLVP]: Reserved
20	0b RW	**DPRAUDM_CKGATE_PKTCNTRL_IDLE_DIS:** Chicken bit to disable audclk gating when pktcontrol FSM is idle (DPRAUDM_ckgate_pktcntrl_idle_dis)
19	0b RW	**DPR_DPIO_PORTOFF_NOT_HBLK_CHICKEN:** This bit is needed to qualify the port off with hblank to take care of fragmented audio packet sent off. When chicken bit is enabled, the port off is dependent upon state of hblank, else the legacy behavior rules (dpr_dpio_portoff_not_hblk_chicken)
18	0b RW	**MMIO_WRITE_EVENT:** 0: mmio_write_event = RMDecPipeSLC_pre 1: mmio_write_event = 1'b0
17	0b RW	**DBLATEN_ARMED_CURA_B:** Dblaten_armed_curA/B

Bit Range	Default & Access	Field Name (ID): Description
16	0b RW	**HPD_INTR_FIX:** Freeses hpdb_intr_fix, hpdc_intr_fix, hpdd_intr_fix
15	0b RW	**RESERVED_1:** Reserved.
14	0b RW	**PORT_B_LANES_READY_IGNORE:** 1: Lanes considered as ready for normal operation 0: usual operation: Lanes readiness indications arrived from DPIO SEG outputs [DevVLVP]: Reserved
13	0b RW	**PORT_C_LANES_READY_IGNORE:** 1: Lanes considered as ready for normal operation 0: usual operation: Lanes readiness indications arrived from DPIO SEG outputs [DevVLVP]: Reserved
12	0b RW	**DPLLS_OK_IGNORE:** 1: Both mPHY DPLLs considered as OK ('1'). Lanes can be enabled. 0: usual operation: DPLL readiness indications arrived from DPIO SEG outputs [DevVLVP]: Reserved
11	0b RW	**DPR_DPS_NOA_SCALEEN:** This bit is to enable viewing critical control signals that were added as a result of Cantiga B0 Overlay changes. Default = 0. (dpr_dps_noa_scaleen) 0: Non-scaling signals are sent to NOA bus 1: Scaling signals are sent to the NOA bus
10	0b RW	**DPR_VS_AFLIPTOTAL_CHICKEN:** This chicken bit bypasses the current logic used for calculating the number of requests to make for an asynchronous flip. It will be helpful because the current logic is very difficult to validate. (dpr_vs_afliptotal_chicken)
9	0b RW	**DPR_VS_BYTEEN_CHICKEN:** This chicken bit bypasses the current logic used for selecting the proper byte enables. It is intended to address byte enables during asynchronous flips, but it was easier to bypass the entire byte-enable circuit instead. HSD bug #1932963. (dpr_vs_byteen_chicken)
8	0b RW	**DPR_VS_AFLIPADDR_CHICKEN:** This chicken bit bypasses the current logic used for selecting the starting fetch address of an asynchronous flip. HSD bug #1932964. (dpr_vs_aflipaddr_chicken)
7:6	0b RW	**DPRDDB_SYNC_SELECT:** When set vsync reset is asserted and when clear no reset is asserted. (dprddb_novsyncreset) This selects between VRVSYNC and hi-res VSYCN when set with dprvrd_novsyncreset also set sync_select novsyncreset. (dprddb_sync_select) X0 = No Vsync reset 01 = VGA vsync or hi-res between Nat and UL mode 11 = VGA vsync reset in both UL and native
5	0b RW	**DDBMUNIT:** C0 ECO1 chicken bit defaulted to fix enable
4	0b RW	**HDCPUNIT:** EGLK A5 ECO1 Fix. Read Data Fix For RMBus Protocol. vsmunit: Lock Up Issue.
3:2	0b RW	**DPRVGA_DPBSTALL_UL_THRESHOLD:** VGATEST2 issue fix, Stall throttling done during horiz_blank and UL mode is asserted. (DPRVGA_dpbstall_ul_threshold). 01: DPB to VGA stall during UL mode
1	0b RW	**DPRAUDM_SAMPLE_PRESENT_DISABLE:** When set this bit will disable the sample present bits being set in layout 1 mode of Audio. Default is to enable sample present on Audio. (DPRAUDM_sample_present_disable) vsmunit: FBC/SR Power Fix
0	0b RW	**RESERVED_2:** [DevVLVP] MBZ. This bit si the same as bit 31 in 70450h rega_loadcount_crtdetect

4	0	DITHERING_ENABLE
3:2	0 0	DITHERING_TYPE
1	0	DDA_RESET_TEST_MODE
0	0	RESERVED_2

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**PIPE_B_ENABLE:** Setting this bit to the value of one, turns on pipe B. This must be done before any planes are enabled on this pipe. Changing it to a zero should only be done when all planes that are assigned to this pipe have been disabled. Turning the pipe enable bit off disables the timing generator in this pipe. Plane disable occurs after the next VBLANK event after the plane is disabled. Synchronization pulses to the display are not maintained if the timing generator is disabled. Power consumption will be at its lowest state when disabled. A separate bit controls the DPLL enable for this pipe. Pipe timing registers should contain valid values before this bit is enabled. Disabling the Pipe and changing the timing registers and re-enabling the pipe before the next VBLANK will cause the mode change to occur at the end of the current frame. This requires no wait on the software s part. On the other hand, if this is the disabling of the pipe, that does require a software wait for VBLANK to occur. Synchronization pulses to the display are not maintained if the timing generator is disabled. Power consumption is at it s lowest state. 1 = Enable 0 = Disable
30	0b RO	**PIPE_STATE:** This bit indicates the actual state of the pipe. Since there can be some delay between disabling the pipe and the pipe actually shutting off, this bit indicates the true current state of the pipe. 0 = Disabled 1 = Enabled AccessType: Read Only

Bit Range	Default & Access	Field Name (ID): Description
29	0b RW	**RESERVED:** Write as zero.
28:27	0b RW	**FRAME_START_DELAY:** Used to delay the frame start signal that is sent to the display planes. Normal operation uses the default 00 value and test modes can use the delayed frame start to shorten the test time. This would be set to 00 for normal operation. 00 = Frame Start occurs on the first HBLANK after the start of VBLANK 01 = Frame Start occurs on the second HBLANK after the start of VBLANK 10 = Frame Start occurs on the third HBLANK after the start of VBLANK 11 = Frame Start occurs on the forth HBLANK after the start of VBLANK
26	0b RW	**DISPLAY_PORT_AUDIO_ONLY_MODE:** [DevVLVP] Setting this bit to 1 indicates the DisplayPort will output audio only. 0 = DisplayPort will output Video or Video and Audio 1 = DisplayPort will output Audio only
25	0b RW	**FORCE_BORDER:** : (TEST MODE)0 = Normal Operation 1 = Color information is ignored and border color is substituted during active region
24	0b RW	**PIPE_B_GAMMA_UNIT_MODE:** . This bit selects which mode the pipe gamma correction logic works in. In the palette mode, it behaves as a 3X256x8 RAM lookup. VGA and indexed mode operation should use the palette in 8-bit mode. In the 10-bit gamma mode, it will act as a piecewise linear interpolation. Other gamma units such as in the overlay and sprite are unaffected by this bit.0 = 8-bit Palette Mode 1 = 10-bit Gamma Mode
23:21	0b RW	**INTERLACED_MODE:** These bits are used for software control of interlaced behavior. They are updated immediately if the pipe is off, or in the vertical blank after programming if pipe is enabled. 0xx = Progressive 100 = Interlaced embedded panel using programmable vertical sync shift (2x) 101 = Interlaced using vertical sync shift. Backup option to setting 110. (2x) 110 = Interlaced with VSYNC/HSYNC Field Indication using legacy vertical sync shift. Used for SDVO. 111 = Interlaced with Field 0 Only using legacy vertical sync shift. Not used. Note: VGA display modes, sDVO line stall, and Panel fitting do not work while in interlaced modes Setting the Interlaced embedded panel mode causes hardware to automatically modify the output to match the specifications of panels that support interlaced mode.
20	0b RW	**MIPI_DISPLAY_SELF_REFRESH_MODE_FOR_MIPI_B:** .0 = Normal Operation, display controller generate timing and refresh display panel at refresh rate 1 = Display self-refresh mode. Display controller update frame buffer in display module on demand only
19	0b RW	**DISPLAY_OVERLAY_PLANES_OFF:** . This bit when set will cause all enabled Display and overlay planes that are assigned to this pipe to be disabled by overriding the current setting of the plane enable bit, at the next VBLANK. Timing signals continue as they were but the screen becomes blank. Setting the bit back to a zero will then allow the display and overlay planes to resume on the following VBLANK.0 = Normal Operation 1 = Planes assigned to this pipe are disabled.
18	0b RW	**CURSOR_PLANES_OFF:** . This bit when set will cause all enabled cursor planes that are assigned to this pipe to be disabled by overriding the current setting of the plane enable bit, at the next VBLANK. Timing signals continue as they were but the screen becomes blank. Setting the bit back to a zero will then allow the cursor planes to resume on the following VBLANK. 0 = Normal Operation 1 = Planes assigned to this pipe are disabled.

Bit Range	Default & Access	Field Name (ID): Description
17:16	0b RW	**REFRESH_RATE_CXSR_MODE_ASSOCIATION:** These bits select how refresh rates are tied to CxSR on pipe B. When they are set to anything other than 00, bits 23:21 of this register must be programmed to 0xx. Switching between 01 and 10 settings directly is not allowed. Software must program this field to 00 before switching. Software is responsible for enabling this mode only for integrated dispay panels that support corresponding mode. 00 Default no dynamic refresh rate change enabled. Software control only. 01 Progressive-to-progressive refresh rate change enabled and tied to CxSR. Pixel clock values set in FPB0/FPB1 settings in the DPLLB control register and FPB0/FPB1 divider registers. 10 Progressive-to-interlaced refresh rate change enabled and tied to CxSR. Pixel clock value does not change in this case. Scaling must be disabled in this mode. Uses programmable VS shift 11 Reserved
15	0b RW	**COLOR_CORRECTION_MATRIX_ENABLE_ON_PIPE_B:** 1 = Color Correction Coefficients are enabled to perform color correction 0 = Color Correction Coefficients are disabled
14	0b RW	**DISPLAYPORT_POWER_MODE_SWITCH_DEVVLVP:** This bit selects the software controlled progressive to progressive power saving mode (software controlled DRRS). Hardware Controlled Refresh Rate Select must be disabled when enabling this. Link and data M/N 1 values are used for normal settings, M/N 2 values are used for low power settings. 0 Normal progressive refresh rate (default) 1 Low Power progressive refresh rate
13	0b RW	**COLOR_RANGE_SELECT:** [DevVLVP]: This bit is used to select the color range of RBG outputs. 0 = Apply full 0-255 color range to the output (Default) 1 = Apply 16-235 color range to the output
12	0b RW	**S3D_SPRITE_ORDER:** This bit controls the blending order of the sprite planes for S3D support: 0 = Sprite C first. The first line or pixel comes from Sprite C (default) 1 = Sprite D first. The first line or pixel comes from Sprite D
11:10	0b RW	**S3D_SPRITE_INTERLEAVING_FORMAT:** These bits control the Sprite C/D interleaving format in S3D mode 00 = No interleaving 01 = Line interleaving 10 = Pixel interleaving 11 = Reserved
9:8	0b RW	**RESERVED_1:** [DevCDV, DevVLVP] MBZ Scrambling enable [DevCTG]: This bit enables scrambling for DisplayPort. Software must set this bit appropriately when enabling a DisplayPort output. 00 = Scrambling disabled (Default) 01 = Scrambling enabled, no SR after initialization at loop 2 of training 10 - RESERVED 11 = Scrambling and SR enabled. Scrambling is reset every 512 BS symbols.
7:5	0b RW	**BITS_PER_COLOR:** [DevCTG, DevCDV, DevVLVP]: This field selects the number of bits per color sent to a receiver device connected to this port. Color format takes place on the Vblank after being written. Color format change can be done independent of a pixel clock change. Selecting a pixel color depth higher or lower than the pixel color depth of the frame buffer results in dithering the output stream. For further details on Display Port fixed frequency programming to accommodate these formats refer to DP Frequency Programming in DPLL section of Bspec. 000 = 8 bits per color (Default) 001 = 10 bits per color 010 = 6 bits per color 011 = RESERVED 1xx = RESERVED
4	0b RW	**DITHERING_ENABLE:** [DevCTG, DevCDV]: This bit enables dithering for DisplayPort 6bpc or 8bpc modes 0 Dithering disabled (Default) 1 Dithering enabled Programming Note: Dithering should only be enabled for 8bpc or 6bpc.

Bit Range	Default & Access	Field Name (ID): Description
3:2	0b RW	**DITHERING_TYPE:** [DevCTG, DevCDV]: This bit selects dithering type for DisplayPort 6bpc or 8bpc modes 00 - Spatial only (default) 01- Spatio-Temporal 1 10- Spatio-Temporal 2 (testmode) 11- Temporal only (testmode)
1	0b RW	**DDA_RESET_TEST_MODE:** [DevCTG, DevCDV]: 0 Do not reset DDA 1 Reset DDA every 8th display frame
0	0b RW	**RESERVED_2:** Write as zero

DISPLAY_B_START_ADDRESS_BITS																				RESERVED_MBZ								FLIP_SOURCE	DECRYPTION_REQUEST	RESERVED_MBZ_1	

Bit Range	Default & Access	Field Name (ID): Description
31:12	0b RW	**DISPLAY_B_START_ADDRESS_BITS:** This register provides the start address of the display B plane or the first eye when running in stereo mode. This address must be at least pixel aligned. This register can be written directly through software or by command packets in the command stream. It represents an offset from the graphics memory aperture base and is mapped to physical pages through the global GTT. This address must be 4K aligned. When performing asynchronous flips and the display surface is in tiled memory, this address must be 256K aligned. This register can be written directly through software or by command packets in the command stream. It represents an offset from the graphics memory aperture base and is mapped to physical pages through the global GTT. If the device supports trusted operation and this plane is not marked trusted, the memory pages must not be marked NoDMA . Write to this register triggers async flip The async flip address is written into the Display B Base Address register 0x7119C
11:4	0b RW	**RESERVED_MBZ:** Reserved.
3	0b RW	**FLIP_SOURCE:** Project: All Default Value: 0b This bit indicates if the source of the flip is CS or BCS so display can send the flip done response to the appropriate destination. ValueNameDescriptionProject 0b CS Flip source is CS All 1b BCS Flip source is BCS All
2	0b RW	**DECRYPTION_REQUEST:** Project: All Default Value: 0b This bit requests decryption to be enabled for this plane. This request will be qualified with the separate decryption allow message in order to create the decryption enable. This bit is only allowed to change on a synchronous flip, but once set with a synchronous flip, the bit can remain set while using asynchronous flips. This value is loaded into the surface base address register of the associated plane. Usage must conform to the rules outlined in the plane surface base address register.
1:0	0b RW	**RESERVED_MBZ_1:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**DISPLAY_B_SPRITE_PRIMARY_B_ENABLE:** This bit will enable or disable the display B/sprite. When this bit is set, the plane will generate pixels for display. When set to zero, memory fetches cease and display is blanked (from this plane) at the next VBLANK event from the pipe that this plane is assigned. At least one of the display pipes must be enabled to enable this plane. There is an override for the enable of this plane in the Pipe Configuration register. 1 = Enable 0 = Disable
30	0b RW	**DISPLAY_B_SPRITE_GAMMA_ENABLE:** This bit should only be changed after the plane has been disabled. It controls the bypassing of the display pipe gamma unit for this display plane pixel data only. For 8-bit indexed display data, this bit should be set to a one. 0 = Display B pixel data bypasses the pipe gamma correction logic (default). 1 = Display B pixel data is gamma corrected in the pipe gamma correction logic

Bit Range	Default & Access	Field Name (ID): Description
29:26	0b RW	**DISPLAY_B_SOURCE_PIXEL_FORMAT:** This field selects the pixel format for the sprite/display B. Pixel formats with an alpha channel (8:8:8:8) should not use source keying. Before entering the blender, each source format is converted to 10 bits per pixel (details are described in the intermediate precision for the blender section of the Display Functions chapter). 000x = Reserved. 0010 = 8-bpp Indexed. 0011 = Reserved. 0100 = Reserved. 0101 = 16-bit BGRX (5:6:5:0) pixel format (XGA compatible). 0110 = 32-bit BGRX (8:8:8:8) pixel format. Ignore alpha. 0111 = 32-bit BGRA (8:8:8:8) pixel format. (with pre-multiplied alpha color format) 1000 = 32-bit RGBX (10:10:10:2) pixel format. Ignore alpha. 1001 = 32-bit RGBA (10:10:10:2) pixel format. (with pre-multiplied alpha color format) 1010 = 32-bit BGRX (10:10:10:2) pixel format Ignore alpha 1011 = 32-bit BGRA (10:10:10:2) pixel format (with pre-multiplied alpha color format) 1100 = 64-bit RGBX (16:16:16:16) 16 bit floating point pixel format. Ignore alpha. 1101 = 64-bit RGBA (16:16:16:16) 16-bit floating point pixel format (with pre-multiplied color format) 1110 = 32-bit RGBX (8:8:8:8) pixel format. Ignore alpha. 1111 = 32-bit RGBA (8:8:8:8) pixel format (with pre-multiplied color format)
25:24	01b RO	**PIPE_SELECT:** Plane B always ties to Pipe B. Reserved AccessType: Read Only
23	0b RW	**KEY_WINDOW_ENABLE:** This applies only to devices with a Display Plane C. It determines what area of the screen the source key compare should be applied. This bit is set to one when the color key is used as a destination key for display C. Display plane C must be enabled on the same pipe and display A should not be enabled on this pipe for this to be used. The function is only effective when display C is enabled and defined by Z-order to be behind display B. 0 = If keying is enabled, it applies to the entire display B plane 1 = If keying is enabled, it applies only to the intersection between display B and display C [DevBLC] and [DevCTG]: Reserved
22	0b RW	**SOURCE_KEY_ENABLE:** When used as a sprite or a secondary this enables source color keying. Sprite pixel values that match the key will become transparent. Source keying allows a plane that is behind (below) this plane to show through where the display B data matches the display B key. This function is overloaded to provide display C destination keying when combined with the key window enable bit.. Setting this bit is not allowed when the display pixel format includes an alpha channel. 0 = Sprite source key is disabled (default) 1 = Sprite source key is enabled. [DevBLC] and [DevCTG]: Reserved In destination keying, primary plane pixel will be made transparent when blending with sprite pixel as the destination if the primary src key matches with the primary pixel value.
21:20	0b RW	**PIXEL_MULTIPLY:** This cause the display plane to duplicate lines and pixels sent to the assigned pipe. In the line/pixel doubling mode, the horizontal pixels are doubled and lines are sent twice. Asynchronous flips are not used in this mode. Programming Notes: Asynchronous flips are not permitted when pixel multiply is enabled. 00 = No duplication 01 = Line/pixel Doubling 10 = Reserved 11 = Pixel Doubling only
19:16	0b RW	**RESERVED:** Write as zero
15	0b RW	**_180DISPLAY_ROTATION:** This mode causes the display plane to be rotated 180 . In addition to setting this bit, software must also set the base address to the lower right corner of the unrotated image. [DevCL] Do not enable 180 rotation together with Frame Buffer Compression 0 = No rotation 1 = 180 rotation

Bit Range	Default & Access	Field Name (ID): Description
14	0b RW	**RESERVED_1:** [DevBW, DevCL, DevCDV] [DevBLC, DevCTG] Display B Trickle Feed Enable: 0 = Trickle Feed Enabled - Display B data requests are sent whenever there is space in the Display Data Buffer. 1 = Trickle Feed Disabled - Display B data requests are sent in bursts. Note: On mobile products this bit will be ignored such that Trickle Feed is always disabled. [DevELK] Must always be programmed disabled
13	0b RW	**RESERVED_2:** [DevBW, DevCL, DevCDV] [DevBLC, DevCTG] Display B Data Buffer Partitioning Control: 0 = Display B Data Buffer will encompass Sprite B buffer space when Sprite B is disabled. 1 = Display B Data Buffer will not use Sprite B buffer space when Sprite B is disabled. Note: When in C3xR Max FIFO mode, this bit will be ignored.
12:11	0b RW	**RESERVED_3:** Reserved.
10	0b RW	**TILED_SURFACE:** This bit indicates that the display B surface data is in tiled memory. The tile pitch is specified in bytes in the DSPBSTRIDE register. Only X tiling is supported for display surfaces. When this bit is set, it affects the hardware interpretation of the DSPBLINOFF, DSPBTILEOFF, and DSPBSURF registers. 0 = Display B surface uses linear memory 1 = Display B surface uses X-tiled memory
9	0b RW	**RESERVED_4:** [DevBW, DevCL, DevCDV] Write as zero [DevBLC, DevCTG] Asynchronous Surface Address Update Enable: This bit will enable asynchronous updates of the surface address when written by MMIO. The surface address will change with the next TLB request or when start of vertical blank is reached. Updates during vertical blank may not complete until after the first few active lines are displayed. Restrictions: No command streamer initiated surface address updates are allowed when this bit is enabled. Only one asynchronous update may be made per frame. Must wait for vertical blank before again writing the surface address register. 0 = DSPBSURF MMIO writes will update synchronous to start of vertical blank (default) 1 = DSPBSURF MMIO writes will update asynchronously
8:1	0b RW	**RESERVED_5:** Write as zero
0	0b RW	**S3D_FORCE_DISPLAY_B_BOTTOM:** This bit will force the display B plane to be on the bottom of any sprite planes in the Z order. 0 = Display B Z-order is determined by the other control bits in pipe B 1 = Display B is forced to be on the bottom of any sprite planes in Z-order in pipe B

DISPLAY_B_SPRITE_STRIDE

RESERVED

Bit Range	Default & Access	Field Name (ID): Description
31:6	0b RW	**DISPLAY_B_SPRITE_STRIDE:** This is the stride for display B/Sprite in bytes. When using linear memory, this must be 64 byte aligned. When using tiled memory, this must be 512 byte aligned. The maximum value for this register is fixed. This register is updated through a command packet passed through the command stream or writes to this register. When it is desired to update both this and the start register, the stride register must be written first because the write to the start register is the trigger that causes the update of both registers on the next VBLANK event. When using tiled memory, the actual memory buffer stride is limited to a maximum of 16K bytes. [DevBW, DevCL, DevCDV] The display stride must be power of 2 when doing Asynch Flips. [DevBW, DevCL, DevCDV] The display stride must be 8KB or greater when doing Asynch Flips together with 180 rotation. The value in this register is updated through the command streamer during a synchronous flip.

DISPLAY_B_SURFACE_BASE_ADDRESS	RESERVED_MBZ	FLIP_SOURCE	DECRYPTION_REQUEST	RESERVED_MBZ_1

Bit Range	Default & Access	Field Name (ID): Description
31:12	0b RW	**DISPLAY_B_SURFACE_BASE_ADDRESS:** This address specifies the surface base address. When the surface is tiled, panning is specified using (x, y) offsets in the DSPBTILEOFF register. When the surface is in linear memory, panning is specified using a linear offset in the DSPBLINOFF register. This address must be 4K aligned. When performing asynchronous flips and the display surface is in tiled memory, this address must be 256K aligned. This register can be written directly through software or by command packets in the command stream. It represents an offset from the graphics memory aperture base and is mapped to physical pages through the global GTT. [DevBW] and [DevCL]: This address must be 128K aligned for linear memory.
11:4	0b RW	**RESERVED_MBZ:** Reserved.
3	0b RW	**FLIP_SOURCE:** Project: All Default Value: 0b This bit indicates if the source of the flip is CS or BCS so display can send the flip done response to the appropriate destination. ValueNameDescriptionProject 0b CS Flip source is CS All 1b BCS Flip source is BCS All

Bit Range	Default & Access	Field Name (ID): Description
2	0b RW	**DECRYPTION_REQUEST:** Project: All Default Value: 0b This bit requests decryption to be enabled for this plane. This request will be qualified with the separate decryption allow message in order to create the decryption enable. This bit is only allowed to change on a synchronous flip, but once set with a synchronous flip, the bit can remain set while using asynchronous flips. This value is loaded into the surface base address register of the associated plane. Usage must conform to the rules outlined in the plane surface base address register.
1:0	0b RW	**RESERVED_MBZ_1:** Reserved.

14.11.257 DSPBTILEOFF—Offset 711A4h

Display B Tiled Offset Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 711A4h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)

GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

LEGACY_VGA_8_BIT_PALETTE_ENABLE
PALETTE_BYPASS_TEST_MODE
NINE_DOT_DISABLE
RESERVED
RESERVED__1
BLINK_DUTY_CYCLE
VSYNC_BLINK_RATE

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**VGA_DISPLAY_DISABLE:** This bit will disable the VGA compatible display mode. It has no effect on VGA register or A0000-BFFFF memory aperture accesses which are controlled by the PCI configuration and VGA register settings. VGA display should only be enabled if all display planes other than VGA are disabled. After enabling the VGA, most display planes need to stay disabled, only the VGA popup (cursor A) can be enabled. The VGA display is never trusted. No secrets are allowed in the pre-allocated memory and VGA is limited to access only that memory. During trusted operation (when registers are locked via Lock), this bit will always act as if it was set to a one (disabled VGA display). VGA 132 Column text mode is not supported. 0 = VGA Display Enabled 1 = VGA Display Disabled
30	0b RW	**VGA_POP_UP_2X_CENTERED_MODE_SCALING:** When this bit is set to a one, the VGA and pop-up data is scaled using pixel doubling in both the horizontal and vertical direction for use on un-scaled flat panel displays. Setting this bit allows the VGA to run at higher dot clock frequencies and creates a larger (4x the size) image for better quality on larger displays. It is intended for use in one of the centering modes when not using the internal panel fitting. Do not use it for native VGA modes or when internal panel fitting is used to scale VGA. In the situations where it is used, for 1280 wide or larger panels this bit should be set. For exactly 1280 wide panels, the Nine-dot disable bit should also be set. This operation is in addition to the VGA functions that double the pixels and lines. 0 = VGA display is normal size 1 = VGA and VGA popup data is doubled in the horizontal and vertical direction.
29	0b RW	**VGA_PIPE_SELECT:** This bit only applies to devices with dual pipe support. For devices with a single display pipe, this bit will be ignored. For dual pipe devices, this bit determines which pipe is to receive the VGA display data. This must be changed only when the VGA display is in the disabled state via the VGA display disable bit or during the write to enable VGA display. 0 = Selects Assigns the VGA display to Pipe A 1 = Selects Assigns the VGA display to Pipe B
28:27	0b RW	**RESERVED_:** Software must preserve the contents of these bits.

Bit Range	Default & Access	Field Name (ID): Description
26	0b RW	**VGA_BORDER_ENABLE:** This bit determines if the VGA border areas during VGA centering modes are included in the active display area and do or do not appear on integrated TV encoder output and devices that use centering such as on DVO connected flat panel, TV displays, or integrated panels. For use with the internal panel fitting logic, the border if enabled will be scaled along with the pixel data. Setting this bit allows the popup to be positioned overlapping the border area of the image. 0 = VGA Border areas are not included in the image size calculations for centering only active area. 1 = VGA Border areas are enabled and is passed to the display pipe for display and used in the image size calculation for centering modes
25:24	0b RW	**VGA_CENTERING_ENABLE:** VGA centering modes use the pipe timing generators to determine the actual display timings. This would normally correspond to the display panel size and timings. The VGA registers determine the centered VGA image height and width. The VGA border may or may not be considered in the calculation selected by the VGA Border Enable bit. For a proper image, the VGA image size should not exceed the pipe timing generator active rectangle. When using the internal panel fitting logic, the horizontal image size needs to be less than or equal to 2048 pixels to generate a proper image. The VGA image will either be centered within the pipe timing rectangle or appear in the upper left corner. Upper left corner centered mode is generally used for external panel scaling where the DVO stall signal is used and is always used for internal panel fitting operation. When panel fitter is enabled on the same pipe as VGA this register setting is ignored and upper left corner centered mode is always selected. When centering is disabled, the VGA CRTC registers determine the display timing compatible with legacy VGA devices for driving CRT like devices. 00 = VGA centering is disabled, VGA operates in Native VGA mode or when driving integrated TV 01 = VGA centering is enabled, VGA image appears in the center of the larger rectangle 10 = VGA centering is enabled, VGA image appears in the upper left corner of the larger rectangle 11 = VGA centering is enabled, VGA image appears in the upper left corner of the larger rectangle
23	0b RW	**VGA_PALETTE_READ_SELECT:** This bit only applies to dual display pipe devices and determines which palette VGA palette read accesses will occur from. 0 = VGA palette reads will access Palette A (default). 1 = VGA palette reads will access Palette B VGA palette reads are reads from I/O address 0x3c9.
22	0b RW	**VGA_PALETTE_A_WRITE_DISABLE:** This determines which palette the VGA palette writes will have as a destination. One or both palettes can be the destination. If both are disabled, writes will not affect the palette RAM contents. 0 = VGA palette writes will update Palette A (default). 1 = VGA palette writes will not update Palette A VGA palette writes are writes to I/O address 0x3C9h.
21	0b RW	**DUAL_PIPE_VGA_PALETTE_B_WRITE_DISABLE:** This determines which palette the VGA palette writes will have as a destination. One or both palettes can be the destination. If both are disabled, writes will not affect the palette RAM contents. 0 = VGA palette writes will update Palette B (default). 1 = VGA palette writes will not update Palette B VGA palette writes are writes to I/O address 0x3C9h.
20	0b RW	**LEGACY_VGA_8_BIT_PALETTE_ENABLE:** This bit only affects reads and writes to the palette through VGA I/O addresses. In the 6-bit mode, the 8-bits of data are shifted up two bits on the write (upper two bits are lost) and shifted two bits down on the read. It provides backward compatibility for original VGA programs (in it s default state) as well as VESA VBE support for 8-bit palette. It does not affect palette accesses through the palette register MMIO path. 0 = 6-bit DAC (default). 1 = 8-bit DAC.
19	0b RW	**PALETTE_BYPASS_TEST_MODE:** 0 = Pass VGA data through the palette for translation (Normal Operation) 1 = Bypass the palette for allowing testing without loading palette both VGA and popup data will bypass the palette in this mode.

Bit Range	Default & Access	Field Name (ID): Description
18	0b RW	**NINE_DOT_DISABLE:** Prevents DOS applications from setting the VGA display into a real 9-dot per character operation mode, instead the device emulates that using 8-dots per character. This is intended to provide VGA compatibility on DVI type connectors and integrated panels where there would otherwise not be room for the 720 horizontal pixels or 1440 pixels when horizontally doubled. The VGA register bit SR01(0) functionality is disabled. VGA panning control handles the pseudo 9-dot mode when both this bit is set and SR01(0) is clear. 0 = Enable use of 9-dot enable bit in VGA registers 1 = Ignore the 9-dot per character bit and always use 8
17	0b RW	**RESERVED:** Reserved.
16:8	0b RW	**RESERVED__1:** Software must preserve the contents of these bits.
7:6	0b RW	**BLINK_DUTY_CYCLE:** Controls the VGA text mode blink duty cycle relative to the cursor blink duty cycle. 00 = 100% Duty Cycle, Full Cursor Rate (Default) 01 = 25% Duty Cycle, Cursor Rate 10 = 50% Duty Cycle, Cursor Rate 11 = 75% Duty Cycle, Cursor Rate
5:0	0b RW	**VSYNC_BLINK_RATE:** Controls the VGA blink rate in terms of the number of VSYNCs per on/off cycle. These bits are programmed with the (VSYNCs/cycle)/2-1. The proper programming of this register is determined by the VSYNC rate that the display requires when in a VGA display mode.

Fields (bit 31 to bit 0): SPRITE_A_ENABLE, SPRITE_A_GAMMA_ENABLE, SPRITE_A_SOURCE_PIXEL_FORMAT, SPRITE_A_PIPE_SELECT, RESERVED, SPRITE_SOURCE_KEY_ENABLE, PIXEL_MULTIPLY, COLOR_CONVERSION_DISABLED, YUV_FORMAT, YUV_BYTE_ORDER, _180DISPLAY_ROTATION, RESERVED_1, TILED_SURFACE, RESERVED_2, SPRITE_A_BOTTOM, RESERVED_3, SPRITE_A_Z_ORDER

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**SPRITE_A_ENABLE:** This bit will enable or disable the Sprite A. When this bit is set, the plane will generate pixels for display to be combined by the blender for the target pipe. When set to zero, memory fetches cease and display is blanked (from this plane) at the next VBLANK event from the pipe that this plane is assigned. At least one of the display pipes must be enabled to enable this plane. There is an override for the enable of this plane in the Pipe Configuration register. This bit only has an effect when the plane is not trusted. When the plane is marked trusted, this bit will be overridden and the display disabled when the registers are unlocked. 1 = Enable 0 = Disable
30	0b RW	**SPRITE_A_GAMMA_ENABLE:** There are two gamma adjustments possible in the Sprite A data path. This bit controls the gamma correction in the display pipe not the gamma control in this plane. It affects only the pixel data from this display plane. For pixel format of 8-bit indexed, this bit should be set to a one. Gamma correction logic that is contained in the Sprite A logic is disabled by loading the default values into those registers. When this plane is marked as trusted, this bit should always be set to zero to force the pipe gamma to be always be bypassed. 0 = Sprite A pixel data bypasses the display pipe gamma correction logic (default). 1 = Sprite A pixel data is gamma corrected in the pipe gamma correction logic
29:26	0b RW	**SPRITE_A_SOURCE_PIXEL_FORMAT:** This field selects the pixel format for the sprite/Sprite A. Pixel formats with an alpha channel should not use source keying. Before entering the blender, each source format is converted to 10 bits per pixel (details are described in the intermediate precision for the blender section of the Display Functions chapter). 0000 = YUV 4:2:2 packed (see byte order below). 0001 = Reserved 0010 = 8-bpp Indexed. 0011 = Reserved. 0100 = Reserved. 0101 = 16-bit BGRX (5:6:5:0) pixel format (XGA compatible). 0110 = 32-bit BGRX (8:8:8:8) pixel format. Ignore alpha. 0111 = 32-bit BGRA (8:8:8:8) pixel format with pre-multiplied alpha channel. 1000 = 32-bit RGBX (10:10:10:2) pixel format. Ignore alpha. 1001 = 32-bit RGBA (10:10:10:2) pixel format 1010 = Reserved. 1011 = Reserved. 1100 = Reserved. 1101 = Reserved. 1110 = 32-bit RGBX (8:8:8:8) pixel format. Ignore alpha. 1111 = 32-bit RGBA (8:8:8:8)
25:24	0b RW	**SPRITE_A_PIPE_SELECT:** Sprite A always ties to pipe A. Reserved.
23	0b RW	**RESERVED:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
22	0b RW	**SPRITE_SOURCE_KEY_ENABLE:** When used as a sprite in the 16/32-bpp modes without alpha this enables source color keying. Sprite pixel values that match (within range) the key will become transparent. Setting this bit is not allowed when the Sprite A pixel format includes an alpha channel. [DevBW] Erratum: This bit must always be set to 0 when Sprite A pixel format is YUV 0 = Sprite source key is disabled (default) 1 = Sprite source key is enabled. Each sprite has built in source keying enabled/disabled. If the source keying is disabled and no alpha blending is enabled, the pixels are tagged as opaque. If sprite source keying is enabled and no alpha blending is enabled, it works as follows: For YUV sprite data, each yuv channel data is compared with the corresponding channel s key color Low and High (each channel inrange can be masked out). If all three channels are in range between the low and high key values, it is considered source compared. For RGB sprite data, each 24-bit RGB pixel data is compared with the 24-bit key value (note it only uses the 24-bit Low key value for comparison). Each 24-bit has to be equal (each bit comparison can also be masked out) for the source compared. If the sprite source data compare and matches, then the sprite data will be tagged as transparent when blending with its destination pixel. If the sprite source data does not compare, then the sprite data will be tagged as opaque when blending with its destination pixel.
21:20	0b RW	**PIXEL_MULTIPLY:** This cause the display plane to duplicate lines and pixels sent to the assigned pipe. In the line/pixel doubling mode, the horizontal pixels are doubled and lines are sent twice. This is a method of scaling the source image by two (both H and V). 00 = No line/Pixel duplication 01 = Line/Pixel Doubling 10 = Line Doubling only 11 = Pixel Doubling only
19	0b RW	**COLOR_CONVERSION_DISABLED:** This bit enables or disables the color conversion logic. Color conversion is intended to be used with the formats that support YUV formats such as the YUV 4:2:2 packed format and x:8:8:8 and 8:8:8:8 formats. Formats such as RGB5:5:5 and 5:6:5 do not have YUV versions. 0 = Pixel data is sent through the conversion logic (only applies to YUV formats) 1 = Pixel data is not sent through the YUV-)RGB conversion logic.
18	0b RW	**YUV_FORMAT:** This bit specifies the source YUV format for the YUV to RGB color conversion operation. This field is ignored when source data is RGB. 0 = ITU-R Recommendation BT.601 1 = ITU-R Recommendation BT.709
17:16	0b RW	**YUV_BYTE_ORDER:** This field is used to select the byte order when using YUV 4:2:2 data formats. For other formats, this field is ignored. 00 = YUYV 01 = UYVY 10 = YVYU 11 = VYUY
15	0b RW	**_180DISPLAY_ROTATION:** This mode causes the display plane to be rotated 180 . In addition to setting this bit, software must also set the base address to the lower right corner of the unrotated image and calculate the x, y offset as relative to the lower right corner. 0 = No rotation 1 = 180 rotation
14:11	0b RW	**RESERVED_1:** Reserved.
10	0b RW	**TILED_SURFACE:** This bit indicates that the Sprite A surface data is in tiled memory. The tile pitch is specified in bytes in the DSPCSTRIDE register. Only X tiling is supported for display surfaces. When this bit is set, it affects the hardware interpretation of the DSPCTILEOFF, DSPCLINOFF, and DSPCSURFADDR registers. 0 = Sprite A surface uses linear memory 1 = Sprite A surface uses X-tiled memory
9:3	0b RW	**RESERVED_2:** Write as zero

Bit Range	Default & Access	Field Name (ID): Description
2	0b RW	**SPRITE_A_BOTTOM:** This bit will force the Sprite A plane to be on the bottom of the Z order. If the plane is marked as trusted, it only applies to the Z order of the trusted planes. 0 = Sprite A Z order is determined by the other control bits 1 = Sprite A is forced to be on the bottom of the Z order.
1	0b RW	**RESERVED_3:** Reserved.
0	0b RW	**SPRITE_A_Z_ORDER:** With Sprite A and B z-order, bottom control bits, Sprite A plane is placed in a specific z-order among other planes. Display Pipe A Z-orders SA zorderSA bottomSB zorderSB bottomResulting Pipe Z-order (from bottom to top)Source Keying 0000PA SA SB CAPA in Black 1000PA SB SA CAPA in Black 0001SB PA SA CAuse src keying on SB 0011SB PA SA CAuse src keying on SB 1001SB SA PA CAuse src keying on SA 1011SB SA PA CAuse src keying on SA 0100SA PA SB CAuse src keying on SA 1100SA PA SB CAuse src keying on SA 0110SA SB PA CAuse src keying on SB 1110SA SB PA CAuse src keying on SB 0: Sprite A z-order is disabled 1: Sprite A z-order is enabled

SPRITE_A_OFFSET

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	**SPRITE_A_OFFSET:** This register provides the panning offset into the Sprite A plane. This value is added to the surface address to get the graphics address of the first pixel to be displayed. This offset must be at least pixel aligned. This offset is the difference between the address of the upper left pixel to be displayed and the display surface address. When performing 180 rotation, this offset must be the difference between the last pixel of the last line of the display data in its unrotated orientation and the display surface address.

14.11.279 SPASTRIDE—Offset 72188h

Sprite A Stride Register

Access Method

Type: Memory Mapped I/O Register

SPRITE_A_STRIDE (31:6)	RESERVED (5:0)

Bit Range	Default & Access	Field Name (ID): Description
31:6	0b RW	**SPRITE_A_STRIDE:** This is the stride for Sprite A in bytes. When using linear memory, this must be 64 byte aligned. When using tiled memory, this must be 256 byte aligned. This register is updated through a command packet passed through the command stream or writes to this register. When it is desired to update both this and the start register, the stride register must be written first because the write to the start register is the trigger that causes the update of both registers on the next VBLANK event. When using tiled memory, the actual memory buffer stride is limited to a maximum of 16K bytes.
5:0	0b RW	**RESERVED:** Reserved.

14.11.280 SPAPOS—Offset 7218Ch

Sprite A Position Register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 7218Ch

31:28	0b RW	**RESERVED:** Write as zero
27:16	0b RW	**PLANE_START_Y_POSITION:** These 12 bits specify the vertical position in lines of the beginning of the active display plane relative to the display surface. When performing 180 rotation, this field specifies the vertical position of the lower right corner relative to the start of the active display plane in the unrotated orientation.
15:12	0b RW	**RESERVED_1:** Write as zero
11:0	0b RW	**PLANE_START_X_POSITION:** These 12 bits specify the horizontal offset in pixels of the beginning of the active display plane relative to the display surface. When performing 180 rotation, this field specifies the horizontal position of the lower right corner relative to the start of the active display plane in the unrotated orientation.

14.11.287 SPACONTALPHA—Offset 721A8h

Sprite A Constant Alpha Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 721A8h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

31	30:8	7:0
0	0000000 0000000000000000	00000000
ENABLE_CONSTANT_ALPHA	RESERVED	SPRITE_A_CONSTANT_ALPHA_VALUE

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**ENABLE_CONSTANT_ALPHA:** Sprite A Sprite constant alpha provides a way to apply an alpha value to all video sprite pixels. Each pixel color channel is multiplied by the constant alpha before proceeding to the blender. This can be used to create fade out effects. This is intended for CE device use where the video sprite might still be used to generate video output. 0 Sprite A Sprite Constant Alpha is disabled 1 Sprite A Sprite Constant Alpha is enabled
30:8	0b RW	**RESERVED:** : MBZ
7:0	0b RW	**SPRITE_A_CONSTANT_ALPHA_VALUE:** This field provides the alpha value when constant alpha is enabled. A value of FF means fully opaque and a value of zero means fully transparent. Values in between those values allow for a blending of sprite with other surfaces.

14.11.288 SPALIVESURF—Offset 721ACh

Sprite A Live Surface Address Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 721ACh

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)

RESERVED (31:27), CONTRAST (26:18), RESERVED_1 (17:8), BRIGHTNESS (7:0)

Bit Range	Default & Access	Field Name (ID): Description
31:27	0b RW	**RESERVED:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
26:18	001000000b RW	**CONTRAST:** Contrast adjustment applies to YUV data. The Y channel is multiplied by the value contained in the register field. This signed fixed-point number is in 3i.6f format with the first 3 MSBs as the integer value and the last 6 LSBs as the fraction value. The allowed contrast value ranges from 0 to 7.53125 decimal. Bypassing Contrast, for YUV modes and for source data in RGB format, is accomplished by programming this field to a field value that represents 1.0 decimal or 001.000000 binary .
17:8	0b RW	**RESERVED_1:** Reserved.
7:0	0b RW	**BRIGHTNESS:** This field provides the brightness adjustment with a 8-bit 2 s compliment value ranging [-128, +127]. This value is added to the Y value after contrast multiply and before YUV to RGB conversion. A value of zero disables this adjustment affect. This 8-bit signed value provides half of the achievable brightness adjustment dynamic range. A full range brightness value would have a programmable range of [-255, +255]. Bypassing Brightness for YUV formats and for source data in RGB format, is accomplished by programming this field to 0.

2	0	SPRITE_B_BOTTOM
1	0	RESERVED_3
0	0	SPRITE_B_Z_ORDER

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**SPRITE_B_ENABLE:** This bit will enable or disable the Sprite B. When this bit is set, the plane will generate pixels for display to be combined by the blender for the target pipe. When set to zero, memory fetches cease and display is blanked (from this plane) at the next VBLANK event from the pipe that this plane is assigned. At least one of the display pipes must be enabled to enable this plane. There is an override for the enable of this plane in the Pipe Configuration register. This bit only has an effect when the plane is not trusted. When the plane is marked trusted, this bit will be overridden and the display disabled when the registers are unlocked. 1 = Enable 0 = Disable

Bit Range	Default & Access	Field Name (ID): Description
30	0b RW	**SPRITE_B_GAMMA_ENABLE:** There are two gamma adjustments possible in the Sprite B data path. This bit controls the gamma correction in the display pipe not the gamma control in this plane. It affects only the pixel data from this display plane. For pixel format of 8-bit indexed, this bit should be set to a one. Gamma correction logic that is contained in the Sprite B logic is disabled by loading the default values into those registers. When this plane is marked as trusted, this bit should always be set to zero to force the pipe gamma to be always be bypassed. 0 = Sprite B pixel data bypasses the display pipe gamma correction logic (default). 1 = Sprite B pixel data is gamma corrected in the pipe gamma correction logic
29:26	0b RW	**SPRITE_B_SOURCE_PIXEL_FORMAT:** This field selects the pixel format for the sprite/Sprite B. Pixel formats with an alpha channel should not use source keying. Before entering the blender, each source format is converted to 10 bits per pixel (details are described in the intermediate precision for the blender section of the Display Functions chapter). 0000 = YUV 4:2:2 packed (see byte order below). 0001 = Reserved 0010 = 8-bpp Indexed. 0011 = Reserved. 0100 = Reserved. 0101 = 16-bit BGRX (5:6:5:0) pixel format (XGA compatible). 0110 = 32-bit BGRX (8:8:8:8) pixel format. Ignore alpha. 0111 = 32-bit BGRA (8:8:8:8) pixel format with pre-multiplied alpha channel. 1000 = 32-bit RGBX (10:10:10:2) pixel format. Ignore alpha. 1001 = 32-bit RGBA (10:10:10:2) pixel format 1010 = Reserved. 1011 = Reserved. 1100 = Reserved. 1101 = Reserved. 1110 = 32-bit RGBX (8:8:8:8) pixel format. Ignore alpha. 1111 = 32-bit RGBA (8:8:8:8)
25:24	0b RW	**SPRITE_B_PIPE_SELECT:** Sprite B always ties to Pipe A. Reserved
23	0b RW	**RESERVED:** Reserved.
22	0b RW	**SPRITE_SOURCE_KEY_ENABLE:** When used as a sprite in the 16/32-bpp modes without alpha this enables source color keying. Sprite pixel values that match (within range) the key will become transparent. Setting this bit is not allowed when the Sprite B pixel format includes an alpha channel. [DevBW] Erratum: This bit must always be set to 0 when Sprite B pixel format is YUV 0 = Sprite source key is disabled (default) 1 = Sprite source key is enabled.
21:20	0b RW	**PIXEL_MULTIPLY:** This cause the display plane to duplicate lines and pixels sent to the assigned pipe. In the line/pixel doubling mode, the horizontal pixels are doubled and lines are sent twice. This is a method of scaling the source image by two (both H and V). 00 = No line/Pixel duplication 01 = Line/Pixel Doubling 10 = Line Doubling only 11 = Pixel Doubling only
19	0b RW	**COLOR_CONVERSION_DISABLED:** This bit enables or disables the color conversion logic. Color conversion is intended to be used with the formats that support YUV formats such as the YUV 4:2:2 packed format and x:8:8:8 and 8:8:8:8 formats. Formats such as RGB5:5:5 and 5:6:5 do not have YUV versions. 0 = Pixel data is sent through the conversion logic (only applies to YUV formats) 1 = Pixel data is not sent through the YUV-)RGB conversion logic.
18	0b RW	**YUV_FORMAT:** This bit specifies the source YUV format for the YUV to RGB color conversion operation. This field is ignored when source data is RGB. 0 = ITU-R Recommendation BT.601 1 = ITU-R Recommendation BT.709

Bit Range	Default & Access	Field Name (ID): Description
17:16	0b RW	**YUV_BYTE_ORDER:** This field is used to select the byte order when using YUV 4:2:2 data formats. For other formats, this field is ignored. 00 = YUYV 01 = UYVY 10 = YVYU 11 = VYUY
15	0b RW	**_180DISPLAY_ROTATION:** This mode causes the display plane to be rotated 180 . In addition to setting this bit, software must also set the base address to the lower right corner of the unrotated image and calculate the x, y offset as relative to the lower right corner. 0 = No rotation 1 = 180 rotation
14:11	0b RW	**RESERVED_1:** Reserved.
10	0b RW	**TILED_SURFACE:** This bit indicates that the Sprite B surface data is in tiled memory. The tile pitch is specified in bytes in the DSPCSTRIDE register. Only X tiling is supported for display surfaces. When this bit is set, it affects the hardware interpretation of the DSPCTILEOFF, DSPCLINOFF, and DSPCSURFADDR registers. 0 = Sprite B surface uses linear memory 1 = Sprite B surface uses X-tiled memory
9:3	0b RW	**RESERVED_2:** Write as zero
2	0b RW	**SPRITE_B_BOTTOM:** This bit will force the Sprite B plane to be on the bottom of the Z order. If the plane is marked as trusted, it only applies to the Z order of the trusted planes. 0 = Sprite B Z order is determined by the other control bits 1 = Sprite B is forced to be on the bottom of the Z order.
1	0b RW	**RESERVED_3:** Reserved.
0	0b RW	**SPRITE_B_Z_ORDER:** With Sprite A and B z-order, bottom control bits, Sprite B plane is placed in a specific z-order among other planes in pipe A. 31:6	5:0
SPRITE_B_STRIDE	RESERVED

Bit Range	Default & Access	Field Name (ID): Description
31:6	0b RW	**SPRITE_B_STRIDE:** This is the stride for Sprite B in bytes. When using linear memory, this must be 64 byte aligned. When using tiled memory, this must be 256 byte aligned. This register is updated through a command packet passed through the command stream or writes to this register. When it is desired to update both this and the start register, the stride register must be written first because the write to the start register is the trigger that causes the update of both registers on the next VBLANK event. When using tiled memory, the actual memory buffer stride is limited to a maximum of 16K bytes.
5:0	0b RW	**RESERVED:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
31:27	0b RW	**RESERVED:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
26:18	001000000b RW	**CONTRAST:** Contrast adjustment applies to YUV data. The Y channel is multiplied by the value contained in the register field. This signed fixed-point number is in 3i.6f format with the first 3 MSBs as the integer value and the last 6 LSBs as the fraction value. The allowed contrast value ranges from 0 to 7.53125 decimal. Bypassing Contrast, for YUV modes and for source data in RGB format, is accomplished by programming this field to a field value that represents 1.0 decimal or 001.000000 binary .
17:8	0b RW	**RESERVED_1:** Reserved.
7:0	0b RW	**BRIGHTNESS:** This field provides the brightness adjustment with a 8-bit 2 s compliment value ranging [-128, +127]. This value is added to the Y value after contrast multiply and before YUV to RGB conversion. A value of zero disables this adjustment affect. This 8-bit signed value provides half of the achievable brightness adjustment dynamic range. A full range brightness value would have a programmable range of [-255, +255]. Bypassing Brightness for YUV formats and for source data in RGB format, is accomplished by programming this field to 0.

14.11.310 SPBCLRC1—Offset 722D4h

Sprite B Color Correction 1 Register

Access Method

Type: Memory Mapped I/O Register

31:27	0b RW	**RESERVED:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
26:16	0b RW	**SATURATION_AND_HUE_SIN_SH_SIN:** This 11-bit signed fixed-point number is in 2 s compliment (s3i.7f) format with the MSB as the sign, next 3 MSBs as the integer value and the last 7 LSBs as the fraction value. This field can be used in two modes. When full range YUV data is operated on, this field contains the saturation value. When the range-limited YCbCr data is used, software should program this field with the product of the saturation multiplier value multiplied by the CbCr range scale factor (=128/112). Similar to the contrast field, there is no limit for saturation reduction saturation = 0 means all pixels become the same value. However, increasing contrast can only be increased by a factor less than 8. For example, the largest contrast with value of 0x7.7F can bring input range [0, 32] to a full display color range of [0, 255]. Bypassing Hue, even for source data in RGB format, is accomplished by programming this field to 0.0.
15:10	0b RW	**RESERVED_1:** Reserved.
9:0	001000000 0b RW	**SATURATION_AND_HUE_COS_SH_COS:** This unsigned fixed-point number is in 3i.7f format with the first 3 MSBs be the integer value and the last 7 LSBs be the fraction value. This field can be used in two modes. When full range YUV data is operated on, this field contains the saturation value. When the range-limited YCbCr data is used, software should program this field with the product of the saturation multiplier value multiplied by the CbCr range scale factor (=128/112). 2	0	SPRITE_C_BOTTOM
1	0	RESERVED_3
0	0	SPRITE_C_Z_ORDER

Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**SPRITE_C_ENABLE:** This bit will enable or disable the Sprite C. When this bit is set, the plane will generate pixels for display to be combined by the blender for the target pipe. When set to zero, memory fetches cease and display is blanked (from this plane) at the next VBLANK event from the pipe that this plane is assigned. At least one of the display pipes must be enabled to enable this plane. There is an override for the enable of this plane in the Pipe Configuration register. This bit only has an effect when the plane is not trusted. When the plane is marked trusted, this bit will be overridden and the display disabled when the registers are unlocked. 1 = Enable 0 = Disable

Bit Range	Default & Access	Field Name (ID): Description
30	0b RW	**SPRITE_C_GAMMA_ENABLE:** There are two gamma adjustments possible in the Sprite C data path. This bit controls the gamma correction in the display pipe not the gamma control in this plane. It affects only the pixel data from this display plane. For pixel format of 8-bit indexed, this bit should be set to a one. Gamma correction logic that is contained in the Sprite C logic is disabled by loading the default values into those registers. When this plane is marked as trusted, this bit should always be set to zero to force the pipe gamma to be always be bypassed. 0 = Sprite C pixel data bypasses the display pipe gamma correction logic (default). 1 = Sprite C pixel data is gamma corrected in the pipe gamma correction logic
29:26	0b RW	**SPRITE_C_SOURCE_PIXEL_FORMAT:** This field selects the pixel format for the sprite/Sprite C. Pixel formats with an alpha channel should not use source keying. Before entering the blender, each source format is converted to 10 bits per pixel (details are described in the intermediate precision for the blender section of the Display Functions chapter). 0000 = YUV 4:2:2 packed (see byte order below). 0001 = Reserved 0010 = 8-bpp Indexed. 0011 = Reserved. 0100 = Reserved. 0101 = 16-bit BGRX (5:6:5:0) pixel format (XGA compatible). 0110 = 32-bit BGRX (8:8:8:8) pixel format. Ignore alpha. 0111 = 32-bit BGRA (8:8:8:8) pixel format with pre-multiplied alpha channel. 1000 = 32-bit RGBX (10:10:10:2) pixel format. Ignore alpha. 1001 = 32-bit RGBA (10:10:10:2) pixel format 1010 = Reserved. 1011 = Reserved. 1100 = Reserved. 1101 = Reserved. 1110 = 32-bit RGBX (8:8:8:8) pixel format. Ignore alpha. 1111 = 32-bit RGBA (8:8:8:8)
25:24	0b RW	**SPRITE_C_PIPE_SELECT:** Sprite C always ties to Pipe B Reserved.
23	0b RW	**RESERVED:** Reserved.
22	0b RW	**SPRITE_SOURCE_KEY_ENABLE:** When used as a sprite in the 16/32-bpp modes without alpha this enables source color keying. Sprite pixel values that match (within range) the key will become transparent. Setting this bit is not allowed when the Sprite C pixel format includes an alpha channel. [DevBW] Erratum: This bit must always be set to 0 when Sprite C pixel format is YUV 0 = Sprite source key is disabled (default) 1 = Sprite source key is enabled.
21:20	0b RW	**PIXEL_MULTIPLY:** This cause the display plane to duplicate lines and pixels sent to the assigned pipe. In the line/pixel doubling mode, the horizontal pixels are doubled and lines are sent twice. This is a method of scaling the source image by two (both H and V). 00 = No line/Pixel duplication 01 = Line/Pixel Doubling 10 = Line Doubling only 11 = Pixel Doubling only
19	0b RW	**COLOR_CONVERSION_DISABLED:** This bit enables or disables the color conversion logic. Color conversion is intended to be used with the formats that support YUV formats such as the YUV 4:2:2 packed format and x:8:8:8 and 8:8:8:8 formats. Formats such as RGB5:5:5 and 5:6:5 do not have YUV versions. 0 = Pixel data is sent through the conversion logic (only applies to YUV formats) 1 = Pixel data is not sent through the YUV-)RGB conversion logic.
18	0b RW	**YUV_FORMAT:** This bit specifies the source YUV format for the YUV to RGB color conversion operation. This field is ignored when source data is RGB. 0 = ITU-R Recommendation BT.601 1 = ITU-R Recommendation BT.709

Bit Range	Default & Access	Field Name (ID): Description
17:16	0b RW	**YUV_BYTE_ORDER:** This field is used to select the byte order when using YUV 4:2:2 data formats. For other formats, this field is ignored. 00 = YUYV 01 = UYVY 10 = YVYU 11 = VYUY
15	0b RW	**_180DISPLAY_ROTATION:** This mode causes the display plane to be rotated 180 . In addition to setting this bit, software must also set the base address to the lower right corner of the unrotated image and calculate the x, y offset as relative to the lower right corner. 0 = No rotation 1 = 180 rotation
14:11	0b RW	**RESERVED_1:** Reserved.
10	0b RW	**TILED_SURFACE:** This bit indicates that the Sprite C surface data is in tiled memory. The tile pitch is specified in bytes in the DSPCSTRIDE register. Only X tiling is supported for display surfaces. When this bit is set, it affects the hardware interpretation of the DSPCTILEOFF, DSPCLINOFF, and DSPCSURFADDR registers. 0 = Sprite C surface uses linear memory 1 = Sprite C surface uses X-tiled memory
9:3	0b RW	**RESERVED_2:** Write as zero
2	0b RW	**SPRITE_C_BOTTOM:** This bit will force the Sprite C plane to be on the bottom of the Z order. If the plane is marked as trusted, it only applies to the Z order of the trusted planes. 0 = Sprite C Z order is determined by the other control bits 1 = Sprite C is forced to be on the bottom of the Z order.
1	0b RW	**RESERVED_3:** Reserved.
0	0b RW	**SPRITE_C_Z_ORDER:** With Sprite C and D z-order, bottom control bits, Sprite C plane is placed in a specific z-order among other planes in pipe B. SPRITE_C_OFFSET

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	**SPRITE_C_OFFSET:** This register provides the panning offset into the Sprite C plane. This value is added to the surface address to get the graphics address of the first pixel to be displayed. This offset must be at least pixel aligned. This offset is the difference between the address of the upper left pixel to be displayed and the display surface address. When performing 180 rotation, this offset must be the difference between the last pixel of the last line of the display data in its unrotated orientation and the display surface address.

14.11.319 SPCSTRIDE—Offset 72388h

Sprite C Stride Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 72388h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)

SPRITE_C_STRIDE

RESERVED

Bit Range	Default & Access	Field Name (ID): Description
31:6	0b RW	**SPRITE_C_STRIDE:** This is the stride for Sprite C in bytes. When using linear memory, this must be 64 byte aligned. When using tiled memory, this must be 256 byte aligned. This register is updated through a command packet passed through the command stream or writes to this register. When it is desired to update both this and the start register, the stride register must be written first because the write to the start register is the trigger that causes the update of both registers on the next VBLANK event. When using tiled memory, the actual memory buffer stride is limited to a maximum of 16K bytes.
5:0	0b RW	**RESERVED:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
31:27	0b RW	**RESERVED:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
26:18	001000000b RW	**CONTRAST:** Contrast adjustment applies to YUV data. The Y channel is multiplied by the value contained in the register field. This signed fixed-point number is in 3i.6f format with the first 3 MSBs as the integer value and the last 6 LSBs as the fraction value. The allowed contrast value ranges from 0 to 7.53125 decimal. Bypassing Contrast, for YUV modes and for source data in RGB format, is accomplished by programming this field to a field value that represents 1.0 decimal or 001.000000 binary .
17:8	0b RW	**RESERVED_1:** Reserved.
7:0	0b RW	**BRIGHTNESS:** This field provides the brightness adjustment with a 8-bit 2 s compliment value ranging [-128, +127]. This value is added to the Y value after contrast multiply and before YUV to RGB conversion. A value of zero disables this adjustment affect. This 8-bit signed value provides half of the achievable brightness adjustment dynamic range. A full range brightness value would have a programmable range of [-255, +255]. Bypassing Brightness for YUV formats and for source data in RGB format, is accomplished by programming this field to 0.

31:27	0b RW	**RESERVED:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
26:16	0b RW	**SATURATION_AND_HUE_SIN_SH_SIN:** This 11-bit signed fixed-point number is in 2 s compliment (s3i.7f) format with the MSB as the sign, next 3 MSBs as the integer value and the last 7 LSBs as the fraction value. This field can be used in two modes. When full range YUV data is operated on, this field contains the saturation value. When the range-limited YCbCr data is used, software should program this field with the product of the saturation multiplier value multiplied by the CbCr range scale factor (=128/112). Similar to the contrast field, there is no limit for saturation reduction saturation = 0 means all pixels become the same value. However, increasing contrast can only be increased by a factor less than 8. For example, the largest contrast with value of 0x7.7F can bring input range [0, 32] to a full display color range of [0, 255]. Bypassing Hue, even for source data in RGB format, is accomplished by programming this field to 0.0.
15:10	0b RW	**RESERVED_1:** Reserved.
9:0	001000000 0b RW	**SATURATION_AND_HUE_COS_SH_COS:** This unsigned fixed-point number is in 3i.7f format with the first 3 MSBs be the integer value and the last 7 LSBs be the fraction value. Bit Range	Default & Access	Field Name (ID): Description
31	0b RW	**SPRITE_D_ENABLE:** This bit will enable or disable the Sprite D. When this bit is set, the plane will generate pixels for display to be combined by the blender for the target pipe. When set to zero, memory fetches cease and display is blanked (from this plane) at the next VBLANK event from the pipe that this plane is assigned. At least one of the display pipes must be enabled to enable this plane. There is an override for the enable of this plane in the Pipe Configuration register. This bit only has an effect when the plane is not trusted. When the plane is marked trusted, this bit will be overridden and the display disabled when the registers are unlocked. 1 = Enable 0 = Disable
30	0b RW	**SPRITE_D_GAMMA_ENABLE:** There are two gamma adjustments possible in the Sprite D data path. This bit controls the gamma correction in the display pipe not the gamma control in this plane. It affects only the pixel data from this display plane. For pixel format of 8-bit indexed, this bit should be set to a one. Gamma correction logic that is contained in the Sprite D logic is disabled by loading the default values into those registers. When this plane is marked as trusted, this bit should always be set to zero to force the pipe gamma to be always be bypassed. 0 = Sprite D pixel data bypasses the display pipe gamma correction logic (default). 1 = Sprite D pixel data is gamma corrected in the pipe gamma correction logic
29:26	0b RW	**SPRITE_D_SOURCE_PIXEL_FORMAT:** This field selects the pixel format for the sprite/Sprite D. Pixel formats with an alpha channel should not use source keying. Before entering the blender, each source format is converted to 10 bits per pixel (details are described in the intermediate precision for the blender section of the Display Functions chapter). 0000 = YUV 4:2:2 packed (see byte order below). 0001 = Reserved 0010 = 8-bpp Indexed. 0011 = Reserved. 0100 = Reserved. 0101 = 16-bit BGRX (5:6:5:0) pixel format (XGA compatible). 0110 = 32-bit BGRX (8:8:8:8) pixel format. Ignore alpha. 0111 = 32-bit BGRA (8:8:8:8) pixel format with pre-multiplied alpha channel. 1000 = 32-bit RGBX (10:10:10:2) pixel format. Ignore alpha. 1001 = 32-bit RGBA (10:10:10:2) pixel format 1010 = Reserved. 1011 = Reserved. 1100 = Reserved. 1101 = Reserved. 1110 = 32-bit RGBX (8:8:8:8) pixel format. Ignore alpha. 1111 = 32-bit RGBA (8:8:8:8)
25:24	0b RW	**SPRITE_D_PIPE_SELECT:** Sprite D always ties to Pipe B. Reserved.

Bit Range	Default & Access	Field Name (ID): Description
23	0b RW	**RESERVED:** Reserved.
22	0b RW	**SPRITE_SOURCE_KEY_ENABLE:** When used as a sprite in the 16/32-bpp modes without alpha this enables source color keying. Sprite pixel values that match (within range) the key will become transparent. Setting this bit is not allowed when the Sprite D pixel format includes an alpha channel. [DevBW] Erratum: This bit must always be set to 0 when Sprite D pixel format is YUV 0 = Sprite source key is disabled (default) 1 = Sprite source key is enabled.
21:20	0b RW	**PIXEL_MULTIPLY:** This cause the display plane to duplicate lines and pixels sent to the assigned pipe. In the line/pixel doubling mode, the horizontal pixels are doubled and lines are sent twice. This is a method of scaling the source image by two (both H and V). 00 = No line/Pixel duplication 01 = Line/Pixel Doubling 10 = Line Doubling only 11 = Pixel Doubling only
19	0b RW	**COLOR_CONVERSION_DISABLED:** This bit enables or disables the color conversion logic. Color conversion is intended to be used with the formats that support YUV formats such as the YUV 4:2:2 packed format and x:8:8:8 and 8:8:8:8 formats. Formats such as RGB5:5:5 and 5:6:5 do not have YUV versions. 0 = Pixel data is sent through the conversion logic (only applies to YUV formats) 1 = Pixel data is not sent through the YUV-)RGB conversion logic.
18	0b RW	**YUV_FORMAT:** This bit specifies the source YUV format for the YUV to RGB color conversion operation. This field is ignored when source data is RGB. 0 = ITU-R Recommendation BT.601 1 = ITU-R Recommendation BT.709
17:16	0b RW	**YUV_BYTE_ORDER:** This field is used to select the byte order when using YUV 4:2:2 data formats. For other formats, this field is ignored. 00 = YUYV 01 = UYVY 10 = YVYU 11 = VYUY
15	0b RW	**_180DISPLAY_ROTATION:** This mode causes the display plane to be rotated 180 . In addition to setting this bit, software must also set the base address to the lower right corner of the unrotated image and calculate the x, y offset as relative to the lower right corner. 0 = No rotation 1 = 180 rotation
14:11	0b RW	**RESERVED_1:** Reserved.
10	0b RW	**TILED_SURFACE:** This bit indicates that the Sprite D surface data is in tiled memory. The tile pitch is specified in bytes in the DSPCSTRIDE register. Only X tiling is supported for display surfaces. When this bit is set, it affects the hardware interpretation of the DSPCTILEOFF, DSPCLINOFF, and DSPCSURFADDR registers. 0 = Sprite D surface uses linear memory 1 = Sprite D surface uses X-tiled memory
9:3	0b RW	**RESERVED_2:** Write as zero
2	0b RW	**SPRITE_D_BOTTOM:** This bit will force the Sprite D plane to be on the bottom of the Z order. If the plane is marked as trusted, it only applies to the Z order of the trusted planes. 0 = Sprite D Z order is determined by the other control bits 1 = Sprite D is forced to be on the bottom of the Z order.
1	0b RW	**RESERVED_3:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description

SPRITE_D_OFFSET

Bit Range	Default & Access	Field Name (ID): Description
31:0	0b RW	**SPRITE_D_OFFSET:** This register provides the panning offset into the Sprite D plane. This value is added to the surface address to get the graphics address of the first pixel to be displayed. This offset must be at least pixel aligned. This offset is the difference between the address of the upper left pixel to be displayed and the display surface address. When performing 180 rotation, this offset must be the difference between the last pixel of the last line of the display data in its unrotated orientation and the display surface address.

14.11.342 SPDSTRIDE—Offset 72488h

Sprite D Stride Register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 72488h

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00000000h

0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

SPRITE_D_STRIDE (31:6), RESERVED (5:0)

Bit Range	Default & Access	Field Name (ID): Description
31:6	0b RW	**SPRITE_D_STRIDE:** This is the stride for Sprite D in bytes. When using linear memory, this must be 64 byte aligned. When using tiled memory, this must be 256 byte aligned. This register is updated through a command packet passed through the command stream or writes to this register. When it is desired to update both this and the start register, the stride register must be written first because the write to the start register is the trigger that causes the update of both registers on the next VBLANK event. When using tiled memory, the actual memory buffer stride is limited to a maximum of 16K bytes.
5:0	0b RW	**RESERVED:** Reserved.

14.11.343 SPDPOS—Offset 7248Ch

Sprite D Position Register

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

Offset: [GTTMMADR_LSB + 180000h] + 7248Ch

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)

31:27	0b RW	**RESERVED:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
26:16	0b RW	**SATURATION_AND_HUE_SIN_SH_SIN:** This 11-bit signed fixed-point number is in 2 s compliment (s3i.7f) format with the MSB as the sign, next 3 MSBs as the integer value and the last 7 LSBs as the fraction value. This field can be used in two modes. When full range YUV data is operated on, this field contains the saturation value. When the range-limited YCbCr data is used, software should program this field with the product of the saturation multiplier value multiplied by the CbCr range scale factor (=128/112). Similar to the contrast field, there is no limit for saturation reduction saturation = 0 means all pixels become the same value. However, increasing contrast can only be increased by a factor less than 8. For example, the largest contrast with value of 0x7.7F can bring input range [0, 32] to a full display color range of [0, 255]. Bypassing Hue, even for source data in RGB format, is accomplished by programming this field to 0.0.
15:10	0b RW	**RESERVED_1:** Reserved.
9:0	001000000 0b RW	**SATURATION_AND_HUE_COS_SH_COS:** This unsigned fixed-point number is in 3i.7f format with the first 3 MSBs be the integer value and the last 7 LSBs be the fraction value. This field can be used in two modes. When full range YUV data is operated on, this field contains the saturation value. 14.12.1 ST01 (ST01_MDA)—Offset 3BAh

Input Status 1

Access Method

Type: Memory Mapped I/O Register
(Size: 8 bits)

Offset: [GTTMMADR_LSB + 180000h] + 3BAh

GTTMMADR_LSB Type: PCI Configuration Register (Size: 32 bits)
GTTMMADR_LSB Reference: [B:0, D:2, F:0] + 10h

Default: 00h

7			4				0
0	0	0	0	0	0	0	0
RESERVED_AS_PER_VGA_SPECIFICATION	RESERVED	VIDEO_FEEDBACK_1_0		VER_TI_CAL_RETRACE_VIDEO	RESERVED_1		DIS_PLAY_ENA_BLE_OUTPUT

Bit Range	Default & Access	Field Name (ID): Description
7	0b RO	**RESERVED_AS_PER_VGA_SPECIFICATION:** Read as 0s.
6	0b RO	**RESERVED:** Read as 0.
5:4	0b RO	**VIDEO_FEEDBACK_1_0:** These are diagnostic video bits that are selected by the Color Plane Enable Register. These bits that are programmably connected to 2 of the 8 color bits sent to the palette. Bits 4 and 5 of the Color Plane Enable Register (AR12) selects which two of the 8 possible color bits become connected to these 2 bits of this register. The current software normally does not use these 2 bits. They exist for EGA compatibility.

Bit Range	Default & Access	Field Name (ID): Description
3	0b RO	**VER_TI_CAL_RETRACE_VIDEO:** 0 = VSYNC inactive (Indicates that a vertical retrace interval is not taking place). 1 = VSYNC active (Indicates that a vertical retrace interval is taking place). Note: VGA pixel generation is not locked to the display output but is loosely coupled. A VSYNC indication may not occur during the actual VSYNC going to the display but during the VSYNC that is generated as part of the VGA pixel generation. The exact relationship will vary with the VGA display operational mode. This status bit will remain active when the VGA is disabled and the device is running in high resolution modes (non-VGA) to allow for applications that (now it is incorrect) use these status registers bits. In this case, the status will come from the pipe that the VGA is assigned to. Bits 4 and 5 of the Vertical Retrace End Register (CR11) previously could program this bit to generate an interrupt at the start of the vertical retrace interval. This ability to generate interrupts at the start of the vertical retrace interval is a feature that is largely unused by legacy software. Interrupts are not supported through the VGA register bits.
2:1	0b RO	**RESERVED_1:** Read as 0s.
0	0b RO	**DIS_PLAY_ENA_BLE_OUTPUT:** Display Enable is a status bit (bit 0) in VGA Input Status Register 1 that indicates when either a horizontal retrace interval or a vertical retrace interval is taking place. This was used with the IBM* EGA graphics system (and the ones that preceded it, including MDA and CGA). In those cases, it was important to check the status of this bit to ensure that one or the other retrace intervals was taking place before reading from or writing to the frame buffer. In these earlier systems, reading from or writing to frame buffer at times outside the retrace intervals meant that the CRT controller would be denied access to the frame buffer. This resulted in either snow or a flickering display. This bit provides compatibility with software designed for those early graphics controllers. This bit is currently used in DOS applications that access the palette to prevent the sparkle associated with read and write accesses to the palette ram with the same address on the same clock cycle. This status bit will remain active when the VGA display is disabled and the device is running in high resolution modes (non-VGA) to allow for applications that (now considered incorrect) use these status registers bits. In this case, the status will come from the pipe that the VGA is assigned to. When in panel fitting VGA or centered VGA operation, the meaning of these bits will not be consistent with native VGA timings. 0 = Active display data is being sent to the display. Neither a horizontal retrace interval or a vertical retrace interval is currently taking place. 1 = Either a horizontal retrace interval (horizontal blanking) or a vertical retrace interval (vertical blanking) is currently taking place.

7	0b RO	**CRT_INTER_RUPT_PENDING:** This bit is here for EGA compatibility and will always return zero. Note that the generation of interrupts was originally enabled, through bits [4,5] of the Vertical Retrace End Register (CR11). This ability to generate interrupts at the start of the vertical retrace interval is a feature that is typically unused by DOS software and therefore is only supported through other means for use under a operating system support. 0 = CRT (vertical retrace interval) interrupt is not pending. 1 = CRT (vertical retrace interval) interrupt is pending
6:5	0b RO	**RESERVED:** Read as 0s.
4	0b RO	**RGB_COMPARATOR_SENSE:** This bit returns the state of the output of the RGB output comparator(s). Video BIOS uses this bit during POST to determine whether the display is connected and if it is a color or monochrome CRT. BIOS blanks the screen or clears the frame buffer to display only black. Next, BIOS outputs a ramp to the D-to-A converters to test for the presence of a color display by determining which code cause the comparator to switch. Finally, if the BIOS does not detect any termination resistors on Red or Blue, it tests for the presence of a display using the Green signal. The result of each such test is read via this bit. 0 = Below threshold 1 = Above threshold
3:0	0b RO	**RESERVED_1:** Read as 0s.

</table>

Bit Range	Default & Access	Field Name (ID): Description
7	0b RO	**RESERVED_AS_PER_VGA_SPECIFICATION:** Read as 0s.
6	0b RO	**RESERVED:** Read as 0.
5:4	0b RO	**VIDEO_FEEDBACK_1_0:** These are diagnostic video bits that are selected by the Color Plane Enable Register. These bits that are programmably connected to 2 of the 8 color bits sent to the palette. Bits 4 and 5 of the Color Plane Enable Register (AR12) selects which two of the 8 possible color bits become connected to these 2 bits of this register. The current software normally does not use these 2 bits. They exist for EGA compatibility.

Bit Range	Default & Access	Field Name (ID): Description
3	0b RO	**VER_TI_CAL_RETRACE_VIDEO:** 0 = VSYNC inactive (Indicates that a vertical retrace interval is not taking place). 1 = VSYNC active (Indicates that a vertical retrace interval is taking place). Note: VGA pixel generation is not locked to the display output but is loosely coupled. A VSYNC indication may not occur during the actual VSYNC going to the display but during the VSYNC that is generated as part of the VGA pixel generation. The exact relationship will vary with the VGA display operational mode. This status bit will remain active when the VGA is disabled and the device is running in high resolution modes (non-VGA) to allow for applications that (now it is incorrect) use these status registers bits. In this case, the status will come from the pipe that the VGA is assigned to. Bits 4 and 5 of the Vertical Retrace End Register (CR11) previously could program this bit to generate an interrupt at the start of the vertical retrace interval. This ability to generate interrupts at the start of the vertical retrace interval is a feature that is largely unused by legacy software. Interrupts are not supported through the VGA register bits.
2:1	0b RO	**RESERVED_1:** Read as 0s.
0	0b RO	**DIS_PLAY_ENA_BLE_OUTPUT:** Display Enable is a status bit (bit 0) in VGA Input Status Register 1 that indicates when either a horizontal retrace interval or a vertical retrace interval is taking place. This was used with the IBM* EGA graphics system (and the ones that preceded it, including MDA and CGA). In those cases, it was important to check the status of this bit to ensure that one or the other retrace intervals was taking place before reading from or writing to the frame buffer. In these earlier systems, reading from or writing to frame buffer at times outside the retrace intervals meant that the CRT controller would be denied access to the frame buffer. This resulted in either snow or a flickering display. This bit provides compatibility with software designed for those early graphics controllers. This bit is currently used in DOS applications that access the palette to prevent the sparkle associated with read and write accesses to the palette ram with the same address on the same clock cycle. This status bit will remain active when the VGA display is disabled and the device is running in high resolution modes (non-VGA) to allow for applications that (now considered incorrect) use these status registers bits. In this case, the status will come from the pipe that the VGA is assigned to. When in panel fitting VGA or centered VGA operation, the meaning of these bits will not be consistent with native VGA timings. 0 = Active display data is being sent to the display. Neither a horizontal retrace interval or a vertical retrace interval is currently taking place. 1 = Either a horizontal retrace interval (horizontal blanking) or a vertical retrace interval (vertical blanking) is currently taking place.

14.13 Memory Mapped Registers (Write Only)

CRT_VSYNC_POLARITY	CRT_HSYNC_POLA_RITY	PAGE_SELECT	RESERVED	CLOCK_SELECT		A0000_BFFFFH_MEMORY_ACCESS_ENABLE	I_O_ADDRESS_SELECT

Bit Range	Default & Access	Field Name (ID): Description
7	0b RW	**CRT_VSYNC_POLARITY:** This is a legacy function that is used in native VGA modes. For most cases, sync polarity will be controlled by the port control bits. The VGA settings can be optionally selected for compatibility with the original VGA when used in the VGA native mode. Sync polarity was used in VGA to signal the monitor how many lines of active display are being generated. 0 = Positive Polarity (default). 1 = Negative Polarity.
6	0b RW	**CRT_HSYNC_POLA_RITY:** This is a legacy function that is used in native VGA modes. For most cases, sync polarity will be controlled by the port control bits. The VGA settings can be optionally selected for compatibility with the original VGA when used in the VGA native mode. 0 = Positive Polarity (default). 1 = Negative Polarity
5	0b RW	**PAGE_SELECT:** In Odd/Even Memory Map Mode 1 (GR6), this bit selects the upper or lower 64 KB page in dis play mem ory for CPU access: 0 = Upper page (default) 1 = Lower page. Selects between two 64KB pages of frame buffer memory during standard VGA odd/ even modes (modes 0h through 5h). Bit 1 of register GR06 can also program this bit in other modes. Note that this bit is would normally set to 1 by the software.
4	0b RW	**RESERVED:** Read as 0.

Bit Range	Default & Access	Field Name (ID): Description
3:2	0b RW	**CLOCK_SELECT:** These bits can select the dot clock source for the CRT interface. The bits should be used to select the dot clock in standard native VGA modes only. When in the centering or upper left corner modes, these bits should be set to have no effect on the clock rate. The actual frequencies that these bits select, if they have any affect at all, is programmable through the DPLL registers that default to the standard values used for VGA. 00 = CLK0, 25.175 MHz (for standard VGA modes with 640 pixel (8-dot) horizontal resolution) (default) 01 = CLK1, 28.322 MHz. (for standard VGA modes with 720 pixel (9-dot) horizontal resolution) 10 = Was used to select an external clock (now unused) 11 = Reserved
1	0b RW	**A0000_BFFFFH_MEMORY_ACCESS_ENABLE:** VGA Compatibility bit enables access to local video memory (frame buffer) at A0000(BFFFFh. When disabled, accesses to VGA memory are blocked in this region. This bit is independent of and does not block CPU access to the video linear frame buffer at other addresses. Note that it is typical for AGP chipsets to shadow this register to allow proper steering of memory accesses to the proper bus. 0 = Prevent CPU access to memory/registers/ROM through the A0000-BFFFF VGA memory aperture (default). 1 = Allow CPU access to memory/registers/ROM through the A0000-BFFFF VGA memory aperture. This memory must be mapped as UC by the CPU; see VGA Host Access Memory Munging in Display and Overlay Functions.
0	0b RW	**I_O_ADDRESS_SELECT:** This bit selects 3Bxh or 3Dxh as the I/O address for the CRT Controller re gisters, the Feature Control Register (FCR), and Input Status Register 1 (ST01). Presently ignored (whole range is claimed), but will ignore 3Bx for color configuration or 3Dx for monochrome. Note that it is typical in AGP chipsets to shadow this bit and properly steer I/O cycles to the proper bus for operation where a MDA exists on another bus such as ISA. 0 = Select 3Bxh I/O address (MDA emulation) (default). 1 = Select 3Dxh I/O address (CGA emulation).

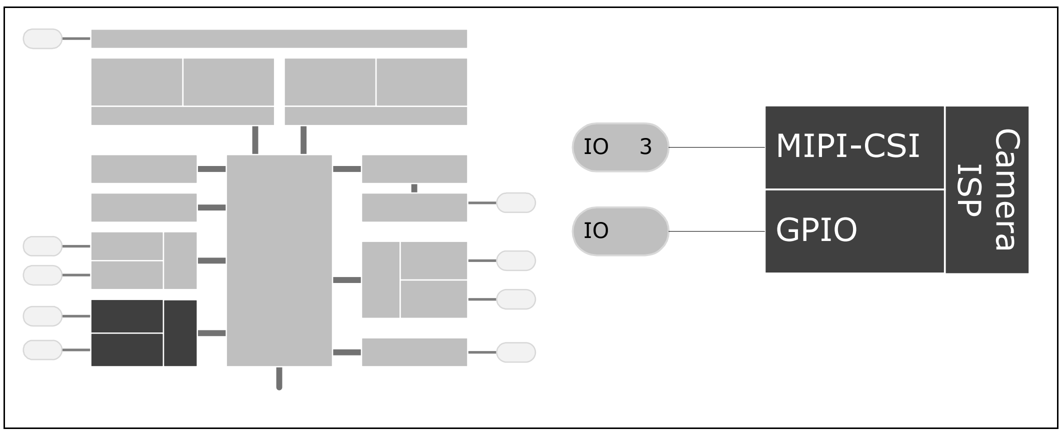
15 MIPI-Camera Serial Interface (CSI) and ISP

Note: The MIPI CSI and controller front end interfaces with three sensors and is capable of simultaneously acquiring three streams, one from each sensor. These three streams are presented to the ISP.

Note: If a 1-lane sensor needs to be connected to a MIPI-CSI port, that port must use a 1-lane port configuration.



15.1 Signal Descriptions

See Chapter 2, “Physical Interfaces” for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction**: The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power**: The reference power plane.
- **Description**: A brief explanation of the signal’s function

Table 176. CSI Signals

Signal Name	Direction Plat. Power	Description
MCSI1_CLKP/N	I V1P24S	**Clock Lane:** MIPI CSI input clock lane 0 for port 1.
MCSI1_DP/N[3:0]	I V1P24S	**Data Lanes:** Four MIPI CSI Data Lanes (0-3) for port 1. Lanes 2 and 3 can optionally used as data lanes for port 3.
MCSI2_CLKP/N	I V1P24S	**Clock Lane:** MIPI CSI input clock lane 0 for port 2.
MCSI2_DP/N[0]	I V1P24S	**Data Lane:** Single MIPI CSI Data Lanes for port 2.
MCSI3_CLKP/N	I V1P24S	**Clock Lane:** MIPI CSI input clock lane 0 for port 3.
MCSI_RCOMP	I/O	**Resistor Compensation:** This is for pre-driver slew rate compensation for the MIPI CSI Interface. Contact your Intel representative for details.

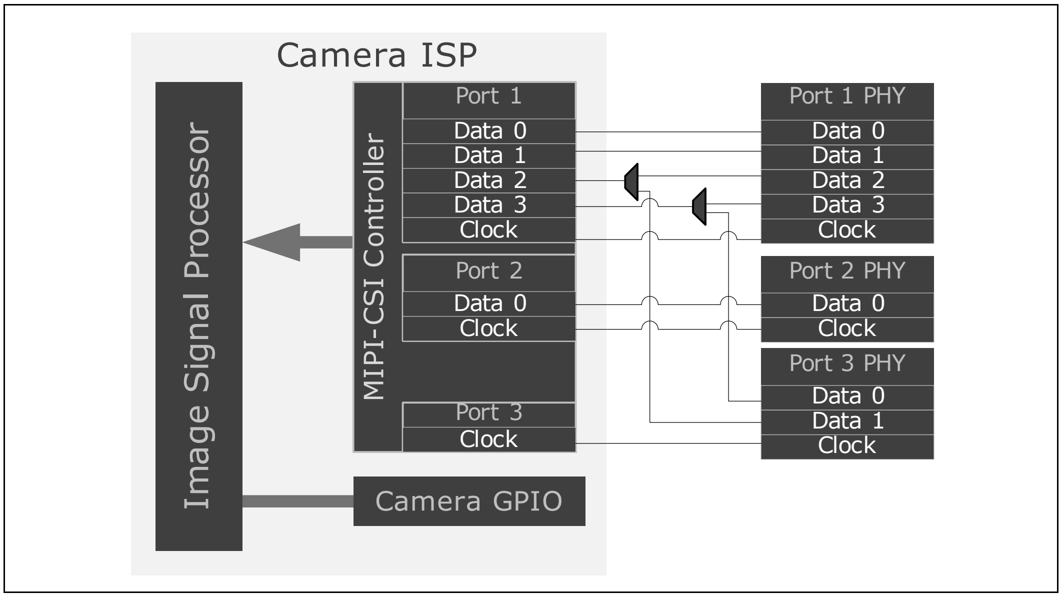
Table 177. GPIO Signals (Sheet 1 of 2)

Signal Name	Direction Plat. Power	Description
MCSI_GPIO[00]	I/O V1P8S	Output from shutter switch when its pressed halfway. This switch state is used to trigger the Auto focus LED for Xenon Flash or Torch mode for LED Flash
MCSI_GPIO[01]	I/O V1P8S	Output from shutter switch when its pressed full way. This switch state is used to trigger Xenon flash or LED Flash
MCSI_GPIO[02]	I/O V1P8S	Active high control signal to Xenon Flash to start charging the Capacitor
MCSI_GPIO[03]	I/O V1P8S	Active low output from Xenon Flash to indicate that the capacitor is fully charged and is ready to be triggered
MCSI_GPIO[04]	I/O V1P8S	Active high Xenon Flash trigger / Enables Torch Mode on LED Flash IC
MCSI_GPIO[05]	I/O V1P8S	Enables Red Eye Reduction LED for Xenon / Triggers STROBE on LED Flash IC /
MCSI_GPIO[06]	I/O V1P8S	Camera Sensor 0 Strobe Output to SoC to indicate beginning of capture / Active high signal to still camera to power down the device.
MCSI_GPIO[07]	I/O V1P8S	Camera Sensor 1 Strobe Output to SoC to indicate beginning of capture / Active high signal to still camera to power down the device.

Table 177. GPIO Signals (Sheet 2 of 2)

Signal Name	Direction Plat. Power	Description
MCSI_GPIO[08]	I/O V1P8S	Active high signal to video camera to power down the device.
MCSI_GPIO[09]	I/O V1P8S	Active low output signal to reset digital still camera #0.
MCSI_GPIO[10]	I/O V1P8S	Active low output signal to reset digital still camera #1
MCSI_GPIO[11]	I/O V1P8S	Active low output signal to reset digital video camera

Figure 94. Camera Connectivity



15.2 Features

- Integrated MIPI-CSI 2.0 interface
- Image Signal Processor (ISP) with DMA and local SRAM
- Imaging data is received by the MIPI-CSI interface and is relayed to the ISP for processing
- Up to five MIPI-CSI 2.0 data lanes
  — Each lane can operate at up to 1GT/s. resulting in roughly 800 Mbit/s of actual pixels
- The MIPI-CSI interface supports lossless compressed image streams to increases the effective bandwidth without losing data

- Up to 24MP sensors supported, and full HD 1080p60
  - Can also support Stereo HD 1080p30
- Up to 3 cameras can be operated simultaneously
  - Stereoscopic Captures
  - Front + Back Camera Usage

15.2.1 Imaging Capabilities

The following table summarizes imaging capabilities.

Table 178. Imaging Capabilities

Feature	Capabilities
Sensor interface	Configurable MIPI-CSI2 interfaces. 3 sensors: x2, x2, x1 or x3, x1, x1 2 sensors: x4, x1
Simultaneous sensors	Up to 3 simultaneous sensors
2D Image capture	24MP @ 15fps
2D video capture	Up to 1080p60
Input formats (Sensor -> SoC)	RAW 8, 10, 12, 14, RGB444, 565, 888, YUV420, 422, JPEG.
Output formats (SoC -> Sensor)	YUV422, YUV420, RAW
Special Features	Image and video stabilization Low light noise reduction Burst mode capture Memory to memory processing 3A (Auto Exposure (AE), Auto White Balance (AWB) and Auto Focus (AF)) High Dynamic Range (HDR) Multi-focus Zero shutter lag

15.2.2 Simultaneous Acquisition

All three cameras can be active at the same time.

SoC will support on-the-fly processing for only one image at a time. While this image is being processed on-the-fly, images from the other two cameras are saved to DRAM for later processing.

15.2.3 Primary Camera Still Image Resolution

Maximum still image resolution for the primary camera in post-processing mode is limited by the resolution of the sensors. Currently 24 Mpixel sensors are supported.

Maximum primary camera on-the-fly still image resolution for primary camera is 16 Mpixel at 18 fps.

Higher resolution, or higher frame rates are supported as long as the product of resolution and frame rate does not exceed 288 Mpixels/s (= 16 Mpixels * 18 fps).

Maximum primary camera on-the-fly stereoscopic still image resolution for primary camera is 8 Mpixel for each of the left and right images at 18 fps. The number of Mpixels can be increased by decreasing the frame rate.

15.2.4 Burst Mode Support

The SoC supports capturing multiple images back to back at maximum sensor resolution. At least 5 images must be captured in burst mode. The maximum number of images that can be so captured is limited only by available system memory. These images need not be processed on-the-fly.

15.2.5 Continuous Mode Capture

SoC supports capturing images and saving them to DRAM in a ring of frame buffers continuously at maximum sensor resolution. These images must then be fetched and processed on-the-fly by the ISP. This adds a round trip to memory for every frame and increases the bandwidth requirements.

15.2.6 Secondary Camera Still Image Resolution

Maximum secondary camera still image resolution is 4 Mpixel at 15 fps.

15.2.7 Primary Camera Video Resolution

Maximum primary camera video resolution is 1080p60.

Maximum primary camera dual video resolution is 1080p30.

Maximum stereo resolution is 1080p30.

15.2.8 Secondary Camera Video Resolution

Maximum secondary camera video resolution is 1080p30.

15.2.9 Bit Depth

Capable of processing 14-bit images at the stated performance levels.

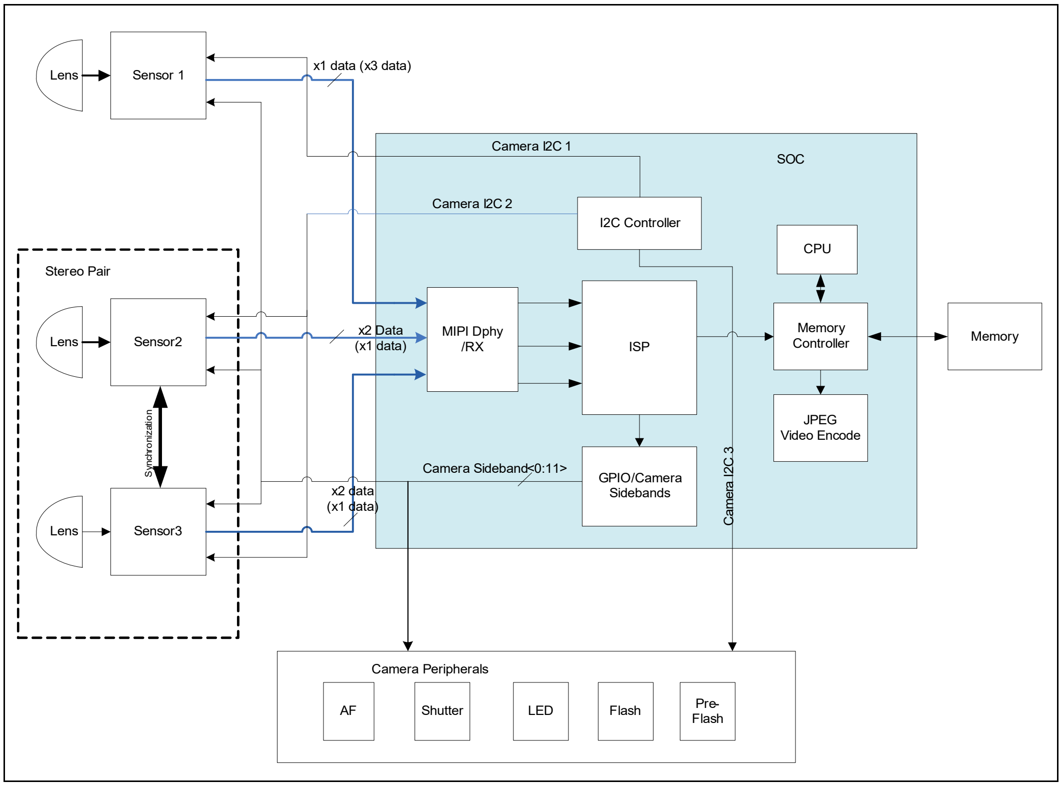
Capable of processing 18-bit images at half the performance levels, i.e. process on-the-fly 16 Mpixel 18-bit images at 7 fps instead of 15 fps.

Capable of processing up to 18-bit precision.

The higher precision processing will be employed mainly for high dynamic range imaging (HDR).

15.3 Imaging Subsystem Integration

Figure 95. Image Processing Components



15.3.1 CPU Core

The CPU core augments the signal processing capabilities of the hardware to perform post-processing on images such as auto focus, auto white balance, and auto exposure. The CPU also runs the drivers that control the GPIOs and I^2C for sensor control.

15.3.2 Imaging Signal Processor (ISP)

The ISP (Imaging Signal Processor) includes a 64-way vector processor enabling high quality camera functionality. Key features include support of three camera sensors.

15.3.2.1 MIPI-CSI-2 Ports

The SoC has three MIPI clock lanes and five MIPI data lanes. The Analog Front End (AFE) and Digital Physical Layer (DPHY) take these lanes and connects them to three virtual ports. Two data lanes are dedicated to each of the rear facing cameras and the remaining one data lane is connected to the front facing camera. The MIPI interfaces follow the MIPI-CSI-2 specifications as defined by the MIPI Alliance. They support YUV420, YUV422, RGB444, RGB555, RGB565, RGB 888 and RAW 8b/10b/12b. Both MIPI ports support compression settings specified in MIPI-CSI-2 draft specification 1.01.00 Annex E. The compression is implemented in Hardware with support for Predictor 1 and Predictor 2. Supported compression schemes:

- 12-8-12
- 12-7-12
- 12-6-12
- 10-8-10
- 10-7-10
- 10-6-10

The data compression schemes above use an X-Y-Z naming convention where X is the number of bits per pixel in the original image, Y is the encoded (compressed) bits per pixel and Z is the decoded (uncompressed) bits per pixel.

15.3.2.2 Camera Sideband for Camera Interface

Twelve (12) GPIO signals are allocated for camera functions, refer to Table 177 for signal names. These GPIOs are multiplexed and are available for other usages without powering on the ISP. The ISP provides a timing control block through which the GPIOs can be controlled to support assertion, de-assertion, pulse widths and delay. The configuration below of camera GPIOs is just an example of how the GPIOs can be used. Several of these functions could be implemented using I^2C, depending on the sensor implementation for the platform.

- Sensor Reset signals
  - —Force hardware reset on one or more of the sensors.
- Sensor Single Shot Trigger signal
  - —Indicate that the target sensor needs to send a full frame in a single shot mode, or to capture the full frame for flash synchronization.
- PreLight Trigger signal
  - —Light up a pilot lamp prior to firing the flash for preventing red-eye.
- Flash Trigger signal
  - —Indicate that a full frame is about to be captured. The Flash fires when it detects an assertion of the signal.
- Sensor Strobe Trigger signal
  - —Asserted by the target sensor to indicate the start of a full frame, when it is configured in the single shot mode, or to indicate a flash exposed frame for flash synchronization.

15.4 Functional Description

At a high level, the Camera Subsystem supports the following modes:

- Preview
- Image capture
- Video capture

15.4.1 Preview Mode

Once the ISP and the camera subsystem is enabled, the ISP goes into the preview mode where very low resolution frames, such as VGA/480p (programmable), are being processed.

15.4.2 Image Capture

During the image capture mode, the camera subsystem can acquire at a peak throughput of 24 Mpixels @ 15fps. While doing this, it continues to output preview frames simultaneously.

- The ISP can output RAW, RGB or YUV formats. The ISP can capture one full frame at a time or perform burst mode capture, where up to five full back-to-back frames are recorded.
- The ISP will not limit the number of back-to-back full frames captured, but the number is programmable and determined on how much memory can be allocated dynamically.
- The ISP can process all the frames on the fly and writes to memory only after fully processing the frames, without requiring download of any part of the frame for further processing.
  - —The exceptions to this approach are image stabilization and some other advanced functions requiring temporal information over multiple frames.

The ISP can support image stabilization in image capture model.

- The ISP initially outputs preview frames.
- When the user decides to capture the picture, image stabilization is enabled. The ISP checks the previous frame for motion and compensates for it appropriately.

Auto Exposure (AE), Auto Focus (AF), and Auto White Balance (AWB), together known as 3A, are implemented in the CPU to provide flexibility.

15.4.3 Video Capture

During video recording, the ISP can capture video up to 1080p @ 60 fps and output preview frames concurrently. The ISP output video frames to memory in YUV420 or YUV422 format.

15.4.4 ISP Overview

The Camera Subsystem consists of 2 parts, the hardware subsystem and a software stack that implements the ISP functionality on top of this hardware.

The core of the ISP is a vector processor. The vector processor is supported by the following components:

- Interfaces for data and control
- A small input formatter that parallelizes the data
- A scalar (RISC) processor, for system control and low-rate processing
- An accelerator for scaling, digital zoom, and lens distortion correction
- A DMA engine transfers large amounts of data such as input and output image data or large parameter sets between LPDDR2 and the ISP block.

15.4.5 Memory Management Unit (MMU)

The camera subsystem has capabilities to deal with a virtual address space, since a contiguous memory range in the order 16–32MB cannot be guaranteed by the OS.

15.4.5.1 Interface

The MMU performs the lookup required for address translation from a virtual to physical 32-bit address. The lookup tables are stored external to the system. The MMU performs the lookup through a master interface without burst support that is connected to the Open Core Protocol (OCP) master of the subsystem. The MMU configuration registers can be accessed through a 32-bit Core I/O (CIO) slave interface. Additionally there is a 32-bit CIO slave interface connected to the address translator.

15.5 MIPI-CSI-2 Receiver

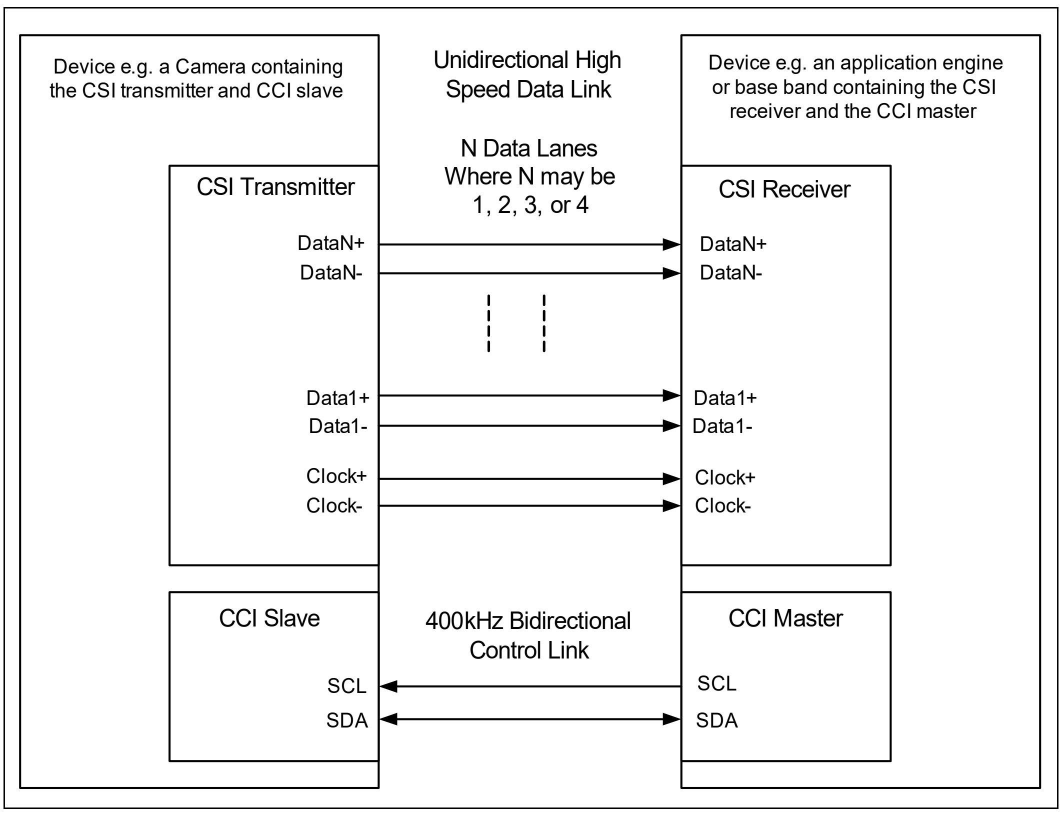
MIPI-CSI-2 devices are camera serial interface devices. They are categorized into two types, a CSI transmitter device with Camera Control Interface (CCI) slave and CSI receiver device with CCI master.

Data transfer by means of MIPI-CSI is unidirectional that is, from transmitter to receiver. CCI data transfer is bidirectional between the CCI slave and master.

Camera Serial Interface Bus (CSI) is a type of serial bus that enables transfer of data between a Transmitter device and a receiver device. The CSI device has a point-to-point connections with another CSI device by means of D-PHYs and as shown in Figure 96.

Similarly, CCI (Camera Control Interface bus) is a type of serial bus that enables transfer back and forth between the master CCI and a Slave CCI Unit.

Figure 96. MIPI-CSI Bus Block Diagram



D-PHY data lane signals are transferred point-to-point differentially using two signal lines and a clock lane. There are two signaling modes, a high speed mode that operates at 1000Mbs and a low power mode that works at 10Mbs. The mode is set to low power mode and a stop state at start up/power up. Depending on the desired data transfer type, the lanes switch between high and low power modes.

The CCI interface consists of an I^2C bus which has a clock line and a bidirectional data line.

The MIPI-CSI-2 devices operate in a layered fashion. There are 5 layers identified at the receiver and transmitter ends.

MIPI-CSI-2 Functional Layers:

- **PHY Layer**:
  — An embedded electrical layer sends and detects start of packet signalling and end of packet signalling on the data lanes. It contains a serializer and deserializer unit to interface with the PPI / lane management unit. There is also a clock divider unit to source and receive the clock during different modes of operation.
- **PPI/Lane Management Unit**:
  — This layer does the lane buffering and distributes the data in the lanes as programmed in a round robin manner and also merges them for the PLI/Low Level Protocol unit.
- **PLI/Low Level Protocol Unit**:
  — This layer packetizes as well as de-packetizes the data with respect to channels, frames, colors and line formats. There are ECC generator and corrector units to recover the data free from errors in the packet headers. There is also a CRC checker or CRC generator unit to pack the payload data with CRC checksum bits for payload data protection.
- **Pixel/Byte to Byte/Pixel Packing Formats**:
  — Conversion of pixel formats to data bytes in the payload data is done depending on the type of image data supported by the application. It also re-converts the raw data bytes to pixel format understandable to the application layer.
- **Application**:
  — Depending on the type of formats, camera types, capability of the camera used by the transmitter, the application layer recovers the image formats and reproduces the image in the display unit. It also works on de-framing the data into pixel-to-packing formats. High level encoding and decoding of image data is handled in the application unit.

15.5.1 MIPI-CSI-2 Receiver Features

CSI Features:

- Compliant to CSI-2 MIPI specification for Camera Serial Interface (Version 1.00)
- Supports standard D-PHY transceiver compliant to the MIPI Specification
- Supports PHY data programmability up to four lanes.
- Supports PHY data time-out programming.
- Has controls to start and re-start the CSI-2 data transmission for synchronization failures and to support recovery.

- The ISP may not support all the data formats that the CSI-2 receiver can handle.
  —Refer to Table 178 for formats supported by the ISP
- Supports all generic short packet data types.
- Single Image Signal Processor interface for pixel transfers to support multiple image streams for all virtual channel numbers.

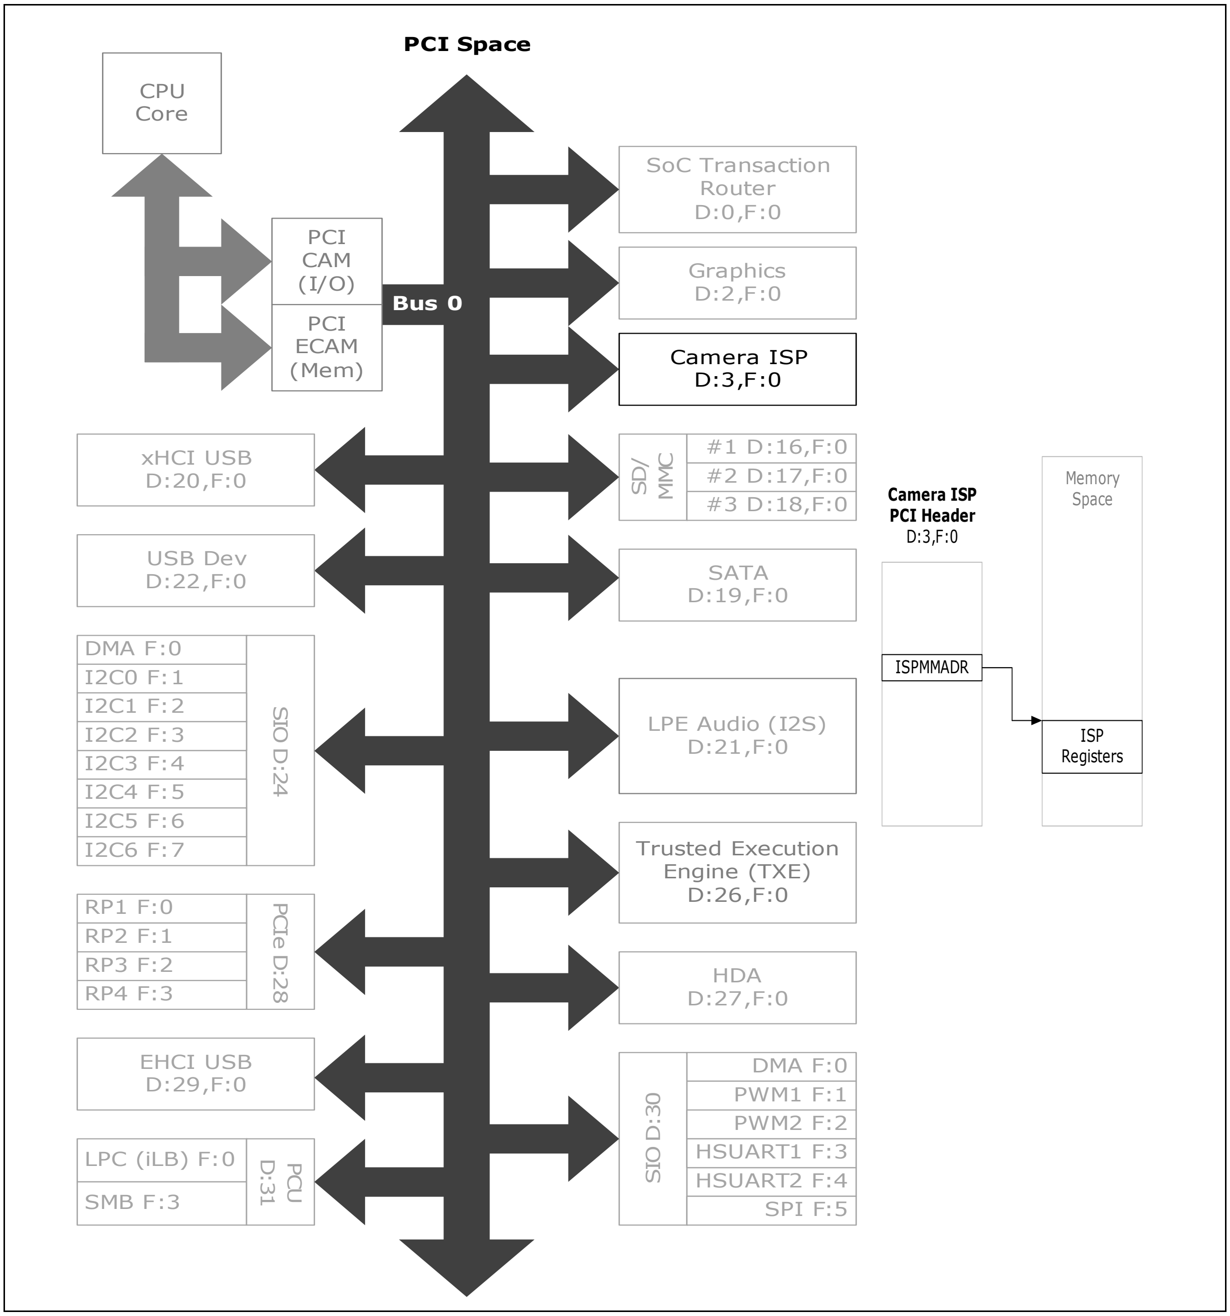
D-PHY Features:

- Supports synchronous transfer in high speed mode with a bit rate of 80-1000Mb/s
- Supports asynchronous transfer in low power mode with a bit rate of 10Mb/s.
- Differential signalling for HS data
- Spaced one-hot encoding for Low Power [LP] data
- Data lanes support transfer of data in high speed as well as low power modes.
- Supports ultra low power mode, escape mode, and high speed mode
- Has a clock divider unit to generate clock for parallel data reception and transmission from and to the PPI unit.
- Activates and disconnects high speed terminators for reception and control mode.
- Activates and disconnects low power terminators for reception and transmission.

15.6 Register Map

Refer to Chapter 3, "Register Access Methods" and Chapter 4, "Mapping Address Spaces" for additional information.

Figure 97. MIPI CSI Register Map



§

15.7 Image Signal Processor PCI Configuration Registers

Table 179. Summary of Image Signal Processor PCI Configuration Registers—0/2/0

Offset	Size	Register ID—Description	Default Value
0h	4	"iunit_ID_type (ID)—Offset 0h" on page 1059	0F388086h
4h	4	"iunit_PCICMDSTS_type (PCICMDSTS)—Offset 4h" on page 1059	00100000h
8h	4	"iunit_RIDCC_type (RIDCC)—Offset 8h" on page 1060	04800001h
Ch	4	"iunit_HDR_type (HDR)—Offset Ch" on page 1061	00000000h
10h	4	"iunit_ISPMMADR_type (ISPMMADR)—Offset 10h" on page 1061	00000000h
2Ch	4	"iunit_SSID_type (SSID)—Offset 2Ch" on page 1062	00000000h
34h	4	"iunit_CAPPOINT_type (CAPPOINT)—Offset 34h" on page 1062	00000080h
3Ch	4	"iunit_INTR_type (INTR)—Offset 3Ch" on page 1062	00000000h
80h	4	"iunit_PMCAP_type (PMCAP)—Offset 80h" on page 1063	00229001h
84h	4	"iunit_PMCS_type (PMCS)—Offset 84h" on page 1064	00000000h
90h	4	"iunit_MSI_CAPID_type (MSI_CAPID)—Offset 90h" on page 1064	00000005h
94h	4	"iunit_MSI_ADDRESS_type (MSI_ADDRESS)—Offset 94h" on page 1065	00000000h
98h	4	"iunit_MSI_DATA_type (MSI_DATA)—Offset 98h" on page 1066	00000000h
9Ch	4	"iunit_INTERRUPT_CONTROL_type (INTERRUPT_CONTROL)—Offset 9Ch" on page 1066	00000100h
B0h	4	"iunit_PERF0_type (PERF0)—Offset B0h" on page 1067	00000000h
B4h	4	"iunit_PERF1_type (PERF1)—Offset B4h" on page 1068	00000000h
B8h	4	"iunit_PERF2_type (PERF2)—Offset B8h" on page 1068	00000000h
BCh	4	"iunit_PERF3_type (PERF3)—Offset BCh" on page 1069	00000000h
C0h	4	"iunit_MISR0_type (MISR0)—Offset C0h" on page 1069	FFFFFFFFh
C4h	4	"iunit_MISR1_type (MISR1)—Offset C4h" on page 1070	FFFFFFFFh
C8h	4	"iunit_MISR2_type (MISR2)—Offset C8h" on page 1070	FFFFFFFFh
CCh	4	"iunit_MISR3_type (MISR3)—Offset CCh" on page 1071	FFFFFFFFh
D0h	4	"iunit_MANUFACTURING_ID_type (MANUFACTURING_ID)—Offset D0h" on page 1071	00000000h
D4h	4	"iunit_IUNIT_ACCESS_CTRL_VIOL_type (IUNIT_ACCESS_CTRL_VIOL)—Offset D4h" on page 1071	00000000h
D8h	4	"iunit_IUNIT_DEADLINE_STATUS_type (IUNIT_DEADLINE_STATUS)—Offset D8h" on page 1072	00000000h
DCh	4	"iunit_IUNIT_AFE_HS_CONTROL_type (IUNIT_AFE_HS_CONTROL)—Offset DCh" on page 1073	64000A00h
E0h	4	"iunit_IUNIT_AFE_RCOMP_CONTROL_type (IUNIT_AFE_RCOMP_CONTROL)—Offset E0h" on page 1074	00000000h
E4h	4	"iunit_IUNIT_AFE_TRIM_CONTROL_type (IUNIT_AFE_TRIM_CONTROL)—Offset E4h" on page 1075	00000000h
E8h	4	"iunit_IUNIT_CSI_CONTROL_type (IUNIT_CSI_CONTROL)—Offset E8h" on page 1076	000003F8h
ECh	4	"iunit_IUNIT_DEADLINE_CONTROL_type (IUNIT_DEADLINE_CONTROL)—Offset ECh" on page 1077	040A0100h

Table 179. Summary of Image Signal Processor PCI Configuration Registers—0/2/0

Offset	Size	Register ID—Description	Default Value
F0h	4	"iunit_IUNIT_RCOMP_STATUS_type (IUNIT_RCOMP_STATUS)—Offset F0h" on page 1078	16161616h
F4h	4	"iunit_IUNIT_RCOMP_CONTROL_type (IUNIT_RCOMP_CONTROL)—Offset F4h" on page 1079	00200001h
F8h	4	"iunit_IUNIT_STATUS_type (IUNIT_STATUS)—Offset F8h" on page 1080	0000EB01h
FCh	4	"iunit_IUNIT_CONTROL_type (IUNIT_CONTROL)—Offset FCh" on page 1081	00000103h

15.7.1 iunit_ID_type (ID)—Offset 0h

PCI Device and Vendor ID Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

ID: [B:0, D:3, F:0] + 0h

Default: 0F388086h

Bits 31–0: 0 0 0 0 | 1 1 1 1 | 0 0 1 1 | 1 0 0 0 | 1 0 0 0 | 0 0 0 0 | 1 0 0 0 | 0 1 1 0

31:19	18:16	15:0
DIDH	DIDL	VID

Bit Range	Default & Access	Description
31:19	01E7h RO	**DIDH:** DEVICE_IDENTIFICATION_NUMBER_HIGH: Upper bits of ISP Device ID. Connected to straps at IUNIT top level. (Tangier IUNIT Device IDs range from 16'h1178 through 16'h117F. Valleyview IUNIT Device IDs range from 16'h0F38 through 16'h0F3F.)
18:16	000b RO	**DIDL:** DEVICE_IDENTIFICATION_NUMBER_LOW: Lower bits of ISP Device ID. Connected to fuse FB_isp_device_id. (Tangier IUNIT Device IDs range from 16'h1178 through 16'h117F. Valleyview IUNIT Device IDs range from 16'h0F38 through 16'h0F3F.)
15:0	8086h RO	**VID:** VENDOR_IDENTIFICATION_NUMBER: PCI standard identification for Intel.

15.7.2 iunit_PCICMDSTS_type (PCICMDSTS)—Offset 4h

PCI Command and Status Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

PCICMDSTS: [B:0, D:3, F:0] + 4h

Default: 00100000h

Bits 31–0: 0 0 0 0 | 0 0 0 0 | 0 0 0 1 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

31:21	20	19	18:11	10	9:3	2	1	0
RSVD_31_21	CAP	IS	RSVD_18_11	ID	RSVD_9_3	BME	MSE	RSVD_0_0

Bit Range	Default & Access	Description
31:21	0h RO	**RSVD_31_21:** Reserved
20	1b RO	**CAP:** CAPABILITY_LIST: Indicates that the CAPPOINT register at 34h provides an offset into PCI Configuration Space containing a pointer to the location of the first item in the list.
19	0b RO	**IS:** INTERRUPT_STATUS: Reflects the state of the interrupt in the camera device. Is set to 1 if IER and IIR are both set. Otherwise is set to 0.
18:11	0h RO	**RSVD_18_11:** Reserved
10	0b RW	**ID:** INTERRUPT_DISABLE: When 1, blocks the sending of ASSERT_INTA and DEASSERT_INTA messages to the Intel Legacy Block (ILB). The interrupt status is not blocked from being reflected in PCICMDSTS.IS. When 0, permits the sending of ASSERT_INTA and DEASSERT_INTA messages to the ILB.
9:3	0h RO	**RSVD_9_3:** Reserved
2	0h RW	**BME:** BUS_MASTER_ENABLE: Enables ISP to function as a PCI compliant master. When 0, blocks the sending of MSI interrupts. When 1, permits the sending of MSI interrupts.
1	0h RW	**MSE:** MEMORY_SPACE_ENABLE: When set, accesses to this device's memory space is enabled. When 1, the ISP will compare the incoming address on the IOSF bus with ISPMMADR(31:22). If there is a match and if the IOSF command is either a MEMRD or MEMWR, the ISP will select the command and present it on the AHB bus. When 0, the ISP will not claim MEMRD or MEMWR IOSF commands.
0	0h RO	**RSVD_0_0:** Reserved

15.7.3 iunit_RIDCC_type (RIDCC)—Offset 8h

Revision Identification and Class Codes

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

RIDCC: [B:0, D:3, F:0] + 8h

Default: 04800001h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	1	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
BCC								SCC								PI								RID							

Bit Range	Default & Access	Description
31:24	04h RO	**BCC:** BASE_CLASS_CODE: Indicates a multimedia device.
23:16	80h RO	**SCC:** SUB_CLASS_CODE: Indicates other multimedia device.
15:8	0h RO	**PI:** PROGRAMMING_INTERFACE: Default programming interface.
7:0	01h RO	**RID:** REVISION_ID: The value in this field reflects the value of strapRID(7:0) (which is an input pin of ISP) and can be changed with each stepping of the silicon.

15.7.4 iunit_HDR_type (HDR)—Offset Ch

Header Type

Access Method

Type: PCI Configuration Register (Size: 32 bits)	**HDR:** [B:0, D:3, F:0] + Ch

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: RSVD_31_24 (31:24), MFUNC (23), HDR (22:16), RSVD_15_0 (15:0)

Bit Range	Default & Access	Description
31:24	0h RO	**RSVD_31_24:** Reserved
23	0h RO	**MFUNC:** MULTI_FUNCTION_STATUS: IUNIT is a single function.
22:16	0h RO	**HDR:** HEADER_CODE: Indicates a type 0 header format.
15:0	0h RO	**RSVD_15_0:** Reserved

15.7.5 iunit_ISPMMADR_type (ISPMMADR)—Offset 10h

Memory Mapped Address Range. This is the base address for all memory mapped registers.

Access Method

Type: PCI Configuration Register (Size: 32 bits)	**ISPMMADR:** [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: BA (31:22), RSVD_21_0 (21:0)

Bit Range	Default & Access	Description
31:22	0h RW	**BA:** BASE_ADDRESS: Set by the OS, these bits correspond to address signals (31:22). The ISP will compare the IOSF address (31:22) with ISPMMADR(31:22). If there is a match, and PCICMDSTS(1) = MSE = 1 and the IOSF command is either a MEMRD or MEMWR, the ISP will select the command and present it on the AHB bus to the vendor IP.

Bit Range	Default & Access	Description
21:0	0h RO	**RSVD_21_0:** Reserved

15.7.6 iunit_SSID_type (SSID)—Offset 2Ch

Subsystem Identifiers

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

SSID: [B:0, D:3, F:0] + 2Ch

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
SSID																															

Bit Range	Default & Access	Description
31:0	0h RO	**SSID:** SUBSYSTEM_IDENTIFIERS: The value in this field is a copy of the SSID register programmed by the graphics device driver or BIOS in the Device 0/2/0 PCI header. To change the subsystem ID, write to Device 0/2/0 SSID instead of to this SSID.

15.7.7 iunit_CAPPOINT_type (CAPPOINT)—Offset 34h

Capabilities Pointer

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

CAPPOINT: [B:0, D:3, F:0] + 34h

Default: 00000080h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
RSVD_31_8																								CAP							

Bit Range	Default & Access	Description
31:8	0h RO	**RSVD_31_8:** Reserved
7:0	80h RO	**CAP:** CAPABILITIES_POINTER: The first item in the capabilities list is at address 80h.

15.7.8 iunit_INTR_type (INTR)—Offset 3Ch

Interrupt. This register is programmed by SBIOS.

Access Method

Type: PCI Configuration Register (Size: 32 bits) **INTR:** [B:0, D:3, F:0] + 3Ch

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: RSVD_31_16 (31:16), IPIN (15:8), ILIN (7:0)

Bit Range	Default & Access	Description
31:16	0h RO	**RSVD_31_16:** Reserved
15:8	0h RO	**IPIN:** INTERRUPT_PIN: PCI Device 0/3/0 (IUNIT) is a single function device. If INTx is used, the PCI spec requires that it use INTA#. If INTx is used (FB_intx_supported fuse is 1), then this field is hard coded to 01h. If INTx is not used (FB_intx_supported fuse is 0), this field is hard coded to 00h.
7:0	0h RW	**ILIN:** INTERRUPT_LINE: BIOS written value to communicate interrupt line routing information to the ISP device driver.

15.7.9 iunit_PMCAP_type (PMCAP)—Offset 80h

Power Management Capabilities

Access Method

Type: PCI Configuration Register (Size: 32 bits) **PMCAP:** [B:0, D:3, F:0] + 80h

Default: 00229001h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	0	1	0	0	1	0	0	0	0	0	0	0	0	0	0	0	1

Fields: PMES (31:27), D2S (26), D1S (25), RSVD_24_22 (24:22), DSI (21), RSVD_20_19 (20:19), VS (18:16), NEXT_CAP (15:8), CAPID (7:0)

Bit Range	Default & Access	Description
31:27	0h RO	**PMES:** PME_SUPPORT: The camera controller does not generate PME#.
26	0h RO	**D2S:** D2_SUPPORT: The D2 power management state is not supported.
25	0h RO	**D1S:** D1_SUPPORT: The D1 power management state is not supported.
24:22	0h RO	**RSVD_24_22:** Reserved

Bit Range	Default & Access	Description
21	01h RO	**DSI:** DEVICE_SPECIFIC_INITIALIZATION: Hardwired to 1 to indicate that special initialization of the camera controller is required before generic class device driver is to use it.
20:19	0h RO	**RSVD_20_19:** Reserved
18:16	2h RO	**VS:** VERSION: Indicates compliance with revision 1.1 of the PCI Power Management Specification.
15:8	90h RO	**NEXT_CAP:** POINTER_TO_NEXT_CAPABILITY: Indicates the next item in the capabilities list.
7:0	01h RO	**CAPID:** CAPABILITIES: SIG defines this ID is 01h for power management.

15.7.10 iunit_PMCS_type (PMCS)—Offset 84h

Power Management Control/Status.

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

PMCS: [B:0, D:3, F:0] + 84h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
RSVD_31_2																														PS	

Bit Range	Default & Access	Description
31:2	0h RO	**RSVD_31_2:** Reserved
1:0	0h RW	**PS:** POWER_STATE: Power management is implemented by writing to control registers in the PUNIT. This field may be programmed by the software driver, but no action is taken based on writing to this field.

15.7.11 iunit_MSI_CAPID_type (MSI_CAPID)—Offset 90h

Message Signaled Interrupts Capability ID and Control Register

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

MSI_CAPID: [B:0, D:3, F:0] + 90h

Default: 00000005h

31	28	24	20	16	12	8	4	0
	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 1 0 1

RSVD_31_24	C64	MME	MMC	MSIE	NEXT_CAP	CAPID

Bit Range	Default & Access	Description
31:24	0h RO	**RSVD_31_24:** Reserved
23	0h RO	**C64:** 64_BIT_ADDRESS_CAPABLE: 32-bit capable only.
22:20	0h RW	**MME:** MULTIPLE_MESSAGE_ENABLE: This field is RW for software compatibility, but only a single message is ever generated.
19:17	0h RO	**MMC:** MULTIPLE_MESSAGE_CAPABLE: This device is only single message capable.
16	0h RW	**MSIE:** MSI_ENABLE: If set, MSI is enabled. PCICMDSTS.BME must be set for an MSI to be generated.When 0, blocks the sending of a MSI interrupt. The interrupt status is not blocked from being reflected in the PCICMDSTS.IS bit. When 1, permits sending of a MSI interrupt.
15:8	0h RO	**NEXT_CAP:** POINTER_TO_NEXT_CAPABILITY: Indicates this is the last item in the list.
7:0	05h RO	**CAPID:** CAPABILITY_ID: Indicates an MSI capability.

15.7.12 iunit_MSI_ADDRESS_type (MSI_ADDRESS)—Offset 94h

MSI Message Address

Access Method

Type: PCI Configuration Register (Size: 32 bits)

MSI_ADDRESS: [B:0, D:3, F:0] + 94h

Default: 00000000h

31	28	24	20	16	12	8	4	0
	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0

MA	RSVD_1_0

Bit Range	Default & Access	Description
31:2	0h RW	**MA:** MSI_ADDRESS: System specified message address, always DW aligned. When the ISP issues an MSI interrupt as a MEMWR on the IOSF, the memory address used is 12xFEE, MSI_ADDRESS[19:0].
1:0	0h RO	**RSVD_1_0:** Reserved

15.7.13 iunit_MSI_DATA_type (MSI_DATA)—Offset 98h

MSI Message Data

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

MSI_DATA: [B:0, D:3, F:0] + 98h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits 31:16	Bits 15:0
RSVD_31_16	MD

Bit Range	Default & Access	Description
31:16	0h RO	**RSVD_31_16:** Reserved
15:0	0h RW	**MD:** MSI_DATA: This 16-bit field is programmed by system software and is driven onto the lower word of data during the data phase of the MSI write transaction. When the ISP issues an MSI interrupt as a MEMWR on the IOSF, the write data corresponds to the value of this field.

15.7.14 iunit_INTERRUPT_CONTROL_type (INTERRUPT_CONTROL)—Offset 9Ch

INTERRUPT_CONTROL

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

INTERRUPT_CONTROL: [B:0, D:3, F:0] + 9Ch

Default: 00000100h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0

Bits 31:25	Bit 24	Bits 23:17	Bit 16	Bits 15:9	Bit 8	Bits 7:1	Bit 0
RSVD_31_25	IER	RSVD_23_17	IIR	RSVD_15_9	IMR	RSVD_7_1	ISR

Bit Range	Default & Access	Description
31:25	0h RO	**RSVD_31_25:** Reserved

Bit Range	Default & Access	Description
24	0h RW	**IER:** IER: This is an enable bit that allows the sending of an interrupt to the CPU using either MSI or INTR mechanisms. The interrupt is sent immediately to the CPU. The firmware running on the ISP guarantees ordering by reading the last data write from memory before raising the interrupt. 1 = If MSI_ENABLE is set, then an MSI is sent to the CPU when the IIR bit is set, or if the IIR bit remains set after software writes to this register. If INTERRUPT_DISABLE is not set, then an ASSERT_INTA message is sent to the Intel Legacy Block (ILB) when the IIR bit is set by hardware, or if the IIR bit remains set after software writes to this register. If software clears the IIR bit, and INTERRUPT_DISABLE is not set then a DEASSERT_INTA message is sent to the ILB. 0 = Do not generate an MSI even if the MSI_ENABLE bit is set. Do not send ASSERT_INTA or DEASSERT_INTA messages to the ILB even if the INTERRUPT_DISABLE bit is not set.
23:17	0h RO	**RSVD_23_17:** Reserved
16	0h RW/1C	**IIR:** IIR: This is the persistent value of the interrupt bit. It is set by hardware, and cleared by software. Software must write a 1 to clear this bit. Writing a 0 is a NOP. If both software and hardware attempt to write to this field in the same clock cycle, hardware wins. 1 = An interrupt was received from the vendor IP when the IMR bit was not set, and software has not yet cleared it. 0 = There is no pending interrupt.
15:9	0h RO	**RSVD_15_9:** Reserved
8	1b RW	**IMR:** IMR: Interrupt Mask bit. 1 = IIR bit will not be set when the ISR bit is set. 0 = IIR bit will be set when the ISR bit is set.
7:1	0h RO	**RSVD_7_1:** Reserved
0	0h RO	**ISR:** ISR: Reflects the state of the interrupt line from the vendor IP, after it is synchronized to the czclk domain.

15.7.15 iunit_PERF0_type (PERF0)—Offset B0h

Performance

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

PERF0: [B:0, D:3, F:0] + B0h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CRIFLO

Bit Range	Default & Access	Description
31:0	0h RW/SE	**CRIFLO:** IUNIT has four performance counters. When counting is enabled, the 11-bit reads_in_flight counter keeps track of the number of outstanding reads that have been requested, but not yet returned back at the OCP master interface. The 11-bit max_reads_in_flight counter keeps track of the maximum number of reads in flight in any given clock cycle. Each clock cycle, if there are any reads in flight, the reads_in_fight counter is added to a 64-bit cumulative_reads_in_flight counter, and the 48-bit active_cycles counter is incremented by 1. Reading this register returns bits 31:0 of the cumulative_reads_in_flight counter. This counter should be read only after counting is disabled. Reading while the counters are enabled will return undefined values. All four counters are disabled at reset. Writing (any value) to this register, will enable all four counters.

15.7.16 iunit_PERF1_type (PERF1)—Offset B4h

Performance

Access Method

31:27	0h RO	**RSVD_31_27:** Reserved
26:16	0h RW/SE	**MRIF:** IUNIT has four performance counters. When counting is enabled, the 11-bit reads_in_flight counter keeps track of the number of outstanding reads that have been requested, but not yet returned back at the OCP master interface. The 11-bit max_reads_in_flight counter keeps track of the maximum number of reads in flight in any given clock cycle. Each clock cycle, if there are any reads in flight, the reads_in_fight counter is added to a 64-bit cumulative_reads_in_flight counter, and the 48-bit active_cycles counter is incremented by 1. Reading this register returns bits 11:0 of the max_reads_in_flight counter. This counter should be read only after counting is disabled. Reading while the counters are enabled will return undefined values. All four counters are disabled at reset. Writing (any value) to this register, will clear the max_reads_in_flight counters only. The counters should only be cleared after they are disabled.
15:0	0h RW/SE	**ACHI:** IUNIT has four performance counters. When counting is enabled, the 11-bit reads_in_flight counter keeps track of the number of outstanding reads that have been requested, but not yet returned back at the OCP master interface. The 11-bit max_reads_in_flight counter keeps track of the maximum number of reads in flight in any given clock cycle. Each clock cycle, if there are any reads in flight, the reads_in_fight counter is added to a 64-bit cumulative_reads_in_flight counter, and the 48-bit active_cycles counter is incremented by 1. Reading this register returns bits 47:32 of the active_cycles counter. This counter should be read only after counting is disabled. Reading while the counters are enabled will return undefined values. All four counters are disabled at reset. Writing (any value) to this register, will clear the max_reads_in_flight counters only. The counters should only be cleared after they are disabled.

15.7.19 iunit_MISR0_type (MISR0)—Offset C0h

OCP Master Write Data

Access Method

Type: PCI Configuration Register (Size: 32 bits)	**MISR0:** [B:0, D:3, F:0] + C0h

Default: FFFFFFFFh

31			28				24				20				16				12				8				4				0
1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
															MISR0																

Bit Range	Default & Access	Description
31:0	FFFFFFFFh RW/C	**MISR0:** MISR0: Write to this register address clears this MISR. This is a 8:1 compression MISR capturing the 256-bit write data on the OCP interface between ISP_CSS and Iunit wrapper.

15.7.20 iunit_MISR1_type (MISR1)—Offset C4h

OCP Master Read Data

Access Method

Type: PCI Configuration Register (Size: 32 bits)

MISR1: [B:0, D:3, F:0] + C4h

Default: FFFFFFFFh

31			28				24				20				16				12				8				4				0
1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
															MISR1																

Bit Range	Default & Access	Description
31:0	FFFFFFFFh RW/C	**MISR1:** MISR1: Write to this register address clears this MISR. This is a 8:1 compression MISR capturing the 256-bit read return data on the OCP interface between ISP_CSS and Iunit wrapper.

15.7.21 iunit_MISR2_type (MISR2)—Offset C8h

OCP Master Address and Control

Access Method

Type: PCI Configuration Register (Size: 32 bits)

MISR2: [B:0, D:3, F:0] + C8h

Default: FFFFFFFFh

31			28				24				20				16				12				8				4				0
1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
															MISR2																

Bit Range	Default & Access	Description
31:0	FFFFFFFFh RW/C	**MISR2:** MISR2: Write to this register address clears this MISR. This is a 4:1 compression MISR capturing the control signals on the OCP Master port in the Iunit.

15.7.22 iunit_MISR3_type (MISR3)—Offset CCh

Scalar Processor output

Access Method

Type: PCI Configuration Register (Size: 32 bits)	**MISR3:** [B:0, D:3, F:0] + CCh

Default: FFFFFFFFh

31			28				24				20				16				12				8				4				0
1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

MISR3

Bit Range	Default & Access	Description
31:0	FFFFFFFFh RW/C	**MISR3:** MISR3: Write to this register address clears this MISR. This is a 4:1 compression MISR capturing the output signals of the Scalar Processor.

15.7.23 iunit_MANUFACTURING_ID_type (MANUFACTURING_ID)—Offset D0h

Manufacturing ID

Access Method

Type: PCI Configuration Register (Size: 32 bits)	**MANUFACTURING_ID:** [B:0, D:3, F:0] + D0h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

RSVD_31_24 | MID

Bit Range	Default & Access	Description
31:24	0h RO	**RSVD_31_24:** Reserved
23:0	0h RO	**MID:** MANUFACTURING_ID: Hardwired to strapMANID(23:0).

15.7.24 iunit_IUNIT_ACCESS_CTRL_VIOL_type (IUNIT_ACCESS_CTRL_VIOL)—Offset D4h

IUNIT Access control violation register

Access Method

Type: PCI Configuration Register (Size: 32 bits)	**IUNIT_ACCESS_CTRL_VIOL:** [B:0, D:3, F:0] + D4h

Default: 00000000h

31 28 24 20 16 12 8 4 0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

EN_INTR_ACCESS_CTRL_VIOL	RSVD_30_21	SAI_VIOL	MULTIPLE_SAI_VIOL	RSVD_18_15	VIOL_SAI	RSVD_7_7	INITIAL_SAI

Bit Range	Default & Access	Description
31	0b RW	**EN_INTR_ACCESS_CTRL_VIOL:** Enable Interrupt on access control violation: When set, the IUNIT will latch violation information into this register and send an interrupt request (opcode 0XEE) and (port 0x04) to the PUNIT.
30:21	00h RO	**RSVD_30_21:** Reserved
20	0b RW	**SAI_VIOL:** SAI_VIOL: If set, the IUNIT has detected an SAI violation and has captured the status in this register. This bit must be cleared by software in order for IUNIT to capture the next violation.
19	0b RW	**MULTIPLE_SAI_VIOL:** If set, more than one SAI violation has been detected in the IUNIT. Status for the 1st violation has been captured in this register. It is recommend that software clear this bit whenever it clears bit[20] of this register.
18:15	0h RO	**RSVD_18_15:** Reserved
14:8	00h RW	**VIOL_SAI:** VIOL_SAI: SAI bits that triggered the violation: This 7-bit value indicates the SAI of the subsequent transaction which caused the violation.
7	0b RO	**RSVD_7_7:** Reserved
6:0	00h RW	**INITIAL_SAI:** INITIAL_SAI: This 7-bit value indicates the SAI of the initial transaction for SAI mismatch error codes.

15.7.25 iunit_IUNIT_DEADLINE_STATUS_type (IUNIT_DEADLINE_STATUS)—Offset D8h

IUNIT Deadline Status Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

IUNIT_DEADLINE_STATUS: [B:0, D:3, F:0] + D8h

Default: 00000000h

Bits	31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
Default	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0

Fields: SDRAM_WAKEUP_PSTATE (31:30), DN (29:11), GT (10:0)

Bit Range	Default & Access	Description
31:30	0h RO	**SDRAM_WAKEUP_PSTATE:** SDRAM_WAKEUP_PSTATE: State of the SDRAM_WAKEUP state machine. 00b = State machine is idle; 01b = sdram_wakeup seen, waiting for all memory transactions in flight to complete; 10b = All memory transactions are completed, waiting for acknowledgement from czclk domain before returning to idle state;
29:11	0h RO	**DN:** DN: Computed deadline value to be send with the next request on IB PFI bus. This is the internal deadline value. The actual deadline that is sent on the IB PFI bus is the maximum of GT+MDD or DN.
10:0	0h RO	**GT:** GT: Current value of Global Timer

15.7.26 iunit_IUNIT_AFE_HS_CONTROL_type (IUNIT_AFE_HS_CONTROL)—Offset DCh

High-speed termination control MIPI CSI DPHY

Access Method

Type: PCI Configuration Register (Size: 32 bits)

IUNIT_AFE_HS_CONTROL: [B:0, D:3, F:0] + DCh

Default: 64000A00h

Bits	31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
Default	0 1 1 0	0 1 0 0	0 0 0 0	0 0 0 0	0 0 0 0	1 0 1 0	0 0 0 0	0 0 0 0

Fields: HS_CLK_UNGATE_DLY (31:24), RSVD_23_22 (23:22), CSI3_CLK_HS_TERM_OVRD (21:20), CSI2_CLK_HS_TERM_OVRD (19:18), CSI1_CLK_HS_TERM_OVRD (17:16), HS_CLK_EN_DLY (15:8), HS_DATA_EN_DLY (7:0)

Bit Range	Default & Access	Description
31:24	64h RW	**HS_CLK_UNGATE_DLY:** HS_CLK_UNGATE_DLY: Delay between the assertion of HS enable and the ungating of the HS clocks going to the DPHY logic for all clock lanes. HS clocks are gated by default and are ungated after Tclk-settle time. The range of this field is 0 nsec to 510 nsec in increments of 2 nsec, with reset value 0x64 indicating 200 nsec. Note that we use czclk to increment the counter, hence the actual delay can be as much as 10 nsec larger than the programmed value.
23:22	0h RW	**RSVD_23_22:** Reserved
21:20	00b RW	**CSI3_CLK_HS_TERM_OVRD:** CSI3_CLK_HS_TERM_OVRD: Override for HS termination enable for CSI3 clock lane. 00b = Use the termination enable output from the DPHY IP and gate XOR clocks in high speed mode; 01b = Keep HS termination (and HS enable) always on; 10b = Generate HS termination by sampling the CP/CN lines using coreclk and gate XOR clocks in high speed mode; 11b = Use the termination enable output from the DPHY IP;
19:18	00b RW	**CSI2_CLK_HS_TERM_OVRD:** CSI2_CLK_HS_TERM_OVRD: Override for HS termination enable for CSI2 clock lane. 00b = Use the termination enable output from the DPHY IP and gate XOR clocks in high speed mode; 01b = Keep HS termination (and HS enable) always on; 10b = Generate HS termination by sampling the CP/CN lines using coreclk and gate XOR clocks in high speed mode; 11b = Use the termination enable output from the DPHY IP;
17:16	00b RW	**CSI1_CLK_HS_TERM_OVRD:** CSI1_CLK_HS_TERM_OVRD: Override for HS termination enable for CSI1 clock lane. 00b = Use the termination enable output from the DPHY IP and gate XOR clocks in high speed mode; 01b = Keep HS termination (and HS enable) always on; 10b = Generate HS termination by sampling the CP/CN lines using coreclk and gate XOR clocks in high speed mode; 11b = Use the termination enable output from the DPHY IP;
15:8	0Ah RW	**HS_CLK_EN_DLY:** HS_CLK_EN_DLY: Delay between the assertion of HS termination enable and the assertion of HS enable for all clock lanes. The range of this field is 0 nsec to 510 nsec in increments of 2 nsec, with reset value 0x0A indicating 20 nsec. Note that we use czclk to increment the counter, hence the actual delay can be as much as 10 nsec larger than the programmed value.
7:0	0h RW	**HS_DATA_EN_DLY:** HS_DATA_EN_DLY: Delay between the assertion of HS termination enable and the assertion of HS enable for all data lanes. The range of this field is 0 nsec to 510 nsec in increments of 2 nsec, with reset value 0x0 indicating 0 nsec. Note that we use czclk to increment the counter, hence the actual delay can be as much as 10 nsec larger than the programmed value.

15.7.27 iunit_IUNIT_AFE_RCOMP_CONTROL_type (IUNIT_AFE_RCOMP_CONTROL)—Offset E0h

AFE RCOMP control

Access Method

Type: PCI Configuration Register (Size: 32 bits)

IUNIT_AFE_RCOMP_CONTROL: [B:0, D:3, F:0] + E0h

Default: 00000000h

Bits	31:16	15:9	8	7:4	3:0
Default	0000000000000000	0000000	0	0000	0000
Field	RSVD_31_16	RSVD_15_9	ICSI_RCOMPSTATICLEGDIS	RSVD_7_4	ICSI_RCOMPTARGET

Bit Range	Default & Access	Description
31:16	0h RO	**RSVD_31_16:** Reserved
15:9	0h RW	**RSVD_15_9:** Reserved
8	0b RW	**ICSI_RCOMPSTATICLEGDIS:** ICSI_RCOMPSTATICLEGDIS: Disable RCOMP static leg in AFE
7:4	0h RW	**RSVD_7_4:** Reserved
3:0	0h RW	**ICSI_RCOMPTARGET:** ICSI_RCOMPTARGET: RCOMP target level range is 70ohm to 130ohm differential impedance. 0000b = 50ohms; 0001b = 30ohms; 0010b = 35ohms; 0011b = 40ohms; 0100b = 45ohms; 0101b = 55ohms; 0110b = 60ohms; 0111b = 65ohms;

15.7.28 iunit_IUNIT_AFE_TRIM_CONTROL_type (IUNIT_AFE_TRIM_CONTROL)—Offset E4h

Configurable delay for CSI AFE data/clk lanes

Access Method

Type: PCI Configuration Register (Size: 32 bits)

IUNIT_AFE_TRIM_CONTROL: [B:0, D:3, F:0] + E4h

Default: 00000000h

Bits	31:28	27:24	23:20	19:16	15:0
Default	0000	0000	0000	0000	0000000000000000
Field	ICSI3_HSRXCLKTRIM	ICSI2_HSRXCLKTRIM	ICSI2_HSRXDATATRIM	ICSI1_HSRXCLKTRIM	ICSI1_HSRXDATATRIM

Bit Range	Default & Access	Description
31:28	0h RW	**ICSI3_HSRXCLKTRIM:** ICSI3_HSRXCLKTRIM: Delay for CSI3 clock lane. Refer to the CSI AFE Circuit Architecture Spec (CAS) for the actual delays for each trim value setting.

Bit Range	Default & Access	Description
27:24	0h RW	**ICSI2_HSRXCLKTRIM:** ICSI2_HSRXCLKTRIM: Delay for CSI2 clock lane. Refer to the CSI AFE Circuit Architecture Spec (CAS) for the actual delays for each trim value setting.
23:20	0h RW	**ICSI2_HSRXDATATRIM:** ICSI2_HSRXDATATRIM: Delay for CSI2 data lane. Refer to the CSI AFE Circuit Architecture Spec (CAS) for the actual delays for each trim value setting.
19:16	0h RW	**ICSI1_HSRXCLKTRIM:** ICSI1_HSRXCLKTRIM: Delay for CSI1 clock lane. Refer to the CSI AFE Circuit Architecture Spec (CAS) for the actual delays for each trim value setting.
15:0	0h RW	**ICSI1_HSRXDATATRIM:** ICSI1_HSRXDATATRIM: Delay for CSI1 data lanes. Refer to the CSI AFE Circuit Architecture Spec (CAS) for the actual delays for each trim value setting.

15.7.29 iunit_IUNIT_CSI_CONTROL_type (IUNIT_CSI_CONTROL)—Offset E8h

Control register for MIPI-CSI

Access Method

Type: PCI Configuration Register (Size: 32 bits)

IUNIT_CSI_CONTROL: [B:0, D:3, F:0] + E8h

Default: 000003F8h

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	0	0	0
Field	RSVD_31_20												CSI_PORTCONFIG				RSVD_15_10						CSI3_ACTIVE_LANES		CSI2_ACTIVE_LANES	CSI1_ACTIVE_LANES				CSI3_DISABLE	CSI2_DISABLE	CSI1_DISABLE

Bit Range	Default & Access	Description
31:20	0h RW	**RSVD_31_20:** Reserved
19:16	0h RW	**CSI_PORTCONFIG:** CSI_PORTCONFIG: Used to enable the CSI data lanes to CSI ports if FB_csi_portconfig_override fuse is set. This field is ignored if FB_csi_portconfig_override fuse is clear.
15:10	0h RW	**RSVD_15_10:** Reserved
9:8	11b RW	**CSI3_ACTIVE_LANES:** Used to determine which of the lanes that are enabled by the FB_csi_portconfig fuses or the CSI_PORTCONFIG field, are currently being used on the MIPI CSI3 interface. 1=active, 0=inactive.
7	1b RW	**CSI2_ACTIVE_LANES:** Used to determine which of the lanes that are enabled by the FB_csi_portconfig fuses or the CSI_PORTCONFIG field, are currently being used on the MIPI CSI2 interface. 1=active, 0=inactive.
6:3	1111b RW	**CSI1_ACTIVE_LANES:** Used to determine which of the lanes that are enabled by the FB_csi_portconfig fuses or the CSI_PORTCONFIG field, are currently being used on the MIPI CSI1 interface. 1=active, 0=inactive.
2	0b RW	**CSI3_DISABLE:** 1 = Disable MIPI CSI3 interface. 0 = Enable MIPI CSI3 interface if FB_csi_portdisable[2] fuse is cleared

Bit Range	Default & Access	Description
1	0b RW	**CSI2_DISABLE:** 1 = Disable MIPI CSI2 interface. 0 = Enable MIPI CSI2 interface if FB_csi_portdisable[1] fuse is cleared
0	0b RW	**CSI1_DISABLE:** 1 = Disable MIPI CSI1 interface. 0 = Enable MIPI CSI1 interface if FB_csi_portdisable[0] fuse is cleared

15.7.30 iunit_IUNIT_DEADLINE_CONTROL_type (IUNIT_DEADLINE_CONTROL)—Offset ECh

IUNIT Deadline Control Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

IUNIT_DEADLINE_CONTROL: [B:0, D:3, F:0] + ECh

Default: 040A0100h

Bits	31:28	27:24	23:20	19:16	15:12	11:8	7:4	3	2	1:0
Value	0 0 0 0	0 1 0 0	0 0 0 0	1 0 1 0	0 0 0 0	0 0 0 1	0 0 0 0	0	0	0 0
Field	FDD		DI		RSVD_15_12	MDD	RSVD_7_4	IGNORE_WAKEUP	DIS_GTP64_CHK	DS

Bit Range	Default & Access	Description
31:24	04h RW	**FDD:** FIRST_DEADLINE_DELAY: Delay between the rising edge of WAKEUP signal and the fake deadline that will be specified for the first request of that line. Unit in 250 nsec. Reset value of 8'h04 indicates FDD = 1 usec.
23:16	0Ah RW	**DI:** DEADLINE_INCREMENT: Difference in deadline times between adjacent requests. If the current request is for 32B, the next deadline will be DI more than the current deadline. If the current request is for 64B, the next deadline will be 2*DI more than the current deadline. Unit in 1/1024 usec. Reset value of 8'h0A indicates DI = 9.765625 nsec.
15:12	0h RW	**RSVD_15_12:** Reserved
11:8	1h RW	**MDD:** MINIMUM_DEADLINE_DELAY: Minimum separation between current Global Timer value and the deadline specified with any request on the PFI interface. Unit is 250 nsec. Reset value of 4'h1 indicates MDD = 250 nsec.
7:4	0h RW	**RSVD_7_4:** Reserved
3	0b RW	**IGNORE_WAKEUP:** If clear, then after each rising edge of sdram_wakeup, the OCP master interface is stalled until all reads in flight and all FIFOs are empty and then the next deadline is set to GT + FDD. If set, the sdram_wakeup signal from ISP_CSS is ignored.
2	0b RW	**DIS_GTP64_CHK:** If clear, then the PFI interface is stalled whenever the next deadline value exceeds GT + 64 usec. This check is a safety measure to make sure that deadline does not drift too far into the future. If set, this check is not performed.

Bit Range	Default & Access	Description
1:0	0h RW	**DS:** DEADLINE_SCHEME: 11b = Reserved; 10b = Reserved; 01b = When WAKEUP is asserted, FDD is added to the current global timer to compute DN. With each request, the deadline sent to Pondicherry is either DN, or the sum of the global timer and MDD, whichever is larger. After each request is sent, DN is computed by adding DI for each 32Byte request sent to either DN or the sum of the global timer and MDD, whichever is larger. Each clock cycle, DN is checked to make sure it is greater than the current global timer, else it is set to the global timer.; 00b = When WAKEUP is asserted, FDD is added to the current global timer to compute DN. With each request, the deadline sent to Pondicherry is either DN, or the sum of the global timer and MDD, whichever is larger. After each request is sent, DN is computed by adding DI for each 32Byte request sent to DN. Each cycle, DN is checked to make sure that it is either greater than the current global timer, or is less than the global timer by no more than 64 usec, else it is set to the global timer minus 64 usec.

15.7.31 iunit_IUNIT_RCOMP_STATUS_type (IUNIT_RCOMP_STATUS)—Offset F0h

IUNIT RCOMP Status Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

IUNIT_RCOMP_STATUS: [B:0, D:3, F:0] + F0h

Default: 16161616h

Bits	Default bits	Field
31	0	CALIB_EXIT_TOGGLE_LIMIT
30:24	0 0 1 0 1 1 0	CSI3_RCOMP_UPDATE_VALUE
23	0	CALIB_EXIT_0101
22:16	0 0 1 0 1 1 0	CSI2_RCOMP_UPDATE_VALUE
15	0	CALIB_EXIT_1010
14:8	0 0 1 0 1 1 0	CSI1_RCOMP_UPDATE_VALUE
7	0	CALIB_EXIT_ERROR
6:0	0 0 1 0 1 1 0	CSI_RCOMP_CALIBRATION_VALUE

Bit Range	Default & Access	Description
31	0b RO	**CALIB_EXIT_TOGGLE_LIMIT:** CALIB_EXIT_TOGGLE_LIMIT: If set, indicates that the last calibration cycle exited because the number of toggles matched the value specified by the CSI_HS_ROGGLE_LIMIT_CREG_ENC field of the IUNIT_RCOMP_CONTROL register.
30:24	16h RO	**CSI3_RCOMP_UPDATE_VALUE:** MIPI CSI3 RCOMP value: Current RCOMP value on MIPI CSI3 port
23	0b RO	**CALIB_EXIT_0101:** CALIB_EXIT_0101: If set, indicates that the last calibration cycle exited because the last four states of rcompcountup were 0101
22:16	16h RO	**CSI2_RCOMP_UPDATE_VALUE:** MIPI CSI2 RCOMP value: Current RCOMP value on MIPI CSI2 port
15	0b RO	**CALIB_EXIT_1010:** CALIB_EXIT_1010: If set, indicates that the last calibration cycle exited because the last four states of rcompcountup were 1010

Bit Range	Default & Access	Description
14:8	16h RO	**CSI1_RCOMP_UPDATE_VALUE:** MIPI CSI1 RCOMP value: Current RCOMP value on MIPI CSI1 port
7	0b RO	**CALIB_EXIT_ERROR:** CALIB_EXIT_ERROR: If set, indicates that the last calibration cycle exited due to an error condition.
6:0	16h RO	**CSI_RCOMP_CALIBRATION_VALUE:** MIPI CSI RCOMP value from last calibration cycle

15.7.32 iunit_IUNIT_RCOMP_CONTROL_type (IUNIT_RCOMP_CONTROL)—Offset F4h

MIPI CSI RCOMP control register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

IUNIT_RCOMP_CONTROL: [B:0, D:3, F:0] + F4h

Default: 00200001h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
RSVD_31_24								CSI_HS_OVR_CLK_GATE_ON_UPDATE	CSI_HS_RCOMP_UPDATE_MODE		CSI_HS_TOGGLE_LIMIT_CREG_ENC		CSI_HS_CALIB_LOOP_DELAY			RSVD_15_11					CSI3_HS_RCOMP_OVR_ENABLE	CSI2_HS_RCOMP_OVR_ENABLE	CSI1_HS_RCOMP_OVR_ENABLE	CSI_HS_RCOMP_OVR_CODE							CSI_HS_RCOMP_ENABLE

Bit Range	Default & Access	Description
31:24	0h RW	**RSVD_31_24:** Reserved
23	0b RW	**CSI_HS_OVR_CLK_GATE_ON_UPDATE:** CSI_HS_OVR_CLK_GATE_ON_UPDATE: If cleared, the high speed clock going to the digital logic is gated when RCOMP update is happening. The clock is gated for a minimum of 100 nsec. If this bit is set, then the high speed clock is not gated during the update cycle.
22:21	01b RW	**CSI_HS_RCOMP_UPDATE_MODE:** CSI_HS_RCOMP_UPDATE_MODE: 00b = RCOMP is updated if the clock lane is in LP11 state. 01b = RCOMP is updated if all the data lanes are in LP11 state. 10b = RCOMP is updated immediately after calibration is completed, or the CSI[1-3]_HS_RCOMP_OVR_ENABLE bits are written to 1 by software. 11b = Reserved.
20:19	0h RW	**CSI_HS_TOGGLE_LIMIT_CREG_ENC:** CSI_HS_TOGGLE_LIMIT_CREG_ENC: HS state machine toggle limit. Number of times RCOMP state machine will toggle before exiting. 2'b00: 6 toggles; 2'b01: 4 toggles; 2'b10: 8 toggles; 2'b11: 10 toggles;

Bit Range	Default & Access	Description
18:16	0h RW	**CSI_HS_CALIB_LOOP_DELAY:** CSI_HS_CALIB_LOOP_DELAY: Delay after applying a new RCOMP value to the AFE, before sampling the count up/down input from the AFE. 0h=)50-53ns; 1h=)60ns; 2h=)70-72ns; 3h=)80-83ns; 4h=)90ns; 5h=)100-102ns; 6h=)125-128ns; 7h=)150ns. At the start of each RCOMP calibration cycle, the state machine waits for 8x this delay before starting to sample the count up/down signal.
15:11	0h RW	**RSVD_15_11:** Reserved
10	0b RW	**CSI3_HS_RCOMP_OVR_ENABLE:** CSI3_HS_RCOMP_OVR_ENABLE: If set, then the CSI_HS_RCOMP_OVRD field is used as the RCOMP value during the update cycle for CSI port 3. If clear, then the output of the RCOMP calibration engine (stored in CSI_RCOMP_CALIBRATION_VALUE field of IUNIT_RCOMP_STATUS register) is used as the RCOMP value during the update cycle for CSI port 3.
9	0b RW	**CSI2_HS_RCOMP_OVR_ENABLE:** CSI2_HS_RCOMP_OVR_ENABLE: If set, then the CSI_HS_RCOMP_OVRD field is used as the RCOMP value during the update cycle for CSI port 2. If clear, then the output of the RCOMP calibration engine (stored in CSI_RCOMP_CALIBRATION_VALUE field of IUNIT_RCOMP_STATUS register) is used as the RCOMP value during the update cycle for CSI port 2.
8	0b RW	**CSI1_HS_RCOMP_OVR_ENABLE:** CSI1_HS_RCOMP_OVR_ENABLE: If set, then the CSI_HS_RCOMP_OVRD field is used as the RCOMP value during the update cycle for CSI port 1. If clear, then the output of the RCOMP calibration engine (stored in CSI_RCOMP_CALIBRATION_VALUE field of IUNIT_RCOMP_STATUS register) is used as the RCOMP value during the update cycle for CSI port 1.
7:1	0h RW	**CSI_HS_RCOMP_OVR_CODE:** CSI_HS_RCOMP_OVR_CODE: Software defined value to use as the RCOMP value for CSI[1-3] ports if the CSI[1-3]_HS_RCOMP_OVR_ENABLE fields are set.
0	1b RW	**CSI_HS_RCOMP_ENABLE:** CSI_HS_RCOMP_ENABLE: Enable CSI HS RCOMP. (Note: This bit does not affect the initial RCOMP at the de-assertion of reset which is controlled by the fuse FB_disable_initial_RCOMP.)

15.7.33 iunit_IUNIT_STATUS_type (IUNIT_STATUS)—Offset F8h

IUNIT Status Register

Access Method

Type: PCI Configuration Register
(Size: 32 bits)

IUNIT_STATUS: [B:0, D:3, F:0] + F8h

Default: 0000EB01h

Bits	31–28	27–24	23–20	19–16	15–12	11–8	7–4	3–0
Value	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	1 1 1 0	1 0 1 1	0 0 0 0	0 0 0 1

Fields: RSVD_31_18, ISCLK, CZCLK, RSVD_7_7, TCGSM, RSVD_3_3, LCGSM, ISP_BUSY

Bit Range	Default & Access	Description
31:18	0h RO	**RSVD_31_18:** Reserved
17:13	07h RO	**ISCLK:** Reflects the value of cck_isp_isclk_ratio_zcznfwh input pin.
12:8	0Bh RO	**CZCLK:** Reflects the value of cck_xxx_czclk_ratio_zcznfwh input pin.

Bit Range	Default & Access	Description
7	0b RO	**RSVD_7_7:** Reserved
6:4	0h RO	**TCGSM:** ISP trunk clock gating state machine. 0h = RUN_TRUNK_CLK; 1h = STOP_TRUNK_CLK; 2h = WAIT_FOR_RESUME; 3h = START_TRUNK_CLK; 4h = WAIT_FOR_LOCAL_CLK_TO_START. The reset value will be RUN_TRUNK_CLK. If the FB_override_initial_clock_gating fuse is not set, then shortly after reset, the value of this register will automatically change to STOP_TRUNK_CLK.
3	0b RO	**RSVD_3_3:** Reserved
2:1	0h RO	**LCGSM:** ISP local clock gating state machine. 0h = RUN_LOCAL_CLK; 1h = WAIT_FOR_FIFO_EMPTY; 2h = STOP_LOCAL_CLK. The reset value will be RUN_LOCAL_CLK. If the FB_override_initial_clock_gating fuse is not set, then shortly after reset, the value of this register will automatically change to STOP_LOCAL_CLK.
0	1b RO	**ISP_BUSY:** ISP_BUSY: 1 = ISP is busy; 0 = ISP is idle.

15.7.34 iunit_IUNIT_CONTROL_type (IUNIT_CONTROL)—Offset FCh

IUNIT Control Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)	**IUNIT_CONTROL:** [B:0, D:3, F:0] + FCh

Default: 00000103h

Bits	31	30	29	28:24	23:22	21	20	19	18:16	15:8	7	6:5	4	3:2	1	0
Value	0	0	0	0 0 0 0 0	0 0	0	0	0	0 0 0	0 0 0 0 0 0 0 1	0	0 0	0	0 0	1	1
Field	FUNTION_DISABLE_CFG	FUNCTION_DISABLE_MMIO	RSVD_29_29	PERF_MASK	RSVD_23_22	DISABLE_ISM_IDLE_FREEZE	DISABLE_OCP_PHASE_ORDERING	ICACHE_CMD_WEIGHT	THERM_MASK	MID	RCOMPCLK_GATING_DISABLE	ISPCLK_GATING_DISABLE	DDMA	SRSE	IBEWC	IBERC

Bit Range	Default & Access	Description
31	0b RW	**FUNTION_DISABLE_CFG:** FUNCTION_DISABLE_CFG: When set, the IUNIT stops accepting any new Configuration cycle requests on the IOSF Primary bus including any new configuration cycle requests to clear this bit. Both legacy and MSI interrupts are disabled as well.
30	0b RW	**FUNCTION_DISABLE_MMIO:** FUNCTION_DISABLE_MMIO: When set, the IUNIT stops accepting any new MMIO access requests on the IOSF Primary bus.
29	0b RW	**RSVD_29_29:** Reserved

Bit Range	Default & Access	Description
28:24	0h RW	**PERF_MASK:** PERF_MASK: This field determines the amount of performance throttling applied to ispclk. The value of this field determines how many beat periods of ispclk are killed, where a beat period is defined as 16 ispclk cycles. A 16 cycle period was chosen to make the throttling independent of the actual clock ratio between ispclk and coreclk. Note that clock gating should be enabled when thermal throttling is enabled.
23:22	0h RW	**RSVD_23_22:** Reserved
21	0h RW	**DISABLE_ISM_IDLE_FREEZE:** DISABLE_ISM_IDLE_FREEZE: When IUNIT receive a RESET_WARN message from PUNIT, it will freeze the IOSF primary Idle State Machine (among other things), before sending an OK_TO_RESET message to PUNIT. If the DISABLE_ISM_IDLE_FREEZE bit is set, IUNIT will not freeze the ISM in the IDLE state as part of this reset sequence.
20	0h RW	**DISABLE_OCP_PHASE_ORDERING:** DISABLE_OCP_PHASE_ORDERING: By default, IUNIT will follow the OCP phase ordering protocol and wait until a write command is accepted before accepting the write data corresponding to that command. If the DISABLE_OCP_PHASE_ORDERING bit is set, the IUNIT wrapper will accept the write data independent of the write command.
19	0h RW	**ICACHE_CMD_WEIGHT:** ICACHE_CMD_WEIGHT: 0b = Requests from the OCP master port sending Icache miss traffic will win arbitration over requests from the OCP master port that sends pixel data traffic. 1b = Requests from the two OCP master interfaces will be accepted in a round robin fashion.
18:16	0h RW	**THERM_MASK:** THERM_MASK: This field determines the amount of thermal throttling applied to ispclk. The value of this field determines how many beat periods of ispclk are killed, where a beat period is defined as 16 ispclk cycles. A 16 cycle period was chosen to make the throttling independent of the actual clock ratio between ispclk and coreclk. 000 = No throttling; 001 = 12.5% throttling; 010 = 25% throttling; 011 = 37.5% throttling; 100 = 50% throttling; 101 = 62.5% throttling; 110 = 75% throttling; 111 = 87.5% throttling;
15:8	01h RW	**MID:** MIN_IDLE_DELAY: Minimum wait time after the rising edge of idle, before the clock gating state machine will start the sequence to gate ispclk. Range is 0 to 130 usec. Unit is 0.512 usec. Reset value of 8'h1 indicates MID = 0.512 usec.
7	0b RW	**RCOMPCLK_GATING_DISABLE:** 1 = Disable clock gating for rcompclk. 0 = Enable clock gating for rcompclk. Note: All clock gating is disabled by hardware while reset is asserted, regardless of the state of this field.
6:5	00b RW	**ISPCLK_GATING_DISABLE:** ISPCLK_GATING_DISABLE: 11 = Disable local clock gating and trunk clock gating for ispclk.; 10 = Enable local clock gating for ispclk, but disable trunk clock gating.; 01 = Reserved; 00 = Enable local clock gating and trunk clock gating for ispclk. Note: All clock gating is disabled by hardware while reset is asserted, regardless of the state of this field.
4	0b RW	**DDMA:** 1 = Disable DMA. Stop sending any requests on the IB PFI port. 0 = Enable DMA. IB PFI port operates normally.
3:2	0h RW	**SRSE:** SOFT_RESET_SEQUENCE_ENABLE: If SRSE=2b00: When an IUNIT_RESET_WARN message is received from PUNIT, IUNIT will a) stop accepting requests on the IOSF primary interface, b) stop accepting new requests from the OCP master interface, c) wait until read data from all earlier read requests received from the OCP master interface have been returned by SSA, d) wait until SSA reads data for all earlier PFI write requests, and e) wait for all DPHY lanes to enter stop state (LP11), and then f) send an IUNIT_OK_TO_RESET posted message to PUNIT. If SRSE=2b01: When an IUNIT_RESET_WARN message is received from PUNIT, IUNIT will a) stop accepting requests on the IOSF primary interface, b) stop accepting new requests from the OCP master interface, c) wait until read data from all earlier read requests received from the OCP master interface have been returned by SSA, d) wait until SSA reads data for all earlier PFI write requests, and then e) send an IUNIT_OK_TO_RESET posted message to PUNIT. If SRSE=2b10: When an IUNIT_RESET_WARN message is received from PUNIT, IUNIT will wait for all DPHY lanes to enter stop state (LP11), and then send an IUNIT_OK_TO_RESET posted message to PUNIT. If SRSE=2b11: When an IUNIT_RESET_WARN message is received from PUNIT, IUNIT will immediately send an IUINT_OK_TO_RESET posted message to PUNIT.

Bit Range	Default & Access	Description
1	1b RW	**IBEWC:** IB_ENABLE_WRITE_COMBINING: When set, enables the combining of adjacent 32-byte write requests to the same cache line. When cleared, each 32-byte write request is sent as a separate request on the IB interface.
0	1b RW	**IBERC:** IB_ENABLE_READ_COMBINING: When set, enables the combining of adjacent 32-byte read requests to the same cache line. When cleared, each 32-byte read request is sent as a separate request on the IB interface.

Table 180. Summary of Image Signal Processor Memory Mapped I/O Registers—ISPMMADR (Continued)

Offset	Size	Register ID—Description	Default Value
43200h	4	“reg_isp_dma_Dev_Interf_0_Fifo_status_type (isp_dma_Dev_Interf_0_Fifo_status)—Offset 43200h” on page 1515	00000004h
43204h	4	“reg_isp_dma_Dev_Interf_1_Fifo_status_type (isp_dma_Dev_Interf_1_Fifo_status)—Offset 43204h” on page 1516	00000004h
43208h	4	“reg_isp_dma_Dev_Interf_2_Fifo_status_type (isp_dma_Dev_Interf_2_Fifo_status)—Offset 43208h” on page 1517	00000004h
43300h	4	“reg_isp_dma_Dev_Interf_0_Req_complete_bust_type (isp_dma_Dev_Interf_0_Req_complete_bust)—Offset 43300h” on page 1518	00000000h
43304h	4	“reg_isp_dma_Dev_Interf_1_Req_complete_bust_type (isp_dma_Dev_Interf_1_Req_complete_bust)—Offset 43304h” on page 1519	00000000h
43308h	4	“reg_isp_dma_Dev_Interf_2_Req_complete_bust_type (isp_dma_Dev_Interf_2_Req_complete_bust)—Offset 43308h” on page 1520	00000000h
43408h	4	“reg_isp_dma_Dev_Interf_2_Max_burst_Size_type (isp_dma_Dev_Interf_2_Max_burst_Size)—Offset 43408h” on page 1520	0000007Fh
50000h	4	“reg_gdc1_reg0_type (gdc1_reg0)—Offset 50000h” on page 1521	00000000h
50004h	4	“reg_gdc1_woi_x_type (gdc1_woi_x)—Offset 50004h” on page 1522	00000000h
50008h	4	“reg_gdc1_woi_y_type (gdc1_woi_y)—Offset 50008h” on page 1522	00000000h
5000Ch	4	“reg_gdc1_bpp_type (gdc1_bpp)—Offset 5000Ch” on page 1523	00000000h
50010h	4	“reg_gdc1_fryipxfrx_start_type (gdc1_fryipxfrx_start)—Offset 50010h” on page 1523	00000000h
50014h	4	“reg_gdc1_oxdim_type (gdc1_oxdim)—Offset 50014h” on page 1524	00000000h
50018h	4	“reg_gdc1_oydim_type (gdc1_oydim)—Offset 50018h” on page 1524	00000000h
5001Ch	4	“reg_gdc1_src_addr_type (gdc1_src_addr)—Offset 5001Ch” on page 1525	00000000h
50020h	4	“reg_gdc1_src_end_type (gdc1_src_end)—Offset 50020h” on page 1525	00000000h
50024h	4	“reg_gdc1_src_wrap_type (gdc1_src_wrap)—Offset 50024h” on page 1526	00000000h
50028h	4	“reg_gdc1_src_stride_type (gdc1_src_stride)—Offset 50028h” on page 1526	00000000h
5002Ch	4	“reg_gdc1_dst_addr_type (gdc1_dst_addr)—Offset 5002Ch” on page 1527	00000000h
50030h	4	“reg_gdc1_dst_stride_type (gdc1_dst_stride)—Offset 50030h” on page 1527	00000000h
50034h	4	“reg_gdc1_dx_type (gdc1_dx)—Offset 50034h” on page 1528	00000000h
50038h	4	“reg_gdc1_dy_type (gdc1_dy)—Offset 50038h” on page 1528	00000000h
5003Ch	4	“reg_gdc1_P0_primX_ixdim_type (gdc1_P0_primX_ixdim)—Offset 5003Ch” on page 1529	00000000h
50040h	4	“reg_gdc1_P0_primY_iydim_type (gdc1_P0_primY_iydim)—Offset 50040h” on page 1529	00000000h
50044h	4	“reg_gdc1_P1_primX_type (gdc1_P1_primX)—Offset 50044h” on page 1530	00000000h
50048h	4	“reg_gdc1_P1_primY_type (gdc1_P1_primY)—Offset 50048h” on page 1530	00000000h
5004Ch	4	“reg_gdc1_P2_primX_type (gdc1_P2_primX)—Offset 5004Ch” on page 1531	00000000h

Table 180. Summary of Image Signal Processor Memory Mapped I/O Registers—ISPMMADR (Continued)

Offset	Size	Register ID—Description	Default Value
50050h	4	"reg_gdc1_P2_primY_type (gdc1_P2_primY)—Offset 50050h" on page 1531	00000000h
50054h	4	"reg_gdc1_P3_primX_type (gdc1_P3_primX)—Offset 50054h" on page 1532	00000000h
50058h	4	"reg_gdc1_P3_primY_type (gdc1_P3_primY)—Offset 50058h" on page 1532	00000000h
5005Ch	4	"reg_gdc1_perf_mode_type (gdc1_perf_mode)—Offset 5005Ch" on page 1533	00000000h
50060h	4	"reg_gdc1_interp_type_type (gdc1_interp_type)—Offset 50060h" on page 1534	00000000h
50064h	4	"reg_gdc1_scan_mode_type (gdc1_scan_mode)—Offset 50064h" on page 1534	00000000h
50068h	4	"reg_gdc1_proc_mode_type (gdc1_proc_mode)—Offset 50068h" on page 1535	00000000h
60000h	4	"reg_gdc2_reg0_type (gdc2_reg0)—Offset 60000h" on page 1535	00000000h
60004h	4	"reg_gdc2_woi_x_type (gdc2_woi_x)—Offset 60004h" on page 1536	00000000h
60008h	4	"reg_gdc2_woi_y_type (gdc2_woi_y)—Offset 60008h" on page 1536	00000000h
6000Ch	4	"reg_gdc2_bpp_type (gdc2_bpp)—Offset 6000Ch" on page 1537	00000000h
60010h	4	"reg_gdc2_fryipxfrx_start_type (gdc2_fryipxfrx_start)—Offset 60010h" on page 1537	00000000h
60014h	4	"reg_gdc2_oxdim_type (gdc2_oxdim)—Offset 60014h" on page 1538	00000000h
60018h	4	"reg_gdc2_oydim_type (gdc2_oydim)—Offset 60018h" on page 1538	00000000h
6001Ch	4	"reg_gdc2_src_addr_type (gdc2_src_addr)—Offset 6001Ch" on page 1539	00000000h
60020h	4	"reg_gdc2_src_end_type (gdc2_src_end)—Offset 60020h" on page 1539	00000000h
60024h	4	"reg_gdc2_src_wrap_type (gdc2_src_wrap)—Offset 60024h" on page 1540	00000000h
60028h	4	"reg_gdc2_src_stride_type (gdc2_src_stride)—Offset 60028h" on page 1540	00000000h
6002Ch	4	"reg_gdc2_dst_addr_type (gdc2_dst_addr)—Offset 6002Ch" on page 1541	00000000h
60030h	4	"reg_gdc2_dst_stride_type (gdc2_dst_stride)—Offset 60030h" on page 1541	00000000h
60034h	4	"reg_gdc2_dx_type (gdc2_dx)—Offset 60034h" on page 1542	00000000h
60038h	4	"reg_gdc2_dy_type (gdc2_dy)—Offset 60038h" on page 1542	00000000h
6003Ch	4	"reg_gdc2_P0_primX_ixdim_type (gdc2_P0_primX_ixdim)—Offset 6003Ch" on page 1543	00000000h
60040h	4	"reg_gdc2_P0_primY_iydim_type (gdc2_P0_primY_iydim)—Offset 60040h" on page 1543	00000000h
60044h	4	"reg_gdc2_P1_primX_type (gdc2_P1_primX)—Offset 60044h" on page 1544	00000000h
60048h	4	"reg_gdc2_P1_primY_type (gdc2_P1_primY)—Offset 60048h" on page 1544	00000000h
6004Ch	4	"reg_gdc2_P2_primX_type (gdc2_P2_primX)—Offset 6004Ch" on page 1545	00000000h
60050h	4	"reg_gdc2_P2_primY_type (gdc2_P2_primY)—Offset 60050h" on page 1545	00000000h

Table 180. Summary of Image Signal Processor Memory Mapped I/O Registers—ISPMMADR (Continued)

Offset	Size	Register ID—Description	Default Value
60054h	4	"reg_gdc2_P3_primX_type (gdc2_P3_primX)—Offset 60054h" on page 1546	00000000h
60058h	4	"reg_gdc2_P3_primY_type (gdc2_P3_primY)—Offset 60058h" on page 1546	00000000h
6005Ch	4	"reg_gdc2_perf_mode_type (gdc2_perf_mode)—Offset 6005Ch" on page 1547	00000000h
60060h	4	"reg_gdc2_interp_type_type (gdc2_interp_type)—Offset 60060h" on page 1548	00000000h
60064h	4	"reg_gdc2_scan_mode_type (gdc2_scan_mode)—Offset 60064h" on page 1548	00000000h
60068h	4	"reg_gdc2_proc_mode_type (gdc2_proc_mode)—Offset 60068h" on page 1549	00000000h
70000h	4	"reg_data_out_sys_c_mmu_MMU_invalidate_cache_type (data_out_sys_c_mmu_MMU_invalidate_cache)—Offset 70000h" on page 1549	00000000h
70004h	4	"reg_data_out_sys_c_mmu_MMU_page_table_base_type (data_out_sys_c_mmu_MMU_page_table_base)—Offset 70004h" on page 1550	00000000h
80100h	4	"reg_inp_sys_csi_receiver_csi1_dev_ready_type (inp_sys_csi_receiver_csi1_dev_ready)—Offset 80100h" on page 1550	00000000h
80104h	4	"reg_inp_sys_csi_receiver_csi1_int_status_type (inp_sys_csi_receiver_csi1_int_status)—Offset 80104h" on page 1551	00000000h
80108h	4	"reg_inp_sys_csi_receiver_csi1_int_enable_type (inp_sys_csi_receiver_csi1_int_enable)—Offset 80108h" on page 1553	00000000h
8010Ch	4	"reg_inp_sys_csi_receiver_csi1_func_prg_type (inp_sys_csi_receiver_csi1_func_prg)—Offset 8010Ch" on page 1554	0007FFFFh
80110h	4	"reg_inp_sys_csi_receiver_csi1_init_cnt_type (inp_sys_csi_receiver_csi1_init_cnt)—Offset 80110h" on page 1555	00000000h
8011Ch	4	"reg_inp_sys_csi_receiver_csi_backend_fs_ls_type (inp_sys_csi_receiver_csi_backend_fs_ls)—Offset 8011Ch" on page 1555	00000002h
80120h	4	"reg_inp_sys_csi_receiver_csi_backend_ls_dvalid_type (inp_sys_csi_receiver_csi_backend_ls_dvalid)—Offset 80120h" on page 1556	00000002h
80124h	4	"reg_inp_sys_csi_receiver_csi_backend_dvalid_le_type (inp_sys_csi_receiver_csi_backend_dvalid_le)—Offset 80124h" on page 1557	00000002h
80128h	4	"reg_inp_sys_csi_receiver_csi_backend_le_fe_type (inp_sys_csi_receiver_csi_backend_le_fe)—Offset 80128h" on page 1557	00000002h
8012Ch	4	"reg_inp_sys_csi_receiver_csi_backend_fe_fs_type (inp_sys_csi_receiver_csi_backend_fe_fs)—Offset 8012Ch" on page 1558	00000002h
80130h	4	"reg_inp_sys_csi_receiver_csi_backend_le_ls_type (inp_sys_csi_receiver_csi_backend_le_ls)—Offset 80130h" on page 1559	00000004h
80134h	4	"reg_inp_sys_csi_receiver_csi_backend_two_pixel_en_type (inp_sys_csi_receiver_csi_backend_two_pixel_en)—Offset 80134h" on page 1559	00000000h
80138h	4	"reg_inp_sys_csi_receiver_csi1_raw16_18_data_id_type (inp_sys_csi_receiver_csi1_raw16_18_data_id)—Offset 80138h" on page 1560	00000000h
8013Ch	4	"reg_inp_sys_csi_receiver_csi1_sync_cnt_type (inp_sys_csi_receiver_csi1_sync_cnt)—Offset 8013Ch" on page 1561	FFFFFFFFh

Table 180. Summary of Image Signal Processor Memory Mapped I/O Registers—ISPMMADR (Continued)

Offset	Size	Register ID—Description	Default Value
80140h	4	"reg_inp_sys_csi_receiver_csi1_rx_cnt_type (inp_sys_csi_receiver_csi1_rx_cnt)—Offset 80140h" on page 1561	FFFFFFFFh
80144h	4	"reg_inp_sys_csi_receiver_csi_backend_rst_type (inp_sys_csi_receiver_csi_backend_rst)—Offset 80144h" on page 1562	00000000h
80148h	4	"reg_inp_sys_csi_receiver_csi_backend_comp_pred_reg0_vc0_type (inp_sys_csi_receiver_csi_backend_comp_pred_reg0_vc0)—Offset 80148h" on page 1563	00000000h

15.8.1 reg_gpd_gp_reg_reg_gp_sdram_wakeup_type (gpd_gp_reg_reg_gp_sdram_wakeup)—Offset 0h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_gp_reg_reg_gp_sdram_wakeup: [ISPMMADR] + 0h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: unused_reg_gp_sdram_wakeup (31:1), reg_gp_sdram_wakeup (0)

Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_sdram_wakeup:** Unused
0	0h RW	**reg_gp_sdram_wakeup:** when set to 1, this signal will cause the memory controller to bring the external SDRAM into an active state.

15.8.2 reg_gpd_gp_reg_reg_gp_idle_type (gpd_gp_reg_reg_gp_idle)—Offset 4h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_gp_reg_reg_gp_idle: [ISPMMADR] + 4h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: unused_reg_gp_idle (31:1), reg_gp_idle (0)

Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_idle:** Unused

Bit Range	Default & Access	Description
0	0h RW	**reg_gp_idle:** Should be set to 1 when ISP system is in ?idle? mode.

15.8.3 reg_gpd_gp_reg_reg_gp_irq_req0_type (gpd_gp_reg_reg_gp_irq_req0)—Offset 8h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_gp_reg_reg_gp_irq_req0: [ISPMMADR] + 8h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: unused_reg_gp_irq_req0 (bits 31:1), reg_gp_irq_req0 (bit 0)

Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_irq_req0:** Unused
0	0h RW	**reg_gp_irq_req0:** possibly causes an interrupt request (if the host interrupt controller is properly configured)

15.8.4 reg_gpd_gp_reg_reg_gp_irq_req1_type (gpd_gp_reg_reg_gp_irq_req1)—Offset Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_gp_reg_reg_gp_irq_req1: [ISPMMADR] + Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Default	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Field
31:1	unused_reg_gp_irq_req1
0	reg_gp_irq_req1

Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_irq_req1:** Unused
0	0h RW	**reg_gp_irq_req1:** possibly causes an interrupt request (if the host interrupt controller is properly configured)

15.8.5 reg_gpd_gp_reg_reg_gp_sp_stream_stat_type (gpd_gp_reg_reg_gp_sp_stream_stat)—Offset 10h

Indicate the status of the streaming ports of the scalar processor. All valid and accept signals of the scalar processor are reflected in this register and in reg_gp_sp_stream_stat_b.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gpd_gp_reg_reg_gp_sp_stream_stat: [ISPMMADR] + 10h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00022022h

Bit	Default	Field
31	0	SP_STR_MON_PIFB2SP_accept

3	0	SP_STR_MON_SIF2SP_accept
2	0	SP_STR_MON_SIF2SP_valid
1	1	SP_STR_MON_SP2SIF_accept
0	0	SP_STR_MON_SP2SIF_valid

Bit Range	Default & Access	Description
31	0h RO	**SP_STR_MON_PIFB2SP_accept:** Returns the value 1 if the SP can accept an acknowledge token from the FIFO between the primary input formatter B acknowledge port and the SP. Returns the value 0 if the SP cannot accept a token on this SP input port.

Bit Range	Default & Access	Description
30	0h RO	**SP_STR_MON_PIFB2SP_valid:** Returns the value 1 if a valid acknowledge token from the FIFO between the primary input formatter B acknowledge port and the SP, is present on the primary input formatter B input port of the SP. Returns the value 0 if there is no valid acknowledge token available on this SP input port.
29	0h RO	**SP_STR_MON_SP2PIFB_accept:** Returns the value 1 if the command FIFO between SP and the Primary input formatter B can accept a command from the SP. Returns the value 0 if this FIFO cannot accept a token from the SP.
28	0h RO	**SP_STR_MON_SP2PIFB_valid:** Returns the value 1 if SP sends a command using the streaming port connected to the Primary Input Formatter B command FIFO. Returns the value 0 if the SP does not send a command to this FIFO
27	0h RO	**SP_STR_MON_PIF2SP_accept:** Returns the value 1 if the SP can accept an acknowledge token from the FIFO between the primary input formatter acknowledge port and the SP. Returns the value 0 if the SP cannot accept a token on this SP input port.
26	0h RO	**SP_STR_MON_PIF2SP_valid:** Returns the value 1 if a valid acknowledge token from the FIFO between the primary input formatter acknowledge port and the SP, is present on the primary input formatter input port of the SP. Returns the value 0 if there is no valid acknowledge token available on this SP input port.
25	0h RO	**SP_STR_MON_SP2PIF_accept:** Returns the value 1 if the command FIFO between SP and the Primary input formatter can accept a command from the SP. Returns the value 0 if this command FIFO cannot accept a command from the SP.
24	0h RO	**SP_STR_MON_SP2PIF_valid:** Returns the value 1 if SP sends a command using the streaming port connected to the Primary Input Formatter command FIFO. Returns the value 0 if the SP does not send a command to the Primary Input formatter
23	0h RO	**SP_STR_MON_ISYS2SP_accept:** Returns the value 1 if the SP can accept an acknowledge token from the FIFO between the input system acknowledge port and the SP. Returns the value 0 if the SP cannot accept a token on this SP input port.
22	0h RO	**SP_STR_MON_ISYS2SP_valid:** Returns the value 1 if a valid acknowledge token from the FIFO between the input system acknowledge port and the SP, is present on the input system input port of the SP. Returns the value 0 if there is no valid acknowledge token available on this SP input port.
21	0h RO	**SP_STR_MON_SP2ISYS_accept:** Returns the value 1 if the command FIFO between SP and the input system can accept a command from the SP. Returns the value 0 if this command FIFO cannot accept a command from the SP.
20	0h RO	**SP_STR_MON_SP2ISYS_valid:** Returns the value 1 if SP sends a command using the streaming port connected to the input system command FIFO. Returns the value 0 if the SP does not send a command to the input system
19	0h RO	**SP_STR_MON_GPD2SP_accept:** Returns the value 1 if the SP can accept a token from the streaming FIFO between the fifo adpater in GP devices and the SP. Returns 0 if the SP cannot accept a token from this FIFO.
18	0h RO	**SP_STR_MON_GPD2SP_valid:** Returns the value 1 if the streaming FIFO between the fifo adapter in GP devices and the SP has a valid token for the SP. Returns the value 0 if this FIFO is empty.
17	1h RO	**SP_STR_MON_SP2GPD_accept:** Returns the value 1 if the token FIFO between SP and fifo adapter can accept a token from the SP. Returns the value 0 if this token FIFO is full.
16	0h RO	**SP_STR_MON_SP2GPD_valid:** Returns the value 1 if SP sends a token using the streaming port connected to the token FIFO between the SP and the fifo adapter in GP_devices. Returns the value 0 if the SP does not send a token to the fifo adapter.
15	0h RO	**SP_STR_MON_ISP2SP_accept:** Returns the value 1 if the SP can accept a token from the streaming FIFO between the ISP and the SP. Returns 0 if the SP cannot accept a token from this FIFO.
14	0h RO	**SP_STR_MON_ISP2SP_valid:** Returns the value 1 if the streaming FIFO between the ISP and the SP has a valid token for the SP. Returns the value 0 if this FIFO is empty
13	1h RO	**SP_STR_MON_SP2ISP_accept:** Returns the value 1 if the token FIFO between SP and ISP can accept a token from the SP. Returns the value 0 if this token FIFO is full.

Bit Range	Default & Access	Description
12	0h RO	**SP_STR_MON_SP2ISP_valid:** Returns the value 1 if SP sends a token using the streaming port connected to the ISP token FIFO. Returns the value 0 if the SP does not send a token to the ISP
11	0h RO	**SP_STR_MON_DMA2SP_accept:** Returns the value 1 if the SP can accept an acknowledge token from the FIFO between the DMA acknowledge port and the SP. Returns the value 0 if the SP cannot accept a token on this SP input port.
10	0h RO	**SP_STR_MON_DMA2SP_valid:** Returns the value 1 if a valid acknowledge token from the FIFO between the DMA acknowledge port and the SP, is present on the DMA input port of the SP. Returns the value 0 if there is no valid acknowledge token available on this SP input port.
9	0h RO	**SP_STR_MON_SP2DMA_accept:** Returns the value 1 if the command FIFO between SP and the DMA can accept a command from the SP. Returns the value 0 if this command FIFO cannot accept a command from the SP.
8	0h RO	**SP_STR_MON_SP2DMA_valid:** Returns the value 1 if SP sends a command using the streaming port connected to the DMA command FIFO. Returns the value 0 if the SP does not send a command to the DMA
7	0h RO	**SP_STR_MON_MC2SP_accept:** Returns the value 1 if the SP can accept an acknowledge token from the FIFO between the stream2mem acknowledge port and the SP. Returns the value 0 if the SP cannot accept a token on this SP input port.
6	0h RO	**SP_STR_MON_MC2SP_valid:** Returns the value 1 if a valid acknowledge token from the FIFO between the stream2mem acknowledge port and the SP, is present on the stream2mem input port of the SP. Returns the value 0 if there is no valid acknowledge token available on this SP input port.
5	1h RO	**SP_STR_MON_SP2MC_accept:** Returns the value 1 if the command FIFO between SP and the stream2mem can accept a command from the SP. Returns the value 0 if this command FIFO is full.
4	0h RO	**SP_STR_MON_SP2MC_valid:** Returns the value 1 if SP sends a command using the streaming port connected to the stream2mem command FIFO. Returns the value 0 if the SP does not send a command to the stream2mem
3	0h RO	**SP_STR_MON_SIF2SP_accept:** Returns the value 1 if the SP can accept an acknowledge token from the FIFO between the secondary input formatter acknowledge port and the SP. Returns the value 0 if the SP cannot accept a token on this SP input port.
2	0h RO	**SP_STR_MON_SIF2SP_valid:** Returns the value 1 if a valid acknowledge token from the FIFO between the secondary input formatter acknowledge port and the SP, is present on the secondary input formatter input port of the SP. Returns the value 0 if there is no valid acknowledge token available on this SP input port.
1	1h RO	**SP_STR_MON_SP2SIF_accept:** Returns the value 1 if the command FIFO between SP and the secondary input formatter can accept a command from the SP. Returns the value 0 if this command FIFO is full.
0	0h RO	**SP_STR_MON_SP2SIF_valid:** Returns the value 1 if SP sends a command using the streaming port connected to the Secondary Input Formatter command FIFO. Returns the value 0 if the SP does not send a command to the Secondary Input formatter

15.8.6 reg_gpd_gp_reg_reg_gp_sp_stream_stat_b_type (gpd_gp_reg_reg_gp_sp_stream_stat_b)—Offset 14h

Indicate the status of the streaming ports of the scalar processor. All valid and accept signals of the scalar processor are reflected in this register and in reg_gp_sp_stream_stat.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_gp_reg_reg_gp_sp_stream_stat_b: [ISPMMADR] + 14h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Description
31:28	0h RW	**unused_reg_gp_isp_stream_stat:** Unused
27	0h RO	**ISP_STR_MON_SP2ISP_accept:** Returns the value 1 if the ISP can accept a token from the streaming FIFO between the SP and the ISP. Returns 0 if the ISP cannot accept a token from this FIFO.
26	0h RO	**ISP_STR_MON_SP2ISP_valid:** Returns the value 1 if the streaming FIFO between the SP and the ISP has a valid token for the ISP. Returns the value 0 if this FIFO is empty
25	1h RO	**ISP_STR_MON_ISP2SP_accept:** Returns the value 1 if the token FIFO between ISP and SP can accept a token from the ISP. Returns the value 0 if this token FIFO is full.
24	0h RO	**ISP_STR_MON_ISP2SP_valid:** Returns the value 1 if ISP sends a token using the streaming port connected to the SP token FIFO. Returns the value 0 if the ISP does not send a token to the SP
23	0h RO	**ISP_STR_MON_GPD2ISP_accept:** Returns the value 1 if the ISP can accept a token from the streaming FIFO between the fifo adpater in GP devices and the ISP. Returns 0 if the ISP cannot accept a token from this FIFO.
22	0h RO	**ISP_STR_MON_GPD2ISP_valid:** Returns the value 1 if the streaming FIFO between the fifo adapter in GP devices and the ISP has a valid token for the ISP. Returns the value 0 if this FIFO is empty.
21	1h RO	**ISP_STR_MON_ISP2GPD_accept:** Returns the value 1 if the token FIFO between ISP and fifo adapter can accept a token from the ISP. Returns the value 0 if this token FIFO is full.
20	0h RO	**ISP_STR_MON_ISP2GPD_valid:** Returns the value 1 if ISP sends a token using the streaming port connected to the token FIFO between the ISP and the fifo adapter in GP_devices. Returns the value 0 if the ISP does not send a token to the fifo adapter.

Bit Range	Default & Access	Description
19	0h RO	**ISP_STR_MON_GDC22ISP_accept:** Returns the value 1 if the ISP can accept an acknowledge token from the FIFO between the GDC2 acknowledge port and the ISP. Returns the value 0 if the ISP cannot accept a token on this ISP input port.
18	0h RO	**ISP_STR_MON_GDC22ISP_valid:** Returns the value 1 if a valid acknowledge token from the FIFO between the GDC2 acknowledge port and the ISP, is present on the GDC2 input port of the ISP. Returns the value 0 if there is no valid acknowledge token available on this ISP input port.
17	0h RO	**ISP_STR_MON_ISP2GDC2_accept:** Returns the value 1 if the command FIFO between ISP and GDC2 can accept a command from the ISP. Returns the value 0 if this command FIFO is full.
16	0h RO	**ISP_STR_MON_ISP2GDC2_valid:** Returns the value 1 if ISP sends a command using the streaming port connected to the GDC2 command FIFO. Returns the value 0 if the ISP does not send a command to GDC2
15	0h RO	**ISP_STR_MON_GDC12ISP_accept:** Returns the value 1 if the ISP can accept an acknowledge token from the FIFO between the GDC1 acknowledge port and the ISP. Returns the value 0 if the ISP cannot accept a token on this ISP input port.
14	0h RO	**ISP_STR_MON_GDC12ISP_valid:** Returns the value 1 if a valid acknowledge token from the FIFO between the GDC1 acknowledge port and the ISP, is present on the GDC1 input port of the ISP. Returns the value 0 if there is no valid acknowledge token available on this ISP input port.
13	0h RO	**ISP_STR_MON_ISP2GDC1_accept:** Returns the value 1 if the command FIFO between ISP and GDC1 can accept a command from the ISP. Returns the value 0 if this command FIFO is full.
12	0h RO	**ISP_STR_MON_ISP2GDC1_valid:** Returns the value 1 if ISP sends a command using the streaming port connected to the GDC1 command FIFO. Returns the value 0 if the ISP does not send a command to GDC1
11	0h RO	**ISP_STR_MON_DMA2ISP_accept:** Returns the value 1 if the ISP can accept an acknowledge token from the FIFO between the DMA acknowledge port and the ISP. Returns the value 0 if the ISP cannot accept a token on this ISP input port.
10	0h RO	**ISP_STR_MON_DMA2ISP_valid:** Returns the value 1 if a valid acknowledge token from the FIFO between the DMA acknowledge port and the ISP, is present on the DMA input port of the ISP. Returns the value 0 if there is no valid acknowledge token available on this ISP input port.
9	0h RO	**ISP_STR_MON_ISP2DMA_accept:** Returns the value 1 if the command FIFO between ISP and the DMA can accept a command from the ISP. Returns the value 0 if this command FIFO cannot accept a token from the ISP.
8	0h RO	**ISP_STR_MON_ISP2DMA_valid:** Returns the value 1 if ISP sends a command using the streaming port connected to the DMA command FIFO. Returns the value 0 if the ISP does not send a command to the DMA
7	0h RO	**ISP_STR_MON_PIFB2ISP_accept:** Returns the value 1 if the ISP can accept an acknowledge token from the FIFO between the primary input formatter B acknowledge port and the ISP. Returns the value 0 if the ISP cannot accept a token on this ISP input port.
6	0h RO	**ISP_STR_MON_PIFB2ISP_valid:** Returns the value 1 if a valid acknowledge token from the FIFO between the primary input formatter B acknowledge port and the ISP, is present on the primary input formatter B input port of the ISP. Returns the value 0 if there is no valid acknowledge token available on this ISP input port.
5	0h RO	**ISP_STR_MON_ISP2PIFB_accept:** Returns the value 1 if the command FIFO between ISP and the Primary input formatter B can accept a command from the ISP. Returns the value 0 if this FIFO cannot accept a command from the ISP.
4	0h RO	**ISP_STR_MON_ISP2PIFB_valid:** Returns the value 1 if ISP sends a command using the streaming port connected to the Primary Input Formatter B command FIFO. Returns the value 0 if the ISP does not send a command to the Primary Input formatter B
3	0h RO	**ISP_STR_MON_PIF2ISP_accept:** Returns the value 1 if the ISP can accept an acknowledge token from the FIFO between the primary input formatter acknowledge port and the ISP. Returns the value 0 if the ISP cannot accept a token on this ISP input port.

Bit Range	Default & Access	Description
2	0h RO	**ISP_STR_MON_PIF2ISP_valid:** Returns the value 1 if a valid acknowledge token from the FIFO between the primary input formatter acknowledge port and the ISP, is present on the primary input formatter input port of the ISP. Returns the value 0 if there is no valid acknowledge token available on this ISP input port.
1	0h RO	**ISP_STR_MON_ISP2PIF_accept:** Returns the value 1 if the command FIFO between ISP and the Primary input formatter can accept a command from the ISP. Returns the value 0 if this command FIFO is full.
0	0h RO	**ISP_STR_MON_ISP2PIF_valid:** Returns the value 1 if ISP sends a command using the streaming port connected to the Primary Input Formatter command FIFO. Returns the value 0 if the ISP does not send a command to the Primary Input formatter

15.8.8 reg_gpd_gp_reg_reg_gp_mod_stream_stat_type (gpd_gp_reg_reg_gp_mod_stream_stat)—Offset 1Ch

Indicate the status of the streaming ports of the modules. All module's valid and accept ports used for control are reflected in this register.

Access Method

Bit Range	Default & Access	Description
31	1h RO	**MOD_STR_MON_CELLS2GDC2_accept:** Returns the value 1 if the acknowledge FIFO between GDC2 and ISP/SP can accept an acknowledge token from GDC2. Returns the value 0 if this FIFO is full.
30	0h RO	**MOD_STR_MON_CELLS2GDC2_valid:** Returns the value 1 if GDC2 sends an acknowledge token using the streaming port connected to the acknowledge FIFO to the ISP/SP. Returns the value 0 if GDC2 does not send an acknowledge token to this FIFO.
29	1h RO	**MOD_STR_MON_GDC22CELLS_accept:** Returns the value 1 if GDC2 can accept a command token from the command FIFO between the ISP/SP and GDC2. Returns the value 0 if GDC2 cannot accept a command token.

Bit Range	Default & Access	Description
28	0h RO	**MOD_STR_MON_GDC22CELLS_valid:** Returns the value 1 if there is a command available on the command fifo between SP/ISP and GDC2. Returns the value 0 if the command FIFO for GDC2 is empty.
27	1h RO	**MOD_STR_MON_CELLS2GDC1_accept:** Returns the value 1 if the acknowledge FIFO between GDC1 and ISP/SP can accept an acknowledge token from GDC1. Returns the value 0 if this FIFO is full.
26	0h RO	**MOD_STR_MON_CELLS2GDC1_valid:** Returns the value 1 if GDC1 sends an acknowledge token using the streaming port connected to the acknowledge FIFO to the ISP/SP. Returns the value 0 if GDC1 does not send an acknowledge token to this FIFO.
25	1h RO	**MOD_STR_MON_GDC12CELLS_accept:** Returns the value 1 if GDC1 can accept a command token from the command FIFO between the ISP/SP and GDC1. Returns the value 0 if GDC1 cannot accept a command token.
24	0h RO	**MOD_STR_MON_GDC12CELLS_valid:** Returns the value 1 if there is a command available on the command fifo between SP/ISP and GDC1. Returns the value 0 if the command FIFO for GDC1 is empty.
23	1h RO	**MOD_STR_MON_SP2DMA_accept:** Returns the value 1 if the acknowledge FIFO between the DMA and SP can accept an acknowledge token from the DMA. Returns the value 0 if this FIFO is full.
22	0h RO	**MOD_STR_MON_SP2DMA_valid:** Returns the value 1 if DMA sends an acknowledge token using the streaming port connected to the acknowledge FIFO to the SP. Returns the value 0 if the DMA does not send an acknowledge token to this FIFO.
21	0h RO	**MOD_STR_MON_DMA2SP_accept:** Returns the value 1 if the DMA can accept a command token from the command FIFO between the SP and the DMA. Returns the value 0 if the DMA cannot accept a command token.
20	0h RO	**MOD_STR_MON_DMA2SP_valid:** Returns the value 1 if there is a command available on the command fifo between SP and the DMA. Returns the value 0 if the command FIFO for the DMA is empty.
19	1h RO	**MOD_STR_MON_ISP2DMA_accept:** Returns the value 1 if the acknowledge FIFO between the DMA and ISP can accept an acknowledge token from the DMA. Returns the value 0 if this FIFO is full.
18	0h RO	**MOD_STR_MON_ISP2DMA_valid:** Returns the value 1 if DMA sends an acknowledge token using the streaming port connected to the acknowledge FIFO to the ISP. Returns the value 0 if the DMA does not send an acknowledge token to this FIFO.
17	0h RO	**MOD_STR_MON_DMA2ISP_accept:** Returns the value 1 if the DMA can accept a command token from the command FIFO between the SP and the DMA. Returns the value 0 if the DMA cannot accept a command token.
16	0h RO	**MOD_STR_MON_DMA2ISP_valid:** Returns the value 1 if there is a command available on the command fifo between ISP and the DMA. Returns the value 0 if the command FIFO for the DMA is empty.
15	1h RO	**MOD_STR_MON_SP2MC_accept:** Returns the value 1 if stream2mem can accept a command token from the command FIFO between the SP and the stream2mem. Returns the value 0 if stream2mem cannot accept a command token.
14	0h RO	**MOD_STR_MON_SP2MC_valid:** Returns the value 1 if there is a command available on the command fifo between the SP and the stream2mem. Returns the value 0 if the command FIFO for the stream2mem is empty.
13	1h RO	**MOD_STR_MON_MC2SP_accept:** Returns the value 1 if the acknowledge FIFO between the stream2mem and the SP can accept an acknowledge token from the stream2mem. Returns the value 0 if this FIFO is full.
12	0h RO	**MOD_STR_MON_MC2SP_valid:** Returns the value 1 if the stream2mem sends an acknowledge token using its acknowledge output port connected to the acknowledge FIFO between the stream2mem and the SP. Returns the value 0 if the stream2mem does not send an acknowledge token to this FIFO.
11	0h RO	**MOD_STR_MON_SP2SIF_accept:** Returns the value 1 if secondary input formatter can accept a command token from the command FIFO between the SP and the secondary input formatter. Returns the value 0 if this FIFO is full.

Bit Range	Default & Access	Description
10	0h RO	**MOD_STR_MON_SP2SIF_valid:** Returns the value 1 if there is a command available on the command fifo between the SP and the secondary input formatter. Returns the value 0 if the command FIFO for the secondary input formatter is empty.
9	1h RO	**MOD_STR_MON_SIF2SP_accept:** Returns the value 1 if the acknowledge FIFO between the secondary input formatter and the SP can accept an acknowledge token from the secondary input formatter. Returns the value 0 if this FIFO is full.
8	0h RO	**MOD_STR_MON_SIF2SP_valid:** Returns the value 1 if the secondary input formatter sends an acknowledge token using its acknowledge output port connected to the acknowledge FIFO between the secondary input formatter and the SP. Returns the value 0 if the secondary input formatter does not send an acknowledge token to this FIFO.
7	0h RO	**MOD_STR_MON_CELLS2PIFB_accept:** Returns the value 1 if primary input formatter B can accept a command token from the command FIFO between the ISP/SP and the primary input formatter B. Returns the value 0 if the primary input formatter B cannot accept a command token.
6	0h RO	**MOD_STR_MON_CELLS2PIFB_valid:** Returns the value 1 if there is a command available on the command fifo between SP/ISP and the primary input formatter B. Returns the value 0 if the command FIFO for the primary input formatter B is empty.
5	1h RO	**MOD_STR_MON_PIFB2CELLS_accept:** Returns the value 1 if the acknowledge FIFO between the primary input formatter B and the ISP/SP can accept an acknowledge token from the primary input formatter B. Returns the value 0 if this command FIFO is full.
4	0h RO	**MOD_STR_MON_PIFB2CELLS_valid:** Returns the value 1 if primary input formatter B sends an acknowledge token using the streaming port connected to the acknowledge FIFO to the ISP/SP. Returns the value 0 if the primary input formatter B does not send an acknowledge token to this FIFO.
3	0h RO	**MOD_STR_MON_CELLS2PIFA_accept:** Returns the value 1 if primary input formatter A can accept a command token from the command FIFO between the ISP/SP and the primary input formatter A. Returns the value 0 if the primary input formatter A cannot accept a command token.
2	0h RO	**MOD_STR_MON_CELLS2PIFA_valid:** Returns the value 1 if there is a command available on the command fifo between SP/ISP and the primary input formatter A. Returns the value 0 if the command FIFO for the primary input formatter A is empty.
1	1h RO	**MOD_STR_MON_PIFA2CELLS_accept:** Returns the value 1 if the acknowledge FIFO between the primary input formatter A and the ISP/SP can accept an acknowledge token from the primary input formatter A. Returns the value 0 if this command FIFO is full.
0	0h RO	**MOD_STR_MON_PIFA2CELLS_valid:** Returns the value 1 if primary input formatter A sends an acknowledge token using the streaming port connected to the acknowledge FIFO to the ISP/SP. Returns the value 0 if the primary input formatter A does not send an acknowledge token to this FIFO.

31:16	0h RW	**unused_reg_gp_mod_stream_stat_irq_enable:** Unused
15:0	0h RW	**reg_gp_mod_stream_stat_irq_enable:** This register enables the MOD streaming stat irq output for each of the 16 ports

15.8.17 reg_gpd_gp_reg_reg_gp_switch_if_type (gpd_gp_reg_reg_gp_switch_if)—Offset 40h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gpd_gp_reg_reg_gp_switch_if: [ISPMMADR] + 40h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31 28 24 20 16 12 8 4 0

0000 0000 0000 0000 0000 0000 0000 0000

unused_reg_gp_switch_if (31:1) | reg_gp_switch_if (0)

Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_switch_if:** Unused

Bit Range	Default & Access	Description
0	0h RW	**reg_gp_switch_if:** Selects the control stream switch for the primary input formatter and for primary input formatter b. The input formatters can be controlled by the scalar processor (value=1) or by the ISP (value=0)

15.8.18 reg_gpd_gp_reg_reg_gp_switch_gdc1_type (gpd_gp_reg_reg_gp_switch_gdc1)—Offset 44h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_gp_reg_reg_gp_switch_gdc1: [ISPMMADR] + 44h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_reg_gp_switch_gdc1 (bits 31:1), reg_gp_switch_gdc1 (bit 0)

Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_switch_gdc1:** Unused
0	0h RW	**reg_gp_switch_gdc1:** Selects the control stream switch for the GDC1. GDC1 can be controlled by the scalar processor (value=1) or the ISP (value=0)

15.8.19 reg_gpd_gp_reg_reg_gp_switch_gdc2_type (gpd_gp_reg_reg_gp_switch_gdc2)—Offset 48h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_gp_reg_reg_gp_switch_gdc2: [ISPMMADR] + 48h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bits	Default	Field
31:1	0	unused_reg_gp_switch_gdc2
0	0	reg_gp_switch_gdc2

Bit Range	Default & Access	Description
31:1	0h RW	**unused_reg_gp_switch_gdc2:** Unused
0	0h RW	**reg_gp_switch_gdc2:** Selects the control stream switch for the GDC2. GDC2 can be controlled by the scalar processor (value=1) or the ISP (value=0)

15.8.20 reg_gpd_gp_reg_reg_gp_srst_type (gpd_gp_reg_reg_gp_srst)—Offset 4Ch

Soft reset for several modules in the system. If '1' is written to a bit, the module(s) connected to that bit are held in reset until a '0' is written to that bit.

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gpd_gp_reg_reg_gp_srst: [ISPMMADR] + 4Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bits	Default	Field
31:29	000	unused_reg_gp_srst
28	0	SRST_WBUS
27	0	SRST_HOST12BUS
26	0	SRST_NBUS
25	0	SRST_OCP2CIO
24	0	SRST_SP
23	0	SRST_SF_GDC2_CELLS

4	0	SRST_GPIO
3	0	SRST_GPDEV_CBUS
2	0	SRST_IFMT_CBUS
1	0	SRST_ISEL_CBUS
0	0	SRST_ISYS_CBUS

Bit Range	Default & Access	Description
31:29	0h RW	**unused_reg_gp_srst:** Unused
28	0h RW	**SRST_WBUS:** soft reset bit for the wide bus

Bit Range	Default & Access	Description
27	0h RW	**SRST_HOST12BUS:** soft reset bit for the bus from host to fifo adapters
26	0h RW	**SRST_NBUS:** soft reset bit for the narrow bus
25	0h RW	**SRST_OCP2CIO:** soft reset bit for the OCP2CIO converter
24	0h RW	**SRST_SP:** soft reset bit for the SP
23	0h RW	**SRST_SF_GDC2_CELLS:** soft reset bit for the FIFOs between the GDC2 and the cells
22	0h RW	**SRST_SF_GDC1_CELLS:** soft reset bit for the FIFOs between the GDC1 and the cells
21	0h RW	**SRST_SF_DMA_CELLS:** soft reset bit for the FIFOs between the DMA and the cells
20	0h RW	**SRST_SF_ISYS_SP:** soft reset bit for the FIFOs between the input system and the SP
19	0h RW	**SRST_SF_MC_SP:** soft reset bit for the FIFOs between the stream2memory and the SP
18	0h RW	**SRST_SF_SIF_SP:** soft reset bit for the FIFOs between the secondary input formatter and the SP
17	0h RW	**SRST_SF_PIF_CELLS:** soft reset bit for the FIFOs between the primary input formatters and the cells
16	0h RW	**SRST_SF_ISP_SP:** soft reset bit for the FIFOs between SP and ISP
15	0h RW	**SRST_DMA:** soft reset bit for the DMA
14	0h RW	**SRST_SLV_GRP_BUS:** soft reset bit for the slave group bus
13	0h RW	**SRST_ISP:** soft reset bit for the isp (vector processor)
12	0h RW	**SRST_VEC_BUS:** soft reset bit for the vector bus
11	0h RW	**SRST_GDC2:** soft reset bit for the GDC2 block
10	0h RW	**SRST_GDC1:** soft reset bit for the GDC1 block
9	0h RW	**SRST_IFT_SEC_PIPE:** soft reset bit for the CIO pipeline after the secondary input formatter
8	0h RW	**SRST_OSYS:** soft reset bit for the blocks in the output system cluster
7	0h RW	**SRST_FACELLFIFOS:** soft reset bit for the fifo's connected to the fifo adapter between host and cells
6	0h RW	**SRST_GPTIMER:** soft reset bit for the GP timer block
5	0h RW	**SRST_TC:** soft reset bit for the timed controller block

Bit Range	Default & Access	Description
4	0h RW	**SRST_GPIO:** soft reset bit for the gpio block
3	0h RW	**SRST_GPDEV_CBUS:** soft reset bit for the gp devices cluster control bus
2	0h RW	**SRST_IFMT_CBUS:** soft reset bit for the input formatting cluster control bus
1	0h RW	**SRST_ISEL_CBUS:** soft reset bit for the input selector cluster control bus
0	0h RW	**SRST_ISYS_CBUS:** soft reset bit for the input system control bus

15.8.21 reg_gpd_gp_reg_reg_gp_slv_reg_srst_type (gpd_gp_reg_reg_gp_slv_reg_srst)—Offset 50h

Soft reset for the slave accessible registers in some blocks. If '1' is written to a bit, the attached registers get their default value. They can only be overwritten after writing a '0' to this bit

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gpd_gp_reg_reg_gp_slv_reg_srst: [ISPMMADR] + 50h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bits	31:3	2	1	0
Default	0000 0000 0000 0000 0000 0000 0000 0	0	0	0
Field	unused_reg_gp_slv_reg_srst	SLV_REG_SRST_GDC2	SLV_REG_SRST_GDC1	SLV_REG_SRST_DMA

Bit Range	Default & Access	Description
31:3	0h RW	**unused_reg_gp_slv_reg_srst:** Unused
2	0h RW	**SLV_REG_SRST_GDC2:** soft reset bit for the slave registers in the GDC2
1	0h RW	**SLV_REG_SRST_GDC1:** soft reset bit for the slave registers in the GDC1
0	0h RW	**SLV_REG_SRST_DMA:** soft reset bit for the slave registers in the DMA

15.8.22 reg_gpd_tc_FifoWriteCmd_type (gpd_tc_FifoWriteCmd)—Offset 100h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_tc_FifoWriteCmd: [ISPMMADR] + 100h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
FifoWriteCmd																															

Bit Range	Default & Access	Description
31:0	0h WO	**FifoWriteCmd:** Timed controller Command input. A Timed Controller command consists of 5 32-bit tokens that need to be written sequentially to this register location

15.8.23 reg_gpd_c_gpio_reg_gpio_doe_type (gpd_c_gpio_reg_gpio_doe)—Offset 400h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_c_gpio_reg_gpio_doe: [ISPMMADR] + 400h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
unused_reg_gpio_doe																				reg_gpio_doe											

Bit Range	Default & Access	Description
31:12	0h RW	**unused_reg_gpio_doe:** Unused
11:0	0h RW	**reg_gpio_doe:** indicates for each bit whether it is intended to be an input (value='0') or an output (value='1')

15.8.24 reg_gpd_c_gpio_reg_gpio_do_select_type (gpd_c_gpio_reg_gpio_do_select)—Offset 404h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_c_gpio_reg_gpio_do_select: [ISPMMADR] + 404h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: unused_reg_gpio_do_select (bits 31:12), reg_gpio_do_select (bits 11:0)

Bit Range	Default & Access	Description
31:12	0h RW	**unused_reg_gpio_do_select:** Unused
11:0	0h RW	**reg_gpio_do_select:** indicates for each bit of gpio_do whether it should have the value from source 0 (value='0') or source 1 (value='1').

15.8.25 reg_gpd_c_gpio_reg_gpio_do_0_type (gpd_c_gpio_reg_gpio_do_0)—Offset 408h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_c_gpio_reg_gpio_do_0: [ISPMMADR] + 408h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: unused_reg_gpio_do_0 (bits 31:12), reg_gpio_do_0 (bits 11:0)

Bit Range	Default & Access	Description
31:12	0h RW	**unused_reg_gpio_do_0:** Unused
11:0	0h RW	**reg_gpio_do_0:** provides the value for each of the output bits (source 0)

15.8.26 reg_gpd_c_gpio_reg_gpio_do_1_type (gpd_c_gpio_reg_gpio_do_1)—Offset 40Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_c_gpio_reg_gpio_do_1: [ISPMMADR] + 40Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31 28 24 20 16 12 8 4 0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

unused_reg_gpio_do_1 | reg_gpio_do_1

Bit Range	Default & Access	Description
31:12	0h RW	**unused_reg_gpio_do_1:** Unused
11:0	0h RW	**reg_gpio_do_1:** provides the value for each of the output bits (source 1)

15.8.27 reg_gpd_c_gpio_reg_gpio_do_pwm_cnt_0_type (gpd_c_gpio_reg_gpio_do_pwm_cnt_0)—Offset 410h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_c_gpio_reg_gpio_do_pwm_cnt_0: [ISPMMADR] + 410h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: bits 31:6 unused_reg_gpio_do_pwm_cnt_0; bits 5:0 reg_gpio_do_pwm_cnt_0

Bit Range	Default & Access	Description
31:6	0h RW	**unused_reg_gpio_do_pwm_cnt_0:** Unused
5:0	0h RW	**reg_gpio_do_pwm_cnt_0:** indicates duty cycle for PWM output 0. value d means duty cycle d/64

15.8.28 reg_gpd_c_gpio_reg_gpio_do_pwm_cnt_1_type (gpd_c_gpio_reg_gpio_do_pwm_cnt_1)—Offset 414h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_c_gpio_reg_gpio_do_pwm_cnt_1: [ISPMMADR] + 414h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)

0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_reg_gpio_do_pwm_cnt_3 (31:6), reg_gpio_do_pwm_cnt_3 (5:0)

Bit Range	Default & Access	Description
31:6	0h RW	**unused_reg_gpio_do_pwm_cnt_3:** Unused
5:0	0h RW	**reg_gpio_do_pwm_cnt_3:** indicates duty cycle for PWM output 3. value d means duty cycle d/64

15.8.31 reg_gpd_c_gpio_reg_gpio_do_pwm_main_cnt_type (gpd_c_gpio_reg_gpio_do_pwm_main_cnt)—Offset 420h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gpd_c_gpio_reg_gpio_do_pwm_main_cnt: [ISPMMADR] + 420h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_reg_gpio_do_pwm_main_cnt (31:20), reg_gpio_do_pwm_main_cnt (19:0)

Bit Range	Default & Access	Description
31:20	0h RW	**unused_reg_gpio_do_pwm_main_cnt:** Unused

Bit Range	Default & Access	Description
19:0	0h RW	**reg_gpio_do_pwm_main_cnt:** indicates wrapping value for PWM main counter

15.8.32 reg_gpd_c_gpio_reg_gpio_do_pwm_enable_type (gpd_c_gpio_reg_gpio_do_pwm_enable)—Offset 424h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gpd_c_gpio_reg_gpio_do_pwm_enable: [ISPMMADR] + 424h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits 31:12: unused_reg_gpio_do_pwm_enable
Bits 11:0: reg_gpio_do_pwm_enable

Bit Range	Default & Access	Description
31:12	0h RW	**unused_reg_gpio_do_pwm_enable:** Unused
11:0	0h RW	**reg_gpio_do_pwm_enable:** indicates per bit whether PWM is on (value='1') or output is fixed '0' (value='0')

15.8.33 reg_gpd_c_gpio_reg_gpio_di_debouncemethod_type (gpd_c_gpio_reg_gpio_di_debouncemethod)—Offset 428h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gpd_c_gpio_reg_gpio_di_debouncemethod: [ISPMMADR] + 428h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_reg_gpio_di_debouncemethod

reg_gpio_di_debouncemethod

Bit Range	Default & Access	Description
31:24	0h RW	**unused_reg_gpio_di_debouncemethod:** Unused
23:0	0h RW	**reg_gpio_di_debouncemethod:** indicates for each input bit which debouncing counter value is chosen: '00': debounce_cnt0, '01': debounce_cnt1, '10': debounce_cnt2, '11': debounce_cnt3'

15.8.34 reg_gpd_c_gpio_reg_gpio_di_debounce_cnt0_type (gpd_c_gpio_reg_gpio_di_debounce_cnt0)—Offset 42Ch

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gpd_c_gpio_reg_gpio_di_debounce_cnt0: [ISPMMADR] + 42Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

reg_gpio_di_debounce_cnt0

Bit Range	Default & Access	Description
31:0	0h RW	**reg_gpio_di_debounce_cnt0:** Indicates the period an input has to be stable before passing its value to the output*

15.8.35 reg_gpd_c_gpio_reg_gpio_di_debounce_cnt1_type (gpd_c_gpio_reg_gpio_di_debounce_cnt1)—Offset 430h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gpd_c_gpio_reg_gpio_di_debounce_cnt1: [ISPMMADR] + 430h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

reg_gpio_di_debounce_cnt1

Bit Range	Default & Access	Description
31:0	0h RW	**reg_gpio_di_debounce_cnt1:** Indicates the period an input has to be stable before passing its value to the output*

15.8.36 reg_gpd_c_gpio_reg_gpio_di_debounce_cnt2_type (gpd_c_gpio_reg_gpio_di_debounce_cnt2)—Offset 434h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gpd_c_gpio_reg_gpio_di_debounce_cnt2: [ISPMMADR] + 434h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

reg_gpio_di_debounce_cnt2

Bit Range	Default & Access	Description
31:0	0h RW	**reg_gpio_di_debounce_cnt2:** Indicates the period an input has to be stable before passing its value to the output

15.8.37 reg_gpd_c_gpio_reg_gpio_di_debounce_cnt3_type (gpd_c_gpio_reg_gpio_di_debounce_cnt3)—Offset 438h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gpd_c_gpio_reg_gpio_di_debounce_cnt3: [ISPMMADR] + 438h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

reg_gpio_di_debounce_cnt3

Bit Range	Default & Access	Description
31:0	0h RW	**reg_gpio_di_debounce_cnt3:** Indicates the period an input has to be stable before passing its value to the output

15.8.38 reg_gpd_c_gpio_reg_gpio_di_activelevel_type (gpd_c_gpio_reg_gpio_di_activelevel)—Offset 43Ch

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gpd_c_gpio_reg_gpio_di_activelevel: [ISPMMADR] + 43Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000FFFh

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1

Bits 31:12	Bits 11:0
unused_reg_gpio_di_activelevel	reg_gpio_di_activelevel

Bit Range	Default & Access	Description
31:12	0h RW	**unused_reg_gpio_di_activelevel:** Unused
11:0	FFFh RW	**reg_gpio_di_activelevel:** indicates for each bit whether it is intended to be active low (value='0') or active high (value='1').

15.8.39 reg_gpd_c_gpio_reg_gpio_di_type (gpd_c_gpio_reg_gpio_di)—Offset 440h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_c_gpio_reg_gpio_di: [ISPMMADR] + 440h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000FFFh

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1

Bits 31:12	Bits 11:0
unused_reg_gpio_di	reg_gpio_di

Bit Range	Default & Access	Description
31:12	0h RW	**unused_reg_gpio_di:** Unused
11:0	FFFh RO	**reg_gpio_di:** contains the values of all debounced, active level compensated inputs

15.8.40 reg_gpd_irq_ctrl_reg_irq_edge_type (gpd_irq_ctrl_reg_irq_edge)—Offset 500h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gpd_irq_ctrl_reg_irq_edge: [ISPMMADR] + 500h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0

0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0
reg_irq_edge							

Bit Range	Default & Access	Description
31:0	0h RW	**reg_irq_edge:** indicates for each bit whether an interrupt request should be generated on a falling edge (value='0') or a rising edge (value='1').

15.8.41 reg_gpd_irq_ctrl_reg_irq_mask_type (gpd_irq_ctrl_reg_irq_mask)—Offset 504h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gpd_irq_ctrl_reg_irq_mask: [ISPMMADR] + 504h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0

0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0
reg_irq_mask							

Bit Range	Default & Access	Description
31:0	0h RW	**reg_irq_mask:** indicates for each bit of irq_di whether it can generate an interrupt request (value='1') or not (value='0'). Setting will affect reg_irq_value as well as IRQ output pin

15.8.42 reg_gpd_irq_ctrl_reg_irq_status_type (gpd_irq_ctrl_reg_irq_status)—Offset 508h

Indicates for each bit whether a non-masked interrupt has been generated (value='1'). Can be cleared by writing a '1' into the the corresponding bit of the req_irq_clear register.

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_irq_ctrl_reg_irq_status: [ISPMMADR] + 508h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

Bit	Default	Field
31	0	IRQ_STAT_SP_SMON_B
30	0	IRQ_STAT_DMA
29	0	IRQ_STAT_SW_1
28	0	IRQ_STAT_SW_0
27	0	IRQ_STAT_GPTIMER_1
26	0	IRQ_STAT_GPTIMER_0
25	0	IRQ_STAT_ISYS_2
24	0	IRQ_STAT_SP_DMEM_ERROR
23	0	IRQ_STAT_SP_IMEM_ERROR
22	0	IRQ_STAT_ISP_DMEM_ERROR
21	0	IRQ_STAT_ISP_BAMEM_ERROR
20	0	IRQ_STAT_ISP_PMEM_ERROR
19	0	IRQ_STAT_MOD_SMON
18	0	IRQ_STAT_ISP_SMON
17	0	IRQ_STAT_SP_SMON
16	0	IRQ_STAT_IFMT
15	0	IRQ_STAT_ISEL
14	0	IRQ_STAT_ISYS
13	0	IRQ_STAT_ISP
12	0	IRQ_STAT_SP
11:0	0 0 0 0 0 0 0 0 0 0 0 0	IRQ_STAT_GPIO_PINS

Bit Range	Default & Access	Description
31	0h RO	**IRQ_STAT_SP_SMON_B:** Represents the irq status of the irq_out from the SP streaming monitor b
30	0h RO	**IRQ_STAT_DMA:** Represents the irq status of the DMA
29	0h RO	**IRQ_STAT_SW_1:** Represents the irq status of the GP register IRQ SW 1
28	0h RO	**IRQ_STAT_SW_0:** Represents the irq status of the GP register IRQ SW 0
27	0h RO	**IRQ_STAT_GPTIMER_1:** Represents the irq status of the irq[1] out signal from the GP Timer block
26	0h RO	**IRQ_STAT_GPTIMER_0:** Represents the irq status of the irq[0] out signal from the GP Timer block
25	0h RO	**IRQ_STAT_ISYS_2:** Represents the irq status of the irq out signal from the input system
24	0h RO	**IRQ_STAT_SP_DMEM_ERROR:** Represents the irq status of the error signal from the SP data memory
23	0h RO	**IRQ_STAT_SP_IMEM_ERROR:** Represents the irq status of the error signal from the SP instruction cache memory
22	0h RO	**IRQ_STAT_ISP_DMEM_ERROR:** Represents the irq status of the error signal from the ISP data memory
21	0h RO	**IRQ_STAT_ISP_BAMEM_ERROR:** Represents the irq status of the error signal from the ISP vector memory
20	0h RO	**IRQ_STAT_ISP_PMEM_ERROR:** Represents the irq status of the error signal from the ISP program memory
19	0h RO	**IRQ_STAT_MOD_SMON:** Represents the irq status of the irq_out from the MOD streaming monitor

Bit Range	Default & Access	Description
18	0h RO	**IRQ_STAT_ISP_SMON:** Represents the irq status of the irq_out from the ISP streaming monitor
17	0h RO	**IRQ_STAT_SP_SMON:** Represents the irq status of the irq_out from the SP streaming monitor
16	0h RO	**IRQ_STAT_IFMT:** Represents the irq status of the irq_out from the input formatting subsystem
15	0h RO	**IRQ_STAT_ISEL:** Represents the irq status of the irq_out from the input selector
14	0h RO	**IRQ_STAT_ISYS:** Represents the irq status of the irq_out from the input system
13	0h RO	**IRQ_STAT_ISP:** Represents the irq status of the irq_out from isp2300
12	0h RO	**IRQ_STAT_SP:** Represents the irq status of the irq_out from scalar processor
11:0	0h RO	**IRQ_STAT_GPIO_PINS:** Represents the irq status of the - potentially debounced - GPIO input pins

15.8.43 reg_gpd_irq_ctrl_reg_irq_clear_type (gpd_irq_ctrl_reg_irq_clear)—Offset 50Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_irq_ctrl_reg_irq_clear: [ISPMMADR] + 50Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

reg_irq_clear (bits 31:0)

Bit Range	Default & Access	Description
31:0	0h WO	**reg_irq_clear:** Clears (set to '0') bits in reg_irq_status. When writing a '1' into a bit of this register, the corresponding bit in the req_irq_status is cleared. When writing a '0' into a bit of this register, the corresponding bit in the req_irq_status is not affected.

15.8.44 reg_gpd_irq_ctrl_reg_irq_enable_type (gpd_irq_ctrl_reg_irq_enable)—Offset 510h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_irq_ctrl_reg_irq_enable: [ISPMMADR] + 510h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0

0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0

reg_irq_enable

Bit Range	Default & Access	Description
31:0	0h RW	**reg_irq_enable:** Indicates for each bit whether an interrupt cause as monitored by the req_irq_status register also affects the IRQ pin (value='1') or not (value='0')

15.8.45 reg_gpd_irq_ctrl_reg_irq_level_not_pulse_type (gpd_irq_ctrl_reg_irq_level_not_pulse)—Offset 514h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_irq_ctrl_reg_irq_level_not_pulse: [ISPMMADR] + 514h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0

0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0	0 0 0 0

reg_irq_level_not_pulse

Bit Range	Default & Access	Description
31:0	0h RW	**reg_irq_level_not_pulse:** Indicates for each bit whether an interrupt cause is translated into a pulse (value='0') or into a constant level '1' (value='1') on the IRQ pin

15.8.46 reg_gpd_irq_ctrl_reg_irq_str_out_enable_type (gpd_irq_ctrl_reg_irq_str_out_enable)—Offset 518h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_irq_ctrl_reg_irq_str_out_enable: [ISPMMADR] + 518h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

reg_irq_str_out_enable

Bit Range	Default & Access	Description
31:0	0h RW	**reg_irq_str_out_enable:** Indicates for each bit whether an interrupt cause as monitored by the req_irq_status register also results in a send token on the irq_str_out port (value='1') or not (value='0')

15.8.47 reg_gpd_gptimer_reg_reset_type (gpd_gptimer_reg_reset)—Offset 600h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_gptimer_reg_reset: [ISPMMADR] + 600h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31	28	24	20	16	12	8	4	0

0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0 | 0 0 0 0

unused_reg_reset | reg_reset

Bit Range	Default & Access	Description
31:8	0h RW	**unused_reg_reset:** Unused
7:0	0h WO	**reg_reset:** GP Timer reset. Write '1' to bit x to reset timer x. Write 0xFF to reset all timers.

15.8.48 reg_gpd_gptimer_overall_enable_type (gpd_gptimer_overall_enable)—Offset 604h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_gptimer_overall_enable: [ISPMMADR] + 604h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_overall_enable (bits 31:1), overall_enable (bit 0)

Bit Range	Default & Access	Description
31:1	0h RW	**unused_overall_enable:** Unused
0	0h RW	**overall_enable:** GP Timer enable. Write '1' to enable all enabled timers, write '0' to disable all timers.

15.8.49 reg_gpd_gptimer_enable_timer_0_type (gpd_gptimer_enable_timer_0)—Offset 608h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

gpd_gptimer_enable_timer_0: [ISPMMADR] + 608h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_enable_timer_0 (bits 31:1), enable_timer_0 (bit 0)

Bit Range	Default & Access	Description
31:1	0h RW	**unused_enable_timer_0:** Unused
0	0h RW	**enable_timer_0:** GP Timer enable. Write '1' to enable timer 0. Write '0' to disable timer 0

15.8.50 reg_gpd_gptimer_enable_timer_1_type (gpd_gptimer_enable_timer_1)—Offset 60Ch

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_gptimer_enable_timer_1: [ISPMMADR] + 60Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: unused_enable_timer_1 (bits 31:1), enable_timer_1 (bit 0)

Bit Range	Default & Access	Description
31:1	0h RW	**unused_enable_timer_1:** Unused
0	0h RW	**enable_timer_1:** GP Timer enable. Write '1' to enable timer 1. Write '0' to disable timer 1

15.8.51 reg_gpd_gptimer_enable_timer_2_type (gpd_gptimer_enable_timer_2)—Offset 610h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_gptimer_enable_timer_2: [ISPMMADR] + 610h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: unused_enable_timer_2 (bits 31:1), enable_timer_2 (bit 0)

Bit Range	Default & Access	Description
31:1	0h RW	**unused_enable_timer_2:** Unused
0	0h RW	**enable_timer_2:** GP Timer enable. Write '1' to enable timer 2. Write '0' to disable timer 2

15.8.52 reg_gpd_gptimer_enable_timer_3_type (gpd_gptimer_enable_timer_3)—Offset 614h

Access Method

Type: Memory Mapped I/O Register
(Size: 32 bits)

gpd_gptimer_enable_timer_3: [ISPMMADR] + 614h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

unused_IF_YUV_420_format

IF_YUV_420_format

Bit Range	Default & Access	Description
31:1	0h RW	**unused_IF_YUV_420_format:** Unused
0	0h RW	**IF_YUV_420_format:** YUV 420 format: set to work on legacy format YUV420

15.8.155 reg_ifmt_ift_prim_b_IF_Vsynch_active_low_type (ifmt_ift_prim_b_IF_Vsynch_active_low)—Offset 30238h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_ift_prim_b_IF_Vsynch_active_low: [ISPMMADR] + 30238h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_IF_Vsynch_active_low

IF_Vsynch_active_low

Bit Range	Default & Access	Description
31:1	0h RW	**unused_IF_Vsynch_active_low:** Unused
0	0h RW	**IF_Vsynch_active_low:** Vertical synch active low: set to 1 if Vsynch and EndOfFrame are active low

15.8.156 reg_ifmt_ift_prim_b_IF_Hsynch_active_low_type (ifmt_ift_prim_b_IF_Hsynch_active_low)—Offset 3023Ch

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_ift_prim_b_IF_Hsynch_active_low: [ISPMMADR] + 3023Ch

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_IF_Hsynch_active_low (bits 31:1); IF_Hsynch_active_low (bit 0)

Bit Range	Default & Access	Description
31:1	0h RW	**unused_IF_Hsynch_active_low:** Unused
0	0h RW	**IF_Hsynch_active_low:** Horizontal synch active low: set to 1 if Hsynch and EndOfLine are active low

15.8.157 reg_ifmt_ift_prim_b_IF_ReEnable_type (ifmt_ift_prim_b_IF_ReEnable)—Offset 30240h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_ift_prim_b_IF_ReEnable: [ISPMMADR] + 30240h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

unused_IF_ReEnable (bits 31:1); IF_ReEnable (bit 0)

Bit Range	Default & Access	Description
31:1	0h RW	**unused_IF_ReEnable:** Unused
0	0h RW	**IF_ReEnable:** Re-enable status update: set to 1 to re-enable status update after an error situation

15.8.158 reg_ifmt_ift_prim_b_IF_block_input_type (ifmt_ift_prim_b_IF_block_input)—Offset 30244h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ifmt_ift_prim_b_IF_block_input: [ISPMMADR] + 30244h

ISPMMADR Type: PCI Configuration Register (Size: 32 bits)
ISPMMADR Reference: [B:0, D:3, F:0] + 10h

Default: 00000000h

31			28				24				20				16				12				8				4				0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Fields: unused_IF_block_input (bits 31:1), IF_block_input (bit 0)

Bit Range	Default & Access	Description
31:1	0h RW	**unused_IF_block_input:** Unused
0	0h RW	**IF_block_input:** Block input when no req: set to 1 to block data streaming input when no request is received

15.8.159 reg_ifmt_ift_prim_b_IF_Vert_Deinter_type (ifmt_ift_prim_b_IF_Vert_Deinter)—Offset 30248h

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)
