                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |  |  |  |  |  |  | #### 24.5.124 Source Status Address Register for Channel 5 - High (SSTATAR5\_HI)—Offset 1ECh

Refer to the description for register Source Status Address Register for Channel 0 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 1ECh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

#### 24.5.126 Dest Status Address Register for Channel 5 - High (DSTATAR5\_HI)—Offset 1F4h

Refer to the description for register Dest Status Address Register for Channel 0 - Low.

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 1F4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

## Access Method

**Offset:** [BAR] + 1F8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**Default:** 00000EA0h

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                  |
|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31        | 0h<br>RW         | <b>Automatic Destination Reload (RELOAD_DST):</b> The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.                                                                 |
| 30        | 0h<br>RW         | <b>Automatic Source Reload (RELOAD_SRC):</b> The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.                                                                      |
| 29:20     | 0h<br>RW         | <b>Maximum AMBA Burst Length (MAX_ABRST):</b> Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel. |

### 24.5.152 Source Gather Register for Channel 6 - High (SGR6\_HI)—Offset 25Ch

Refer to the register description for Source Gather Register for Channel 0 - Low.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 25Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

## Access Method

**Offset:** [BAR] + 268h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

#### 24.5.156 Source Address Register for Channel 7 - High (SAR7\_HI)—Offset 26Ch

## Access Method

**Offset:** [BAR] + 26Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

### 24.5.157 Destination Address Register for Channel 7 - Low (DAR7\_LO)– Offset 270h

Refer to the description for register Destination Address Register for Channel 0 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 270h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

[illegible]

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |  |  |  |  |  |  |  |  |  |  |  | #### 24.5.161 Control Register for Channel 7 - Low (CTL7\_LO)—Offset 280h

Refer to the register description for Control Register for Channel 0 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 280h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00304801h

### 24.5.177 Interrupt Raw Status Registers - Low (RawTfr\_LO)—Offset 2C0h

Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel; for example, RawTfr[2] is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 2C0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

[illegible]

## Access Method

**Offset:** [BAR] + 2C4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|-----------|------------------|------------------------------|
| 31:0      | 0h<br>RW         | <b>Undefined:</b> Reserved.  |

### 24.5.179 Interrupt Raw Status Registers - Low (RawBlock\_LO)—Offset 2C8h

## Access Method

**Offset:** [BAR] + 2C8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description                 |

## 24.5.188 Interrupt Status Registers - High (StatusTfr\_HI)—Offset 2ECh

All interrupt events from all channels are stored in these Interrupt Status registers after masking: StatusBlock, StatusDstTran, StatusErr, StatusSrcTran, and StatusTfr. Each Interrupt Status register has a bit allocated per channel; for example, StatusTfr[2] is the Channel 2 status transfer complete interrupt. The contents of these registers are used to generate the interrupt signals (int or int\_n bus, depending on interrupt polarity) leaving the DW\_ahb\_dmac.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 2ECh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

|-----------|------------------|------------------------------|
| 31:0      | 0h<br>RW         | <b>Undefined:</b> Reserved.  |

#### 24.5.207 Interrupt Clear Registers - Low (ClearTfr\_LO)—Offset 338h

Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel; for example, ClearTfr[2] is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

##### Access Method

## 24.5.209 Interrupt Clear Registers - Low (ClearBlock\_LO)—Offset 340h

Refer to the description for register ClearTfr\_HI.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 340h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

|           |    |    |    |    |    |   |       |   |
|-----------|----|----|----|----|----|---|-------|---|
| 31        | 28 | 24 | 20 | 16 | 12 | 8 | 4     | 0 |

#### 24.5.236 DW\_ahb\_dmac ID Register - High (DmaIdReg\_HI)—Offset 3ACh

Refer to the description of DW\_ahb\_dmac ID Register - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 3ACh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

Diagram of a 32-bit register. The register is divided into four 8-bit segments, each labeled with its bit position range: 31-24, 23-16, 15-8, and 7-0. The register contains the value 0x00000000, represented by 32 zeros. A vertical line at bit 16 is labeled "Undefined".

| Bit Range | Default & Access | Field Name (ID): Description |
|-----------|------------------|------------------------------|
| 31:0      | 0h<br>RW         | <b>Undefined:</b> Reserved.  |

### 24.5.237 DW\_ahb\_dmac Test Register - Low (DmaTestReg\_LO)—Offset 3B0h

This register is used to put the AHB slave interface into test mode, during which the readback value of the writable registers match the value written, assuming the DW\_ahb\_dmac configuration has not optimized the same registers. In normal operation, the readback value of some registers is a function of the DW\_ahb\_dmac state, and does not match the value written.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 3B0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

[illegible]

## 24.5.248 DW\_ahb\_dmac Component Parameters Register 2 - High (DMA\_COMP\_PARAMS\_2\_HI)—Offset 3ECh

This is a constant read-only register that contains encoded information about the component parameter settings. The reset value depends on coreConsultant parameter(s).

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 3ECh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

## 24.5.249 DW\_ahb\_dmac Component Parameters Register 1 - Low (DMA\_COMP\_PARAMS\_1\_LO)—Offset 3F0h

This is a constant read-only register that contains encoded information about the component parameter settings. The reset value depends on coreConsultant parameter(s).

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 3F0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** AAAAAAAAh

## 24.5.252 DMA Component ID Register - High (DmaCompsID\_HI)—Offset 3FCh

This is the DW\_ahb\_dmac Component Version register, which is a read-only register that specifies the version of the packaged component in the upper 32 bits and the component type in the lower 32 bits.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 3FCh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 3231362Ah

| 31               |   | 28               |   | 24                                                     |   | 20 |   | 16 |   | 12 |   | 8 |   | 4 |   | 0 |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

## 25 SIO - Serial Peripheral Interface (SPI)

The Serial I/O implements one SPI controller that supports master mode.

**Note:** This SPI controller does not support platform firmware (BIOS). See the SPI controller in the PCU instead.

### 25.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

**Figure 115.SPI Interface Signals (Sheet 1 of 2)**

| Signal Name | Direction<br>Plat. Power | Description      |
|-------------|--------------------------|------------------|
| SIO_SPI_CLK | I/O<br>V1P8S             | SPI Serial Clock |

Figure 115.SPI Interface Signals (Sheet 2 of 2)

| Signal Name         | Direction<br>Plat. Power | Description                                              |

## 25.2 Features

The following is a list of SPI features:

- Single interrupt line
  - Could be assigned to interrupt PCI INT [A] or ACPISIO INT[1]
- Configurable frame format, clock polarity and clock phase
- supporting one SPI peripheral only
- Supports master mode only
- Receive and transit buffers are both 256x32bits
  - The receive buffer has only 1 water mark
  - The transmit buffer has 2 water marks
- Supports up to 15 Mbps

### 25.2.1 Clock Phase and Polarity

SPI clock phase and clock polarity overview.

- The SSCR1.SPO polarity setting bit determines whether the serial transfer occurs on the rising edge of the clock or the falling edge of the clock.
  - When SSCR1.SPO = 0, the inactive or idle state of SIO\_SPI\_CLK is low.
  - When SSCR1.SPO = 1, the inactive or idle state of SIO\_SPI\_CLK is high.
- The SSCR1.SPH phase setting bit selects the relationship of the serial clock with the slave select signal.
  - When SSCR1.SPH = 0, SIO\_SPI\_CLK is inactive until one cycle after the start of a frame and active until 1/2 cycle after the end of a frame.
  - When SSCR1.SPH = 1, SIO\_SPI\_CLK is inactive until 1/2 cycle after the start of a frame and active until one cycle after the end of a frame.

Below figure shows an 8-bit data transfer with different phase and polarity settings.

**Figure 116. Clock Phase and Polarity**

- In a single frame transfer, the SPI controller supports all four possible combinations for the serial clock phase and polarity.

## 25.2.2 Mode Numbers

The combinations of polarity and phases are referred to as modes which are commonly numbered according to the following convention, with SSCR1.SPO as the high order bit and SSCR1.SPH as the low order bit.

**Table 259. SPI Modes**

| Mode | SSCR1.SPO | SSCR1.SPH |
|------|-----------|-----------|
| 0    | 0         | 0         |
| 1    | 0         | 1         |
| 2    | 1         | 0         |
| 3    | 1         | 1         |

### **25.2.3 Frame Direction**

The SSCR1.SFRMDIR bit is a read-write bit that determines whether the SSP is the master or slave with respect to driving the SSPSFRM. When SSCR1.SFRMDIR=0, the SSP generates the SSPSFRM internally, acts as the master and drives it. When SSCR1.SFRMDIR=1, the SSP acts as the slave and receives the SSPSFRM signal from an external device. When the SSP is to be configured as a slave to the frame, the external device driving frame must wait until the SSSR.CSS bit is cleared after enabling the SSP before asserting frame (i.e. not external clock cycles are needed, the external device just needs to wait a certain amount of time before asserting frame). When the GPIO alternate function is selected for the SSP, this bit has precedence over the GPIO direction bit (i.e. if SFRMDIR=1, the GPIO is an input, and if SFRMDIR=0, then the pin is an output). Therefore, the SCLKDIR and SFRMDIR bits should be written to before the GPIO direction bits (to prevent any possible contention of the SSPSCLK or SSPSFRM pins). Also, when the SCLKDIR bit is set, the SSCR0.NCS and SSCR0.ECS bits must be cleared.

## 25.3 Register Map

Figure 117.SIO - SPI Register Map

**Type:** PCI Configuration Register  
(Size: 32 bits)

|             |    |    |    |    |                   |   |   |   |

## 25.5.2 SSP Control Register 1 (SSCR1)—Offset 4h

The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:5] + 10h

**Default:** 00000000h

## 25.5.4 SSP Interrupt Test Register (SSITR)—Offset Ch

The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:5] + 10h

**Default:** 00000000h

The Enhanced SSP Time-Out registers have single bit fields that specify the time-out value used to signal a period of inactivity within the Receive FIFO. Note that Writes to reserved bits must be zeroes, and Read values of these bits are undetermined.

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                      |

### 25.5.7 SSP Programmable Serial Protocol (SSPSP)—Offset 2Ch

The Enhanced SSP Programmable Protocol registers are read-write registers that contain eight fields that are used to program the various programmable serial-protocol parameters. When using PST format in Network mode, the parameters SFRMDLY, STRTDLY, DMYSTP, DMYSTRT must be set to 0. Other parameters (such as FRMPOL, SCMODE, FSRT, SFRMDWTH) are programmable. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**Default:** 00000000h

## 25.5.8 SSP TX Time Slot Active (SSTSA)—Offset 30h

The Enhanced SSP TX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will transmit data in. They are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 30h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:5] + 10h

**Default:** 00000000h

### 25.5.10 SSP Time Slot Status (SSTSS)—Offset 38h

The Enhanced SSP Time Slot Status registers are read only registers that indicate which Time Slot the Enhanced SSP is currently in when the Enhanced SSP is in Network Mode (SSCR0.MOD = 1). This register is not valid when the Enhanced SSP is not in Network Mode. Note that Writes to reserved bits must be zeroes, and Read values of these bits are undetermined.

#### Access Method

## 26 SIO - I<sup>2</sup>C Interface

The SoC supports 7 instances of I<sup>2</sup>C controller. Both 7-bit and 10-bit addressing modes are supported. These controllers operate in master mode only.

### 26.1 Signal Descriptions

I<sup>2</sup>C is a two-wire bus for inter-IC communication. Data and clock signals carry information between the connected devices. The following is the I<sup>2</sup>C Interface. The SoC supports 7 I<sup>2</sup>C interfaces for general purpose to control external devices. The I<sup>2</sup>C signals are muxed over GPIOs.

Please see [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

**Table 262. I<sup>2</sup>C[6:0] Signals**

| Signal Name              | Direction<br>Plat. Power | Description                                                                                              |

## 26.2 Features

### 26.2.1 I<sup>2</sup>C Protocol

The I<sup>2</sup>C bus is a two-wire serial interface, consisting of a serial data line and a serial clock. These wires carry information between the devices connected to the bus. Each device is recognized by a unique address and can operate as either a “transmitter” or “receiver,” depending on the function of the device. Devices are considered slaves when performing data transfers, as the SoC will always be a Master. A master is a device which initiates a data transfer on the bus and generates the clock signals to permit that transfer. At that time, any device addressed is considered a slave.

- The SoC is always the I<sup>2</sup>C master; and it supports multi-master mode.
- The SoC can support clock stretching by slave devices.
- The SIO\_I2Cx\_DATA line is a bidirectional signal and changes only while the SIO\_I2Cx\_CLK line is low, except for STOP, START, and RESTART conditions.
- The output drivers are open-drain or open-collector to perform wire-AND functions on the bus.
- The maximum number of devices on the bus is limited by the maximum capacitance specification of 400 pF
- Refer to [Chapter 9, “Electrical Specifications”](#) for details.
- Data is transmitted in byte packages.

### 26.2.2 I<sup>2</sup>C Modes of Operation

The I<sup>2</sup>C module can operate in the following modes:

- Standard mode (with a bit rate up to 100 Kb/s)
- Fast mode (with a bit rate up to 400 Kb/s)
- Fast-mode Plus (Fm+, with a bit rate up to 1 Mb/s)
- High-speed mode (Hs-mode, with a bit rate up to 3.4 Mb/s)

**Note:** Higher speeds require tuning of the analog buffers. Please work with your BIOS vendor to incorporate.

The I<sup>2</sup>C can communicate with devices only using these modes as long as they are attached to the bus. Additionally, high speed mode, fast mode plus and fast mode devices are downward compatible.

- High-speed mode devices can communicate with fast mode and standard mode devices in a mixed speed bus system.
- Fast mode devices can communicate with standard mode devices in a 0–100 Kb/s I<sup>2</sup>C bus system.

However, according to the I<sup>2</sup>C specification, standard mode devices are not upward compatible and should not be incorporated in a fast-mode I<sup>2</sup>C bus system since they cannot follow the higher transfer rate and unpredictable states would occur.

### 26.2.3 Functional Description

- The I<sup>2</sup>C master is responsible for generating the clock and controlling the transfer of data.
- The slave is responsible for either transmitting or receiving data to/from the master.
- The acknowledgment of data is sent by the device that is receiving data, which can be either a master or a slave.
- Each slave has a unique address that is determined by the system designer:
  - When a master wants to communicate with a slave, the master transmits a START/RESTART condition that is then followed by the slave's address and a control bit (R/W), to determine if the master wants to transmit data or receive data from the slave.
  - The slave then sends an acknowledge (ACK) pulse after the address.
- If the master (master-transmitter) is writing to the slave (slave-receiver)
  - The receiver gets one byte of data.
  - This transaction continues until the master terminates the transmission with a STOP condition.
- If the master is reading from a slave (master-receiver)
  - The slave transmits (slave-transmitter) a byte of data to the master, and the master then acknowledges the transaction with the ACK pulse.
  - This transaction continues until the master terminates the transmission by not acknowledging (NACK) the transaction after the last byte is received, and then the master issues a STOP condition. This behavior is illustrated in below figure.

**Figure 118. Data Transfer on the I<sup>2</sup>C Bus**

### 26.2.3.1 START and STOP Conditions

When the bus is idle, both the clock and data signals are pulled high through external pull-up resistors on the bus.

When the master wants to start a transmission on the bus, the master issues a START condition.

- This is defined to be a high-to-low transition of the data signal while the clock is high.
- When the master wants to terminate the transmission, the master issues a STOP condition. This is defined to be a low-to-high transition of the data line while the clock is high. [Figure 119](#) shows the timing of the START and STOP conditions.
- When data is being transmitted on the bus, the data line must be stable when the clock is high.

**Figure 119. START and STOP Conditions**

The signal transitions for the START/STOP conditions, as depicted above, reflect those observed at the output of the master driving the I<sup>2</sup>C bus. Care should be taken when observing the data/clock signals at the input of the slave(s), because unequal line delays may result in an incorrect data/clock timing relationship.

### 26.2.3.2 Addressing Slave Protocol

There are two address formats—seven-bit address format and 10-bit address format.

#### Seven-bit Address Format

- During the seven-bit address format, the first seven bits (bits 7:1) of the first byte set the slave address and the LSB bit (bit 0) is the R/W bit as shown in [Figure 120](#).
- When bit 0 (R/W) is set to 0, the master writes to the slave. When bit 0 (R/W) is set to 1, the master reads from the slave.

Figure 120. Seven-Bit Address Format

### Ten-bit Address Format

- During 10-bit addressing, 2 bytes are transferred to set the 10-bit address. The transfer of the first byte contains the following bit definition.
  - The first five bits (bits 7:3) notify the slaves that this is a 10-bit transfer. The next two bits (bits 2:1) set the slaves address bits 9:8, and the LSB bit (bit 0) is the RW bit.
  - The second byte transferred sets bits 7:0 of the slave address.
  - Figure 121 shows the 10-bit address format, and Table 263 defines the special purpose and reserved first byte addresses.

Figure 121. Ten-Bit Address Format

Table 263. I<sup>2</sup>C Definition of Bits in First Byte (Sheet 1 of 2)

| Slave Address | RW Bit | Description                                                                                                                             |
|---------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 0000 000      | 0      | <b>General Call Address</b> —The I <sup>2</sup> C controller places the data in the receive buffer and issues a General Call interrupt. |

| 1111 0XX      | X      | Ten (10)-bit slave addressing |

### 26.2.3.3 Transmit and Receive Protocol

The master can initiate data transmission and reception to/from the bus, acting as either a master-transmitter or master-receiver. A slave responds to requests from the master by either transmitting data or receiving data to/from the bus, acting as either a slave-transmitter or slave-receiver, respectively.

#### Master-Transmitter and Slave-Receiver

All data is transmitted in byte format, with no limit on the number of bytes transferred per data transfer. After the master sends the address and RW bit or the master transmits a byte of data to the slave, the slave-receiver must respond with the acknowledge signal (ACK). When a slave-receiver does not respond with an ACK pulse, the master aborts the transfer by issuing a STOP condition. The slave must leave the data line high so that the master can abort the transfer.

If the master-transmitter is transmitting data as shown in Figure 122, then the slave-receiver responds to the master-transmitter with an acknowledge pulse after every byte of data is received.

Figure 122. Master Transmitter Protocol

### Master-Receiver and Slave-Transmitter

If the master is receiving data as shown in Figure 123, the master responds to the Slave-Transmitter with an acknowledge pulse after a byte of data has been received, except for the last byte. This is the way the Master-Receiver notifies the Slave-Transmitter that this is the last byte. The Slave-Transmitter relinquishes the data line after detecting the No Acknowledge (NACK) so that the master can issue a STOP condition.

When a master does not want to relinquish the bus with a STOP condition, the master can issue a RESTART condition. This is identical to a START condition except it occurs after the ACK pulse. The master can then communicate with the same slave.

**Figure 123. Master Receiver Protocol**

#### 26.2.3.4 START BYTE Transfer Protocol

The START BYTE Transfer protocol is set up for systems that do not have an on-board dedicated I<sup>2</sup>C hardware module. When the I<sup>2</sup>C controller is a master, it supports the generation of START BYTE transfers at the beginning of every transfer in case a slave device requires it. This protocol consists of 7 '0's being transmitted followed by a 1, as illustrated in Figure 124. This allows the processor that is polling the bus to under-sample the address phase until 0s are detected. Once the microcontroller detects a 0, it switches from the under sampling rate to the correct rate of the master.

**Figure 124. START Byte Transfer**

The START BYTE procedure is as follows:

1. Master generates a START condition.
2. Master transmits the START byte (0000 0001).
3. Master transmits the ACK clock pulse. (Present only to conform with the byte handling format used on the bus.)
4. No slave sets the ACK signal to 0.
5. Master generates a RESTART (R) condition.

A hardware receiver does not respond to the START BYTE because it is a reserved address and resets after the RESTART condition is generated.

## 26.3 Use

### 26.3.1 Master Mode Operation

To use the I<sup>2</sup>C controller as a master, perform the following steps:

1. Disable the I<sup>2</sup>C controller by writing 0 (zero) to IC\_ENABLE.ENABLE.
2. Write to the IC\_CON register to set the maximum speed mode supported for slave operation IC\_CON.SPEED and to specify whether the I<sup>2</sup>C controller starts its transfers in 7/10 bit addressing mode when the device is a slave (IC\_CON.IC\_10BITADDR\_SLAVE).
3. Write to the IC\_TAR register the address of the I<sup>2</sup>C device to be addressed. It also indicates whether a General Call or a START BYTE command is going to be performed by I<sup>2</sup>C. The desired speed of the I<sup>2</sup>C controller master-initiated transfers, either 7-bit or 10-bit addressing, is controlled by the IC\_TAR.IC\_10BITADDR\_MASTER bit field.
4. Write to the IC\_HS\_MADDR register the desired master code for the I<sup>2</sup>C controller. The master code is programmer-defined.
5. Enable the I<sup>2</sup>C controller by writing a 1 in IC\_ENABLE.
6. Now write the transfer direction and data to be sent to the IC\_DATA\_CMD register. If the IC\_DATA\_CMD register is written before the I<sup>2</sup>C controller is enabled, the data and commands are lost as the buffers are kept cleared when the I<sup>2</sup>C controller is not enabled.

The I<sup>2</sup>C controller supports updating of the IC\_TAR.IC\_TAR and IC\_TAR.IC\_10BITADDR\_MASTER. The IC\_TAR register can be written to provided the following conditions are met:

- The I<sup>2</sup>C controller is not enabled (IC\_ENABLE.ENABLE=0)

The I<sup>2</sup>C controller supports switching back and forth between reading and writing based on what is written in IC\_CMD register. To transmit data, write the data to be written to the lower byte of the I<sup>2</sup>C Rx/Tx Data Buffer and Command Register (IC\_DATA\_CMD). The IC\_DATA\_CMD.CMD should be written to 0 for I<sup>2</sup>C write operations. Subsequently, a read command may be issued by writing "don't cares" to IC\_DATA\_CMD.DAT register bits, and a 1 should be written to the IC\_DATA\_CMD.CMD bit.

### 26.3.2 Disabling the I<sup>2</sup>C Controller

The register IC\_ENABLE allows software to unambiguously determine when the hardware has completely shutdown in response to the IC\_ENABLE.ENABLE register being cleared from 1 to 0.

#### Procedure

1. Define a timer interval ( $t_{i2c\_poll}$ ) equal to 10 times the signaling period for the highest I<sup>2</sup>C transfer speed used in the system and supported by the I<sup>2</sup>C controller. For example, if the highest I<sup>2</sup>C transfer mode is 400Kb/s, then this  $t_{i2c\_poll}$  is 25  $\mu$ s.
2. Define a maximum time-out parameter, MAX\_T\_POLL\_COUNT, such that if any repeated polling operation exceeds this maximum value, an error is reported.
3. Execute a blocking thread/process/function that prevents any further I<sup>2</sup>C master transactions to be started by software, but allows any pending transfers to be completed.
4. The variable POLL\_COUNT is initialized to zero (0).
5. Clear IC\_ENABLE.ENABLE to zero (0).
6. Read the IC\_ENABLE\_STATUS.IC\_EN bit. Increment POLL\_COUNT by one. If  $POLL\_COUNT \geq MAX\_T\_POLL\_COUNT$ , exit with the relevant error code.
7. If IC\_ENABLE\_STATUS.IC\_EN is 1, then sleep for  $t_{i2c\_poll}$  and proceed to the previous step. Otherwise, exit with a relevant success code.

| 2:0       | 1h<br>RW         | <b>IC_HS_MAR:</b> This bit field holds the value of the I2C HS mode master code. HS-mode master codes are reserved 8-bit codes (00001xxx) that are not used for slave addressing or other purposes. Each master has its unique master code; up to eight highspeed mode masters can be present on the same I2C bus system. Valid values are from 0 to 7. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. |

## 26.7.5 I2C Rx/Tx Data Buffer and Command Register (IC\_DATA\_CMD)—Offset 10h

This is the register written to by the CPU when filling the TX FIFO, and read from by the CPU when retrieving bytes from RX FIFO.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 10h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:1] + 10h

**Default:** 00000000h

| 8         | 0h<br>RO         | <b>R_ACTIVITY:</b> This bit captures DW_apb_i2c activity and stays set until it is cleared. There are four ways to clear it: Disabling the DW_apb_i2c, Reading the IC_CLR_ACTIVITY register, Reading the IC_CLR_INTR register, System reset     |
| 7         | 0h<br>RO         | <b>R_RX_DONE:</b> When the DW_apb_i2c is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done. |
| 6         | 0h<br>RO         | <b>R_TX_ABRT:</b> This bit indicates whether DW_apb_i2c, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO.                                                                                |
| 5         | 0h<br>RO         | <b>R_RD_REQ:</b> This bit is set to 1 when DW_apb_i2c is acting as a slave and another I2C master is attempting to read data from DW_apb_i2c.                                                                                                   |
| 4         | 0h<br>RO         | <b>R_TX_EMPTY:</b> This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register.                                                                                                               |
| 3         | 0h<br>RO         | <b>R_TX_OVER:</b> Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH, and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register.                                                   |
| 2         | 0h<br>RO         | <b>R_RX_FULL:</b> Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register.                                                                                                                               |
| 1         | 0h<br>RO         | <b>R_RX_OVER:</b> Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register.                                                    |
| 0         | 0h<br>RO         | <b>R_RX_UNDER:</b> Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register.                                                                                                          |

### 26.7.13 I2C Interrupt Mask Register (IC\_INTR\_MASK)—Offset 30h

These bits mask their corresponding interrupt status bits. This register is active low.

- 0 masks the interrupt
- 1 unmask the interrupt

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 30h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:1] + 10h

**Default:** 000008FFh

### 26.7.29 I2C Status Register (IC\_STATUS)—Offset 70h

### 26.7.30 I2C Transmit FIFO Level Register (IC\_TXFLR)—Offset 74h

This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever:

- The I2C is disabled
- There is a transmit abort -- that is, TX\_ABRT bit is set in the IC\_RAW\_INTR\_STAT register
- The slave bulk transmit mode is aborted

The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 74h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:1] + 10h

**Default:** 00000000h

### 26.7.31 I2C Receive FIFO Level Register (IC\_RXFLR)—Offset 78h

This register contains the number of valid data entries in the receive FIFO buffer. The register is cleared by the following methods:

- The I2C is disabled
- Whenever there is a transmit abort caused by any of the events tracked in IC\_TX\_ABRT\_SOURCE

The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 78h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:1] + 10h

This register controls the amount of hold time on the SDA signal after a negative edge of SCL in both master and slave mode, in units of `ic_clk` period. The value programmed must be greater than the minimum hold time in each mode for the value to be implemented: one cycle in master mode, seven cycles in slave mode. Writes to this register succeed only when `IC_ENABLE=0`. The programmed SDA hold time cannot exceed at any time the duration of the low part of `scl`. Therefore the programmed value cannot be larger than `N_SCL_LOW-2`, where `N_SCL_LOW` is the duration of the low part of the `scl` period measured in `ic_clk` cycles.

### 26.7.33 I2C Transmit Abort Source Register (IC\_TX\_ABRT\_SOURCE)—Offset 80h

This register has 16 bits that indicate the source of the TX\_ABRT bit. Except for Bit 9, this register is cleared whenever the IC\_CLR\_TX\_ABRT register or the IC\_CLR\_INTR register is read. To clear Bit 9, the source of the ABRT\_SBYTE\_NORSTRT must be fixed first; RESTART must be enabled (IC\_CON[5]=1), the SPECIAL bit must be cleared (IC\_TAR[11]), or the GC\_OR\_START bit must be cleared (IC\_TAR[10]). Once the source of the ABRT\_SBYTE\_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT\_SBYTE\_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

### 26.7.34 Generate Slave Data NACK Register (IC\_SLV\_DATA\_NACK\_ONLY)—Offset 84h

The register is used to generate a NACK for the data part of a transfer when DW\_apb\_i2c is acting as a slave-receiver. A write can occur on this register if either of the following conditions are met.

- DW\_apb\_i2c is disabled (IC\_ENABLE[0] = 0)
- Slave part is inactive (IC\_STATUS[6] = 0)

**NOTE** = The IC\_STATUS[6] is a register read-back location for the internal slv\_activity signal; the user should poll this before writing the ic\_slv\_data\_nack\_only bit.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 84h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:1] + 10h

**Default:** 00000000h

### 26.7.36 DMA Transmit Data Level Register (IC DMA TDLR)—Offset 8Ch

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                           |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0         | 0h<br>RW         | <b>Receive DMA Enable (RDMAE):</b> This bit enables/disables the receive FIFO DMA channel. <ul style="list-style-type: none"> <li>0 = Receive DMA disabled</li> <li>1 = Receive DMA enabled</li> </ul> |

### 26.7.36 DMA Transmit Data Level Register (IC DMA TDLR)—Offset 8Ch

This register is only valid when the DW\_apb\_i2c is configured with a set of DMA interface signals (IC\_HAS\_DMA = 1). When DW\_apb\_i2c is not configured for DMA operation, this register does not exist, writing to its address has no effect, and reading from its address returns zero.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 8Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:1] + 10h

**Default:** 00000000h

|               |    |    |    |    |    |   |        |   |

| 0         | 1h<br>RW         | <b>ACK General Call (ACK_GEN_CALL):</b> When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the DW_apb_i2c does not generate General Call interrupts. |

### 26.7.40 I2C Enable Status Register (IC\_ENABLE\_STATUS)—Offset 9Ch

The register is used to report the DW\_apb\_i2c hardware status when the IC\_ENABLE register is set from 1 to 0, that is, when DW\_apb\_i2c is disabled.

- If IC\_ENABLE has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1.
- If IC\_ENABLE has been set to 0, bits 2:1 will only be valid as soon as bit 0 is read as 0.

**NOTE** = When IC\_ENABLE has been written with 0, a delay occurs for bit 0 to be read as 0 because disabling the DW\_apb\_i2c depends on I2C bus activities.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 9Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:1] + 10h

| 7:0       | 2h<br>RW         | <b>IC_HS_SPKLEN:</b> This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that are filtered out by the spike suppression logic; for more information, refer to Spike Suppression on page 52. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 2 being set. |

## 26.7.44 I2C Component Version Register (IC\_COMP\_VERSION)—Offset F8h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

| 31:8      | 000000h<br>RO    | <b>Class Code (CLASS_CODES):</b> The Class Code register is read-only and used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level. |
| 7:0       | 00h<br>RO        | <b>Revision ID (RID):</b> Revision ID identifies the revision of particular AHB device. This is tied to a strap at the top level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Access Method

## 26.9.1 I2C Control Register (IC\_CON)—Offset 0h

This register can be written only when the DW\_apb\_i2c is disabled, which corresponds to the IC\_ENABLE register being set to 0. Writes at other times have no effect.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:2] + 10h

**Default:** 0000007Fh

|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:7      | 0b<br>RW         | <b>Reserved_7_31:</b> Reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 6         | 1h<br>RW         | <b>IC_SLAVE_DISABLE:</b> This bit controls whether I2C has its slave disabled. By default, the slave is always enabled (in reset state as well). If you need to disable it after reset, set this bit to 1. If this bit is set (slave is disabled), DW_apb_i2c functions only as a master and does not perform any action that requires a slave.                                                                                                                    |
| 5         | 1h<br>RW         | <b>IC_RESTART_EN:</b> Determines whether RESTART conditions may be sent when acting as a master. When the RESTART is disabled, the DW_apb_i2c master is incapable of performing the following functions: <ul style="list-style-type: none"> <li>• Sending a START BYTE</li> <li>• Performing any high-speed mode operation</li> <li>• Performing direction changes in combined format mode</li> <li>• Performing a read operation with a 10-bit address</li> </ul> |
| 4         | 1h<br>RO         | <b>IC_10BITADDR_MASTER (IC_10BITADDR_MASTER_rd_only):</b> Controls whether the DW_apb_i2c starts its transfers in 7- or 10-bit addressing mode when acting as a master. If I2C_DYNAMIC_TAR_UPDATE = 1, then this bit is read-only copy of bit 12 of IC_TAR register.                                                                                                                                                                                               |
| 3         | 1h<br>RW         | <b>IC_10BITADDR_SLAVE:</b> When acting as a slave, this bit controls whether the DW_apb_i2c responds to 7- or 10-bit addresses.                                                                                                                                                                                                                                                                                                                                    |
| 2:1       | 3h<br>RW         | <b>SPEED:</b> These bits control at which speed the DW_apb_i2c operates; its setting is relevant only if one is operating the DW_apb_i2c in master mode. Hardware protects against illegal values being programmed by software. This register should be programmed only with a value in the range of 1 to IC_MAX_SPEED_MODE; otherwise, hardware updates this register with the value of IC_MAX_SPEED_MODE.                                                        |
| 0         | 1h<br>RW         | <b>MASTER MODE (MASTER_MODE):</b> This bit controls whether the DW_apb_i2c master is enabled. Software should ensure that if this bit is set to X, then bit 6 should also be set to X.                                                                                                                                                                                                                                                                             |

### 26.9.7 Standard Speed I2C Clock SCL Low Count Register (IC\_SS\_SCL\_LCNT)—Offset 18h

This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock low period count for standard speed.

## Access Method

**Offset:** [BAR] + 18h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:2] + 10h

**Default:** 000001D6h

## 26.9.8

### Fast Speed I2C Clock SCL High Count Register (IC\_FS\_SCL\_HCNT)—Offset 1Ch

This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 1Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:2] + 10h

### 26.9.29 I2C Status Register (IC\_STATUS)—Offset 70h

This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. The following occurs when the I2C is disabled by writing 0 in bit 0 of the IC\_ENABLE register:

- Bits 1 and 2 are set to 1
- Bits 3 and 4 are set to 0

When the master or slave state machines goes to idle and `ic_en=0`:

- Bits 5 and 6 are set to 0

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 74h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:2] + 10h

**Default:** 00000000h

### 26.9.31 I2C Receive FIFO Level Register (IC\_RXFLR)—Offset 78h

This register contains the number of valid data entries in the receive FIFO buffer. The register is cleared by the following methods:

- The I2C is disabled
- Whenever there is a transmit abort caused by any of the events tracked in IC\_TX\_ABRT\_SOURCE

The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 78h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:2] + 10h

### 26.9.32 I2C SDA Hold Time Length Register (IC\_SDA\_HOLD)—Offset 7Ch

This register controls the amount of hold time on the SDA signal after a negative edge of SCL in both master and slave mode, in units of ic\_clk period. The value programmed must be greater than the minimum hold time in each mode for the value to be implemented one cycle in master mode, seven cycles in slave mode. Writes to this register succeed only when IC\_ENABLE=0. The programmed SDA hold time cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N\_SCL\_LOW-2, where N\_SCL\_LOW is the duration of the low part of the scl period measured in ic\_clk cycles.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 7Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:2] + 10h

**Default:** 00000001h

### 26.9.33 I2C Transmit Abort Source Register (IC\_TX\_ABRT\_SOURCE)—Offset 80h

This register has 16 bits that indicate the source of the TX\_ABRT bit. Except for Bit 9, this register is cleared whenever the IC\_CLR\_TX\_ABRT register or the IC\_CLR\_INTR register is read. To clear Bit 9, the source of the ABRT\_SBYTE\_NORSTRT must be fixed first; RESTART must be enabled (IC\_CON[5]=1), the SPECIAL bit must be cleared (IC\_TAR[11]), or the GC\_OR\_START bit must be cleared (IC\_TAR[10]). Once the source of the ABRT\_SBYTE\_NORSTRT is fixed, then this bit can be cleared in the same

manner as other bits in this register. If the source of the ABRT\_SBYTE\_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 80h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:2] + 10h

**Default:** 00000000h

### 26.9.35 DMA Control Register (IC DMA CR)—Offset 88h

This register is only valid when DW\_apb\_i2c is configured with a set of DMA Controller interface signals (IC\_HAS\_DMA = 1). When DW\_apb\_i2c is not configured for DMA operation, this register does not exist and writing to the registers address has no effect and reading from this register address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC\_ENABLE.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 88h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:2] + 10h

**Default:** 00000000h

| 0         | 1h<br>RW         | <b>ACK General Call (ACK_GEN_CALL):</b> When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the DW_apb_i2c does not generate General Call interrupts. |

### 26.9.40 I2C Enable Status Register (IC\_ENABLE\_STATUS)—Offset 9Ch

The register is used to report the DW\_apb\_i2c hardware status when the IC\_ENABLE register is set from 1 to 0, that is, when DW\_apb\_i2c is disabled.

- If IC\_ENABLE has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1.
- If IC\_ENABLE has been set to 0, bits 2:1 will only be valid as soon as bit 0 is read as 0.

**NOTE** = When IC\_ENABLE has been written with 0, a delay occurs for bit 0 to be read as 0 because disabling the DW\_apb\_i2c depends on I2C bus activities.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 9Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

| 7:0       | 5h<br>RW         | <b>IC_FS_SPKLEN:</b> This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that are filtered out by the spike suppression logic; for more information, refer to Spike Suppression on page 52. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 2 being set. |

#### 26.9.42 IC HS SPKLEN—Offset A4h

This register is used to store the duration, measured in ic\_clk cycles, of the longest spike that is filtered out by the spike suppression logic when the component is operating in HS mode. The relevant I2C requirement is tSP (Table 6) as detailed in the I2C Bus Specification. This register must be programmed with a minimum value of 1

## Access Method

| 31:8      | 000000h<br>RO    | <b>Class Code (CLASS_CODES):</b> The Class Code register is read-only and used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level. |
| 7:0       | 00h<br>RO        | <b>Revision ID (RID):</b> Revision ID identifies the revision of particular AHB device. This is tied to a strap at the top level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 26.10.7 Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 2Ch

**Default:** 00000000h

|             |    |    |    |    |    |   |   |                   |
|-------------|----|----|----|----|----|---|---|-------------------|
| 31          | 28 | 24 | 20 | 16 | 12 | 8 | 4 | 0                 |
| 0           | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0                 |
| SUBSYSTEMID |    |    |    |    |    |   |   | SUBSYSTEMVENDORID |

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                                                                                                                                                     |
|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:16     | 0000h<br>RW/O    | <b>Subsystem ID (SUBSYSTEMID):</b> This register should be implemented for any function that could be instantiated more than once in a given system. The SID register, in combination with the Subsystem Vendor ID register, make it possible for the operating environment to distinguish one audio subsystem from the other. This register is a Read Write Once type register. |
| 15:0      | 0000h<br>RW/O    | <b>Subsystem Vendor ID (SUBSYSTEMVENDORID):</b> This register should be implemented for any function that could be instantiated more than once in a given system. The SVID register, in combination with the Subsystem ID register, enables the operating environment to distinguish one subsystem from the other. This register is a Read Write Once register.                  |

### 26.10.9 Capabilities Pointer (CAPABILITYPTR)—Offset 34h

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                |
|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:8      | 000000h<br>RO    | <b>Reserved0:</b> Reserved.                                                                                                                                                                                                                 |
| 7:0       | 00h<br>RO        | <b>Capabilities Pointer (CAPPTR_POWER):</b> Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. If PM capability is disabled then this register has 00h. |

### 26.10.11 PowerManagement Capability ID (POWERCAPID)—Offset 80h

|            |   |   |   |    |   |   |   |           |   |   |   |    |   |   |   |         |   |   |   |        |   |   |   |   |   |   |   |           |   |   |   |   |   |   |   |

## 26.11.2 I2C Target Address Register (IC\_TAR)—Offset 4h

Writes to IC\_TAR succeed when one of the following conditions are true:

- DW\_apb\_i2c is NOT enabled (IC\_ENABLE is set to 0)
- 
- OR
- 
- DW\_apb\_i2c is enabled (IC\_ENABLE=1)
- AND
- DW\_apb\_i2c is NOT engaged in any Master (tx, rx) operation (IC\_STATUS[5]=0)
- AND
- DW\_apb\_i2c is enabled to operate in Master mode (IC\_CON[0]=1)
- AND
- There are NO entries in the TX FIFO (IC\_STATUS[2]=1)

## 26.11.8 Fast Speed I2C Clock SCL High Count Register (IC\_FS\_SCL\_HCNT)—Offset 1Ch

This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL.

| 15:0      | 003ch<br>RW      | <b>Fast Speed I2C Clock SCL High Count Register (IC_FS_SCL_HCNT):</b> This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. |

This register must be set before any I2C bus transaction can take place, to ensure proper I/O timing. This register sets the SCL clock low-period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL. The SCL High time depends on the loading of the bus. For 100pF loading, the SCL High time is 60ns; for 400pF loading, the SCL High time is 120ns. This register goes away and becomes read-only if IC\_MAX\_SPEED\_MODE!= high. This register can be written only when the I2C interface is disabled, which corresponds to the IC\_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 8; hardware prevents values less than this being written, and, if attempted, results in 8 being set. For designs with APB\_DATA\_WIDTH == 8 the order of programming is important to ensure the correct operation of the DW\_apb\_i2c. The lower byte must be programmed first. Then the upper byte can be programmed.

### 26.11.12 I2C Interrupt Status Register (IC\_INTR\_STAT)—Offset 2Ch

Each bit in this register has a corresponding mask bit in the IC\_INTR\_MASK register. These bits are cleared by reading the matching interrupt clear register. The unmasked raw versions of these bits are available in the IC\_RAW\_INTR\_STAT register.

| 0         | 0h<br>RO         | <b>R_RX_UNDER:</b> Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register.                                                        |

### 26.11.13 I2C Interrupt Mask Register (IC\_INTR\_MASK)—Offset 30h

These bits mask their corresponding interrupt status bits. This register is active low.

- 0 masks the interrupt
- 1 unmasks the interrupt

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 30h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:3] + 10h

**Default:** 000008FFh

| 31:1      | 0b<br>RW         | <b>Reserved_1_31:</b> Reserved.                                                                                |
| 0         | 0h<br>RO         | <b>CLR_GEN_CALL:</b> Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register. |

### 26.11.28 I2C Enable Register (IC\_ENABLE)—Offset 6Ch

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 6Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:3] + 10h

**Default:** 00000000h

[illegible]

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                       |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:2      | 0b<br>RW         | <b>Reserved_2_31:</b> Reserved                                                                                                                                                                                     |
| 1         | 0h<br>WO         | <b>ABORT:</b> Software can abort the I2C transfer by setting this bit. This bit can be set only when ENABLE = 1 and fix_ctrl_1680 = 1. The HW will clear the ABORT bit once the STOP condition has been sent.      |
| 0         | 0h<br>RW         | <b>ENABLE:</b> Controls whether the DW_apb_i2c is enabled. <ul style="list-style-type: none"> <li>0 = Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state)</li> <li>1 = Enables DW_apb_i2c</li> </ul> |

### 26.11.29 I2C Status Register (IC\_STATUS)—Offset 70h

This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. The following occurs when the I2C is disabled by writing 0 in bit 0 of the IC\_ENABLE register:

- Bits 1 and 2 are set to 1
- Bits 3 and 4 are set to 0

When the master or slave state machines goes to idle and `ic_en=0`:

- Bits 5 and 6 are set to 0

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 70h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:3] + 10h

### 26.11.30 I2C Transmit FIFO Level Register (IC\_TXFLR)—Offset 74h

This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever:

- The I2C is disabled
- There is a transmit abort -- that is, TX\_ABRT bit is set in the IC\_RAW\_INTR\_STAT register
- The slave bulk transmit mode is aborted

The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

#### Access Method

| Bit Range | Default & Access | Field Name (ID): Description                                                                      |

| 8:0       | 0h<br>RO         | <b>Receive FIFO Level (RXFLR):</b> Contains the number of valid data entries in the receive FIFO. |

### 26.11.32 I2C SDA Hold Time Length Register (IC\_SDA\_HOLD)—Offset 7Ch

This register controls the amount of hold time on the SDA signal after a negative edge of SCL in both master and slave mode, in units of ic\_clk period. The value programmed must be greater than the minimum hold time in each mode for the value to be implemented one cycle in master mode, seven cycles in slave mode. Writes to this register succeed only when IC\_ENABLE=0. The programmed SDA hold time cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N\_SCL\_LOW-2, where N\_SCL\_LOW is the duration of the low part of the scl period measured in ic\_clk cycles.

#### Access Method

### 26.11.33 I2C Transmit Abort Source Register (IC\_TX\_ABRT\_SOURCE)—Offset 80h

This register has 16 bits that indicate the source of the TX\_ABRT bit. Except for Bit 9, this register is cleared whenever the IC\_CLR\_TX\_ABRT register or the IC\_CLR\_INTR register is read. To clear Bit 9, the source of the ABRT\_SBYTE\_NORSTRT must be fixed first; RESTART must be enabled (IC\_CON[5]=1), the SPECIAL bit must be cleared (IC\_TAR[11]), or the GC\_OR\_START bit must be cleared (IC\_TAR[10]). Once the source of the ABRT\_SBYTE\_NORSTRT is fixed, then this bit can be cleared in the same

- DW\_apb\_i2c is disabled (IC\_ENABLE[0] = 0)
- Slave part is inactive (IC\_STATUS[6] = 0)

| 0         | 0h<br>RW         | <p><b>Generate NACK (NACK):</b> This NACK generation only occurs when DW_apb_i2c is a slavereceiver. If this register is set to a value of 1, it can only generate a NACK after a data byte is received; hence, the data transfer is aborted and the data received is not pushed to the receive buffer. When the register is set to a value of 0, it generates NACK/ACK, depending on normal criteria.</p> <ul style="list-style-type: none"> <li>1 = generate NACK after data byte received</li> <li>0 = generate NACK/ACK normally</li> </ul> |

### 26.11.35 DMA Control Register (IC DMA CR)—Offset 88h

This register is only valid when DW\_apb\_i2c is configured with a set of DMA Controller interface signals (IC\_HAS\_DMA = 1). When DW\_apb\_i2c is not configured for DMA operation, this register does not exist and writing to the registers address has no effect and reading from this register address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC\_ENABLE.

## Access Method

### 26.11.36 DMA Transmit Data Level Register (IC\_DMA\_TDLR)—Offset 8Ch

This register is only valid when the DW\_apb\_i2c is configured with a set of DMA interface signals (IC\_HAS\_DMA = 1). When DW\_apb\_i2c is not configured for DMA operation, this register does not exist, writing to its address has no effect, and reading from its address returns zero.

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7:0       | 0h<br>RW         | <b>Receive Data Level (DMARDL):</b> This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or more than this field value + 1, and RDMAE =1. For instance, when DMARDL is 0, then dma_rx_req is asserted when 1 or more data entries are present in the receive FIFO. |

### 26.11.38 I2C SDA Setup Register (IC\_SDA\_SETUP)—Offset 94h

This register controls the amount of time delay (in terms of number of ic\_clk clock periods) introduced in the rising edge of SCL -- relative to SDA changing -- by holding SCL low when DW\_apb\_i2c services a read request while operating as a slave-transmitter. The relevant I2C requirement is tSU:DAT (note 4) as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. **NOTE:** The length of setup time is calculated using  $[(IC\_SDA\_SETUP - 1) * (ic\_clk\_period)]$ , so if the user requires 10 ic\_clk periods of setup time, they should program a value of 11. The IC\_SDA\_SETUP register is only used by the DW\_apb\_i2c when operating as a slave transmitter.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 94h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:1      | 0b<br>RW         | <b>Reserved_1_31:</b> Reserved.                                                                                                                                                                                           |
| 0         | 1h<br>RW         | <b>ACK General Call (ACK_GEN_CALL):</b> When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the DW_apb_i2c does not generate General Call interrupts. |

### 26.11.40 I2C Enable Status Register (IC\_ENABLE\_STATUS)—Offset 9Ch

The register is used to report the DW\_apb\_i2c hardware status when the IC\_ENABLE register is set from 1 to 0, that is, when DW\_apb\_i2c is disabled.

- If IC\_ENABLE has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1.
- If IC\_ENABLE has been set to 0, bits 2:1 will only be valid as soon as bit 0 is read as 0.

**NOTE** = When IC\_ENABLE has been written with 0, a delay occurs for bit 0 to be read as 0 because disabling the DW\_apb\_i2c depends on I2C bus activities.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 9Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

| 7:0       | 5h<br>RW         | <b>IC_FS_SPKLEN:</b> This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that are filtered out by the spike suppression logic; for more information, refer to Spike Suppression on page 52. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 2 being set. |

#### 26.11.42 IC\_HS\_SPKLEN—Offset A4h

This register is used to store the duration, measured in ic\_clk cycles, of the longest spike that is filtered out by the spike suppression logic when the component is operating in HS mode. The relevant I2C requirement is tSP (Table 6) as detailed in the I2C Bus Specification. This register must be programmed with a minimum value of 1

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + A4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:3] + 10h

**Default:** 00000002h

| 31:8      | 000000h<br>RO    | <b>Class Code (CLASS_CODES):</b> The Class Code register is read-only and used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level. |
| 7:0       | 00h<br>RO        | <b>Revision ID (RID):</b> Revision ID identifies the revision of particular AHB device. This is tied to a strap at the top level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### 26.13.2 I2C Target Address Register (IC\_TAR)—Offset 4h

## Access Method

**Offset:** [BAR] + 8h**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:4] + 10h

**Default:** 00000055h

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                                                                                    |
|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:10     | 0b<br>RW         | <b>Reserved_10_31:</b> Reserved.                                                                                                                                                                                                                                                                                |
| 9:0       | 55h<br>RW        | <b>IC_SAR:</b> The IC_SAR holds the slave address when the I2C is operating as a slave. For 7-bit addressing, only IC_SAR[6:0] is used. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. |

#### 26.13.4 I2C High Speed Master Mode Code Address Register (IC\_HS\_MADDR)—Offset Ch

**Note:** It is not necessary to perform any write to this register if DW\_apb\_i2c is enabled as an I2C slave only.

## Access Method

**Offset:** [BAR] + Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:4] + 10h

**Default:** 00000001h

|               |    |    |    |    |    |   |   |           |

#### 26.13.14 I2C Raw Interrupt Status Register (IC\_RAW\_INTR\_STAT)—Offset 34h

Unlike the IC\_INTR\_STAT register, these bits are not masked -- so they always show the true status of the DW\_apb\_i2c.

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 34h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:4] + 10h

**Default:** 00000000h

|                |    |    |    |    |    |          |           |          |

### 26.13.31 I2C Receive FIFO Level Register (IC\_RXFLR)—Offset 78h

This register contains the number of valid data entries in the receive FIFO buffer. The register is cleared by the following methods:

- The I2C is disabled
- Whenever there is a transmit abort caused by any of the events tracked in IC\_TX\_ABRT\_SOURCE

The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

#### Access Method

### 26.13.32 I2C SDA Hold Time Length Register (IC\_SDA\_HOLD)—Offset 7Ch

This register controls the amount of hold time on the SDA signal after a negative edge of SCL in both master and slave mode, in units of ic\_clk period. The value programmed must be greater than the minimum hold time in each mode for the value to be implemented one cycle in master mode, seven cycles in slave mode. Writes to this register succeed only when IC\_ENABLE=0. The programmed SDA hold time cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N\_SCL\_LOW-2, where N\_SCL\_LOW is the duration of the low part of the scl period measured in ic\_clk cycles.

#### Access Method

### 26.13.33 I2C Transmit Abort Source Register (IC\_TX\_ABRT\_SOURCE)—Offset 80h

This register has 16 bits that indicate the source of the TX\_ABRT bit. Except for Bit 9, this register is cleared whenever the IC\_CLR\_TX\_ABRT register or the IC\_CLR\_INTR register is read. To clear Bit 9, the source of the ABRT\_SBYTE\_NORSTRT must be fixed first; RESTART must be enabled (IC\_CON[5]=1), the SPECIAL bit must be cleared (IC\_TAR[11]), or the GC\_OR\_START bit must be cleared (IC\_TAR[10]). Once the source of the ABRT\_SBYTE\_NORSTRT is fixed, then this bit can be cleared in the same

manner as other bits in this register. If the source of the ABRT\_SBYTE\_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

### Access Method

### 26.13.36 DMA Transmit Data Level Register (IC\_DMA\_TDLR)—Offset 8Ch

This register is only valid when the DW\_apb\_i2c is configured with a set of DMA interface signals (IC\_HAS\_DMA = 1). When DW\_apb\_i2c is not configured for DMA operation, this register does not exist, writing to its address has no effect, and reading from its address returns zero.

This register controls the amount of time delay (in terms of number of ic\_clk clock periods) introduced in the rising edge of SCL -- relative to SDA changing -- by holding SCL low when DW\_apb\_i2c services a read request while operating as a slave-transmitter. The relevant I2C requirement is tSU:DAT (note 4) as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. **NOTE:** The length of setup time is calculated using  $[(IC\_SDA\_SETUP - 1) * (ic\_clk\_period)]$ , so if the user requires 10 ic\_clk periods of setup time, they should program a value of 11. The IC\_SDA\_SETUP register is only used by the DW\_apb\_i2c when operating as a slave transmitter.

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 94h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:4] + 10h

| 0         | 1h<br>RW         | <b>ACK General Call (ACK_GEN_CALL):</b> When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the DW_apb_i2c does not generate General Call interrupts. |

## 26.13.40 I2C Enable Status Register (IC\_ENABLE\_STATUS)—Offset 9Ch

The register is used to report the DW\_apb\_i2c hardware status when the IC\_ENABLE register is set from 1 to 0, that is, when DW\_apb\_i2c is disabled.

- If IC\_ENABLE has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1.
- If IC\_ENABLE has been set to 0, bits 2:1 will only be valid as soon as bit 0 is read as 0.

**NOTE** = When IC\_ENABLE has been written with 0, a delay occurs for bit 0 to be read as 0 because disabling the DW\_apb\_i2c depends on I2C bus activities.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 9Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:4] + 10h

## 26.15.2 I2C Target Address Register (IC\_TAR)—Offset 4h

Writes to IC\_TAR succeed when one of the following conditions are true:

- DW\_apb\_i2c is NOT enabled (IC\_ENABLE is set to 0)
- 
- OR
- 
- DW\_apb\_i2c is enabled (IC\_ENABLE=1)
- AND
- DW\_apb\_i2c is NOT engaged in any Master (tx, rx) operation (IC\_STATUS[5]=0)
- AND
- DW\_apb\_i2c is enabled to operate in Master mode (IC\_CON[0]=1)
- AND
- There are NO entries in the TX FIFO (IC\_STATUS[2]=1)

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:5] + 10h

**Default:** 00001055h

| 15:0      | 003ch<br>RW      | <b>Fast Speed I2C Clock SCL High Count Register (IC_FS_SCL_HCNT):</b> This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. |

This register must be set before any I2C bus transaction can take place, to ensure proper I/O timing. This register sets the SCL clock low-period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL. The SCL High time depends on the loading of the bus. For 100pF loading, the SCL High time is 60ns; for 400pF loading, the SCL High time is 120ns. This register goes away and becomes read-only if IC\_MAX\_SPEED\_MODE!= high. This register can be written only when the I2C interface is disabled, which corresponds to the IC\_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 8; hardware prevents values less than this being written, and, if attempted, results in 8 being set. For designs with APB\_DATA\_WIDTH == 8 the order of programming is important to ensure the correct operation of the DW\_apb\_i2c. The lower byte must be programmed first. Then the upper byte can be programmed.

The valid range is 0-255, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. |

## 26.15.17 Clear Combined and Individual Interrupt Register (IC\_CLR\_INTR)—Offset 40h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 40h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:5] + 10h

**Default:** 00000000h

|               |    |    |    |    |    |   |   |          |

| 0         | 0h<br>RW         | <b>ENABLE:</b> Controls whether the DW_apb_i2c is enabled. <ul style="list-style-type: none"> <li>0 = Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state)</li> <li>1 = Enables DW_apb_i2c</li> </ul> |

### 26.15.29 I2C Status Register (IC\_STATUS)—Offset 70h

This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. The following occurs when the I2C is disabled by writing 0 in bit 0 of the IC\_ENABLE register:

- Bits 1 and 2 are set to 1
- Bits 3 and 4 are set to 0

When the master or slave state machines goes to idle and `ic_en=0`:

- Bits 5 and 6 are set to 0

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 70h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:5] + 10h

**Default:** 00000006h

### 26.15.30 I2C Transmit FIFO Level Register (IC\_TXFLR)—Offset 74h

This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever:

- The I2C is disabled
- There is a transmit abort -- that is, TX\_ABRT bit is set in the IC\_RAW\_INTR\_STAT register
- The slave bulk transmit mode is aborted

The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

## Access Method

| Bit Range | Default & Access | Field Name (ID): Description                                                                      |

| 8:0       | 0h<br>RO         | <b>Receive FIFO Level (RXFLR):</b> Contains the number of valid data entries in the receive FIFO. |

### 26.15.32 I2C SDA Hold Time Length Register (IC\_SDA\_HOLD)—Offset 7Ch

This register controls the amount of hold time on the SDA signal after a negative edge of SCL in both master and slave mode, in units of ic\_clk period. The value programmed must be greater than the minimum hold time in each mode for the value to be implemented one cycle in master mode, seven cycles in slave mode. Writes to this register succeed only when IC\_ENABLE=0. The programmed SDA hold time cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N\_SCL\_LOW-2, where N\_SCL\_LOW is the duration of the low part of the scl period measured in ic\_clk cycles.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 7Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:5] + 10h

**Default:** 00000001h

|                |    |    |    |    |    |   |   |             |

### 26.15.33 I2C Transmit Abort Source Register (IC\_TX\_ABRT\_SOURCE)—Offset 80h

This register has 16 bits that indicate the source of the TX\_ABRT bit. Except for Bit 9, this register is cleared whenever the IC\_CLR\_TX\_ABRT register or the IC\_CLR\_INTR register is read. To clear Bit 9, the source of the ABRT\_SBYTE\_NORSTRT must be fixed first; RESTART must be enabled (IC\_CON[5]=1), the SPECIAL bit must be cleared (IC\_TAR[11]), or the GC\_OR\_START bit must be cleared (IC\_TAR[10]). Once the source of the ABRT\_SBYTE\_NORSTRT is fixed, then this bit can be cleared in the same

### 26.15.34 Generate Slave Data NACK Register (IC\_SLV\_DATA\_NACK\_ONLY)—Offset 84h

[illegible]

## Access Method

| 7:0       | 0h<br>RW         | <b>Transmit Data Level (DMATDL):</b> This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1. |

## 26.15.37 I2C Receive Data Level Register (IC\_DMA\_RDLR)—Offset 90h

This register is only valid when DW\_apb\_i2c is configured with a set of DMA interface signals(IC\_HAS\_DMA = 1). When DW\_apb\_i2c is not configured for DMA operation, this register does not exist, writing to its address has no effect, and reading from its address returns zero.

## Access Method

|-----------|------------------|---------------------------------|
| 31:8      | 0b<br>RW         | <b>Reserved_8_31:</b> Reserved. |

This register controls the amount of time delay (in terms of number of ic\_clk clock periods) introduced in the rising edge of SCL -- relative to SDA changing -- by holding SCL low when DW\_apb\_i2c services a read request while operating as a slave-transmitter. The relevant I2C requirement is tSU:DAT (note 4) as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. **NOTE:** The length of setup time is calculated using  $[(IC\_SDA\_SETUP - 1) * (ic\_clk\_period)]$ , so if the user requires 10 ic\_clk periods of setup time, they should program a value of 11. The IC\_SDA\_SETUP register is only used by the DW\_apb\_i2c when operating as a slave transmitter.

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:5] + 10h

[illegible]

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                      |

| 0         | 1h<br>RW         | <b>ACK General Call (ACK_GEN_CALL):</b> When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the DW_apb_i2c does not generate General Call interrupts. |

### 26.15.40 I2C Enable Status Register (IC\_ENABLE\_STATUS)—Offset 9Ch

The register is used to report the DW\_apb\_i2c hardware status when the IC\_ENABLE register is set from 1 to 0, that is, when DW\_apb\_i2c is disabled.

- If IC\_ENABLE has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1.
- If IC\_ENABLE has been set to 0, bits 2:1 will only be valid as soon as bit 0 is read as 0.

**NOTE** = When IC\_ENABLE has been written with 0, a delay occurs for bit 0 to be read as 0 because disabling the DW\_apb\_i2c depends on I2C bus activities.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 9Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

## 26.15.45 I2C Component Type Register (IC\_COMP\_TYPE)—Offset FCh

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + FCh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:5] + 10h

**Default:** 44570140h

|    |    |    |    |    |    |   |   |   |
|----|----|----|----|----|----|---|---|---|
| 31 | 28 | 24 | 20 | 16 | 12 | 8 | 4 | 0 |
| 0  | 1  | 0  | 0  | 0  | 1  | 0 | 0 | 0 |
| 0  | 1  | 0  | 0  | 0  | 1  | 0 | 0 | 0 |
| 0  | 1  | 0  | 1  | 0  | 1  | 1 | 1 | 0 |
| 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 1 |
| 0  | 0  | 0  | 0  | 1  | 0  | 1 | 0 | 0 |
| 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 |
| 0  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 |

IC\_COMP\_TYPE

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                         |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0      | 44570140h<br>RO  | <b>IC_COMP_TYPE:</b> Designware Component Type number = 0x44_57_01_40. This assigned unique hex value is constant and is derived from the two ASCII letters DW followed by a 16-bit unsigned number. |

## 26.15.46 reg\_CLOCK\_PARAMS (CLOCK\_PARAMS)—Offset 800h

indicate if the i2c uses 133MHz or 100MHz

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 800h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:5] + 10h

**Default:** 00000000h

|       |    |    |    |    |    |   |   |                 |
|-------|----|----|----|----|----|---|---|-----------------|
| 31    | 28 | 24 | 20 | 16 | 12 | 8 | 4 | 0               |
| 0     | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0               |
| RSVD0 |    |    |    |    |    |   |   | hs_source_clock |

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                           |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:8      | 000000h<br>RO    | <b>Class Code (CLASS_CODES):</b> The Class Code register is read-only and used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level. |
| 7:0       | 00h<br>RO        | <b>Revision ID (RID):</b> Revision ID identifies the revision of particular AHB device. This is tied to a strap at the top level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 26.16.4 Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:24, F:6] + Ch

**Default:** 00800000h

|           |    |    |    |          |                |   |   |   |

#### 26.17.14 I2C Raw Interrupt Status Register (IC\_RAW\_INTR\_STAT)—Offset 34h

Unlike the IC\_INTR\_STAT register, these bits are not masked -- so they always show the true status of the DW\_apb\_i2c.

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 34h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:6] + 10h

**Default:** 00000000h

### 26.17.31 I2C Receive FIFO Level Register (IC\_RXFLR)—Offset 78h

This register contains the number of valid data entries in the receive FIFO buffer. The register is cleared by the following methods:

- The I2C is disabled
- Whenever there is a transmit abort caused by any of the events tracked in IC\_TX\_ABRT\_SOURCE

The register increments whenever data is placed into the receive FIFO and decrements when data is taken from the receive FIFO.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 78h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:6] + 10h

### 26.17.32 I2C SDA Hold Time Length Register (IC\_SDA\_HOLD)—Offset 7Ch

This register controls the amount of hold time on the SDA signal after a negative edge of SCL in both master and slave mode, in units of ic\_clk period. The value programmed must be greater than the minimum hold time in each mode for the value to be implemented one cycle in master mode, seven cycles in slave mode. Writes to this register succeed only when IC\_ENABLE=0. The programmed SDA hold time cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N\_SCL\_LOW-2, where N\_SCL\_LOW is the duration of the low part of the scl period measured in ic\_clk cycles.

#### Access Method

### 26.17.33 I2C Transmit Abort Source Register (IC\_TX\_ABRT\_SOURCE)—Offset 80h

This register has 16 bits that indicate the source of the TX\_ABRT bit. Except for Bit 9, this register is cleared whenever the IC\_CLR\_TX\_ABRT register or the IC\_CLR\_INTR register is read. To clear Bit 9, the source of the ABRT\_SBYTE\_NORSTRT must be fixed first; RESTART must be enabled (IC\_CON[5]=1), the SPECIAL bit must be cleared (IC\_TAR[11]), or the GC\_OR\_START bit must be cleared (IC\_TAR[10]). Once the source of the ABRT\_SBYTE\_NORSTRT is fixed, then this bit can be cleared in the same

manner as other bits in this register. If the source of the ABRT\_SBYTE\_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

### Access Method

### 26.17.36 DMA Transmit Data Level Register (IC\_DMA\_TDLR)—Offset 8Ch

This register is only valid when the DW\_apb\_i2c is configured with a set of DMA interface signals (IC\_HAS\_DMA = 1). When DW\_apb\_i2c is not configured for DMA operation, this register does not exist, writing to its address has no effect, and reading from its address returns zero.

This register controls the amount of time delay (in terms of number of ic\_clk clock periods) introduced in the rising edge of SCL -- relative to SDA changing -- by holding SCL low when DW\_apb\_i2c services a read request while operating as a slave-transmitter. The relevant I2C requirement is tSU:DAT (note 4) as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. **NOTE:** The length of setup time is calculated using  $[(IC\_SDA\_SETUP - 1) * (ic\_clk\_period)]$ , so if the user requires 10 ic\_clk periods of setup time, they should program a value of 11. The IC\_SDA\_SETUP register is only used by the DW\_apb\_i2c when operating as a slave transmitter.

| 0         | 1h<br>RW         | <b>ACK General Call (ACK_GEN_CALL):</b> When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the DW_apb_i2c does not generate General Call interrupts. |

### 26.17.40 I2C Enable Status Register (IC\_ENABLE\_STATUS)—Offset 9Ch

The register is used to report the DW\_apb\_i2c hardware status when the IC\_ENABLE register is set from 1 to 0, that is, when DW\_apb\_i2c is disabled.

- If IC\_ENABLE has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1.
- If IC\_ENABLE has been set to 0, bits 2:1 will only be valid as soon as bit 0 is read as 0.

**NOTE** = When IC\_ENABLE has been written with 0, a delay occurs for bit 0 to be read as 0 because disabling the DW\_apb\_i2c depends on I2C bus activities.

|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:8      | 000000h<br>RO    | <b>Class Code (CLASS_CODES):</b> The Class Code register is read-only and used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level. |
| 7:0       | 00h<br>RO        | <b>Revision ID (RID):</b> Revision ID identifies the revision of particular AHB device. This is tied to a strap at the top level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 26.19.2 I2C Target Address Register (IC\_TAR)—Offset 4h

Writes to IC\_TAR succeed when one of the following conditions are true:

- DW\_apb\_i2c is NOT enabled (IC\_ENABLE is set to 0)
- 
- OR
- 
- DW\_apb\_i2c is enabled (IC\_ENABLE=1)
- AND
- DW\_apb\_i2c is NOT engaged in any Master (tx, rx) operation (IC\_STATUS[5]=0)
- AND
- DW\_apb\_i2c is enabled to operate in Master mode (IC\_CON[0]=1)
- AND
- There are NO entries in the TX FIFO (IC\_STATUS[2]=1)

### 26.19.7 Standard Speed I2C Clock SCL Low Count Register (IC\_SS\_SCL\_LCNT)—Offset 18h

This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock low period count for standard speed.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 18h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:7] + 10h

**Default:** 000001D6h

This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL.

## Access Method

| 15:0      | 003ch<br>RW      | <b>Fast Speed I2C Clock SCL High Count Register (IC_FS_SCL_HCNT):</b> This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. |

This register must be set before any I2C bus transaction can take place, to ensure proper I/O timing. This register sets the SCL clock low-period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL. The SCL High time depends on the loading of the bus. For 100pF loading, the SCL High time is 60ns; for 400pF loading, the SCL High time is 120ns. This register goes away and becomes read-only if `IC_MAX_SPEED_MODE` != high. This register can be written only when the I2C interface is disabled, which corresponds to the `IC_ENABLE` register being set to 0. Writes at other times have no effect. The minimum valid value is 8; hardware prevents values less than this being written, and, if attempted, results in 8 being set. For designs with `APB_DATA_WIDTH` == 8 the order of programming is important to ensure the correct operation of the `DW_apb_i2c`. The lower byte must be programmed first. Then the upper byte can be programmed.

## 26.19.12 I2C Interrupt Status Register (IC\_INTR\_STAT)—Offset 2Ch

Each bit in this register has a corresponding mask bit in the IC\_INTR\_MASK register. These bits are cleared by reading the matching interrupt clear register. The unmasked raw versions of these bits are available in the IC\_RAW\_INTR\_STAT register.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

| 0         | 0h<br>RO         | <b>R_RX_UNDER:</b> Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register.                                                        |

### 26.19.13 I2C Interrupt Mask Register (IC\_INTR\_MASK)—Offset 30h

These bits mask their corresponding interrupt status bits. This register is active low.

- 0 masks the interrupt
- 1 unmasks the interrupt

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 30h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:7] + 10h

**Default:** 000008FFh

| 0         | 0h<br>RW         | <b>ENABLE:</b> Controls whether the DW_apb_i2c is enabled. <ul style="list-style-type: none"> <li>0 = Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state)</li> <li>1 = Enables DW_apb_i2c</li> </ul> |

### 26.19.29 I2C Status Register (IC\_STATUS)—Offset 70h

This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. The following occurs when the I2C is disabled by writing 0 in bit 0 of the IC\_ENABLE register:

- Bits 1 and 2 are set to 1
- Bits 3 and 4 are set to 0

When the master or slave state machines goes to idle and `ic_en=0`:

- Bits 5 and 6 are set to 0

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 70h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:7] + 10h

**Default:** 00000006h

### 26.19.30 I2C Transmit FIFO Level Register (IC\_TXFLR)—Offset 74h

This register contains the number of valid data entries in the transmit FIFO buffer. It is cleared whenever:

- The I2C is disabled
- There is a transmit abort -- that is, TX\_ABRT bit is set in the IC\_RAW\_INTR\_STAT register
- The slave bulk transmit mode is aborted

The register increments whenever data is placed into the transmit FIFO and decrements when data is taken from the transmit FIFO.

#### Access Method

| Bit Range | Default & Access | Field Name (ID): Description                                                                      |

| 8:0       | 0h<br>RO         | <b>Receive FIFO Level (RXFLR):</b> Contains the number of valid data entries in the receive FIFO. |

### 26.19.32 I2C SDA Hold Time Length Register (IC\_SDA\_HOLD)—Offset 7Ch

This register controls the amount of hold time on the SDA signal after a negative edge of SCL in both master and slave mode, in units of ic\_clk period. The value programmed must be greater than the minimum hold time in each mode for the value to be implemented one cycle in master mode, seven cycles in slave mode. Writes to this register succeed only when IC\_ENABLE=0. The programmed SDA hold time cannot exceed at any time the duration of the low part of scl. Therefore the programmed value cannot be larger than N\_SCL\_LOW-2, where N\_SCL\_LOW is the duration of the low part of the scl period measured in ic\_clk cycles.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 7Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:7] + 10h

### 26.19.33 I2C Transmit Abort Source Register (IC\_TX\_ABRT\_SOURCE)—Offset 80h

This register has 16 bits that indicate the source of the TX\_ABRT bit. Except for Bit 9, this register is cleared whenever the IC\_CLR\_TX\_ABRT register or the IC\_CLR\_INTR register is read. To clear Bit 9, the source of the ABRT\_SBYTE\_NORSTRT must be fixed first; RESTART must be enabled (IC\_CON[5]=1), the SPECIAL bit must be cleared (IC\_TAR[11]), or the GC\_OR\_START bit must be cleared (IC\_TAR[10]). Once the source of the ABRT\_SBYTE\_NORSTRT is fixed, then this bit can be cleared in the same

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

If this register is set to a value of 1, it can only generate a NACK after a data byte is received; hence, the data transfer is aborted and the data received is not pushed to the receive buffer. When the register is set to a value of 0, it generates NACK/ACK, depending on normal criteria.</p> <ul style="list-style-type: none"> <li>1 = generate NACK after data byte received</li> <li>0 = generate NACK/ACK normally</li> </ul> |

### 26.19.35 DMA Control Register (IC\_DMA\_CR)—Offset 88h

This register is only valid when DW\_apb\_i2c is configured with a set of DMA Controller interface signals (IC\_HAS\_DMA = 1). When DW\_apb\_i2c is not configured for DMA operation, this register does not exist and writing to the registers address has no effect and reading from this register address will return zero. The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC\_ENABLE.

## Access Method

**Type:** Memory Mapped I/O Register

| 7:0       | 0h<br>RW         | <b>Transmit Data Level (DMATDL):</b> This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1. |

## 26.19.37 I2C Receive Data Level Register (IC\_DMA\_RDLR)—Offset 90h

This register is only valid when DW\_apb\_i2c is configured with a set of DMA interface signals(IC\_HAS\_DMA = 1). When DW\_apb\_i2c is not configured for DMA operation, this register does not exist, writing to its address has no effect, and reading from its address returns zero.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 90h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:7] + 10h

**Default:** 00000000h

|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7:0       | 0h<br>RW         | <b>Receive Data Level (DMARDL):</b> This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or more than this field value + 1, and RDMAE =1. For instance, when DMARDL is 0, then dma_rx_req is asserted when 1 or more data entries are present in the receive FIFO. |

### 26.19.38 I2C SDA Setup Register (IC\_SDA\_SETUP)—Offset 94h

This register controls the amount of time delay (in terms of number of ic\_clk clock periods) introduced in the rising edge of SCL -- relative to SDA changing -- by holding SCL low when DW\_apb\_i2c services a read request while operating as a slave-transmitter. The relevant I2C requirement is tSU:DAT (note 4) as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. **NOTE:** The length of setup time is calculated using  $[(IC\_SDA\_SETUP - 1) * (ic\_clk\_period)]$ , so if the user requires 10 ic\_clk periods of setup time, they should program a value of 11. The IC\_SDA\_SETUP register is only used by the DW\_apb\_i2c when operating as a slave transmitter.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 94h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:7] + 10h

**Default:** 00000064h

[illegible]

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                      |

|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:1      | 0b<br>RW         | <b>Reserved_1_31:</b> Reserved.                                                                                                                                                                                           |
| 0         | 1h<br>RW         | <b>ACK General Call (ACK_GEN_CALL):</b> When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the DW_apb_i2c does not generate General Call interrupts. |

### 26.19.40 I2C Enable Status Register (IC\_ENABLE\_STATUS)—Offset 9Ch

The register is used to report the DW\_apb\_i2c hardware status when the IC\_ENABLE register is set from 1 to 0, that is, when DW\_apb\_i2c is disabled.

- If IC\_ENABLE has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1.
- If IC\_ENABLE has been set to 0, bits 2:1 will only be valid as soon as bit 0 is read as 0.

**NOTE** = When IC\_ENABLE has been written with 0, a delay occurs for bit 0 to be read as 0 because disabling the DW\_apb\_i2c depends on I2C bus activities.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 9Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:7] + 10h

**Default:** 00000000h

## Access Method

| 7:0       | 2h<br>RW         | <b>IC_HS_SPKLEN:</b> This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that are filtered out by the spike suppression logic; for more information, refer to Spike Suppression on page 52. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 2 being set. |

## 27 SIO – High Speed UART

The SoC implements two instances of high speed UART controller that support baud rates between 300 and 3686400. Hardware flow control is also supported.

### 27.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

**Table 278. UART 1 Interface Signals**

| Signal Name           | Direction<br>Plat. Power | Description                                                                                                   |

## 27.2 Features

### 27.2.1 UART Function

The UART transmits and receives data in bit frames as shown in [Figure 126](#).

- Each data frame is between 7 and 12 bits long, depending on the size of data programmed and if parity and stop bits are enabled.
- The frame begins with a start bit that is represented by a high-to-low transition.
- Next, 5 to 8 bits of data are transmitted, beginning with the least significant bit. An optional parity bit follows, which is set if even parity is enabled and an odd number of ones exist within the data byte; or, if odd parity is enabled and the data byte contains an even number of ones.
- The data frame ends with one, one-and-one-half, or two stop bits (as programmed by users), which is represented by one or two successive bit periods of a logic one.

**Figure 126. UART Data Transfer Flow**

Each UART has a Transmit FIFO and a Receive FIFO and each holds 64 characters of data. There are two separate methods for moving data into/out of the FIFOs—Interrupts and Polling.

## 27.2.2 Clock and Reset

The BAUD rate generates from serial clock (**Sclock**) frequency which is based on a fixed base/system clock (**Fbase**) of 100 MHz processed through an M/N divider. M/N divider settings are found in the HSUART's PRV\_CLOCK\_PARAMS register. **Sclock** frequency = (Fbase\*M)/N. Some useful Sclock frequencies and related M/N values are shown below:

**Table 280. Sclock Frequencies from M/N Settings**

| M Value       | N Value        | Sclock      |
|---------------|----------------|-------------|
| 288 (0x120)   | 15625 (0x3D09) | 1.84320 MHz |
| 1024 (0x400)  | 3125 (0xC35)   | 32.7680 MHz |
| 9216 (0x2400) | 15625 (0x3D09) | 58.9824 MHz |

## 27.2.3 Baud Rate Generator

The baud rates for the UARTs are generated with from the serial clock frequency (Sclock) by programming the DLH and DLL registers as a divisor. The hexadecimal value of the **divisor** is (IER\_DLH[7:0]<8) | RBR\_THR\_DLL[7:0].

**Fbase** is the system clock frequency in Hz (100,000,000 in decimal when the system clock frequency is 100 MHz.).

The output baud rate is as follows:

$$\text{— } \text{baud rate} = (\text{Sclock}) / (16 * \text{divisor})$$

**Table 281. Baud Rates Achievable with Different DLAB Settings**

| DLH,DLL Divisor             | DLH,DLL Divisor Hexadecimal | Baud Rate |
|-----------------------------|-----------------------------|-----------|
| <b>Sclock = 1.84320 MHz</b> |                             |           |
| 1                           | 0001                        | 115200    |

| 16                          | 0010                        | 230400    |
| 24                          | 0018                        | 153600    |
| <b>Sclock = 32.768 MHz</b>  |                             |           |
| 8                           | 0008                        | 256000    |
| 16                          | 0010                        | 128000    |

## 27.3 Use

Each UART has a transmit FIFO and a receive FIFO, each FIFO holding 64 characters of data. Three separate methods move data into and out of the FIFOs: interrupts, DMA, and polled.

### 27.3.1 DMA Mode Operation

#### 27.3.1.1 Receiver DMA

The data transfer from the HSUART to host memory is controlled by the DMA write channel. To configure the channel in write mode, channel direction in the channel control register needs to be programmed to "1". The software need to program the descriptor start address register, descriptor transfer size register, and descriptor control register before starting the channel using the channel active bit in the channel control register.

#### 27.3.1.2 Transmit DMA

The data transfer from host memory to HSUART is controlled by DMA read channel. To configure the channel in read mode, channel direction in the channel control register needs to be programmed to "0". The software need to program the descriptor start address register, descriptor transfer size register, and descriptor control register before starting the channel using the channel active bit in the channel control register.

#### 27.3.1.3 Removing Trailing Bytes in DMA Mode

When the number of entries in the Receive FIFO is less than its trigger level, and no additional data is received, the remaining bytes are called Trailing bytes. These are DMAed out by the DMA as it has visibility into the FIFO Occupancy register.

### 27.3.2 FIFO Polled-Mode Operation

With the FIFOs enabled (IIR\_FCR.IID0\_FIFOE bit set to 1), clearing IER\_DLH[7] and IER\_DLH[4:0] puts the serial port in the FIFO Polled Operation mode. Because the receiver and the transmitter are controlled separately, either one or both can be in Polled Operation mode. In this mode, software checks Receiver and Transmitter status using the Line Status Register (LSR). The processor polls the following bits for Receive and Transmit Data Service.

#### 27.3.2.1 Receive Data Service

The processor checks data ready (LSR.DR) bit which is set when 1 or more bytes remains in the Receive FIFO or Receive Buffer Register (RBR\_THR\_DLL).

#### 27.3.2.2 Transmit Data Service

The processor checks transmit data request LSR.THRE bit, which is set when the transmitter needs data.

The processor can also check transmitter empty LSR.TEMT, which is set when the Transmit FIFO or Holding register is empty.

### **27.3.2.3 Autoflow Control**

Autoflow Control uses Clear-to-Send (nCTS) and Request-to-Send (nRTS) signals to automatically control the flow of data between the UART and external modem. When autoflow is enabled, the remote device is not allowed to send data unless the UART asserts nRTS low. If the UART de-asserts nRTS while the remote device is sending data, the remote device is allowed to send one additional byte after nRTS is deasserted. An overflow could occur if the remote device violates this rule. Likewise, the UART is not allowed to transmit data unless the remote device asserts nCTS low. This feature increases system efficiency and eliminates the possibility of a Receive FIFO Overflow error due to long interrupt latency.

Autoflow mode can be used in two ways: Full autoflow, automating both nCTS and nRTS, and half autoflow, automating only nCTS. Full Autoflow is enabled by writing a 1 to bits 1 and 5 of the Modem Control Register (MCR). Auto-nCTS-Only mode is enabled by writing a 1 to bit 5 and a 0 to bit 1 of the MCR register.

### **27.3.2.4 RTS (UART Output)**

When in full autoflow mode, nRTS is asserted when the UART FIFO is ready to receive data from the remote transmitter. This occurs when the amount of data in the Receive FIFO is below the programmable threshold value. When the amount of data in the Receive FIFO reaches the programmable threshold, nRTS is de-asserted. It will be asserted once again when enough bytes are removed from the FIFO to lower the data level below the threshold.

### **27.3.2.5 CTS (UART Input)**

When in Full or Half-Autoflow mode, nCTS is asserted by the remote receiver when the receiver is ready to receive data from the UART. The UART checks nCTS before sending the next byte of data and will not transmit the byte until nCTS is low. If nCTS goes high while the transfer of a byte is in progress, the transmitter will complete this byte.

## **27.4 Register Map**

Refer to [Chapter 3, “Register Access Methods”](#) and [Chapter 4, “Mapping Address Spaces”](#) for additional information.

| 7:0       | 0h<br>RW         | <p><b>rbr_thr_dll:</b> RBR[7:0] (Receive Buffer Register) (Read Only):<br/>Data byte received on the serial input port (sin) in UART mode. The data in this register is valid only if the Data Ready (DR) bit in the Line Status Register (LCR) is set.<br/>If FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an over-run error.<br/>If FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO is preserved, but any incoming data are lost and an over-run error occurs.</p> <p><b>THR[7:0] (Transmit Holding Register) (Write Only):</b><br/>Data to be transmitted on the serial output port (sout) in UART mode. Data should only be written to the THR when the THR Empty (THRE) bit (LSR[5]) is set.<br/>If in non-FIFO mode or FIFOs are disabled (FCR[0] = 0) and THRE is set, writing a single character to the THR clears the THRE. Any additional writes to the THR before the THRE is set again causes the THR data to be overwritten.<br/>If in FIFO mode and FIFOs are enabled (FCR[0] = 1) and THRE is set, x number of characters of data may be written to the THR before the FIFO is full. The number x (default=16) is determined by the value of FIFO Depth that you set during configuration. Any attempt to write data when the FIFO is full results in the write data being lost.</p> <p><b>DLL[7:0] (Divisor Latch Low) (Read-Write):</b><br/>Lower 8 bits of a 16-bit, read/write, Divisor Latch register that contains the baud rate divisor for the UART. this register may be accessed only when the DLAB bit (LCR[7]) is set.<br/>The output baud rate is equal to the serial frequency divided by sixteen times the value of the baud rate divisor, as follows: <math>\text{baud rate} = (\text{serial clock freq}) / (16 * \text{divisor})</math>.<br/>Note that with the Divisor Latch Registers (DLL and DLH) set to zero, the baud clock is disabled and no serial communications occur. Also, once the DLL is set, at least 8 clock cycles of the slowest HSUART clock should be allowed to pass before transmitting or receiving data.</p> |

## 27.6.2 Divisor Latch (High)/ Interrupt Enable Register. (IER\_DLH)—Offset 4h

Register bits [7:0] is used for different purposes depending on the mode. DLH (Divisor Latch High) Upper 8-bits of a 16-bit, read/write, Divisor Latch register that contains the baud rate divisor for the UART. This register may be accessed only when the DLAB bit (LCR[7]) is set. The output baud rate is equal to the serial clock frequency divided by sixteen times the value of the baud rate divisor, as follows:  $\text{baud rate} = (\text{serial clock freq}) / (16 * \text{divisor})$ . Note that with the Divisor Latch Registers (DLL and DLH) set to zero, the baud clock is disabled and no serial communications occur. Also, once the DLH is set, at least 8 clock cycles of the slowest HSUART clock should be allowed to pass before transmitting or receiving data.

### Access Method

## 27.6.4 Line Control Register (LCR)—Offset Ch

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:3] + 10h

**Default:** 00000000h

This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO.</p> <ul style="list-style-type: none"> <li>0 = no error in RX FIFO</li> <li>1 = error in RX FIFO</li> </ul> <p>This bit is cleared when the LSR is read, the character with the error is at the top of the receiver FIFO, and there are no subsequent errors in the FIFO. Reset Value: 0x0</p>                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 6         | 1h<br>RW         | <p><b>Transmitter Empty Bit (TEMT):</b> If FIFOs enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If in non-FIFO mode or FIFOs are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty. Reset Value: 0x1</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 5         | 1h<br>RW         | <p><b>Transmit Holding Register Empty Bit (THRE):</b> If THRE mode is disabled (IER[7] set to zero), this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If THRE mode is enabled and and FIFOs enabled (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting. Reset Value: 0x1</p>                                                                                                                                                                                                                                    |
| 4         | 0h<br>RW         | <p><b>Break Interrupt Bit (BI):</b> This is used to indicate the detection of a break sequence on the serial input data.</p> <p>If in UART mode it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits.</p> <p>In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit. In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read.</p>                                                                                                                                                                                                                                                                                                                                         |
| 3         | 0h<br>RW         | <p><b>Framing Error Bit (FE):</b> This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs, the UART tries to resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]).</p> <ul style="list-style-type: none"> <li>0 = no framing error</li> <li>1 = framing error</li> </ul> <p>Reading the LSR clears the FE bit. Reset Value: 0x0</p> |
| 2         | 0h<br>RW         | <p><b>Parity Error Bit (PE):</b> This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]).</p> <ul style="list-style-type: none"> <li>0 = no parity error</li> <li>1 = parity error</li> </ul> <p>Reading the LSR clears the PE bit. Reset Value: 0x0</p>                                                                                                                                                                                                                                                                                       |

| 7:0       | 0h RW            | <b>srbr_sthr0:</b> This is a shadow register for the RBR and has been allocated sixteen 32-bit locations to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an overrun error.<br>If FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO are preserved, but any incoming data are lost. An overrun error also occurs. Reset Value: 0x0 |

| 2         | 0h RW            | <b>XMIT FIFO Reset (XFR):</b> This is a shadow register for the XMIT FIFO Reset bit (FCR[2]). This can be used to remove the burden on software having to store previously written FCR values (which are pretty static) just to reset the transmit FIFO. This resets the control portion of the transmit FIFO and treats the FIFO as empty. This also de-asserts the DMA TX request and single signals when additional DMA handshaking signals are selected (DMA_EXTRA == YES). Note that this bit is 'self-clearing'. It is not necessary to clear this bit. Reset Value: 0x0 |
| 1         | 0h RW            | <b>RCVR FIFO Reset (RFR):</b> This is a shadow register for the RCVR FIFO Reset bit (FCR[1]). This can be used to remove the burden on software having to store previously written FCR values (which are pretty static) just to reset the receive FIFO. This resets the control portion of the receive FIFO and treats the FIFO as empty. This also de-asserts the DMA RX request and single signals when additional DMA handshaking signals are selected (DMA_EXTRA == YES). Note that this bit is 'self-clearing'. It is not necessary to clear this bit. Reset Value: 0x0   |
| 0         | 0h RW            | <b>UART Reset (UR):</b> This asynchronously resets the DW_apb_uart and synchronously removes the reset assertion. For a two clock implementation both pclk and sclk domains are reset. Reset Value: 0x0                                                                                                                                                                                                                                                                                                                                                                        |

### 27.6.32 Shadow Request to Send (SRTS)—Offset 8Ch

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 8Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:3] + 10h

**Default:** 00000000h

### 27.6.33 Shadow Break Control Register (SBCR)—Offset 90h

This is a shadow register for the Break bit (LCR[6]), this can be used to remove the burden of having to performing a read modify write on the LCR. This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 90h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:3] + 10h

**Default:** 00000000h

| 1:0       | 0h<br>RW         | <p><b>Shadow RCVR Trigger (srt):</b> This is a shadow register for the RCVR trigger bits (FCR[7:6]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the RCVR trigger bit gets updated. This is used to select the trigger level in the receiver FIFO at which the Received Data Available Interrupt is generated. It also determines when the dma_rx_req_n signal is asserted when DMA Mode (FCR[3]) = 1. The following trigger levels are supported:</p> <ul style="list-style-type: none"> <li>00 = 1 character in the FIFO</li> <li>01 = FIFO full</li> <li>10 = FIFO full</li> <li>11 = FIFO 2 less than full</li> </ul> <p>Reset Value: 0x0</p> |

### 27.6.37 Shadow TX Empty Trigger (STET)—Offset A0h

This is a shadow register for the TX empty trigger bits (FCR[5:4]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the TX empty trigger bit gets updated. This is used to select the empty threshold level at which the THRE Interrupts are generated when the mode is active. The following trigger levels are supported:

- 00 = FIFO empty
- 01 = 2 characters in the FIFO
- 10 = FIFO full
- 11 = FIFO full

Reset Value: 0x0

## Access Method

## 27.6.41 UART Component Version (UCV)—Offset F8h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + F8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:3] + 10h

**Default:** 3330382Ah

## 27.6.46 UART\_BYTE\_COUNT—Offset 818h

Transaction counter

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 818h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:3] + 10h

**Default:** 00000000h

#### 27.6.47 UART\_OVERFLOW\_INTR\_STAT—Offset 820h

**BAR Reference:** [B:0, D:30, F:3] + 10h

[illegible]

Intel Atom<sup>®</sup> Processor E3800 Product Family  
Datasheet  
4245

## 27.7 PCU PMC Memory Mapped I/O Registers

**Table 284. Summary of PCU iLB PMC Memory Mapped I/O Registers—  
PMC\_BASE\_ADDRESS**

| Offset | Size | Register ID—Description                                                            | Default Value |
|--------|------|------------------------------------------------------------------------------------|---------------|
| 0h     | 4    | "PRSTS - Power and Reset Status (PRSTS)—Offset 0h" on page 4247                    | 00000000h     |
| 8h     | 4    | "PM_CFG - Power Management Configuration (PMC_CFG)—Offset 8h" on page 4248         | 00000000h     |
| Ch     | 4    | "VLV_PM_STS - VLV Power Management Status (VLV_PM_STS)—Offset Ch" on page 4249     | 00000000h     |
| 10h    | 4    | "MTPMC - Message to PMC (MTPMC)—Offset 10h" on page 4251                           | 00000000h     |
| 20h    | 4    | "General PM Configuration 1 (GEN_PMCON1)—Offset 20h" on page 4251                  | 00004004h     |
| 24h    | 4    | "General PM Configuration 2 (GEN_PMCON2)—Offset 24h" on page 4254                  | 00000000h     |

| 23        | 0b<br>RW         | <b>DRAM Initialization Scratchpad Bit (DISB) (disb):</b> This bit does not effect hardware functionality in any way. It is provided as a scratchpad bit that is maintained through main power well resets and CF9h-initiated resets. BIOS is expected to set this bit prior to starting the DRAM initialization sequence and to clear this bit after completing the DRAM initialization sequence. BIOS can detect that a DRAM initialization sequence was interrupted by a reset by reading this bit during the boot sequence. If the bit is 1, then the DRAM initialization was interrupted. This bit is reset by the assertion of the RSMRST_B pin.                                                                                                                  |
| 22        | 0b<br>RO         | <b>RSVDO:</b> Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 21        | 0b<br>RO         | <b>Memory Placed in Self-Refresh (MEM_SR) (mem_sr):</b> This bit will be set to 1 if DRAM should have remained powered and held in Self-Refresh through the last power state transition (i.e. the last time the system left S0). The scenarios where this should be the case are: - successful S3 entry and exit - successful Host partition reset without power cycle This bit will be cleared whenever the SOC begins a transition out of S0. Note: This bit should not be consulted upon wake from S1, as that state does not involve the same type of handshake or placing memory into Self-Refresh. It is assumed that software is already aware that memory context is not impacted by S1 and therefore does not need to check this bit. reset_type=global reset |
| 20        | 0b<br>RW         | <b>System Reset Status (SRS) (srs):</b> SOC sets this bit when the PMU_RESETBUTTON_B# button is pressed. BIOS is expected to read this bit and clear it if it is set. This bit is also reset by RSMRST_B and CF9h resets. reset_type=Resume Well Reset#                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 19        | 0b<br>RW         | <b>CPU Thermal Trip Status (CTS) (cts):</b> This bit is set when the SOC thermal trip active while the system is in a valid state to honor the pin. This bit is also reset by RSMRST_B and CF9h resets. It is not reset by the shutdown and reboot associated with the thermal trip event. reset_type=Resume Well Reset#                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 18        | 0b<br>RW         | <b>Minimum PMU_SLP_S4_B Assertion Width Violation Status (MS4V) (ms4v):</b> Hardware sets this bit when the PMU_SLP_S4_B assertion width is less than the time programmed in the PMU_SLP_S4_B Minimum Assertion Width field. The SOC begins the timer when PMU_SLP_S4_B pin is asserted during S4/S5 entry, or when the RSMRST_B input is deasserted during SUS well power-up. The status bit is cleared by software writing a 1 to the bit. Note that this bit is functional regardless of the value in the PMU_SLP_S4_B Assertion Stretch Enable and the Disable-SLP_X-Stretching-After-SUS-Power-Failure bits. This bit is reset by the assertion of the RSMRST_B pin, but can be set in some cases before the default value is readable. reset_type=RSMRST_B       |
| 17        | 0b<br>RO         | <b>reserved3:</b> Reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 16        | 0b<br>RW         | <b>COREPWROK Failure (PWR_FLR) (pwr_flr):</b> Intel SOC sets this bit any time COREPWROK goes low if the system was in an S0 or S1 state. The bit will be cleared only by software writing a 1 back to the bit or by SUS well power loss. reset_type=global reset                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 15        | 0b<br>RW         | <b>PME B0 S5 Disable (PME_B0_S5_DIS) (pme_b0_s5_dis):</b> When set to '1', this bit blocks wake events from PME_B0_STS in S5, regardless of the state of PME_B0_EN. When cleared (default), wake events from PME_B0_STS are allowed in S5 if PME_B0_EN = '1'. Wakes from power states other than S5 are not affected by this policy bit. The net effect of setting PME_B0_S5_DIS = '1' is described by the truth table below: Y = Wake N = Don't wake B0 = PME_B0_EN OV = WOL Enable Override B0/OV   S1/S3/S4   S5 00   N   N 01   N   Y (LAN only) 11   Y (all PME B0 sources)   Y (LAN only) 10   Y (all PME B0 sources)   N This bit is cleared by the SRTCST_B pin. reset_type=SRTCST_B                                                                           |
| 14        | 1b<br>RW         | <b>SUS Well Power Failure (SUS_PWR_FLR) (sus_pwr_flr):</b> This bit is set to '1' whenever SUS well power is lost, as indicated by RSMRST_B assertion. Software writes a 1 to this bit to clear it. This bit is in the SUS well, and defaults to '1' based on RSMRST_B assertion (not cleared by any type of reset). Implementation Note: RSMRST_B is an asynchronous set term to this bit. reset_type=RSMRST_B                                                                                                                                                                                                                                                                                                                                                        |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 13        | 0b<br>RW         | <b>WOL Enable Override (WOL_EN_OVRD) (wol_en_ovrd):</b> When this bit is set to 1, the integrated LAN is enabled to wake the system from S5 regardless of the value in the PME_B0_EN bit in the GPE0a_EN register. This allows the system BIOS to enable Wake-On-LAN regardless of the policies selected through the operating system. This bit is maintained in the RTC power well, therefore permitting WOL following a surprise power failure even in cases in which the system may have been running in S0 without the PME Enables set. (Note that the LAN NVRAM configuration must support WOL after SUS power loss.) When this bit is cleared to 0, the wake-on-LAN policies are determined by OS-visible bits. This bit has no effect on wakes from S1, S3, or S4. This bit is cleared by the SRTCST_B pin reset_type=SRTCST_B                                                                                                                                                                                                                                                                                                                                           |
| 12        | 0b<br>RW         | <b>Disable SLP_X Stretching After SUS Well Power Up (DIS_SLP_X_STRCH_SUS_UP) (dis_slp_x_strch_sus_up):</b> When this bit is set to 1, all SLP_* pin stretching is disabled when powering up after a SUS well power loss. When this bit is left at 0, SLP_* stretching will be performed after SUS power failure as enabled in various other fields. Note that if this bit is a 0, SLP_* stretch timers start on SUS well power up (the SOC has no ability to count stretch time while the SUS well is powered down). Setting this bit can therefore prevent long delays after SUS power loss which may be common in mobile platforms and in manufacturing flow testing, while still allowing for the full power cycling during S3, S4 and S5 states. If the platform guarantees minimum SUS power down residence in other ways, an additional SOC-induced delay is not needed or wanted. This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. This bit is cleared by the SRTCST_B pin.                                                                                                                                                           |
| 11:10     | 0b<br>RW         | <b>PMU_SLP_S3_B Minimum Assertion Width (SLP_S3_MIN_ASST_WDTH) (slp_s3_min_asst_wdth):</b> This 2-bit value indicates the minimum assertion width of the PMU_SLP_S3_B signal to guarantee that the Main power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: 00: 60 usec 01: 1 ms 10: 50 ms 11: 2 sec This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. This bit is cleared by the RSMRST_B pin. reset_type=RSMRST_B                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 9         | 0b<br>RW         | <b>General Reset Status (GEN_RST_STS) (gen_rst_sts):</b> This bit is set by hardware whenever PMU_PLTRST asserts for any reason other than going into a software-entered sleep state (via PM1_CNT.SLP_EN write). This bit is an optional tool to help BIOS determine when a reset might have collided with a wake from a valid sleep state. A possible usage model would be to consult and then write a '1' to clear this bit during the boot flow before determining what action to take based on reading PM1_STS.WAK_STS = '1'. If GEN_RST_STS = '1', the cold reset boot path could be followed rather than the resume path, regardless of the setting of WAK_STS. This bit does not affect SOC operation in any way, and can therefore be left set if BIOS chooses not to use it. This bit is set by global reset. reset_type=global reset                                                                                                                                                                                                                                                                                                                                  |
| 8         | 0b<br>RW         | <b>RTC_reserved (rtc_reserved):</b> reset_type=SRTCST_B                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Valid values are: 00 1.5ms +/- 0.6ms 01 16ms +/- 4ms 10 32ms +/- 4ms 11 64ms +/- 4ms These bits are not cleared by any type of reset except SRTCST_B.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 5:4       | 0b<br>RW         | <b>PMU_SLP_S4_B Minimum Assertion Width (S4MAW) (s4maw):</b> This 2-bit value indicates the minimum assertion width of the PMU_SLP_S4_B signal to guarantee that the DRAMs have been safely power-cycled. This value may be modified per platform depending on DRAM types, power supply capacitance, etc. Valid values are: - 11: 1 second - 10: 2 seconds - 01: 3 seconds - 00: 4 seconds This value is used in two ways: 1. If the PMU_SLP_S4_B assertion width is ever shorter than this time, a status bit is set for BIOS to read when S0 is entered 2. If enabled by bit 3 in this register, the hardware will prevent the PMU_SLP_S4_B signal from deasserting within this minimum time period after asserting. Note that the logic that measures this time is in the suspend power well. Therefore, when leaving a G3 state, the minimum time is measured from the deassertion of the internal suspend well reset (unless the Disable SLP_X Stretching After SUS Power Failure bit is set). This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. SRTCST_B forces this field to the conservative default state (00b). reset_type=SRTCST_B |

### 27.7.11 Function Disable 2 (FUNC\_DIS\_2)—Offset 38h

BIOS uses this register to disable specific function. Upon writing this register PMC will set the corresponding Function Disable bit in the PSF

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**FUNC\_DIS\_2:** [PMC\_BASE\_ADDRESS] + 38h

**PMC\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**PMC\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 44h

**Default:** 00000000h

### 27.7.12 S0ix wake enable (S0IX\_WAKE\_EN)—Offset 3Ch

This register contains wake enable bit per S0ix wake event. Note: Common wake events with sleep sates have their wake enables in the ACPI space.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**S0IX\_WAKE\_EN:** [PMC\_BASE\_ADDRESS] + 3Ch

**PMC\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**PMC\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 44h

**Default:** 00FFFFFFh

### 27.7.14 S0ix control (S0IX\_CTL)—Offset 44h

This register contains S0ix miscellaneous controls

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**S0IX\_CTL:** [PMC\_BASE\_ADDRESS] + 44h

**PMC\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**PMC\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 44h

**Default:** 00000050h

[illegible]

| Bit Range | Default & Access | Description                                                           |

### 27.7.15 ETR - Extended Test Mode Register (ETR)—Offset 48h

This register resides in the resume well. All bits except bit[23:16] are reset by internal Resume Well Reset. Bit[23:16] are reset by RSMRST\_B only.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ETR:** [PMC BASE ADDRESS] + 48h

**PMC\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**PMC BASE ADDRESS Reference:** [B:0, D:31, F:0] + 44h

**Default:** 00230000h

| 20        | 0b<br>RW         | <b>CF9h Global Reset (CF9GR) (cf9gr):</b> When this bit is set, a CF9h write of 6h or Eh will cause a Global Reset of the Host partition. If this bit is cleared, a CF9h write of 6h or Eh will only reset the Host partition. It is recommended that BIOS should set this bit early on in the boot sequence, and then clear it and set the CF9LOCK bit prior to loading the OS. When this bit is set, the hardware assumes that bit 18 (CF9h Without Resume Well Reset Enable) is cleared. This register is locked by the CF9 Lockdown (CF9LOCK) bit. This register is not reset by a CF9h reset. reset_type=RSMRST_B |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 18        | 0b<br>RW         | <b>CF9h Without Resume Well Reset Enable (CWORWRE) (cworwre):</b> When this bit is set, a CF9h write of 6h or Eh will not cause internal Resume Well Reset (WrsmrstB) to be asserted and thus resume well logic will maintain its state. When this bit is cleared, CF9h write of 6h or Eh will also reset resume well logic. This bit is to be used when a second reset through CF9 write is desired upon power up or after resume from low power states. This bit has to be set prior to the write to CF9 register and has to be cleared upon completing the reset. Failing to do so prevents resume well registers from being reset in the future CF9 writes. reset_type=RSMRST_B |

|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0      | 0b<br>RW         | <b>GPIO Rout (GPIO_ROUT) (gpio_rout):</b> Bits [15:0] determines GPIO SUS events rout. Bits [31:16] determines GPIO CORE events rout. Bits [1:0] determines GPIO SUS event 0. Bits [3:2] determines GPIO SUS event 1 and so on. Bits [17:16] determines GPIO CORE event 0. Bits [19:18] determines GPIO CORE event 1 and so on. If the corresponding GPIO is implemented and is set to an input, a '1' in the GP_LVL bit can be routed to cause an interrupt. If the GPIO is not set to an input, this field has no effect. * 00 No effect (or GPIO unimplemented), * 01 SMI# (if corresponding ALT_GPIO_SMI bit also set), * 10 SCI (if corresponding GPE0a_EN bit also set), * 11 Reserved If the system is in an S0-S5 state and if the GPE0a_EN bit is also set, then the GPIO can cause a Wake event, even if the GPIO is NOT routed to cause an interrupt. Exception: If the system is in S5 state due to a powerbutton override, then the GPIO's will not cause wake events. Note: Core well GPIO's are not capable of waking the system from sleep states where the core well is not powered. |

## 27.7.18 PLT\_CLK\_CTL\_0 - Platform Clock Control 0 (PLT\_CLK\_CTL\_0)—Offset 60h

This register controls Platform clocks.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PLT\_CLK\_CTL\_0:** [PMC\_BASE\_ADDRESS] + 60h

**PMC\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**PMC\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 44h

**Default:** 00000003h

| 7:0       | 0h<br>RW         | <p><b>rbr_thr_dll:</b> RBR[7:0] (Receive Buffer Register) (Read Only):<br/>Data byte received on the serial input port (sin) in UART mode. The data in this register is valid only if the Data Ready (DR) bit in the Line Status Register (LCR) is set.<br/>If FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it is overwritten, resulting in an over-run error.<br/>If FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO is preserved, but any incoming data are lost and an over-run error occurs.</p> <p><b>THR[7:0] (Transmit Holding Register) (Write Only):</b><br/>Data to be transmitted on the serial output port (sout) in UART mode. Data should only be written to the THR when the THR Empty (THRE) bit (LSR[5]) is set.<br/>If in non-FIFO mode or FIFOs are disabled (FCR[0] = 0) and THRE is set, writing a single character to the THR clears the THRE. Any additional writes to the THR before the THRE is set again causes the THR data to be overwritten.<br/>If in FIFO mode and FIFOs are enabled (FCR[0] = 1) and THRE is set, x number of characters of data may be written to the THR before the FIFO is full. The number x (default=16) is determined by the value of FIFO Depth that you set during configuration. Any attempt to write data when the FIFO is full results in the write data being lost.</p> <p><b>DLL[7:0] (Divisor Latch Low) (Read-Write):</b><br/>Lower 8 bits of a 16-bit, read/write, Divisor Latch register that contains the baud rate divisor for the UART. this register may be accessed only when the DLAB bit (LCR[7]) is set.<br/>The output baud rate is equal to the serial frequency divided by sixteen times the value of the baud rate divisor, as follows: baud rate = (serial clock freq) / (16 * divisor).<br/>Note that with the Divisor Latch Registers (DLL and DLH) set to zero, the baud clock is disabled and no serial communications occur. Also, once the DLL is set, at least 8 clock cycles of the slowest HSUART clock should be allowed to pass before transmitting or receiving data.</p> |

## 27.9.2 Divisor Latch (High)/ Interrupt Enable Register. (IER\_DLH)—Offset 4h

Register bits [7:0] is used for different purposes depending on the mode. DLH (Divisor Latch High) Upper 8-bits of a 16-bit, read/write, Divisor Latch register that contains the baud rate divisor for the UART. This register may be accessed only when the DLAB bit (LCR[7]) is set. The output baud rate is equal to the serial clock frequency divided by sixteen times the value of the baud rate divisor, as follows: baud rate = (serial clock freq) / (16 \* divisor). Note that with the Divisor Latch Registers (DLL and DLH) set to zero, the baud clock is disabled and no serial communications occur. Also, once the DLH is set, at least 8 clock cycles of the slowest HSUART clock should be allowed to pass before transmitting or receiving data.

### Access Method

| 4         | 0h<br>RW         | <b>LoopBack Bit (LoopBack):</b> This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. Reset Value: 0x0                                                                                                                                                                                                                                                                                                       |
| 3         | 0h<br>RW         | <b>Output2 (OUT2):</b> This is used to directly control the user-designated Output2 (out2_n) output. The value written to this location is inverted and driven out on out2_n, that is:<br><ul style="list-style-type: none"> <li>0 = out2_n de-asserted (logic 1)</li> <li>1 = out2_n asserted (logic 0)</li> </ul> Note that in Loopback mode (MCR[4] set to one), the out2_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0                                                                                                                                                                                                                                                                                                                                               |
| 2         | 0h<br>RW         | <b>Output1 (OUT1):</b> This is used to directly control the user-designated Output1 (out1_n) output. The value written to this location is inverted and driven out on out1_n, that is:<br><ul style="list-style-type: none"> <li>0 = out1_n de-asserted (logic 1)</li> <li>1 = out1_n asserted (logic 0)</li> </ul> Note that in Loopback mode (MCR[4] set to one), the out1_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0                                                                                                                                                                                                                                                                                                                                               |
| 1         | 0h<br>RW         | <b>Request to Send (RTS):</b> This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high. In Auto Flow Control, (MCR[5] set to one) and FIFOs enable (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal is de-asserted when MCR[1] is set low.<br>Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0 |
| 0         | 0h<br>RW         | <b>Data Terminal Ready (DTR):</b> This is used to directly control the Data Terminal Ready (dtr_n) output. The value written to this location is inverted and driven out on dtr_n, that is:<br><ul style="list-style-type: none"> <li>0 = dtr_n de-asserted (logic 1)</li> <li>1 = dtr_n asserted (logic 0)</li> </ul> The Data Terminal Ready output is used to inform the modem or data set that the UART is ready to establish communications. Note that in Loopback mode (MCR[4] set to one), the dtr_n output is held inactive high while the value of this location is internally looped back to an input. Reset Value: 0x0                                                                                                                                                                                                                  |

## 27.9.6 Line Status Register (LSR)—Offset 14h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 14h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:3] + 10h

**Default:** 00000060h

This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO.</p> <ul style="list-style-type: none"> <li>0 = no error in RX FIFO</li> <li>1 = error in RX FIFO</li> </ul> <p>This bit is cleared when the LSR is read, the character with the error is at the top of the receiver FIFO, and there are no subsequent errors in the FIFO. Reset Value: 0x0</p>                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 6         | 1h RW            | <p><b>Transmitter Empty Bit (TEMT):</b> If FIFOs enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If in non-FIFO mode or FIFOs are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty. Reset Value: 0x1</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 5         | 1h RW            | <p><b>Transmit Holding Register Empty Bit (THRE):</b> If THRE mode is disabled (IER[7] set to zero), this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If THRE mode is enabled and and FIFOs enabled (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting. Reset Value: 0x1</p>                                                                                                                                                                                                                                    |
| 4         | 0h RW            | <p><b>Break Interrupt Bit (BI):</b> This is used to indicate the detection of a break sequence on the serial input data.</p> <p>If in UART mode it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits.</p> <p>In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit. In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read.</p>                                                                                                                                                                                                                                                                                                                                         |
| 3         | 0h RW            | <p><b>Framing Error Bit (FE):</b> This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs, the UART tries to resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]).</p> <ul style="list-style-type: none"> <li>0 = no framing error</li> <li>1 = framing error</li> </ul> <p>Reading the LSR clears the FE bit. Reset Value: 0x0</p> |
| 2         | 0h RW            | <p><b>Parity Error Bit (PE):</b> This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]).</p> <ul style="list-style-type: none"> <li>0 = no parity error</li> <li>1 = parity error</li> </ul> <p>Reading the LSR clears the PE bit. Reset Value: 0x0</p>                                                                                                                                                                                                                                                                                       |

|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5         | 0h<br>RW         | <b>Data Set Ready (DSR):</b> This is used to indicate the current state of the modem control line dsr_n. This bit is the complement of dsr_n. When the Data Set Ready input (dsr_n) is asserted it is an indication that the modem or data set is ready to establish communications with the DW_apb_uart. <ul style="list-style-type: none"> <li>0 = dsr_n input is de-asserted (logic 1)</li> <li>1 = dsr_n input is asserted (logic 0)</li> </ul> In Loopback Mode (MCR[4] set to one), DSR is the same as MCR[0] (DTR). Reset Value: 0x0                                                                                                         |
| 4         | 0h<br>RW         | <b>Clear to Send (CTS):</b> This is used to indicate the current state of the modem control line cts_n. This bit is the complement of cts_n. When the Clear to Send input (cts_n) is asserted, it is an indication that the modem or data set is ready to exchange data with the DW_apb_uart. <ul style="list-style-type: none"> <li>0 = cts_n input is de-asserted (logic 1)</li> <li>1 = cts_n input is asserted (logic 0)</li> </ul> In Loopback Mode (MCR[4] = 1), CTS is the same as MCR[1] (RTS). Reset Value: 0x0                                                                                                                            |
| 3         | 0h<br>RW         | <b>Delta Data Carrier Detect (DDCD):</b> This is used to indicate that the modem control line dcd_n has changed since the last time the MSR was read. <ul style="list-style-type: none"> <li>0 = no change on dcd_n since last read of MSR</li> <li>1 = change on dcd_n since last read of MSR</li> </ul> Reading the MSR clears the DDCD bit. In Loopback Mode (MCR[4] = 1), DDCD reflects changes on MCR[3] (Out2). Note, if the DDCD bit is not set and the dcd_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDCD bit is set when the reset is removed if the dcd_n signal remains asserted. Reset Value: 0x0 |
| 2         | 0h<br>RW         | <b>Trailing Edge of Ring Indicator (TERI):</b> This is used to indicate that a change on the input ri_n (from an active-low to an inactive-high state) has occurred since the last time the MSR was read. <ul style="list-style-type: none"> <li>0 = no change on ri_n since last read of MSR</li> <li>1 = change on ri_n since last read of MSR</li> </ul> Reading the MSR clears the TERI bit. In Loopback Mode (MCR[4] = 1), TERI reflects when MCR[2] (Out1) has changed state from a high to a low. Reset Value: 0x0                                                                                                                           |
| 1         | 0h<br>RW         | <b>Delta Data Set Ready (DDSR):</b> This is used to indicate that the modem control line dsr_n has changed since the last time the MSR was read. <ul style="list-style-type: none"> <li>0 = no change on dsr_n since last read of MSR</li> <li>1 = change on dsr_n since last read of MSR</li> </ul> Reading the MSR clears the DDSR bit. In Loopback Mode (MCR[4] = 1), DDSR reflects changes on MCR[0] (DTR). Note, if the DDSR bit is not set and the dsr_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDSR bit is set when the reset is removed if the dsr_n signal remains asserted. Reset Value: 0x0       |
| 0         | 0h<br>RW         | <b>Delta Clear to Send (DCTS):</b> This is used to indicate that the modem control line cts_n has changed since the last time the MSR was read. <ul style="list-style-type: none"> <li>0 = no change on cts_n since last read of MSR</li> <li>1 = change on cts_n since last read of MSR</li> </ul> Reading the MSR clears the DCTS bit. In Loopback Mode (MCR[4] = 1), DCTS reflects changes on MCR[1] (RTS). Note that if the DCTS bit is not set, the cts_n signal is asserted (low) and a reset occurs (software or otherwise), then the DCTS bit is set when the reset is removed if the cts_n signal remains asserted. Reset Value: 0x0       |

## 27.9.8 Scratchpad Register (SCR)—Offset 1Ch

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 1Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:3] + 10h

**Default:** 00000000h

## 27.9.10 Shadow Receive Buffer Register and Shadow Transmit Holding Register 1 (SRBR\_STHR1)—Offset 34h

Refer to bit field description for SRBR\_STHR0.srbr\_sthr0.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 34h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:3] + 10h

**Default:** 00000000h

|       |    |    |    |    |    |   |            |   |

| 2         | 0h RW            | <b>XMIT FIFO Reset (XFR):</b> This is a shadow register for the XMIT FIFO Reset bit (FCR[2]). This can be used to remove the burden on software having to store previously written FCR values (which are pretty static) just to reset the transmit FIFO. This resets the control portion of the transmit FIFO and treats the FIFO as empty. This also de-asserts the DMA TX request and single signals when additional DMA handshaking signals are selected (DMA_EXTRA == YES). Note that this bit is 'self-clearing'. It is not necessary to clear this bit. Reset Value: 0x0 |
| 1         | 0h RW            | <b>RCVR FIFO Reset (RFR):</b> This is a shadow register for the RCVR FIFO Reset bit (FCR[1]). This can be used to remove the burden on software having to store previously written FCR values (which are pretty static) just to reset the receive FIFO. This resets the control portion of the receive FIFO and treats the FIFO as empty. This also de-asserts the DMA RX request and single signals when additional DMA handshaking signals are selected (DMA_EXTRA == YES). Note that this bit is 'self-clearing'. It is not necessary to clear this bit. Reset Value: 0x0   |
| 0         | 0h RW            | <b>UART Reset (UR):</b> This asynchronously resets the DW_apb_uart and synchronously removes the reset assertion. For a two clock implementation both pclk and sclk domains are reset. Reset Value: 0x0                                                                                                                                                                                                                                                                                                                                                                        |

### 27.9.32 Shadow Request to Send (SRTS)—Offset 8Ch

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 8Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:3] + 10h

**Default:** 00000000h

### 27.9.33 Shadow Break Control Register (SBCR)—Offset 90h

This is a shadow register for the Break bit (LCR[6]), this can be used to remove the burden of having to performing a read modify write on the LCR. This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 90h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:3] + 10h

**Default:** 00000000h

| 1:0       | 0h RW            | <p><b>Shadow RCVR Trigger (srt):</b> This is a shadow register for the RCVR trigger bits (FCR[7:6]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the RCVR trigger bit gets updated. This is used to select the trigger level in the receiver FIFO at which the Received Data Available Interrupt is generated. It also determines when the dma_rx_req_n signal is asserted when DMA Mode (FCR[3]) = 1. The following trigger levels are supported:</p> <ul style="list-style-type: none"> <li>00 = 1 character in the FIFO</li> <li>01 = FIFO full</li> <li>10 = FIFO full</li> <li>11 = FIFO 2 less than full</li> </ul> <p>Reset Value: 0x0</p> |

### 27.9.37 Shadow TX Empty Trigger (STET)—Offset A0h

This is a shadow register for the TX empty trigger bits (FCR[5:4]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the TX empty trigger bit gets updated. This is used to select the empty threshold level at which the THRE Interrupts are generated when the mode is active. The following trigger levels are supported:

- 00 = FIFO empty
- 01 = 2 characters in the FIFO
- 10 = FIFO full
- 11 = FIFO full

Reset Value: 0x0

## Access Method

## 27.9.43 Private Clock Params (PRV\_CLOCK\_PARAMS)—Offset 800h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 800h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:3] + 10h

**Default:** 00000000h

## 28 SIO – Pulse Width Modulation (PWM)

The Pulse Width Modulation block allows control the frequency and duty cycle of an output signal. The SoC has 2 instances of the PWM interface.

### 28.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

**Figure 128.PWM Signals**

| Signal Name | Direction<br>Plat. Power | Description                      |
|-------------|--------------------------|----------------------------------|
| SIO_PWM[0]  | O<br>V1P8S               | Pulse Width Modulation output 0. |
| SIO_PWM[1]  | O<br>V1P8S               | Pulse Width Modulation output 1. |

## 28.2 Features

The software controls the PWM block by updating the PWMCTRL register and setting the PWMCTRL.PWM\_SW\_UPDATE bit whenever a change in frequency or duty cycle of the PWM output signal is required. The PWM block applies the new settings at the start of the next output cycle and resets the PWMCTRL.PWM\_SW\_UPDATE bit. The SoC uses a 25 MHz base clock rate for the PWM counter. See [Figure 129](#) for PWM block diagram:

**Figure 129. PWM Block Diagram**

There are two controls of the PWM output:

- **Frequency** is controlled by the PWMCTRL.PWM\_BASE\_UNIT register. The PWMCTRL.PWM\_BASE\_UNIT value is added to the 16 bit PWM counter every base clock cycle. The counter roll-over/overflow marks the start of a new cycle and resets the counter to the value in PWMCTRL.PWM\_BASE\_UNIT.
- **Duty Cycle** is controlled by the PWMCTRL.PWM\_ON\_TIME\_DIVISOR setting (0 to 255). When the 16 bit PWM counter is less than PWM\_ON\_TIME\_DIVISOR \* 256, the PWM output is low (0). When the 16 bit PWM counter is equal to or greater than PWM\_ON\_TIME\_DIVISOR \* 256, the PWM output is high (1).

The PWM block is clocked by the 25 MHz oscillator clock. The output frequency can be estimated with the equation:

- Target frequency =  $25 \text{ MHz} / \text{CEILING}(65536/\text{PWM\_BASE\_UNIT})$   
Note that the larger the value of base\_unit, the larger the error that the PWM output frequency will have with respect to the equation above. For example any  $\text{Base\_unit\_value}/256 > 128$  will result in 12.5 MHz max frequency. Any value between 86 and 128 will result in 8.33 MHz output frequency. And accordingly the larger the base\_unit value the smaller duty cycle resolution. Maximum duty cycle resolution is 8 bits.

[Table 287](#) illustrates the output frequency and duty-cycle resolution for different settings of the base\_unit\_value (when using 25 MHz oscillator clock).

**Table 287. Example PWM Output Frequency and Resolution**

| Target Frequency | Base Unit Value Register | Base 25 MHz Cycle Count | Duty Cycle Resolution   |
|------------------|--------------------------|-------------------------|-------------------------|
| 12.5 MHz         | $\geq 128 * 256$         | 1                       | no resolution           |
| 1.07 MHz         | $11 * 256$               | 23                      | <8 bit resolution       |
| 488 kHz          | $5 * 256$                | 51                      | <8 bit resolution       |
| 97.6 kHz         | $1 * 256$                | 256                     | 8 resolution            |
| 48.4 kHz         | $0.5 * 256$              | 512                     | $\geq 8$ bit resolution |
| 0                | 0                        | 0                       | Flat 0 output           |

## 28.3 Use

### 28.3.1 PWM Programming Sequence

For first time activation, follow sequence:

1. Program the counter value PWMCTRL.PWM\_BASE\_UNIT and PWMCTRL.PWM\_ON\_TIME\_DIVISOR
2. Set the PWMCTRL.PWM\_SW\_UPDATE bit
3. Enable PWM output by setting the PWMCTRL.PWM\_ENABLE bit

For update on the fly, follow sequence:

1. Program the counter value PWMCTRL.PWM\_BASE\_UNIT and PWMCTRL.PWM\_ON\_TIME\_DIVISOR
2. Set the update bit PWMCTRL.PWM\_SW\_UPDATE

## 28.4 Register Map

Refer to [Chapter 3, “Register Access Methods”](#) and [Chapter 4, “Mapping Address Spaces”](#) for additional information.

## 29 Platform Controller Unit (PCU) Overview

The Platform Controller Unit (PCU) is a collection of HW blocks that are critical for implementing a Windows\* compatible platform. These HW blocks include:

- PCU – Power Management Controller (PMC)
- PCU – Serial Peripheral Interface (SPI)
  - For boot FW and system configuration data Flash storage
- PCU – Universal Asynchronous Receiver/Transmitter (UART)PCU – System Management Bus (SMBus)
- PCU – Intel® Legacy Block (iLB) Overview

The PCU also implements some high level configuration features for BIOS/EFI boot.

### 29.1 Features

The key features of the individual blocks are as follows:

- Universal Asynchronous Receiver/Transmitter (UART)
  - 16550 controller compliant
  - Reduced Signal Count: TX and RX only
  - COM1 interface
- Serial Peripheral Interface (SPI)
  - For one or two SPI Flash, of up to 16MB size each, only. No other SPI peripherals are supported.
  - Stores boot FW and system configuration data

- Supports frequencies of 20 MHz, 33MHz and 50MHz.
- Power Management Controller (PMC)
  - Controls many of the power management features present in the SoC.
- Intel Legacy Block (iLB)
  - Supports legacy PC platform features
  - Sub-blocks include LPC, GPIO, 8259 PIC, IO-APIC, 8254 timers, HPET timers and the RTC.

§

## 29.2 PCU iLB LPC Port 80h I/O Registers

## 30 PCU – Power Management Controller (PMC)

The Power Management Controller (PMC) controls many of the power management features present in the SoC.

### 30.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

**Table 290. PMC Signals (Sheet 1 of 3)**

| Signal Name          | Direction<br>Plat. Power | Description                                                                                                                                                                                                                                                                                                       |
|----------------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PMC_ACPRESENT</b> | I<br>V1P8A               | <b>AC Present:</b> This input pin indicates when the platform is plugged into AC power.                                                                                                                                                                                                                           |
| <b>PMC_BATLOW#</b>   | I<br>V1P8A               | <b>Battery Low:</b> An input from the battery to indicate that there is insufficient power to boot the system. Assertion will prevent wake from the S5 state. This signal can also be enabled to cause an SMI# when asserted.<br>In configurations without a battery, this signal should be tied high to V1P8_S5. |

Table 290. PMC Signals (Sheet 2 of 3)

| Signal Name    | Direction<br>Plat. Power | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PMC_CORE_PWROK | I<br>VRTC                | <p><b>Core Power OK:</b> When asserted, this signal is an indication to the SoC that all of its core power rails have been stable for 10 ms. It can be driven asynchronously. When it is negated, the SoC asserts PMC_PLTRST#.</p> <p><b>NOTE:</b> It is required that the power rails associated with PCI Express (typically the 3.3V, 5V, and 12V core well rails) have been valid for 99 ms prior to PMC_CORE_PWROK assertion in order to comply with the 100 ms <math>T_{PVPERL}</math> PCI Express 2.0 specification on PMC_PLTRST# deassertion.</p> <p><b>NOTE:</b> PMC_CORE_PWROK must not glitch, even if PMC_RSMRST# is low.</p> |
| PMC_PLTRST#    | O<br>V1P8A               | <p><b>Platform Reset:</b> The SoC asserts this signal to reset devices on the platform. The SoC asserts the signal during power-up and when software initiates a reset sequence through the Reset Control (RST_CNT) register when RST_CNT.sys_rst=1b.</p>                                                                                                                                                                                                                                                                                                                                                                                 |
| PMC_PWRBTN#    | I<br>V1P8A               | <p><b>Power Button:</b> The signal will cause SCI to indicate a system request to go to a sleep state. If the system is already in a sleep state, this signal will cause a wake event. If the signal is pressed for more than 4 seconds, this will cause an unconditional transition (power button override) to the S5 state. Override will occur even if the system is in the S3 &amp; S4 states. This signal has an internal pull-up resistor and has an internal ~16 ms de-bounce on the input.</p>                                                                                                                                    |
| PMC_RSMRST#    | I<br>VRTC                | <p><b>Resume Well Reset:</b> Used for resetting the resume well. An external RC circuit is required to guarantee that the resume well power is valid prior to this signal going high.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| PMC_RSTBTN#    | I<br>V1P8S               | <p><b>System Reset:</b> This signal forces an internal reset after being debounced (~16 ms).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| PMC_SLP_S3#    | O<br>V1P8A               | <p><b>S3 Sleep Control:</b> This signal is for power plane control. It can be used to control system power when it is in a S3 (Suspend To RAM), S4 (Suspend to Disk), or S5 (Soft Off) states.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| PMC_SLP_S4#    | O<br>V1P8A               | <p><b>S4 Sleep Control:</b> This signal is for power plane control. It can be used to control system power when it is in a S4 (Suspend to Disk) or S5 (Soft Off) state.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| PMC_SUS_STAT#  | O<br>V1P8A               | <p><b>Suspend Status:</b> This signal is asserted by the SoC to indicate that the system will be entering a low power state soon. This can be monitored by devices with memory that need to switch from normal refresh to suspend refresh mode. It can also be used by other peripherals as an indication that they should isolate their outputs that may be going to powered-off planes. <i>This signal is muxed and may be used by other functions.</i></p>                                                                                                                                                                             |

Table 290. PMC Signals (Sheet 3 of 3)

| Signal Name             | Direction<br>Plat. Power | Description                                                                                                                                                                                                                                                    |
|-------------------------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PMC_SUSCLK              | O<br>V1P8A               | <b>Suspend Clock:</b> This 32 kHz clock is an output of the RTC generator circuit for use by other chips for refresh clock.<br><i>This signal is muxed and may be used by other functions.</i>                                                                 |
| PMC_SUSPWRDNA<br>CK     | O<br>V1P8A               | <b>Suspend Power Down Acknowledge:</b> Asserted by the SoC on S0 to S4/5 transition when it does not require its Suspend well to be powered. This pin requires a pull-up to UNCORE_V1P8_G3.<br><i>This signal is muxed and may be used by other functions.</i> |
| PMC_WAKE_PCIE[3<br>:0]# | I<br>V1P8A               | <b>PCI Express* Port [3:0] Wake Event:</b> Sideband wake signal on PCI Express asserted by a component requesting wake up.<br><i>This signal is muxed and may be used by other functions.</i>                                                                  |
| PMC_PLT_CLK[5:0]        | O<br>V1P8S               | <b>Platform Clocks:</b> Configurable single ended clocks, configurable to 25 MHz.<br><i>This signal is muxed and may be used by other functions.</i>                                                                                                           |

## 30.2 Features

### 30.2.1 Sx-G3-Sx, Handling Power Failures

Depending on when the power failure occurs and how the system is designed, different transitions could occur due to a power failure.

The GEN\_PMCON1.AG3E bit provides the ability to program whether or not the system should boot once power returns after a power loss event. If the policy is to not boot, the system remains in an S5 state (unless previously in S4). There are only two possible events that will wake the system after a power failure.

- **PMC\_PWRBTN#:** PMC\_PWRBTN# is always enabled as a wake event. When RSMRST# is low (G3 state), the PM1\_STS\_EN.PWRBTN\_STS bit is reset. When the SoC exits G3 after power returns (PMC\_RSMRST# goes high), the PMC\_PWRBTN# signal is already high (because the suspend plane goes high before PMC\_RSMRST# goes high) and the PM1\_STS\_EN.PWRBTN\_STS bit is 0b.
- **RTC Alarm:** The PM1\_STS\_EN.RTC\_EN bit is in the RTC well and is preserved after a power loss. Like PM1\_STS\_EN.PWRBTN\_STS the PM1\_STS\_EN.RTC\_STS bit is cleared when PMC\_RSMRST# goes low.

The SoC monitors both PMC\_CORE\_PWROK and PMC\_RSMRST# to detect for power failures. If PMC\_CORE\_PWROK goes low, the GEN\_PMCON1.PWR\_FLR bit is set. If PMC\_RSMRST# goes low, GEN\_PMCON1.SUS\_PWR\_FLR is set.

**Table 291. Transitions Due to Power Failure**

| State at Power Failure | GEN_PMCON1.AG3E bit | Transition When Power Returns |
|------------------------|---------------------|-------------------------------|
| S0, S3                 | 1<br>0              | S5<br>S0                      |
| S4                     | 1<br>0              | S4<br>S0                      |
| S5                     | 1<br>0              | S5<br>S0                      |

### 30.2.2 Event Input Signals and Their Usage

The SoC has various input signals that trigger specific events. This section describes those signals and how they should be used.

### 30.2.3 PCI Express\* WAKE# Signal and PME Event Message

PCI Express ports can wake the platform from any sleep state (S3, S4, or S5) using the PMC\_WAKE\_PCIE[3:0]# pins.

**Note:** PMC\_WAKE\_PCIE[3:0]# functionality is disabled by setting PM1\_STS\_EN.PCIEXP\_WAKE\_DIS to 1b.

PCI Express ports have the ability to cause PME using messages. When a PME message is received, the SoC will set the GPE0a\_STS.PCI\_EXP\_STS bit.

#### 30.2.3.1 PMC\_PWRBTN# (Power Button)

The PMC\_PWRBTN# signal operates as a “Fixed Power Button” as described in the Advanced Configuration and Power Interface specification. The signal has a 16 ms debounce on the input. The state transition descriptions are included in [Table 292](#). Note that the transitions start as soon as the PMC\_PWRBTN# is pressed (but after the debounce logic), and does not depend on when the power button is released.

**Note:** During the time that the PMC\_SLP\_S4# signal is stretched for the minimum assertion width (if enabled), the power button is not a wake event. Refer to note below for more details.

Table 292. Transitions Due to Power Button

| Present State | Event                                                   | Transition/Action                                                    | Comment                                              |
|---------------|---------------------------------------------------------|----------------------------------------------------------------------|------------------------------------------------------|
| S0/Cx         | PMC_PWRBTN# goes low                                    | SCI generated (depending on PM1_CNT.SCI_EN and PM1_STS_EN.PWRBTN_EN) | Software typically initiates a Sleep state           |
| S3–S4/S5      | PMC_PWRBTN# goes low                                    | Wake Event. Transitions to S0 state                                  | Standard wakeup                                      |
| G3            | PMC_PWRBTN# pressed                                     | None                                                                 | No effect since no power<br>Not latched nor detected |
| S0,<br>S3–S4  | PMC_PWRBTN# held low for at least 4 consecutive seconds | Unconditional transition to S5 state                                 | No dependence on processor or any other subsystem    |

#### Power Button Override Function

If PMC\_PWRBTN# is observed active for at least four consecutive seconds, the state machine should unconditionally transition to the S5 state, regardless of present state (S0–S4), even if the PMC\_CORE\_PWROK is not active. In this case, the transition to the G2/S5 state should not depend on any particular response from the processor nor any similar dependency from any other subsystem.

The PMC\_PWRBTN# status is readable to check if the button is currently being pressed or has been released. The status is taken after the de-bounce, and is readable using the GEN\_PMC2.PWRBTN\_LVL bit.

**Note:** The 4-second PMC\_PWRBTN# assertion should only be used if a system lock-up has occurred. The 4-second timer starts counting when the SoC is in a S0 state. If the PMC\_PWRBTN# signal is asserted and held active when the system is in a suspend state (S3–S4), the assertion causes a wake event. Once the system has resumed to the S0 state, the 4-second timer starts.

**Note:** During the time that the SLP\_S4# signal is stretched for the minimum assertion width (if enabled by GEN\_PMC1.S4ASE), the power button is not a wake event. As a result, it is conceivable that the user will press and continue to hold the power button waiting for the system to awake. Since a 4-second press of the power button is already defined as an unconditional power down, the power button timer will be forced to inactive while the power-cycle timer is in progress. Once the power-cycle timer has expired, the power button awakes the system. Once the minimum PMC\_SLP\_S4# power cycle expires, the power button must be pressed for another 4 to 5 seconds to create the override condition to S5.

### 30.2.3.2 Sleep Button

The Advanced Configuration and Power Interface specification defines an optional sleep button. It differs from the power button in that it only is a request to go from S0 to S3–S4 (not S5). Also, in an S5 state, the power button can wake the system, but the sleep button cannot.

Although the SoC does not include a specific signal designated as a sleep button, one of the GPIO signals can be used to create a “Control Method” sleep button. See the Advanced Configuration and Power Interface specification for implementation details.

### 30.2.3.3 PME\_B0 (PCI Power Management Event Bus 0)

The GPE0a\_STS.PME\_B0\_STS bit exists to implement PME#-like functionality for any internal device on Bus 0 with PCI power management capabilities.

### 30.2.3.4 PMC\_RSTBTN# Signal

When the PMC\_RSTBTN# pin is detected as active after the 16 ms debounce logic, the SoC attempts to perform a “graceful” reset, by waiting for the relevant internal devices to signal their idleness. If all devices are idle when the pin is detected active, the reset occurs immediately; otherwise, a counter starts. If at any point during the count all devices go idle the reset occurs. If the counter expires and any device is still active, a reset is forced upon the system even though activity is still occurring.

Once the reset is asserted, it remains asserted for 5 to 6 ms regardless of whether the PMC\_RSTBTN# input remains asserted or not. It cannot occur again until PMC\_RSTBTN# has been detected inactive after the debounce logic, and the system is back to a full S0 state with PMC\_PLTRST# inactive. Note that if RST\_CNT.FULL\_RST is set then PMC\_RSTBTN# will result in a Host Reset with Power Cycle.

## 30.2.4 System Power Planes

The system has several independent power planes, as described in [Table 293](#). Note that when a particular power plane is shut off, it should go to a 0 V level.

**Table 293. System Power Planes (Sheet 1 of 2)**

| Plane | Controlled By | Description                                                                                                                                                                                                                                                                                                                                                                          |
|-------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPU   | PMC_SLP_S3#   | The SLP_S3# signal can be used to cut the CORE_VCC_S3 rail completely.                                                                                                                                                                                                                                                                                                               |
| Main  | PMC_SLP_S3#   | When SLP_S3# goes active, power can be shut off to any circuit not required to wake the system from the S3 state. Since the S3 state requires that the memory context be preserved, power must be retained to the main memory. Devices on LPC bus, PCI-Express, and SATA will typically be shut when the Main power plane is shut, although they may have small subsections powered. |

Table 293. System Power Planes (Sheet 2 of 2)

| Plane              | Controlled By           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Devices and Memory | PMC_SLP_S4#             | When PMC_SLP_S4# goes active, power can be shut off to any circuit not required to wake the system from the S4/S5. Since the memory context does not need to be preserved in the S4/S5 state, the power to the memory can also be shut down. S4 and S5 requests are treated the same so no PMC_SLP_S5# signal is implemented.                                                                                                                                          |
| Devices            | Implementation Specific | Individual subsystems may have their own power plane. For example, GPIO signals may be used to control the power to disk drives, audio amplifiers, or the display screen.                                                                                                                                                                                                                                                                                              |
| Suspend            | PMC_SUSPWRDNACK         | The suspend power planes are generally left on whenever the system has a charged main battery or is plugged in to AC power, even in S4/S5.<br>In some cases, it may be preferable to disable the suspend power planes in S4/S5 states to save additional power. This requires some external logic (such as an embedded controller) to decide on the appropriate power plane control actions and ensure that a wake event is still possible (such as the power button). |

#### 30.2.4.1 Power Plane Control with PMC\_SLP\_S3#, PMC\_SLP\_S4#

The PMC\_SLP\_S3# output signal can be used to cut power to the system core supply, since it only goes active for the Suspend-to-RAM state (typically mapped to ACPI S3). Power must be maintained to the SoC suspend well, and to any other circuits that need to generate wake signals from the Suspend-to-RAM state. During S3 (Suspend-to-RAM) all signals attached to powered down plans will be tri-stated or driven low, unless they are pulled using a pull-up resistor. Cutting power to the core may be done using the power supply, or by external FETs on the motherboard.

The PMC\_SLP\_S4# output signal can be used to cut power to the system core supply, as well as power to the system memory, since the context of the system is saved on the disk. Cutting power to the memory may be done using the power supply, or by external FETs on the motherboard.

#### 30.2.4.2 PMC\_SLP\_S4# and Suspend-To-RAM Sequencing

The PMC\_SLP\_S4# signal should be used to remove power to system memory. The PMC\_SLP\_S4# logic in the SoC provides a mechanism to fully cycle the power to the DRAM and/or detect if the power is not cycled for a minimum time.

**Note:** To use the minimum DRAM power-down feature that is enabled by the GEN\_PMCON1.S4ASE bit, the DRAM power must be controlled by the PMC\_SLP\_S4# signal.

### 30.2.4.3 PMC\_CORE\_PWROK Signal

When asserted, PMC\_CORE\_PWROK is an indication to the SoC that its core well power rails are powered and stable. PMC\_CORE\_PWROK can be driven asynchronously. When PMC\_CORE\_PWROK is low, the SoC asynchronously asserts PMC\_PLTRST#. PMC\_CORE\_PWROK must not glitch, even if PMC\_RSMRST# is low.

It is required that the power rails associated with PCI Express have been valid for 99 ms prior to PWROK assertion in order to comply with the 100 ms  $T_{PVPERL}$  PCI Express 2.0 specification on PMC\_PLTRST# deassertion.

**Note:** PMC\_RSTBTN# is recommended for implementing the system reset button. This saves external logic that is needed if the PMC\_CORE\_PWROK input is used. Additionally, it allows for better handling of the processor resets and avoids improperly reporting power failures.

### 30.2.4.4 PMC\_BATLOW# (Battery Low)

The PMC\_BATLOW# input can inhibit waking from S3, S4, and S5 states if there is not sufficient power. It also causes an SMI if the system is already in an S0 state.

## 30.2.5 SMI#/SCI Generation

Upon any enabled SMI event taking place while the SMI\_EN.EOS bit is set, the SoC will clear the EOS bit and assert SMI to the CPU core, which will cause it to enter SMM space. SMI assertion is performed using a Virtual Legacy Wire (VLW) message. Prior system generations (those based upon legacy processors) used an actual SMI# pin.

Once the SMI message has been delivered, the SoC takes no action on behalf of active SMI events until Host software sets the End of SMI (EOS) bit. At that point, if any SMI events are still active, the SoC will send another SMI message.

The SCI is a level-mode interrupt that is typically handled by an ACPI-aware operating system. In non-APIC systems (which is the default), the SCI IRQ is routed to one of the 8259 interrupts (IRQ 9, 10, or 11). The 8259 interrupt controller must be programmed to level mode for that interrupt.

In systems using the APIC, the SCI can be routed to interrupts IRQs[11:9] or IRQs[23:20]. The interrupt polarity changes depending on whether it is on an interrupt shareable with a PIRQ or not. The interrupt remains asserted until all SCI sources are removed.

Table 294 shows which events can cause an SMI and SCI. Note that some events can be programmed to cause either an SMI or SCI. The usage of the event for SCI (instead of SMI) is typically associated with an ACPI-based system. Each SMI or SCI source has a corresponding enable and status bit.

**Table 294. Causes of SMI and SCI (Sheet 1 of 3)**

| Event                                              | Status Indication <sup>1</sup>                                                                  | Enable Condition                                                                                                            | Interrupt Result         |                       |                          |                       |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|--------------------------|-----------------------|--------------------------|-----------------------|

**NOTES:**

- Most of the status bits (except otherwise is noted) are set according to event occurrence regardless to the enable bit.
- GPIO status bits are set only if enable criteria is true. GPIO\_ROUT[n]=10b & GPE0a\_EN.x\_GPIO\_EN[n] for GPE0a\_STS.x\_GPIO\_STS[n] (SCI). GPIO\_ROUT[n]=01b & ALT\_GPIO\_SMI.x\_GPIO\_SMI\_EN[n]=1b for ALT\_GPIO\_SMI.x\_GPIO\_SMI\_STS[n] (SMI).
- When power button override occurs, the system will transition immediately to S5. The SCI will only occur after the next wake to S0 if the residual status bit (PM1\_STS\_EN.PWRBTNOR\_STS) is not cleared prior to setting PM1\_CNT.SCI\_EN.
- PM1\_STS\_EN.GBL\_STS being set will cause an SCI, even if the PM1\_CNT.SCI\_EN bit is not set. Software must take great care not to set the SMI\_ENBIOS\_RLS bit (which causes PM1\_STS\_EN.GBL\_STS to be set) if the SCI handler is not in place.
- No enable bits for these SCI/SMI messages in the PMC. Enable capability should be implemented in the source unit.
- Sync SMI has the same message opcode toward T-Unit. Special treatment regarding this Sync SMI is holding completion to host till SYNC\_SMI\_ACK message is received from T-Unit.
- Sync SMI has the same message opcode toward T-Unit. Special treatment regarding this Sync SMI is holding the SSMI\_ACK message to iLB till SYNC\_SMI\_ACK message is received from T-Unit.
- The G-Unit is an internal functional sub-block which forms part of the graphics functional block.
- The GPE0a\_STS.CORE\_GPIO\_STS[31:24] & GPE0a\_EN.CORE\_GPIO\_EN[31:24] register bits correspond to GPIO\_S0\_SC[7:0]. GPE0a\_STS.SUS\_GPIO\_STS[23:16] & GPE0a\_EN.SUS\_GPIO\_EN[23:16] correspond to GPIO\_S5[7:0].
- The ALT\_GPIO\_SMI.CORE\_GPIO\_SMI\_STS[31:24] & ALT\_GPIO\_SMI.CORE\_GPIO\_SMI\_EN[15:8] register bits correspond to GPIO\_S0\_SC[7:0]. ALT\_GPIO\_SMI.SUS\_GPIO\_SMI\_STS[23:16] & ALT\_GPIO\_SMI.SUS\_GPIO\_SMI\_EN[7:0] correspond to GPIO\_S5[7:0].

### 30.2.6 Platform Clock Support

The SoC supports up to 6 clocks (PMC\_PLT\_CLK[5:0]) with a frequency of either 19.2 MHz or 25 MHz. These clocks are available for general system use, where appropriate and each have Control & Frequency register fields associated with them.

**Note:** Intel recommends 25 MHz. 19.2 MHz is not validated.

### 30.2.7 INIT# (Initialization) Generation

The INIT# functionality is implemented as a 'virtual wire' internal to the SoC rather than a discrete signal. This virtual wire is asserted based on any one of the events described in below table. When any of these events occur, INIT# is asserted for 16 PCI clocks and then driven high.

INIT#, when asserted, resets integer registers inside the CPU cores without affecting its internal caches or floating-point registers. The cores then begin execution at the power on Reset vector configured during power on configuration.

**Table 295. INIT# Assertion Causes**

| Cause                                                              | Comment |
|--------------------------------------------------------------------|---------|
| PORT92.INIT_NOW transitions from 0b to 1b.                         |         |
| RST_CNT.SYS_RST = 0b and RST_CNT.RST_CPU transitions from 0b to 1b |         |

## 30.3 USB Per-Port Register Write Control

The PMC contains the UPRWC.USB\_PER\_PORT\_WE (USB Per-Port Registers Write Enable) bit. When this bit is written from 0b to 1b, the UPRWC.WE\_STS (Write Enable Status) bit is asserted. This transaction initiates sync-SMI if the UPRWC.WE\_SMIEN (Write Enable SMI Enable) bit and the SMI\_EN.USB\_IS\_SMI\_EN (USB Intel Specific SMI Enable) bit are set to 1b.

## 30.6 PCU PMC IO Registers

**Table 296. Summary of PCI iLB PMC I/O Registers**

| Offset | Size | Register ID—Description                                              | Default Value |
|--------|------|----------------------------------------------------------------------|---------------|
| 92h    | 1    | "PORT92: Init Register (PORT92)—Offset 92h" on page 4356             | 00h           |
| B2h    | 1    | "APM Register (APM)—Offset B2h" on page 4357                         | 00h           |
| B3h    | 1    | "APM_STS Register (APM_STS)—Offset B3h" on page 4357                 | 00h           |
| CF9h   | 1    | "RST_CNT: Reset Control Register (RST_CNT)—Offset CF9h" on page 4358 | 00h           |

### 30.6.1 PORT92: Init Register (PORT92)—Offset 92h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**PORT92:** 92h

**Default:** 00h

|          |   |              |
|----------|---|--------------|
| 7        | 4 | 0            |
| 0        | 0 | 0            |
| reserved |   | alt_a20_gate |
|          |   | init_now     |

| Bit Range | Default & Access | Description                                                                                                             |
|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------|
| 7:2       | 0b<br>RO         | <b>reserved:</b> Reserved.                                                                                              |
| 1         | 0b<br>RW         | <b>ALT_A20_GATE - Alternate A20 Gate (alt_a20_gate):</b> Legacy bit - kept just in case DOS expects it to be read/write |
| 0         | 0b<br>RW         | <b>INIT_NOW (init_now):</b> When this bit transitions from a 0 to a 1, PMC will sent an INIT# VLW to T-Unit             |

### 30.6.2 APM Register (APM)—Offset B2h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**APM:** B2h

**Default:** 00h

|         |   |   |   |   |   |   |   |   |   |
|---------|---|---|---|---|---|---|---|---|---|
| 7       |   |   |   | 4 |   |   |   |   | 0 |
| 0       | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| apm_reg |   |   |   |   |   |   |   |   |   |

| Bit Range | Default & Access | Description                        |
|-----------|------------------|------------------------------------|
| 7:0       | 0b<br>RW         | <b>APM_Register (apm_reg):</b> TBD |

### 30.6.3 APM\_STS Register (APM\_STS)—Offset B3h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**APM\_STS:** B3h

**Default:** 00h

|         |   |   |   |   |   |   |   |   |   |
|---------|---|---|---|---|---|---|---|---|---|
| 7       |   |   |   | 4 |   |   |   |   | 0 |
| 0       | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| apm_sts |   |   |   |   |   |   |   |   |   |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                 |
|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7:0       | 0b<br>RW         | <b>APM_STS (apm_sts):</b> Advanced Power Managment Status Port. used to pass data between the OS and the SMI handler. Basically, this is scratchpad register and is not effected by any other register or function (other than a PCI reset) |

### 30.6.4 RST\_CNT: Reset Control Register (RST\_CNT)—Offset CF9h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**RST\_CNT:** CF9h

**Default:** 00h

|          |  |   |  |   |          |         |         |           |   |
|----------|--|---|--|---|----------|---------|---------|-----------|---|
| 7        |  |   |  | 4 |          |         |         |           | 0 |
| 0        |  | 0 |  | 0 |          | 0       |         | 0         | 0 |
| reserved |  |   |  |   | full_rst | rst_cpu | sys_rst | reserved1 |   |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7:4       | 0b<br>RO         | <b>reserved:</b> Reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 3         | 0b<br>RW         | <b>Full Reset (FULL_RST) (full_rst):</b> When this bit is set to 1 and bit 1 is set to 1 (indicating Hard Reset, not Soft Reset), and the RST_CPU bit (bit 2) is written from 0 to 1, the PMC will do a full reset, including driving PMU_SLP_S3_B and PMU_SLP_S4_B active (low) for at least 3 (and no more than 5) seconds. When this bit is set, it also causes the full power cycle (PMU_SLP_S3/4_B assertion) in response to PMU_RESETBUTTON_B, COREPWROK, and Watchdog timer reset sources. |
| 2         | 0b<br>RW         | <b>Reset CPU (RST_CPU) (rst_cpu):</b> This bit will cause either a hard or soft reset to the CPU depending on the state of the SYS_RST bit (bit 1 in this same register). The software will cause the reset by setting bit 2 from a 0 to a 1.                                                                                                                                                                                                                                                     |
| 1         | 0b<br>RW         | <b>System Reset (SYS_RST) (sys_rst):</b> This bit determines the type of reset caused via RST_CPU (bit 2 of this register). If SYS_RST is 0 when RST_CPU goes from 0 to 1, then the PMC will force INIT# active for 16 PCI clocks. If SYS_RST is 1 when RST_CPU goes from 0 to 1, then the PMC will force PCI reset active for about 1 ms, however the PMU_SLP_S3_B and PMU_SLP_S4_B signals assertion is dependent on the value of the FULL_RST (bit3 of this register).                         |
| 0         | 0b<br>RO         | <b>reserved1:</b> Reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 15        | 0b<br>RW         | <b>Wake Status (WAK_STS) (wak_sts):</b> This bit is set when the system is in one of the Sleep states (via the SLP_EN bit) and an enabled Wake event occurs. Upon setting this bit, the PMC will transition the system to the ON state. This bit can only be set by hardware and can only be cleared by writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by RSMRST_B. If a power failure occurs (such as removed batteries) without the SLP_EN bit set, the WAK_STS bit will not be set when the power returns if the AFTER_G3 bit is 0. If the AFTER_G3 bit is 1, then the WAK_STS bit will be set after waking from a power failure. If necessary, the BIOS can clear the WAK_STS bit in this case This is based on discussions with Microsoft. That behavior is not in the ACPI spec. reset_type=RSMRST_B |

| 14        | 0b<br>RW         | <b>PCI Express Wake Status (PCIEXP_WAKE_STS) (pciexp_wake_sts):</b> This bit is set by hardware to indicate that the system woke due to a PCI Express wakeup event. This event can be caused by the PCI Express WAKE# pins (PMU_WAKE_B, PCI_WAKE1_B, PCI_WAKE2_B, PCI_WAKE3_B) being active, or one or more of the PCI Express ports being in beacon state, or receipt of a PCI Express PME message at root port. This bit should only be set when one of these events causes the system to transition from a non-S0 system power state to the S0 system power state. This bit is set independent of the PCIEXP_WAKE_DIS bit. Software writes a 1 to clear this bit. If one of the WAKE# pins is still active during the write or one or more PCI Express ports is in the beacon state or PME message received indication is not cleared in the root port, then the bit will remain Power Management active (i.e. all inputs to this bit are level sensitive) Note: This bit does not itself cause a wake event or prevent entry to a sleeping state. Thus if the bit is 1 and the system is put into a sleeping state, the system will not automatically wake. reset_type=pmc_global_rst_b |
| 13        | 0b<br>RW         | <b>USB clockless Wake Status (USB_CLKLESS_STS) (usb_clkless_sts):</b> This bit is set by hardware to indicate that the system woke due to change in USB serial lines. This bit is set independent of the USB_CLKLESS_EN bit. Software writes a 1 to clear this bit. reset_type=pmc_global_rst_b                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 11        | 0b<br>RW         | <b>Power Button Override (PWRBTNOR_STS) (pwrbtnor_sts):</b> This bit is set any time a Power Button Override Event occurs (i.e. the power button is pressed for at least 4 consecutive seconds), or due to an internal thermal sensor catastrophic condition. These events cause an unconditional transition to the S5 state. The BIOS or SCI handler clears this bit by writing a 1 to it. This bit is not affected by hard resets via CF9h writes, and is not reset by RSMRST_B. Thus, this bit is preserved through power failures. Note that this bit is still asserted when the global SCI_EN is set to '1' then an SCI will be generated. reset_type=SRTCST_B                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 10        | 0b<br>RW         | <b>RTC Status (RTC_STS) (rtc_sts):</b> This bit is set when the RTC generates an alarm (assertion of the IRQ8# signal), and is not affected by any other enable bit. See RTC_EN for the effect when RTC_STS goes active. This bit is only set by hardware and can only be reset by writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by RSMRST_B. reset_type=RSMRST_B                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 9         | 0b<br>RO         | <b>reserved1:</b> Reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 8         | 0b<br>RW         | <b>Power Button Status (PWRBTN_STS) (pwrbtn_sts):</b> This bit is set when the PMU_PWRBTN_B signal is asserted (low), independent of any other enable bit. See PWRBTN_EN for the effect when PWRBTN_STS goes active. PWRBTN_STS is always a wake event. This bit is only set by hardware and can be cleared by software writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by RSMRST_B. If the PMU_PWRBTN_B signal is held low for more than 4 seconds, the PMC clears the PWRBTN_STS bit, sets the PWRBTNOR_STS bit, the system transitions to the S5 state, and only PMU_PWRBTN_B is enabled as a wake event. If PWRBTN_STS bit is cleared by software while the PMU_PWRBTN_B pin is still held low, this will not cause the PWRBTN_STS bit to be set. The PMU_PWRBTN_B signal must go inactive and active again to set the PWRBTN_STS bit. Note that the CPU Thermal Trip and the Internal Thermal Sensors' Catastrophic Condition result in behavior matching the Powerbutton Override, which includes clearing this bit. reset_type=RSMRST_B                                                                              |
| 7:6       | 0b<br>RO         | <b>reserved2:</b> Reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 5         | 0b<br>RW         | <b>GBL Status (GBL_STS) (gbl_sts):</b> This bit is set when an SCI is generated due to the BIOS wanting the attention of the SCI handler. BIOS has a corresponding bit, BIOS_RLS, which will cause an SCI and set this bit. The SCI handler should then clear this bit by writing a 1 to it. This bit will not cause wake events or SMI#. This bit is not effected by SCI_EN. Note: GBL_STS being set will cause an SCI, even if the SCI_EN bit is not set. Software must take great care not to set the BIOS_RLS bit (which causes GBL_STS to be set) if the SCI handler is not in place. reset_type=PMU_PLTRST_B                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 23:0      | 0b<br>RO         | <b>Timer Value (TMR_VAL) (tmr_val):</b> This read-only field returns the running count of the PM timer. This counter runs off a 3.579545 MHz clock (derived from 14.31818 MHz divided by 4). It is reset (to 0) during a Platform reset, and then continues counting as long as the system is in the S0 state. Anytime bit 22 of the timer goes HIGH to LOW (bits referenced from 0 to 23), the TMROF_STS bit is set. The High-to-Low transition will occur every 2.3435 seconds. Writes to this register have no effect. |

### 30.7.4 GPE0a\_STS - General Purpose Event 0 Status (GPE0a\_STS)—Offset 20h

Note: This register is symmetrical to the General Purpose Event 0a Enable Register. Unless indicated otherwise below, if the corresponding \_EN bit is set, then when the STS bit get set, the PMC will generate a Wake Event. Once back in an S0 state (or if already in an S0 state when the event occurs), the PMC will also generate an SCI if the SCI\_EN bit is set, or an SMI# if the SCI\_EN bit is not set. CLARIFICATION: Bits 15:0 should not be reset by CF9 write. Bits 31:16 are reset by CF9h full resets. reset\_type=RSMRST\_B

#### Access Method

| 10        | 0b<br>RW         | <b>Battery Low Status (BATLOW_STS) (batlow_sts):</b> This bit will be set to 1 by hardware when the PMU_BATLOW_B signal goes low. Software clears the bit by writing a 1 to the bit position. In Desktop Mode, this bit will be treated as Reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 9         | 0b<br>RW         | <b>PCI Express Status (PCI_EXP_STS) (pci_exp_sts):</b> This bit will be set to 1 by hardware to indicate that: - The PME event message was received on one or more of the PCI-Express Ports Note: The PCI PMU_WAKE_B pin and the PCI-Express Beacons have no impact on this bit. Software attempts to clear this bit by writing a 1 to this bit position. If the bit is not cleared and the corresponding PCI_EXP_EN bit is set, the leveltriggered SCI will remain active. Note that a race condition exists where the PCI Express device sends another PME message because the PCI Express device was not serviced within the time when it must resend the message. This may result in a spurious interrupt, and this is comprehended and approved by the PCI Express specification. The window for this race condition is approximately 95-105 milliseconds. |
| 8         | 0b<br>RW         | <b>PCI Express Wake3 Status (PCIE_WAKE3_STS) (pcie_wake3_sts):</b> This bit is set by hardware to indicate that the PCI_WAKE3_B pin was asserted. ### 30.7.5 GPE0a\_EN - General Purpose Event 0 Enables (GPE0a\_EN)—Offset 28h

Note: This register is symmetrical to the General Purpose Event 0a Status Register.  
reset\_type=Resume Well Reset#

#### Access Method

**Type:** I/O Register  
(Size: 32 bits)

**GPE0a\_EN:** [ACPI\_BASE\_ADDRESS] + 28h

**ACPI\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ACPI\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 40h

**Default:** 00000000h

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7         | 0b<br>RW         | <b>BIOS_RLS (BIOS_RLS): (bios_rls):</b> Enables the generation of an SCI interrupt for ACPI software when a one is written to this bit position by BIOS software. This bit always reads a zero. NOTE: GBL_STS being set will cause an SCI, even if the SCI_EN bit is not set. Software must take great care not to set the BIOS_RLS bit (which causes GBL_STS to be set) if the SCI handler is not in place.                                                                   |
| 6         | 0b<br>RW         | <b>Software SMI Timer Enable (SWSMI_TMR_EN): (swsmi_tmr_en):</b> Software sets this bit to a 1 to start the Software SMI# Timer. When the timer expires (depending on the SWSMI_RATE_SEL bits), it will generate an SMI# and set the SWSMI_TMR_STS bit. The SWSMI_TMR_EN bit will remain at 1 until software sets it back to 0. Clearing the SWSMI_TMR_EN bit before the timer expires will reset the timer and the SMI# will not be generated. The default for this bit is 0. |
| 5         | 0b<br>RW         | <b>APMC_EN (apmc_en):</b> APMC Enable - If set, this enables writes to the APM register to cause an SMI#                                                                                                                                                                                                                                                                                                                                                                       |
| 4         | 0b<br>RW         | <b>SMI On Sleep Enable (SMI_ON_SLP_EN): (smi_on_slp_en):</b> If this bit is set, the PMC will generate an SMI# when a write access attempts to set the SLP_EN bit (in the PM1_CNT register). Furthermore, the PMC will not put the system to a sleep state. This allows the SMI# handler work around chip-level bugs. It is expected that the SMI# handler will turn off the SMI_ON_SLP_EN bit before actually setting the SLP_EN bit.                                         |
| 3         | 0b<br>RO         | <b>reserved4:</b> Reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 2         | 0b<br>RW         | <b>BIOS Enable (BIOS_EN): (bios_en):</b> Enables the generation of SMI# when ACPI software writes a 1 to the GBL_RLS bit. Note that if the BIOS_STS bit, which gets set when software writes a 1 to GBL_RLS bit, is already a 1 at the time that BIOS_EN becomes 1, an SMI# will be generated when BIOS_EN gets set.                                                                                                                                                           |
| 1         | 1b<br>RW         | <b>End of SMI (EOS): (eos):</b> SMI handler sets this bit when it finishes handling the SMI. Setting this bit will force the PMC internal SMI request to zero for 1 clock. Thus if the internal SMI request is still asserted due to new SMI trigger a new rising edge will happen, setting the interrupt to the PMC controller.                                                                                                                                               |
| 0         | 0b<br>RW         | <b>Global SMI Enable (GBL_SMI_EN): (gbl_smi_en):</b> When set, this bit enables the generation of SMIs in the system upon any enabled SMI event. This bit is reset by a PMU_PLTRST_B reset event. If this bit is not set, no SMI# will be generated. NOTE: When the SMI_LOCK bit is set, this bit cannot be changed.                                                                                                                                                           |

### 30.7.7 SMI\_STS - SMI Status Register (SMI\_STS)—Offset 34h

#### Access Method

**Type:** I/O Register  
(Size: 32 bits)

**SMI\_STS:** [ACPI\_BASE\_ADDRESS] + 34h

**ACPI\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ACPI\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 40h

**Default:** 00000000h

### 30.7.8 ALT\_GPIO\_SMI - Alternate GPIO SMI Status and Enable Register. (ALT\_GPIO\_SMI)—Offset 38h

reset\_type=Resume Well Reset#

#### Access Method

**Type:** I/O Register  
(Size: 32 bits)

**ALT\_GPIO\_SMI:** [ACPI\_BASE\_ADDRESS] + 38h

**ACPI\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ACPI\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 40h

**Default:** 00000000h

| 31:24     | 0b<br>RW         | <b>CORE GPIO SMI Status Setting (CORE_GPIO_SMI_STS): (core_gpio_smi_sts):</b> These bits report the status of the corresponding GPIO's. 1 = active, -0 = inactive. These bits are sticky. If the following conditions are true, then an SMI# will be generated: 1. The corresponding enable bit in this register is set 2. The corresponding GPIO must be routed in the GPIO_ROUT register to cause an SMI. 3. The corresponding GPIO must be implemented. Core GPIO pins are: SATA_GP0 (GPIO core 0) SATA_GP1 (GPIO core 1) SATA_LEDN (GPIO core 2) PCIE_CLKREQ0B (GPIO core 3) PCIE_CLKREQ1B (GPIO core 4) PCIE_CLKREQ2B (GPIO core 5) PCIE_CLKREQ3B (GPIO core 6) PCIE_CLKREQ4B (GPIO core 7) All bits are in the resume well. Default for these bits are dependent on the state of the GPIO pins. |

Once this bit is set to 1, it can not be cleared by software writing a 0 to this bit location. A core-well reset is required to change this bit from 1 to 0. This bit defaults to 0. |
| 11        | 0b<br>RW         | <b>TCO Timer Halt (TCO_TMR_HALT) (tco_tmr_halt):</b> 1 = The TCO timer will halt. It will not count, and thus cannot reach a value that would cause an SMI# or to cause the SECOND_TO_STS bit to be set. This will also prevent rebooting. 0 = The TCO timer is enabled to count. This is the default.                                          |

## 31 PCU – Serial Peripheral Interface (SPI)

The SoC implements a SPI controller as the interface for BIOS Flash storage. This SPI Flash device is also required to support firmware for the Trusted Execution Engine (required). The controller supports a maximum of two SPI Flash devices, using two chip select signals, with speeds of 20 MHz, 33 MHz or 50 MHz.

**Note:** The default interface speed is 20 MHz.

**Note:** SPI must operate in descriptor mode for correct operation of the SoC.

### 31.1 Signal Descriptions

Please see [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

**Table 298. SPI Signals**

| Signal Name    | Direction<br>Plat. Power | Description                                                                                                                                                       |

| PCU_SPI_CS[0]# | O<br>V1P8A               | <b>SPI Chip Select 0:</b> Used as the SPI bus request signal for the first SPI Flash device.                                                                      |
| PCU_SPI_CS[1]# | O<br>V1P8A               | <b>SPI Chip Select 1:</b> Used as the SPI bus request signal for the second SPI Flash devices.<br><i>This signal is muxed and may be used by other functions.</i> |
| PCU_SPI_MISO   | I<br>V1P8A               | <b>SPI Master IN Slave OUT:</b> Data input pin for the SoC.                                                                                                       |
| PCU_SPI_MOSI   | I/O<br>V1P8A             | <b>SPI Master OUT Slave IN:</b> Data output pin for the SoC. Operates as a second data input pin for the SoC when in Single Input, Dual Output Fast Read mode.    |

**Note:** All SPI signals are tri-stated with 20k ohm internal weak pull-up until PMC\_CORE\_PWROK is asserted.

## 31.2 Features

The SPI controller supports up to two SPI Flash devices using two separate chip select pins. Each SPI Flash device can be up to 16 MB. The SoC SPI interface supports 20 MHz, 33 MHz and 50 MHz SPI Flash devices. No other types of SPI devices are supported.

Communication on the SPI bus is done with a Master – Slave protocol. The Slave is connected to the SoC and is implemented as a tri-state bus.

**Note:** When GCS.BBS = 00b, LPC is selected as the location for BIOS. The SPI Flash may still contain data and firmware for other SoC functionality.

**Note:** When GCS.BBS = 11b and a SPI device is detected by the SoC, LPC based BIOS Flash is disabled.

### 31.2.1 Operation Mode Feature Overview

The SPI controller has two operational modes, Non-Descriptor and Descriptor.

#### 31.2.1.1 Non-Descriptor Mode

If no valid signature is read (either because there is no SPI Flash, or there is an SPI Flash with no valid descriptor), the Flash Controller will operate in a Non-Descriptor mode.

The following features are not supported in Non-Descriptor mode:

- Trusted Execution Engine
- Secure Boot
- Soft Straps
- Two SPI Flash device support
- Hardware sequencing access
- Descriptor-based security access restrictions

**Note:** When operating in Non-Descriptor mode, software sequencing must be used to access the Flash.

**Note:** When operating in Non-Descriptor Mode, and a SPI Flash is attached to the SoC, it is required that the Flash Valid Signature, at offset 10h of the Flash Descriptor, does not equal the expected valid value (0FF0A55Ah) or the SPI Controller will wrongly interpret that it has a valid signature and that a Flash Descriptor has been implemented.

### 31.2.2 Descriptor Mode

Descriptor Mode is required to enable many features of the SoC:

- Trusted Execution Engine
- Secure Boot
- PCI Express\* root port configuration
- Supports for two SPI components using two separate chip select pins
- Hardware enforced security restricting master accesses to different regions
- Soft Strap region providing the ability to use Flash NVM to remove the need for pull-up/pull-down resistors for strapping SoC features
- Support for the SPI Fast Read instruction and frequencies greater than 20 MHz
- Support for Single Input, Dual Output Fast reads
- Use of standardized Flash instruction set

#### SPI Flash Regions

In Descriptor Mode the Flash is divided into five separate regions:

**Table 299. SPI Flash Regions**

| Region | Content                  |
|--------|--------------------------|
| 0      | Flash Descriptor         |
| 1      | BIOS                     |
| 2      | Trusted Execution Engine |
| 3      | Reserved                 |
| 4      | Platform Data            |

Only two masters can access the 3 regions: The SoC CPU core running BIOS code and the Trusted Execution Engine. The only required region is Region 0, the Flash Descriptor. Region 0 must be located in the first sector of Device 0.

### Flash Regions Sizes

SPI Flash space requirements differ by platform and configuration. [Table 300](#) indicates the space needed in the Flash for each region.

**Table 300. Region Size Versus Erase Granularity of Flash Components**

| Region                   | Size with 4 KB Blocks | Size with 8 KB Blocks | Size with 64 KB Blocks |
|--------------------------|-----------------------|-----------------------|------------------------|
| Descriptor               | 4 KB                  | 8 KB                  | 64 KB                  |
| BIOS                     | Varies by Platform    | Varies by Platform    | Varies by Platform     |
| Trusted Execution Engine | Varies by Platform    | Varies by Platform    | Varies by Platform     |

### 31.2.3 Flash Descriptor

The maximum size of the Flash Descriptor is 4 KB. If the block/sector size of the SPI Flash device is greater than 4 KB, the Flash descriptor will only use the first 4 KB of the first block. The Flash descriptor requires its own block at the bottom of memory (00h). The information stored in the Flash Descriptor can only be written during the manufacturing process as its read/write permissions must be set to Read only when the system containing the SoC leaves the manufacturing floor.

The Flash Descriptor is made up of eleven sections as indicated in below figure.

**Figure 131. Flash Descriptor Sections**

- The **Reserved** section at offset 0h is related to functionality not supported by the SoC.
- The **Signature** section selects Descriptor Mode as well as verifies if the Flash is programmed and functioning. The data at the bottom of the Flash (offset 10h) must be 0FF0A55Ah in order to be in Descriptor mode.
- The **Descriptor Map** section defines the logical structure of the Flash in addition to the number of components used.
- The **Component** section has information about the SPI Flash in the system including:
  - Density of each component
  - Illegal instructions (such as chip erase)
  - Frequencies for read, fast read and write/erase instructions.
- The **Region** section points to the four other regions as well as the size of each region.
- The **Master** region contains the security settings for the Flash, granting read/write permissions for each region and identifying each master by a requestor ID.
- The **Soft Straps** section contains parameter bits that can be used to configure SoC features and/or behaviors.

- The **Reserved** section between the top of the **Soft Straps** section and the bottom of the **VSCC Table** is reserved for future SoC usages.
- The **VSCC Table** section holds the JEDEC ID and the VSCC (Vendor Specific Component Capabilities) information of the entire SPI Flash supported by the NVM image.
- The **Descriptor Upper Map** section determines the length and base address of the **VSCC Table** section.
- The **OEM Section** is 256 Bytes reserved at the top of the Flash Descriptor for use by an OEM.

### 31.2.3.1 Master Section

The Master section defines read and write access setting for each region of the SPI device, when the SPI controller is running in Descriptor mode. The master region recognize two masters: SoC CPU core running BIOS code and the Trusted Execution Engine.

**Note:** Each master is only allowed to do direct reads of its primary regions. The Trusted Execution Engine is may also do a direct read of the BIOS region if it has been given read access to that region. See [Section 31.2.4.1, "Direct Access" on page 4382](#) for further details on direct reads.

**Table 301. Region Access Control**

| Master Read/Write Access |                                                                 |                                                                                     |
|--------------------------|-----------------------------------------------------------------|-------------------------------------------------------------------------------------|
| Region                   | BIOS                                                            | Trusted Execution Engine                                                            |
| Descriptor               | N/A                                                             | N/A                                                                                 |
| BIOS                     | CPU core and BIOS can always read from and write to BIOS Region | Read / Write                                                                        |
| Trusted Execution Engine | Read / Write                                                    | Trusted Execution can always read from and write to Trusted Execution Engine Region |
| Platform Data            | N/A                                                             | N/A                                                                                 |

### 31.2.3.2 Invalid Flash Descriptor Handling

The SoC will respond to an invalid Flash Descriptor with the following:

- The SPI controller will operate in Non-Descriptor mode.
- If the BBS strap (see [Section 31.2.2](#) for details) is set to 1, BIOS direct read access will be forwarded to the SPI Controller without any address translation.
- The HSFSTS.FDV register bits remains at 0b.

- All security checks are disabled and the entire Flash is open for reading and writing. No restriction on the 4k crossing.
- Trusted Execution Engine direct read accesses will not be handled, and the SPI controller will return all 1's.

**Note:** To ensure BIOS boot access even when the Flash Descriptor is invalid the BIOS region can be placed at the top of Flash Component 0. Placing the BIOS region in any other location will necessitate a full reprogramming of the Flash before boot is possible from that Flash.

### 31.2.3.3 Descriptor Security Override Strap

A strap is implemented on GPIO\_S0\_SC[065] to allow descriptor security to be overridden when the strap is sampled low.

If the strap is set (0b), it will have the following effect:

- The Master Region Read Access and Master Region Write Access permissions that were loaded from the Flash Descriptor Master Section will be overridden giving every master read and write permissions to the entire Flash component including areas outside the defined regions.
- BIOS Protected Range 4 (PR4), if enabled by soft strap, will be overridden so that all masters are able to write to the PR4. The PR4 base and limit addresses are fetched and received from soft strap.

## 31.2.4 Flash Access

There are two types of Flash accesses: Direct Access and Program Register Access.

### 31.2.4.1 Direct Access

- Direct writes are not allowed for any master.
- The SoC CPU core is only allowed to do a direct read of the BIOS region
- The Trusted Execution Engine is only allowed to do a direct read of the Trusted Execution Engine region. It may also do a direct read of the BIOS region if it has been given read access to that region.

**Note:** Trusted Execution Engine region direct reads are not supported when the SPI controller is operating in Non-Descriptor mode. The SPI controller returns all 1s if a direct read is attempted.

### 31.2.4.2 Security

- Calculated Flash Linear Address (FLA) must fall between primary region base/limit

**Note:** During non descriptor mode, the Flash Physical Address is used instead. Only the two BIOS ranges at the E0000h and F0000h segments just below 1MB are supported.

- Direct Read Cache contents are reset to 0's on a read from a different master

### 31.2.4.3 Program Register Access

- Reads, Writes and Erases are all supported.
- Program Register Access may use Hardware or Software Sequencing. See [Section 31.3.1, “Hardware vs. Software Sequencing” on page 4389](#) for further information.
- Program Register Accesses are not allowed to cross a 4 KB boundary and can not issue a command that might extend across two components
- Software programs the FLA corresponding to the region desired
  - Software must read the devices Primary Region Base/Limit address to create a FLA.

Each master accesses the Flash through a set of memory mapped registers that are dedicated to each device.

There are two separate control and status registers that software can use when using register access to the Flash. The Hardware Sequencing control/status registers rely on hardware to issue appropriate Flash instructions and atomic sequences. The Software Sequencer puts control into the hands of the software for what instructions to issue and when.

The goal is to support all Flash components through hardware sequencing. Software sequencing is intended only for a back-up strategy.

**Note:** Software sequencing is required when operating in a non-descriptor mode.

### 31.2.4.4 Security

- Only primary region masters can access the registers
- Masters are only allowed to read or write those regions they have read/write permission
- Using the Flash region access permissions, one master can give another master read/write permissions to their area
- Using the five Protected Range registers, each master can add separate read/write protection above that granted in the Flash Descriptor for their own accesses
  - Example: BIOS may want to protect different regions of BIOS from being erased
  - Ranges can extend across region boundaries

## 31.2.5 Serial Flash Device Compatibility Requirements

A variety of serial Flash devices exist in the market. For a serial Flash device to be compatible with the SoC SPI bus, it must meet the minimum requirements detailed in the following sections.

### **31.2.5.1 BIOS SPI Flash Requirements**

The SPI Flash device must meet the following minimum requirements when used explicitly for system BIOS storage.

- Erase size capability of at least one of the following: 64 Kbytes, 8 Kbytes, 4 Kbytes, or 256 bytes.
- Device must support multiple writes to a page without requiring a preceding erase cycle (Refer to [Section 31.2.6.](#))
- Serial Flash device must ignore the upper address bits such that an address of FFFFFFFh aliases to the top of the Flash memory.
- SPI Compatible Mode 0 support (clock phase is 0 and data is latched on the rising edge of the clock).
- If the device receives a command that is not supported or incomplete (less than 8 bits), the device must complete the cycle gracefully without any impact on the Flash content.
- An erase command (page, sector, block, chip, etc.) must set all bits inside the designated area (page, sector, block, chip, etc.) to 1 (Fh).
- Status Register bit 0 must be set to 1 when a write, erase or write to status register is in progress and cleared to 0 when a write or erase is NOT in progress.
- Devices requiring the Write Enable command must automatically clear the Write Enable Latch at the end of Data Program instructions.
- Byte write must be supported. The flexibility to perform a write between 1 byte to 64 bytes is recommended.
- Hardware Sequencing requirements are optional in BIOS only platforms.
- SPI Flash devices that do not meet hardware sequencing command set requirements may work in BIOS only platforms using software sequencing.
- If implementing two SPI flash devices, both devices must have the same erasable block/sector size. Additionally, the first device must be of a binary size.

### **31.2.5.2 Intel Trusted Execution Engine Firmware SPI Flash Requirements**

Intel Trusted Execution Engine Firmware must meet all the requirements in [Section 31.2.5.1](#) plus:

- Hardware sequencing
- The Flash device must have a uniform 4-KB erasable block throughout the entire device or have 64 KB blocks with the first block (lowest address) divided into 4-KB or 8-KB blocks.
- The write protection scheme must meet SPI Flash unlocking requirements for the Trusted Execution Engine

### SPI Flash Unlocking Requirements for the Trusted Execution Engine

Flash devices must be globally unlocked (read, write and erase access on the Trusted Execution Engine region) from power on by writing 00h to the Flash's status register to disable write protection.

If the status register must be unprotected, it must use the enable write status register command 50h or write enable 06h.

Opcode 01h (write to status register) must then be used to write a single byte of 00h into the status register. This must unlock the entire device. If the SPI Flash's status register has non-volatile bits that must be written to, bits [5:2] of the Flash's status register must be all 0h to indicate that the Flash is unlocked.

If bits [5:2] return a non zero values, the Trusted Execution Engine firmware will send a write of 00h to the status register. This must keep the Flash part unlocked.

If there is no need to execute a write enable on the status register, then opcodes 06h and 50h must be ignored.

After global unlock, the BIOS has the ability to lock down small sections of the Flash as long as they do not involve the Trusted Execution Engine.

### 31.2.5.3 Hardware Sequencing Requirements

Below table contains a list of commands and the associated opcodes that a SPI-based serial Flash device must support in order to be compatible with hardware sequencing.

**Table 302. Hardware Sequencing Commands and Opcode Requirements**

| Commands                        | Opcode       | Notes                                                                                                                                    |
|---------------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Write to Status Register        | 01h          | Writes a byte to SPI Flash's status register. Enable Write to Status Register command must be run prior to this command.                 |
| Program Data                    | 02h          | Single byte or 64 byte write as determined by Flash part capabilities and software.                                                      |
| Read Data                       | 03h          |                                                                                                                                          |
| Write Disable                   | 04h          |                                                                                                                                          |
| Read Status                     | 05h          | Outputs contents of SPI Flash's status register                                                                                          |
| Write Enable                    | 06h          |                                                                                                                                          |
| Fast Read                       | 0Bh          |                                                                                                                                          |
| Enable Write to Status Register | 50h          | Enables a bit in the status register to allow an update to the status register                                                           |
| Erase                           | Programmable | Uses the value from LVSSC.LEO register or UVSSC.UEO register depending on the FLA and whether it is below or above the FPBA respectively |

### Single Input, Dual Output Fast Read

The SPI controller supports the functionality of a single input, dual output fast read: Opcode 3Bh. This instruction has the same timing (including a dummy byte) and the same frequencies as the Fast Read instruction, with the difference that the read data from the Flash is presented on both the MISO and MOSI pins. During a Dual Read instruction, the odd data bits are on the MISO pin and the even data bits are on the MOSI pin.

**Note:** When Dual Output Fast Read Support is enabled the Fast Read Support must be enabled as well.

**Note:** Micronix\* SPI Flash uses a different opcode for dual fast read, and requires that during the address phase that the address bits are sent on both MOSI and MISO. The SoC does not support this implementation of the protocol.

**Figure 132. Dual Output Fast Read Timing**

### JEDEC ID

Since each serial Flash device may have unique capabilities and commands, the JEDEC ID is the necessary mechanism for identifying the device so the uniqueness of the device can be comprehended by the controller (master). The JEDEC ID uses the opcode 9Fh and a specified implementation and usage model. This JEDEC Standard Manufacturer and Device ID read method is defined in Standard JESD21-C, PRN03-NV.

### Error Correction and Detection

If the first 8 bits specify an opcode which is not supported the slave will not respond and wait for the next high to low transition on PCU\_SPI\_CS[1:0]#. The SPI controller should automatically discard 8 bit words that were not completely received upon de-assertion of the signal.

Any other error correction or detection mechanisms must be implemented in firmware and/or software.

## 31.2.6 Multiple Page Write Usage Model

The BIOS and Trusted Execution Engine firmware usage models require that the serial Flash device support multiple writes to a page (minimum of 512 writes) without requiring a preceding erase command. The BIOS commonly uses capabilities such as counters that are used for error logging and system boot progress logging. These counters are typically implemented by using byte-writes to 'increment' the bits within a page that have been designated as the counter. The Trusted Execution Engine firmware usage model requires the capability for multiple data updates within any given page. These data updates occur using byte-writes without executing a preceding erase to the given page. Both the BIOS and Trusted Execution Engine firmware multiple page write usage models apply to sequential and non-sequential data writes.

This usage model requirement is based on any given bit only being written once from a '1' to a '0' without requiring the preceding erase. An erase would be required to change bits back to the 1 state.

## 31.2.7 Soft Flash Protection

There are two types of Flash protection that are not defined in the Flash descriptor supported by the SPI controller:

1. Flash Range Read and Write Protection
2. Global Write Protection

### 31.2.7.1 Flash Range Read and Write Protection

The SPI controller provides a method for blocking reads and writes to specific ranges in the Flash when the Protected Ranges are enabled. This is achieved by checking the read or write cycle type and the address of the requested command against the base and limit fields of a Read or Write Protected range. Protected range registers are only applied to Programmed Register accesses and have no effect on Direct Reads.

**Note:** Once BIOS has locked down the Protected BIOS Range registers, this mechanism remains in place until the next system reset.

### 31.2.7.2 Global Write Protection

The SPI controller has a Write Protection Disable (BCR.WPD) configuration bit. When BCR.WPD=0b, BIOS is not able to perform any write or erase commands to the Flash. When BCR.WPD=1b, protection against BIOS erase and rewrite is disabled. When the lock enable (BCR.LE) bit is set, the BIOS can disable this protection only during System Management Mode (SMM) execution.

If BCR.LE=1b, the SPI controller confirms that only SMM code succeeds to set BCR.WPD=1b. In addition, if BCS.SMIWPEN=1b, the SPI controller should initiate an SMI when non SMM code tries to set BCR.WPD=1b.

### 31.2.8 SPI Flash Device Recommended Pinout

This table contains the recommended serial Flash device pin-out for an 8-pin device. Use of the recommended pin-out on an 8-pin device reduces complexities involved with designing the serial Flash device onto a motherboard and allows for support of a common footprint usage model (refer to [Section 31.2.9.1](#)).

**Table 303. Recommended Pinout for 8-Pin Serial Flash Device**

| Pin # | Signal         |
|-------|----------------|
| 1     | Chips Select   |
| 2     | Data Output    |
| 3     | Write Protect  |
| 4     | Ground         |
| 5     | Data Input     |
| 6     | Serial Clock   |
| 7     | Hold / Reset   |
| 8     | Supply Voltage |

Although an 8-pin device is preferred over a 16-pin device due to footprint compatibility, [Table 304](#) contains the recommended serial Flash device pin-out for a 16-pin SOIC.

### 31.2.9 Serial Flash Device Package

**Table 304. Recommended Pinout for 16-Pin Serial Flash Device**

| Pin # | Signal         | Pin # | Signal        |
|-------|----------------|-------|---------------|
| 1     | Hold / Reset   | 9     | Write Protect |
| 2     | Supply Voltage | 10    | Ground        |
| 3     | No Connect     | 11    | No Connect    |
| 4     | No Connect     | 12    | No Connect    |
| 5     | No Connect     | 13    | No Connect    |

**Table 304. Recommended Pinout for 16-Pin Serial Flash Device**

| Pin # | Signal          | Pin # | Signal         |
|-------|-----------------|-------|----------------|
| 6     | No Connect      | 14    | No Connect     |
| 7     | Chip Select     | 15    | Serial Data In |
| 8     | Serial Data Out | 16    | Serial Clock   |

### 31.2.9.1 Common Footprint Usage Model

To minimize platform motherboard redesign and to enable platform Bill of Material (BOM) selectability, many OEMs design their motherboard with a single common footprint. This common footprint allows the population of a soldered down device or a socket that accepts a leadless device. This enables the board manufacturer to support, using selection of the appropriate BOM, either of these solutions on the same system without requiring any board redesign.

The common footprint usage model is desirable during system debug and by Flash content developers since the leadless device can be easily removed and reprogrammed without damage to device leads. When the board and Flash content is mature for high-volume production, both the socketed leadless solution and the soldered down leadless solution are available through BOM selection.

### 31.2.9.2 Serial Flash Device Package Recommendations

It is highly recommended that the common footprint usage model be supported. An example of how this can be accomplished is as follows:

- The recommended pinout for 8-pin serial Flash devices is used (refer to [Table 303](#)).
- The 8-pin device is supported in either an 8-contact VDFPN (6x5 mm MLP) package or an 8-contact WSON (5x6 mm) package. These packages can fit into a socket that is land pattern compatible with the wide body SO8 package.
- The 8-pin device is supported in the SO8 (150 mil) and in the wide-body SO8 (200 mil) packages.
- The 16-pin device is supported in the SO16 (300 mil) package.

## 31.3 Use

### 31.3.1 Hardware vs. Software Sequencing

Hardware and Software sequencing are the two methods the SoC uses to communicate with the Flash via programming registers for each of the three masters.

#### 31.3.1.1 Hardware Sequencing

Hardware sequencing has a predefined list of opcodes, see [Table 302](#) for more details, with only the erase opcode being programmable. This mode is only available if the descriptor is present and valid. Security Engine firmware must use HW sequencing, so

BIOS must properly set up the SoC to account for this. The Host VSCC registers and VSCC Table have to be correctly configured for BIOS and Security Engine have read/write access to SPI.

### **31.3.1.2 Software Sequencing**

All commands other than the standard (memory) reads must be programmed by the software in the Software Sequencing Control, Flash Address, Flash Data, and Opcode configuration registers. Software must issue either Read ID or Read JEDEC ID, or a combination of the two to determine what Flash component is attached. Based on the Read ID, software can determine the appropriate Opcode instructions sets to set in the program registers and at what SPI frequency to run the command.

Software must program the Flash Linear Address for all commands, even for those commands that don't require address such as the Read ID or Read Status. This is because the SPI controller uses the address to determine which chip select to use.

The opcode type and data byte count fields determine how many clocks to run before deasserting the chip enable. The Flash data is always shifted in for the number of bytes specified and the Flash Data out is always shifted out for the number of data bytes specified. Note that the hardware restricts the burst lengths that are allowed.

A status bit indicates when the cycle has completed on the SPI port allowing the host to know when read results can be checked and/or when to initiate a new command.

The controller also provides the "Atomic Cycle Sequence" for performing erases and writes to the SPI Flash. When this bit is 1 (and the Go bit is written to 1), a sequence of cycles is performed on the SPI interface without allowing other SPI device to arbitrate and interleave cycles to the Flash device. In this case, the specified cycle is preceded by the Prefix Command (8-bit programmable Opcode) and followed by repeated reads to the Status Register (Opcode 05h) until bit 0 indicates the cycle has completed. The hardware does not attempt to check that the programmed cycle is a write or erase.

If a Programmed Access is initiated (Cycle Go written to 1) while the SPI controller is already busy with a Direct Memory Read, then the SPI Host hardware will hold the new Programmed Access pending until the preceding SPI access completes.

Once the SPI controller has committed to running a programmed access, subsequent writes to the programmed cycle registers that occur before it has completed will not modify the original transaction and will result in the assertion of the FCERR bit. Software should never purposely behave in this way and rely on this behavior. However, the FCERR bit provides basic error-reporting in this situation. Writes to the following registers cause the FCERR bit assertion in this situation:

- Software Sequencing Control
- Software Sequencing Address
- SPI Data

With the exception of Illegal Opcodes, the SPI controller does not police which opcodes are valid to be used in SW Sequencing. For example, if SW programs a Dual Output Fast Read opcode, then the Dual Output Fast Read cycle will be issued, independent of whether the Dual Output Fast Read enable bit was set in the component descriptor section.

## **31.4 Register Map**

Refer to [Chapter 3, "Register Access Methods"](#) and [Chapter 4, "Mapping Address Spaces"](#) for additional information.

### 31.5.2 HSFSTS (Hardware\_Sequencing\_Flash\_Status\_bios)—Offset 4h

Hardware sequencing flash status Note: If operating in Non-Descriptor mode, the Software Sequencing Flash Status register must be used.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Hardware\_Sequencing\_Flash\_Status\_bios:** [SPI\_BASE\_ADDRESS] + 4h

**SPI\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**SPI\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 54h

**Default:** 0000h

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15        | 0b<br>RW/L       | <b>Flash Configuration Lock-Down (FLOCKDN):</b> When set to 1, those Flash Program Registers that are locked down by this FLOCKDN bit cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.                                                                                                                                                                                                                                                |
| 14        | 0b<br>RO         | <b>Flash Descriptor Valid (FDV):</b> This bit is set to a 1 if the Flash Controller read the correct Flash Descriptor Signature. If the Flash Descriptor Valid bit is not 1, software cannot use the Hardware Sequencing registers, but must use the software sequencing registers. Any attempt to use the Hardware Sequencing registers will result in the FCERR bit being set.                                                                                         |
| 13        | 0b<br>RO         | <b>Flash Descriptor Override Pin-Strap Status (FDOPSS):</b> This register reflects the value the Flash Descriptor Override Pin-Strap. '1': No override '0': The Flash Descriptor Override strap is set                                                                                                                                                                                                                                                                   |
| 12:6      | 0b<br>RO         | <b>RSVD0:</b> Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 5         | 0b<br>RO         | <b>SPI Cycle In Progress (SCIP):</b> Hardware sets this bit when software sets the Flash Cycle Go (FGO) bit in the Hardware Sequencing Flash Control register. This bit remains set until the cycle completes on the SPI interface. Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 0. |
| 4:3       | 00b<br>RO        | <b>Block/Sector Erase Size (BERASE):</b> This field identifies the erasable sector size for all Flash components. Valid Bit Settings: 00 : 256 Byte 01 : 4K Byte 10 : 8K Byte 11 : 64K Byte If the FLA ( FPBA then this field reflects the value in the LVSCC.LBES register. If the FLA )= FPBA then this field reflects the value in the UVSCC.UBES register.                                                                                                           |
| 2         | 0b<br>RW/1C      | <b>Access Error Log (AEL):</b> Hardware sets this bit to a 1 when a direct read was made by BIOS that violated the security restrictions. Or, when a SB transaction to read/write one of the BIOS registers was accepted with bad SAI - see security table. This bit has no affect on indirect accesses. This bit is cleared by software writing a 1.                                                                                                                    |
| 1         | 0b<br>RW/1C      | <b>Flash Cycle Error (FCERR):</b> Hardware sets this bit to 1 when an program register access is blocked to the FLASH due to one of the protection policies or when any of the programmed cycle registers is written while a programmed access is already in progress. This bit remains asserted until cleared by software writing a 1 or until hardware reset occurs. Software must clear this bit before setting the FLASH Cycle GO bit in this register.              |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0         | 0b<br>RW/1C      | <b>Flash Cycle Done (FDONE):</b> The SPI controller sets this bit to 1 when the SPI Cycle completes after software previously set the FGO bit. This bit remains asserted until cleared by software writing a 1 or hardware reset. When this bit is set and the SPI SMI# Enable bit is set, an internal signal is asserted to the SMI# generation block. Software must make sure this bit is cleared prior to enabling the SPI SMI# assertion for a new programmed access. |

### 31.5.3 HSFCTL (Hardware\_Sequencing\_Flash\_Control\_bios)—Offset 6h

Hardware sequencing flash control.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Hardware\_Sequencing\_Flash\_Control\_bios:** [SPI\_BASE\_ADDRESS] + 6h

**SPI\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**SPI\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 54h

**Default:** 0000h

| 2:1       | 00b<br>RW        | <b>FLASH Cycle (FCYCLE):</b> This field defines the Flash SPI cycle type generated to the FLASH when the FGO bit is set as defined below: 00 Read (1 up to 64 bytes by setting FDBC) 01 Reserved 10 Write (1 up to 64 bytes by setting FDBC) 11 Block Erase<br>Implementation Note: if reserved 2'b01 is programmed to this field, flash controller will handle it as if it is 00 (Read)                                                                                                                                                                                                                                                                                                                         |
| 0         | 0b<br>RW/SE      | <b>Flash Cycle Go (FGO):</b> A write to this register with a 1 in this bit initiates a request to the Flash SPI Arbiter to start a cycle. This register is cleared by hardware when the cycle is granted by the SPI arbiter to run the cycle on the SPI bus. When the cycle is complete, the FDONE bit is set. Software is forbidden to write to any register in the HSFCTL register between the FGO bit getting set and the FDONE bit being cleared. Any attempt to violate this rule will be ignored by hardware. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1. This saves an additional memory write. This bit always returns 0 on reads. |

Flash data #1

## Access Method

**Flash Data 1 bios:** [SPI BASE ADDRESS] + 14h

**SPI BASE ADDRESS Reference:** [B:0, D:31, F:0] + 54h

**Power Well:** EPW

**Default:** 00000000h

| Bit Range | Default & Access | Description                                                                                                                                            |

| 12:0      | 0000h<br>RW/L    | <b>Protected Range Base (PRB):</b> This field corresponds to FLA address bits 24:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 12'h000 for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range. |

### 31.5.28 PR1 (Protected\_Range\_1\_bios)—Offset 78h

Protected range #1. This register can not be written when the FLOCKDN or PR1LOCKDN bits are set to 1.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Protected\_Range\_1\_bios:** [SPI\_BASE\_ADDRESS] + 78h

**SPI\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**SPI\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 54h

**Default:** 00000000h

| 14:13     | 0b<br>RO         | <b>RSVD1:</b> Reserved                                                                                                                                                                                                                                                                                              |
| 12:0      | 0000h<br>RW/L    | <b>Protected Range Base (PRB):</b> This field corresponds to FLA address bits 24:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 12'h000 for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.       |

### 31.5.31 PR4 (Protected\_Range\_4\_bios)—Offset 84h

Protected range #4. This register use for H/W range protection. All register values are coming from soft-straps, and the Write Protection Enable is controlled also by the Flash Security Override Pin Strap

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Protected\_Range\_4\_bios:** [SPI\_BASE\_ADDRESS] + 84h

**SPI\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**SPI\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 54h

**Default:** 00000000h

| 22        | 0b<br>RW         | <b>Data Cycle (DC):</b> When set to 1, there is data that corresponds to this transaction. When 0, no data is delivered for this cycle, and the DBC and data fields themselves are don't cares.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 21:16     | 000000b<br>RW    | <b>Data Byte Count (DBC):</b> This field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The valid settings (in decimal) are any value from 0 to 63. The number of bytes transferred is the value of this field plus 1. Note that when this field is 00_0000b, then there is 1 byte to transfer and that 11_1111b means there are 64 bytes to transfer.                                                                                                                                                                                                                               |
| 15        | 0b<br>RO         | <b>RSVD0:</b> Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 14:12     | 000b<br>RW       | <b>Cycle Opcode Pointer (COP):</b> This field selects one of the programmed opcodes in the Opcode Menu to be used as the SPI Command/Opcode. In the case of an Atomic Cycle Sequence, this determines the second command.                                                                                                                                                                                                                                                                                                                                                                                                        |
| 11        | 0b<br>RW         | <b>Sequence Prefix Opcode Pointer (SPOP):</b> This field selects one of the two programmed prefix opcodes for use when performing an Atomic Cycle Sequence. A value of 0 points to the opcode in the least significant byte of the Prefix Opcodes register. By making this programmable, the SPI controller supports flash devices that have different opcodes for enabling writes to the data space vs. status register.                                                                                                                                                                                                        |
| 10        | 0b<br>RW         | <b>Atomic Cycle Sequence (ACS):</b> When set to 1 along with the SCGO assertion, the SPI controller will execute a sequence of commands on the SPI interface without allowing the LAN component to arbitrate and interleave cycles. The sequence is composed of: ) Atomic Sequence Prefix Command (8-bit opcode only) ) Primary Command specified below by software (can include address and data) ) Polling the Flash Status Register (opcode 8'h05) until bit 0 becomes 1'b0. The SPI Cycle in Progress bit remains set and the Cycle Done Status bit remains unset until the Busy bit in the Flash Status Register returns 0. |
| 9         | 0b<br>RW/SE      | <b>SPI Cycle Go (SCGO):</b> This bit always returns 1'b0 on reads. However, a write to this register with a 1'b1 in this bit starts the SPI cycle defined by the other bits of this register. The SPI Cycle in Progress (SCIP) bit gets set by this action. Hardware must ignore writes to this bit while the Cycle In Progress bit is set. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1'b1. This saves an additional memory write.                                                                                                                          |
| 8         | 0b<br>RO         | <b>RSVD1:</b> Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| 0         | 0b<br>RO         | <b>SPI Cycle In Progress (SCIP):</b> Hardware sets this bit when software sets the SPI Cycle Go bit in the Command register. This bit remains set until the cycle completes on the SPI interface. Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 1'b0.                                                   |

### 31.5.33 PREOP (Prefix Opcode Configuration bios)—Offset 94h

Prefix opcode configuration. This register is not writable when the SPI Configuration Lock-Down bit is set or when the PREOPLOCKDN bit is set.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Prefix Opcode Configuration\_bios:** [SPI\_BASE\_ADDRESS] + 94h

**SPI\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**SPI BASE ADDRESS Reference:** [B:0, D:31, F:0] + 54h

**Power Well:** EPW

**Default:** 0000h

### 31.5.34 OPTYPE (Opcode\_Type\_Configuration\_bios)—Offset 96h

Opcode type configuration. This register is not writable when the Flash Configuration Lock-Down bit is set or when the OPTYPELOCKDN bit is set. Entries in this register correspond to the entries in the Opcode Menu Configuration register. Note that the definition below only provides write protection for opcodes that have addresses associated with them. Therefore, any erase or write opcodes that do not use an address should be avoided (for example, Chip Erase and Auto-Address Increment Byte Program).

## Access Method

| 1:0       | 00b<br>RW/L      | <b>Opcode Type 0 (OT0):</b> This field specifies information about the corresponding Opcode 0. This information allows the hardware to 1) know whether to use the address field and 2) provide BIOS and Shared Flash protection capabilities. The hardware implementation also uses the read vs. write information for modifying the behavior of the SPI interface logic. The encoding of the two bits is: 00 = No Address associated with this Opcode and Read Cycle type 01 = No Address associated with this Opcode and Write Cycle type 10 = Address required, Read cycle type 11 = Address required, Write cycle type |

### 31.5.35 OPMENU0 (Opcode\_Menu\_Configuration\_0\_bios)—Offset 98h

Opcode (0-3) Menu Configuration. This register is not writable when the SPI Configuration Lock-Down bit is set or when OPMENULOCKDN bit is set. Four entries are available in this register and four are available in OPMENU1 register to give BIOS a sufficient set of commands for communicating with the flash device, while also restricting what malicious software can do. This keeps the hardware flexible enough to operate with a wide variety of SPI devices. It is recommended that BIOS avoid programming Write Enable opcodes in this menu. Malicious software could then perform writes and erases to the SPI flash without using the atomic cycle mechanism. This could cause functional failures in a shared flash environment. Write Enable opcodes should only be programmed in the Prefix Opcodes.

#### Access Method

## 32 PCU – Universal Asynchronous Receiver/Transmitter (UART)

This section describes the Universal Asynchronous Receiver/Transmitter (UART) serial port integrated into the PCU. The UART may be controlled through programmed IO.

**Note:** Only a minimal ball-count, comprising receive & transmit signals, UART port is implemented. Further, a maximum baud rate of only 115,200 bps is supported. For this reason, it is recommended that the UART port be used for debug purposes only.

### 32.1 Signal Descriptions

Please see [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

**Table 306. UART Signals**

| Signal Name  | Direction<br>Plat. Power | Description                                                                                                                                       |

| PCU_UART_TXD | O<br>V1P8S               | <b>COM1 Transmit:</b> Serial data output from transmit port to the device pin.<br><i>This signal is muxed and may be used by other functions.</i> |

## 32.2 Features

The serial port consists of a UART which supports a subset of the functions of the 16550 industry standard.

The UART performs serial-to-parallel conversion on data characters received from a peripheral device and parallel-to-serial conversion on data characters received from the processor. The processor may read the complete status of the UART at any time during the functional operation. Available status information includes the type and condition of the transfer operations being performed by the UART and any error conditions.

The serial port may operate in either FIFO or non-FIFO mode. In FIFO mode, a 16-byte transmit FIFO holds data from the processor to be transmitted on the serial link and a 16-byte Receive FIFO buffers data from the serial link until read by the processor.

The UART includes a programmable baud rate generator which is capable of generating a baud rate of between 50 bps and 115,200 bps from a fixed baud clock input of 1.8432 MHz. The baud rate is calculated as follows:

### Baud Rate Calculation:

$$\text{BaudRate} = \frac{1.8432 \times 10^6}{16 \times \text{Divisor}}$$

The divisor is defined by the Divisor Latch LSB and Divisor Latch MSB registers. Some common values are shown in [Table 307](#).

**Table 307. Baud Rate Examples**

| Desired Baud Rate | Divisor | Divisor Latch LSB Register | Divisor Latch MSB Register |
|-------------------|---------|----------------------------|----------------------------|
| 115,200           | 1       | 1h                         | 0h                         |
| 57,600            | 2       | 2h                         | 0h                         |
| 38,400            | 3       | 3h                         | 0h                         |
| 19,200            | 6       | 6h                         | 0h                         |
| 9,600             | 12      | Ch                         | 0h                         |
| 4,800             | 24      | 18h                        | 0h                         |
| 2,400             | 48      | 30h                        | 0h                         |
| 1,200             | 96      | 60h                        | 0h                         |
| 300               | 384     | 80h                        | 1h                         |
| 50                | 2,304   | 0h                         | 9h                         |

The UART has interrupt support and those interrupts may be programmed to the user's requirements, minimizing the computing required to handle the communications link. Each UART may operate in a polled or an interrupt driven environment as configured by software.

## 32.2.1 FIFO Operation

### 32.2.1.1 FIFO Interrupt Mode Operation

#### Receiver Interrupt

When the Receive FIFO and receiver interrupts are enabled (FIFO Control Register, bit 0 = 1b and Interrupt Enable Register (IIR), bit 0 = 1b), receiver interrupts occur as follows:

- The receive data available interrupt is invoked when the FIFO has reached its programmed trigger level. The interrupt is cleared when the FIFO drops below the programmed trigger level.
- The IIR receive data available indication also occurs when the FIFO trigger level is reached, and like the interrupt, the bits are cleared when the FIFO drops below the trigger level.
- The receiver line status interrupt (IIR = C6h), as before, has the highest priority. The receiver data available interrupt (IIR = C4h) is lower. The line status interrupt occurs only when the character at the top of the FIFO has errors.
- The COM1\_LSR.DR bit is set to 1b as soon as a character is transferred from the shift register to the Receive FIFO. This bit is reset to 0b when the FIFO is empty.

#### Character Time Out Interrupt

When the receiver FIFO and receiver time out interrupt are enabled, a character time out interrupt occurs when all of the following conditions exist:

- At least one character is in the FIFO.
- The last received character was longer than four continuous character times ago (if 2 stop bits are programmed the second one is included in this time delay).
- The most recent processor read of the FIFO was longer than four continuous character times ago.
- The receiver FIFO trigger level is greater than one.

The maximum time between a received character and a timeout interrupt is 160 ms at 300 baud with a 12-bit receive character (i.e., 1 start, 8 data, 1 parity, and 2 stop bits).

When a time out interrupt occurs, it is cleared and the timer is reset when the processor reads one character from the receiver FIFO. If a time out interrupt has not occurred, the time out timer is reset after a new character is received or after the processor reads the receiver FIFO.

#### Transmit Interrupt

When the transmitter FIFO and transmitter interrupt are enabled (FIFO Control Register, bit 0 = 1b and Interrupt Enable Register, bit 0 = 1b), transmit interrupts occur as follows:

The Transmit Data Request interrupt occurs when the transmit FIFO is half empty or more than half empty. The interrupt is cleared as soon as the Transmit Holding Register is written (1 to 16 characters may be written to the transmit FIFO while servicing the interrupt) or the Interrupt Identification Register is read.

#### **32.2.1.2 FIFO Polled Mode Operation**

With the FIFOs enabled (FIFO Control register, bit 0 = 1b), setting Interrupt Enable register (IER), bits 3:0 = 000b puts the serial port in the FIFO polled mode of operation. Since the receiver and the transmitter are controlled separately, either one or both may be in the polled mode of operation. In this mode, software checks receiver and transmitter status through the Line Status Register (LSR). As stated in the register description:

- LSR[0] is set as long as there is one byte in the receiver FIFO.
- LSR[1] through LSR[4] specify which error(s) has occurred for the character at the top of the FIFO. Character error status is handled the same way as interrupt mode. The Interrupt Identification Register is not affected since IER[2] = 0b.
- LSR[5] indicates when the transmitter FIFO needs data.
- LSR[6] indicates that both the transmitter FIFO and shift register are empty.
- LSR[7] indicates whether there are any errors in the receiver FIFO.

### **32.3 Use**

#### **32.3.1 Base I/O Address**

##### **32.3.1.1 COM1**

The base I/O address for the COM1 UART is fixed to 3F8h.

#### **32.3.2 Legacy Interrupt**

##### **32.3.2.1 COM1**

The legacy interrupt assigned to the COM1 UART is fixed to IRQ4.

### **32.4 UART Enable/Disable**

The COM1 UART may be enabled or disabled using the UART\_CONT.COM1EN register bit. By default, the UART is disabled.

**Note:** It is recommended that the UART be disabled during normal platform operation since it is a PIO device and, as such, can prevent residency in lower power states by the processor.

## 32.5 IO Mapped Registers

There are 12 registers associated with the UART. These registers share eight address locations in the IO address space. Table 308 shows the registers and their addresses as offsets of a base address. Note that the state of the COM1\_LCR.DLAB register bit, which is the most significant bit (MSB) of the Serial Line Control register, affects the selection of certain of the UART registers. The COM1\_LCR.DLAB register bit must be set high by the system software to access the Baud Rate Generator Divisor Latches.

**Table 308. Register Access List**

| Register Address<br>(Offset to Base<br>IO Address) | COM1_LCR.DLAB<br>B Value | Register<br>Access<br>Type | Register Accessed                                       |

**Notes:**

1. These registers are consolidated in the Receiver Buffer / Transmitter Holding Register (COM1\_RX\_TX\_BUFFER)
2. These registers are consolidated in the Interrupt Enable Register (COM1\_IER)
3. These registers are consolidated in the Interrupt Identification / FIFO Control Register (COM1\_IIR)
4. These registers are implemented but unused since the UART signals related to modem interaction are not implemented.

## 32.6 PCU iLB UART IO Registers

### 32.6.1 Receiver Buffer / Transmitter Holding Register (COM1\_Rx\_Tx\_Buffer)—Offset 3F8h

This register is a combination of three registers: the receiver buffer register (RBR) that is a read-only register when DLAB=0, the transmitter holding register (THR) that is a write-only register when DLAB=0 and the divisor latch LSB (DLL) register when DLAB=1.

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**COM1\_Rx\_Tx\_Buffer:** 3F8h

**Default:** 00h

| 7:0        | 00h<br>RW        | <p><b>Receiver buffer / transmitter holding (RBR_THR_DLL):</b> When reading from this register and <b>DLAB=1'b0</b>, it contains the byte received if no FIFO is used, or the oldest unread byte with FIFO's. If FIFO buffering is used, each new read action of the register will return the next byte, until no more bytes are present. Bit 0 in the LSR line status register can be used to check if all received bytes have been read. This bit will change to zero if no more bytes are present. <b>When writing to this register and DLAB=1'b0</b>, it is used to buffer outgoing characters. If no FIFO buffering is used, only one character can be stored. Otherwise the amount of characters depends on the type of UART. Bit 5 in the LSR, line status register can be used to check if new information must be written to this register. The value 1'b1 indicates that the register is empty. If FIFO buffering is used, more than one character can be written to the transmitter holding register when the bit signals an empty state. There is no indication of the amount of bytes currently present in the transmitter FIFO. This register is not used to transfer the data directly. The byte is first transferred to a shift register where the information is broken in single bits which are sent one by one. <b>If DLAB=1'b1</b>, this register is used as DLL (Divisor Latch LSB). For generating its timing information, each UART uses an oscillator generating a frequency of about 1.8432 MHz. This frequency is divided by 16 to generate the time base for communication. Because of this division, the maximum allowed communication speed is 115200 bps. Modern UARTS like the 16550 are capable of handling higher input frequencies up to 24 MHz which makes it possible to communicate with a maximum speed of 1.5 Mbps. On PC's higher frequencies than the 1.8432 MHz are rarely seen because this would be software incompatible with the original XT configuration. This 115200 bps communication speed is not suitable for all applications. To change the communication speed, the frequency can be further decreased by dividing it by a programmable value. For very slow communications, this value can go beyond 255. Therefore, the divisor is stored in two separate bytes, the divisor latch registers DLL and DLM which contain the least, and most significant byte. For error free communication, it is necessary that both the transmitting and receiving UART use the same time base. Default values have been defined which are commonly used. The table shows the most common values with the appropriate settings of the divisor latch bytes. Note that these values only hold for a PC compatible system where a clock frequency of 1.8432 MHz is used.</p> <table><tr><th>Speed(bps)</th><th>Divisor</th><th>DLL</th><th>DLM</th></tr><tr><td>50</td><td>2,304</td><td>0x00</td><td>0x09</td></tr><tr><td>300</td><td>384</td><td>0x80</td><td>0x01</td></tr><tr><td>1,200</td><td>96</td><td>0x60</td><td>0x00</td></tr><tr><td>2,400</td><td>48</td><td>0x30</td><td>0x00</td></tr><tr><td>4,800</td><td>24</td><td>0x18</td><td>0x00</td></tr><tr><td>9,600</td><td>12</td><td>0x0C</td><td>0x00</td></tr><tr><td>19,200</td><td>6</td><td>0x06</td><td>0x00</td></tr><tr><td>38,400</td><td>3</td><td>0x03</td><td>0x00</td></tr><tr><td>57,600</td><td>2</td><td>0x02</td><td>0x00</td></tr><tr><td>115,200</td><td>1</td><td>0x01</td><td>0x00</td></tr></table> | Speed(bps) | Divisor | DLL | DLM | 50 | 2,304 | 0x00 | 0x09 | 300 | 384 | 0x80 | 0x01 | 1,200 | 96 | 0x60 | 0x00 | 2,400 | 48 | 0x30 | 0x00 | 4,800 | 24 | 0x18 | 0x00 | 9,600 | 12 | 0x0C | 0x00 | 19,200 | 6 | 0x06 | 0x00 | 38,400 | 3 | 0x03 | 0x00 | 57,600 | 2 | 0x02 | 0x00 | 115,200 | 1 | 0x01 | 0x00 |

### 32.6.2 Interrupt Enable Register (COM1\_IER)—Offset 3F9h

This register is a combination of two registers: the interrupt enable register (IER) when DLAB=0 and the divisor latch MSB (DLM) register when DLAB=1.

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**COM1\_IER:** 3F9h

**Default:** 00h

| 7:0       | 00h<br>RW        | <b>Interrupt Enable (IER_DLM):</b> If <b>DLAB=1'b0</b> , This field is used as interrupt enable register. The smartest way to perform serial communications on a PC is using interrupt driven routines. In that configuration, it is not necessary to poll the registers of the UART periodically for state changes. The UART will signal each change by generating a processor interrupt. A software routine must be present to handle the interrupt and to check what state change was responsible for it. Interrupts are not generated, unless the UART is told to do so. This is done by setting bits in the IER, interrupt enable register. A bit value 1 indicates, that an interrupt may take place. Bit Description 0 ERBFI - Enable Received Data Available Interrupt. This is used to enable/disable the generation of Received Data Available Interrupt and the Character Timeout Interrupt (if in FIFO mode and FIFOs enabled). These are the second highest priority interrupts. 1 ETBEI - Enable Transmit Holding Register Empty Interrupt. This is used to enable/disable the generation of Transmitter Holding Register Empty Interrupt. This is the third highest priority interrupt. 2 ELSI - Enable Receiver Line Status Interrupt. This is used to enable/disable the generation of Receiver Line Status Interrupt. This is the highest priority interrupt. 3 EDSSI - Enable Modem Status Interrupt. This is used to enable/disable the generation of Modem Status Interrupt. This is the fourth highest priority interrupt. 4 Reserved and read as zero 5 Reserved and read as zero 6 Reserved and read as zero 7 PTIME - Programmable THRE Interrupt Mode Enable that can be written to only when THRE_MODE_USER == Enabled, always readable. This is used to enable/disable the generation of THRE Interrupt. If <b>DLAB=1'b1</b> , this register is used as DLM (Divisor Latch MSB). See DLL field description in the Rx_Tx_Buffer register. |

### 32.6.3 Interrupt Identification / FIFO Control Register (COM1\_IIR)—Offset 3FAh

This register is a combination of two registers: the interrupt identification register (IIR) that is a read-only register and the FIFO control register (FCR) that is a write-only register. If FIFOs are not implemented, the FIFO control register does not exist and writing to this register address has no effect.

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**COM1\_IIR:** 3FAh

**Default:** 01h

| 3:0       | 0001b<br>RO      | <b>Interrupt ID (IIR):</b> Read from this field indicates the highest priority pending interrupt which can be one of the following types: '0000' - modem status '0001' - no interrupt pending '0010' - THR empty '0100' - received data available '0110' - receiver line status '0111' - busy detect '1100' - character timeout <b>Write</b> to this field is split to four bits: Bit Description 3 DMA Mode, determines the DMA signalling mode used: '0' - mode 0, '1' - mode 1 2 XMIT FIFO Reset, resets the control portion of the transmit FIFO and treats the FIFO as empty. 1 RCVR FIFO Reset, resets the control portion of the receive FIFO and treats the FIFO as empty. 0 FIFO Enable. This enables/disables the transmit (XMIT) and receive (RCVR) FIFOs. Whenever the value of this bit is changed both the XMIT and RCVR controller portion of FIFOs is reset. |

### 32.6.4 Line Control Register (COM1\_LCR)—Offset 3FBh

The LCR, line control register is used at initialisation to set the communication parameters. Parity and number of data bits can be changed for example. The register also controls the accessibility of the DLL and DLM registers. These registers are mapped to the same I/O port as the RBR, THR and IER registers. Because they are only accessed at initialisation when no communication occurs this register swapping has no influence on performance.

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**COM1\_LCR:** 3FBh

**Default:** 00h

| 2         | 0b<br>RW         | <b>Number of Stop bits (STOP):</b> This is used to select the number of stop bits per character that the peripheral transmits and receives. If set to zero, one stop bit is transmitted in the serial data. If set to one and the data bits are set to 5 (LCR[1:0] set to zero) one and a half stop bits is transmitted. Otherwise, two stop bits are transmitted. Note that regardless of the number of stop bits selected, the receiver checks only the first stop bit. '0' - 1 stop bit '1' - 1.5 stop bits when DLS (LCR[1:0]) is zero, else 2 stop bit |
| 1:0       | 00b<br>RW        | <b>Data Length Select (DLS):</b> This is used to select the number of data bits per character that the peripheral transmits and receives. The number of bit that may be selected areas follows: '00' - 5 bits '01' - 6 bits '10' - 7 bits '11' - 8 bits                                                                                                                                                                                                                                                                                                     |

### 32.6.5 Modem Control Register (COM1\_MCR)—Offset 3FCh

The MCR, modem control register is used to perform handshaking actions with the attached device. In the original UART series including the 16550, setting and resetting of the control signals must be done by software. The new 16750 is capable of handling flow control automatically, thereby reducing the load on the processor.

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**COM1\_MCR:** 3FCh

**Default:** 00h

| 5         | 0b<br>RW         | <b>Auto Flow Control Enable (AFCE):</b> Writeable only when AFCE_MODE == Enabled, always readable. When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set, Auto Flow Control features are enabled as described in 'Auto Flow Control' on Synopsys UART specification. '0' - Auto Flow Control Mode disabled '1' - Auto Flow Control Mode enabled                                                                                                                                                                                                                                                                                                                                                                                      |
| 4         | 0b<br>RW         | <b>LoopBack (LB):</b> This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (SIR_MODE != Enabled or not active, MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. If operating in infrared mode (SIR_MODE == Enabled AND active, MCR[6] set to one), data on the sir_out_n line is held low, while serial data output is inverted and looped back to the sir_in line. |
| 3         | 0b<br>RW         | <b>Auxiliary output 2 (OUT2):</b> This is used to directly control the user-designated Output2 (out2_n) output. The value written to this location is inverted and driven out on out2_n, that is: '0' - out2_n de-asserted (logic 1) '1' - out2_n asserted (logic 0) Note that in Loopback mode (MCR[4] set to one), the out2_n output is held inactive high while the value of this location is internally looped back to an input.                                                                                                                                                                                                                                                                                                                     |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2         | 0b<br>RW         | <b>Auxiliary output 1 (OUT1):</b> This is used to directly control the user-designated Output1 (out1_n) output. The value written to this location is inverted and driven out on out1_n, that is: '0' - out1_n de-asserted (logic 1) '1' - out1_n asserted (logic 0) Note that in Loopback mode (MCR[4] set to one), the out1_n output is held inactive high while the value of this location is internally looped back to an input.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 1         | 0b<br>RW         | <b>Request to Send (RTS):</b> This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto RTS Flow Control is not enabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high. In Auto Flow Control, AFCE_MODE == Enabled and active (MCR[5] set to one) and FIFOs enable (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal is de-asserted when MCR[1] is set low. Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive high while the value of this location is internally looped back to an input. Note that PCU-UART does not implement the Request to Send (rts_n) output. |
| 0         | 0b<br>RW         | <b>Data Terminal Ready (DTR):</b> This is used to directly control the Data Terminal Ready (dtr_n) output. The value written to this location is inverted and driven out on dtr_n, that is: '0' - dtr_n de-asserted (logic 1) '1' - dtr_n asserted (logic 0) The Data Terminal Ready output is used to inform the modem or data set that the UART is ready to establish communications. Note that in Loopback mode (MCR[4] set to one), the dtr_n output is held inactive high while the value of this location is internally looped back to an input. Note that PCU-UART does not implement the Data Terminal Ready (dtr_n) output.                                                                                                                                                                                                                                                                                                     |

## 32.6.6 Line Status Register (COM1\_LSR)—Offset 3FDh

The LSR, line status register shows the current state of communication. Errors are reflected in this register. The state of the receive and transmit buffers is also available.

### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**COM1\_LSR:** 3FDh

**Default:** 60h

|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7         | 0b<br>RO         | <b>Receiver FIFO Error (RFE):</b> This bit is only relevant when FIFO_MODE != NONE AND FIFOs are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO. '0' - no error in RX FIFO '1' - error in RX FIFO This bit is cleared when the LSR is read and the character with the error is at the top of the receiver FIFO and there are no subsequent errors in the FIFO. |
| 6         | 1b<br>RO         | <b>Transmitter Empty (TEMT):</b> If in FIFO mode (FIFO_MODE != NONE) and FIFOs enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If in non-FIFO mode or FIFOs are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty.                                                                                                    |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5         | 1b<br>RO         | <b>Transmit Holding Register Empty (THRE):</b> If THRE_MODE_USER == Disabled or THRE mode is disabled (IER[7] set to zero) and regardless of FIFO's being implemented/enabled or not, this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If THRE_MODE_USER == Enabled AND FIFO_MODE != NONE and both modes are active (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting.                                                                                                                              |
| 4         | 0b<br>RO         | <b>Break Interrupt (BI):</b> This is used to indicate the detection of a break sequence on the serial input data. If in UART mode (SIR_MODE == Disabled), it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits. If in infrared mode (SIR_MODE == Enabled), it is set whenever the serial input, sir_in, is continuously pulsed to logic '0' for longer than the sum of start time + data bits + parity + stop bits. A break condition on serial input causes one and only one character, consisting of all zeros, to be received by the UART. In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO. Reading the LSR clears the BI bit. In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read. |
| 3         | 0b<br>RO         | <b>Framing Error (FE):</b> This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data. In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO. When a framing error occurs, the UART tries to resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). '0' - no framing error '1' - framing error Reading the LSR clears the FE bit.                                                                                |
| 2         | 0b<br>RO         | <b>Parity Error (PE):</b> This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set. In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO. It should be noted that the Parity Error (PE) bit (LSR[2]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]). '0' - no parity error '1' - parity error Reading the LSR clears the PE bit.                                                                                                                                                                                                                                                                                                                                                                      |
| 1         | 0b<br>RO         | <b>Overrun Error (OE):</b> This is used to indicate the occurrence of an overrun error. This occurs if a new data character was received before the previous data was read. In the non-FIFO mode, the OE bit is set when a new character arrives in the receiver before the previous character was read from the RBR. When this happens, the data in the RBR is overwritten. In the FIFO mode, an overrun error occurs when the FIFO is full and a new character arrives at the receiver. The data in the FIFO is retained and the data in the receive shift register is lost. '0' - no overrun error '1' - overrun error Reading the LSR clears the OE bit.                                                                                                                                                                                                                                                                           |
| 0         | 0b<br>RO         | <b>Data Ready (DR):</b> This is used to indicate that the receiver contains at least one character in the RBR or the receiver FIFO. '0' - no data ready '1' - data ready This bit is cleared when the RBR is read in non-FIFO mode, or when the receiver FIFO is empty, in FIFO mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### 32.6.7 Modem Status Register (COM1\_MSR)—Offset 3FEh

The MSR, modem status register contains information about the four incoming modem control lines on the device. The information is split in two nibbles. The four most significant bits contain information about the current state of the inputs where the least significant bits are used to indicate state changes. The four LSB's are reset, each time the register is read. Whenever bits 0, 1, 2 or 3 are set to logic one, to indicate a change on the modem control inputs, a modem status interrupt is generated if enabled through the IER, regardless of when the change occurred. Since the delta

bits (bits 0, 1, 3) can get set after a reset if their respective modem signals are active (see individual bits for details), a read of the MSR after reset can be performed to prevent unwanted interrupts.

|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7         | 0b<br>RO         | <b>Data Carrier Detect (DCD):</b> This is used to indicate the current state of the modem control line dcd_n. This bit is the complement of dcd_n. When the Data Carrier Detect input (dcd_n) is asserted it is an indication that the carrier has been detected by the modem or data set. '0' - dcd_n input is de-asserted (logic 1) '1' - dcd_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), DCD is the same as MCR[3] (Out2). Note that PCU-UART does not implement the Data Carrier Detect (dcd_n) input.                                                                                                                       |
| 6         | 0b<br>RO         | <b>Ring Indicator (RI):</b> This is used to indicate the current state of the modem control line ri_n. This bit is the complement of ri_n. When the Ring Indicator input (ri_n) is asserted it is an indication that a telephone ringing signal has been received by the modem or data set. '0' - ri_n input is de-asserted (logic 1) '1' - ri_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), RI is the same as MCR[2] (Out1). Note that PCU-UART does not implement the Ring Indicator (ri_n) input.                                                                                                                               |
| 5         | 0b<br>RO         | <b>Data Set Ready (DSR):</b> This is used to indicate the current state of the modem control line dsr_n. This bit is the complement of dsr_n. When the Data Set Ready input (dsr_n) is asserted it is an indication that the modem or data set is ready to establish communications with the DW_apb_uart. '0' - dsr_n input is de-asserted (logic 1) '1' - dsr_n input is asserted (logic 0) In Loopback Mode (MCR[4] set to one), DSR is the same as MCR[0] (DTR). Note that PCU-UART does not implement the Data Set Ready (dsr_n) input.                                                                                                              |
| 4         | 0b<br>RO         | <b>Clear to Send (CTS):</b> This is used to indicate the current state of the modem control line cts_n. This bit is the complement of cts_n. When the Clear to Send input (cts_n) is asserted it is an indication that the modem or data set is ready to exchange data with the DW_apb_uart. '0' - cts_n input is de-asserted (logic 1) '1' - cts_n input is asserted (logic 0) In Loopback Mode (MCR[4] = 1), CTS is the same as MCR[1] (RTS). Note that PCU-UART does not implement the Clear to Send (cts_n) input.                                                                                                                                   |
| 3         | 0b<br>RO         | <b>Delta Data Carrier Detect (DDCD):</b> This is used to indicate that the modem control line dcd_n has changed since the last time the MSR was read. '0' - no change on dcd_n since last read of MSR '1' - change on dcd_n since last read of MSR Reading the MSR clears the DDCD bit. In Loopback Mode (MCR[4] = 1), DDCD reflects changes on MCR[3] (Out2). Note, if the DDCD bit is not set and the dcd_n signal is asserted (low) and a reset occurs (software or otherwise), then the DDCD bit is set when the reset is removed if the dcd_n signal remains asserted. Note that PCU-UART does not implement the Data Carrier Detect (dcd_n) input. |
| 2         | 0b<br>RO         | <b>Trailing Edge of Ring Indicator (TERI):</b> This is used to indicate that a change on the input ri_n (from an active-low to an inactive-high state) has occurred since the last time the MSR was read. '0' - no change on ri_n since last read of MSR '1' - change on ri_n since last read of MSR Reading the MSR clears the TERI bit. In Loopback Mode (MCR[4] = 1), TERI reflects when MCR[2] (Out1) has changed state from a high to a low. Note that PCU-UART does not implement the Ring Indicator (ri_n) input.                                                                                                                                 |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 33 PCU – System Management Bus (SMBus)

The SoC provides a System Management Bus (SMBus) 2.0 host controller. The host controller provides a mechanism for the processor to initiate communications with SMBus peripherals (slaves). The SoC is also capable of operating in a mode in which it can communicate with I<sup>2</sup>C compatible devices.

The SoC can perform SMBus messages with packet error checking (PEC) enabled or disabled. The actual PEC calculation and checking can be performed in either hardware or software.

The SMBus Address Resolution Protocol (ARP) is supported by using the existing host controller commands through software, except for the Host Notify command (which is actually a received message).

The programming model of the host controller is combined into two portions: a PCI configuration portion, and a system I/O mapped portion. All static configuration, such as the I/O base address, is done using the PCI configuration space. Real-time programming of the Host interface is done in system I/O space.

### 33.1 Signal Descriptions

Please see [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

Table 310. SMBus Signal Names

| Signal Name    | Direction<br>Plat. Power | Description                                                                                                                           |
|----------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| PCU_SMB_ALERT# | I/OD<br>V1P8S            | <b>SMBus Alert:</b> This signal is used to generate internal SMI#.<br><i>This signal is muxed and may be used by other functions.</i> |
| PCU_SMB_CLK    | I/OD<br>V1P8S            | <b>SMBus Clock:</b> External pull-up resistor is required.<br><i>This signal is muxed and may be used by other functions.</i>         |
| PCU_SMB_DATA   | I/OD<br>V1P8S            | <b>SMBus Data:</b> External pull-up resistor is required.<br><i>This signal is muxed and may be used by other functions.</i>          |

## 33.2 Features

### 33.2.1 Host Controller

The SMBus host controller is used to send commands to other SMBus slave devices. Software sets up the host controller with an address, command, and, for writes, data and optional PEC; and then tells the controller to start. When the controller has finished transmitting data on writes, or receiving data on reads, it generates an SMI# or interrupt, if enabled.
