### 19.6.225 DEPCMD\_25—Offset C99Ch

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**DEPCMD\_25:** [BAR] + C99Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

### 19.6.226 DEPCMDPAR2 26—Offset C9A0h

[illegible]

Intel Atom® Processor E3800 Product Family  
Datasheet  
2631

| Bit Range | Default & Access | Description                           |
|-----------|------------------|---------------------------------------|
| 31:0      | 0h<br>RW         | <b>PARAMETER:</b> Reg field PARAMETER |

### 19.6.228 DEPCMDPAR0\_26—Offset C9A8h

| Bit Range | Default & Access | Description                           |
|-----------|------------------|---------------------------------------|
| 31:0      | 0h<br>RW         | <b>PARAMETER:</b> Reg field PARAMETER |

### 19.6.229 DEPCMD\_26—Offset C9ACh

October 2018  
Document Number: 538136, Rev. 4.3

### 19.6.231 DEPCMDPAR1\_27—Offset C9B4h

| Bit Range | Default & Access | Description                           |
|-----------|------------------|---------------------------------------|
| 31:0      | 0h<br>RW         | <b>PARAMETER:</b> Reg field PARAMETER |

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**DEPCMDPAR1\_27:** [BAR] + C9B4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:22, F:0] + 10h

**Default:** 00000000h

When this event is set, it means that the ramp time is completed (GADPCTL.RTIM has reached its terminal value of 0x7FF). This is a debug feature that allows software to read the ramp time after each cycle.                                                                                                                                                                 |

## 20 Intel® High Definition Audio

The Intel® High Definition Audio (Intel® HD Audio) is an architecture and infrastructure to support high-quality audio implementations for PCs.

**Note:** The High Definition Audio interface is multiplexed on the same balls as LPE\_I2S[1:0].

**Note:** When High Definition Audio is active, the LPE Audio functionality is disabled.

The Intel® High Definition Audio (Intel® HD Audio) controller consists of a set of DMA engines that are used to move samples of digitally encoded data between system memory and internal/external CODECs. The controller communicates with the internal/external CODECs over the Intel® HD Audio serial link. The output DMA engines move digital data from system memory to a D-A converter in a CODEC. The SoC implements a single Serial Data Output (SDO) signal that is connected to the external CODECs. The input DMA engines move digital data from the A-D converter in the CODEC to system memory. The platform supports up to two external CODECs by implementing two Serial Data Input (SDI) signals, each being dedicated to a single CODEC.

Audio software renders outbound, and processes inbound data to/from buffers in memory. The location of the individual buffers is described by a Buffer Descriptor List that is fetched and processed by the audio controller. The data in the buffers is arranged in a pre-defined format. The output DMA engines fetch the digital data from memory and reformat it based on the programmed sample rate, bits/sample and number of channels. The data from the output DMA engines is then combined and serially sent to the CODEC(s) over the Intel® HD Audio link. The input DMA engines receive data from the CODEC(s) over the Intel® HD Audio link and format the data based on the programmable attributes for that stream. The data is then written to memory in the predefined format for software to process. Each DMA engine moves one "stream" of data. A single CODEC can accept or generate multiple "streams" of data, one for each A-D or D-A converter in the CODEC. Multiple CODECs can accept the same output "stream" processed by a single DMA engine.

Codec commands and responses are also transported to and from the CODEC via DMA engines. The DMA engine dedicated to transporting commands from the Command Output Ring Buffer (CORB) in memory to the CODEC(s) is called the CORB engine. The DMA engine dedicated to transporting responses from the CODEC(s) to the Response Input Ring Buffer in memory is called the RIRB engine. Every command sent to a CODEC yields a response from that CODEC. Some commands are “broadcast” type commands in which case a response will be generated from each CODEC. A CODEC may also be programmed to generate unsolicited responses, which the RIRB engine also processes. The platform also supports Programmed IO-based Immediate Command/Response transport mechanism that can be used by BIOS prior to memory initialization.

## 20.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

**Table 223. Signals**

| Signal Name   | Direction<br>Plat. Power | Description                                                                                                                                      |
|---------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| HDA_RST#      | O<br>VAUD                | <b>Intel HD Audio Reset:</b> Master H/W reset to external Codecs                                                                                 |
| HDA_SYNC      | O<br>VAUD                | <b>Intel HD Audio Sync:</b> 48 kHz fixed rate                                                                                                    |
| HDA_CLK       | O<br>VAUD                | <b>Intel HD Audio Bit Clock (Output):</b> 24 MHz serial data clock generated by the Intel HD Audio controller                                    |
| HDA_SDO       | O<br>VAUD                | <b>Intel HD Audio Data Out:</b> Serial TDM data output to the Codec(s). The serial output is double-pumped for a bit rate of 48 Mb/s             |
| HDA_SDI[1:0]  | I/O<br>VAUD              | <b>Intel HD Audio Serial Data In[1:0]:</b> Serial TDM data input from the CODEC(s). The serial input is single-pumped for a bit rate of 24 Mb/s. |
| HDA_LPE_RCOMP | O                        | Impedance/ current Compensation Output.                                                                                                          |

The signals in the table above are all muxed and maybe used by other functions.

## 20.2 Features

The Intel® HD Audio Controller supports the following features:

- Supports MSI and legacy interrupt delivery
- Support for ACPI D3 and D0 Device States
- Supports up to:
  - 6 streams (three input, three output)
  - 16 channels per stream
  - 32 bits/sample
  - 192 kHz sample rate
- 24 MHz HDA\_CLK supports
  - SDO double pumped at 48 Mb/s
  - SDI single pumped at 24 Mb/s
- Supports 1.5V mode only
- Supports optional Immediate Command/Response mechanism

## 20.3 References

High Definition Audio Specification, Revision 1.0a

- <http://www.intel.com/content/www/us/en/standards/high-definition-audio-specification.html>

## 20.4 Register Map

See Chapters 3 and 4 for additional information.

**Note:** PCI mode is supported, but not PCIe mode. Must set TM1.HAPD bit to 1b for PCI mode.

**Figure 105.**Intel® HD Audio Register Map

## 20.5 HD Audio PCI Configuration Registers

## 20.5.1 VID—Offset 0h

Vendor ID

### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**VID:** [B:0, D:27, F:0] + 0h

**Default:** 8086h

|     |    |   |   |   |
|-----|----|---|---|---|
| 15  | 12 | 8 | 4 | 0 |
| 1   | 0  | 0 | 0 | 0 |
| 0   | 0  | 0 | 0 | 0 |
| 1   | 0  | 0 | 0 | 0 |
| 0   | 1  | 1 | 0 | 0 |
| VID |    |   |   |   |

| Bit Range | Default & Access | Description           |
|-----------|------------------|-----------------------|
| 15:0      | 8086h<br>RO      | <b>VID:</b> Vendor ID |

## 20.5.2 DID—Offset 2h

Device ID

### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**DID:** [B:0, D:27, F:0] + 2h

| Bit Range | Default & Access | Description                                     |
|-----------|------------------|-------------------------------------------------|
| 1         | 0h<br>RW         | <b>MSE:</b> Memory space enable                 |
| 0         | 0h<br>RO         | <b>IOS:</b> I/O space enabled. Not implemented. |

## 20.5.4 STS—Offset 6h

Status

### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**STS:** [B:0, D:27, F:0] + 6h

**Default:** 0010h

|     |       |     |     |            |
|-----|-------|-----|-----|------------|
| 15  | 12    | 8   | 4   | 0          |
| 0   | 0     | 0   | 0   | 0          |

## 20.5.6 PI—Offset 9h

Programming Interface

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**PI:** [B:0, D:27, F:0] + 9h

**Default:** 00h

|    |   |   |
|----|---|---|
| 7  | 4 | 0 |
| 0  | 0 | 0 |
| PI |   |   |

| Bit Range | Default & Access | Description                      |
|-----------|------------------|----------------------------------|
| 7:0       | 0h<br>RO         | <b>PI:</b> Programming Interface |

## 20.5.7 SCC—Offset Ah

Sub Class Code

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**SCC:** [B:0, D:27, F:0] + Ah

**Default:** 03h

|     |   |   |   |   |   |   |   |   |   |
|-----|---|---|---|---|---|---|---|---|---|
| 7   |   |   |   | 4 |   |   |   |   | 0 |
| 0   | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |   |
| SCC |   |   |   |   |   |   |   |   |   |

| Bit Range | Default & Access | Description                |
|-----------|------------------|----------------------------|
| 7:0       | 03h<br>RO        | <b>SCC:</b> Sub Class Code |

## 20.5.8 BCC—Offset Bh

Base Class Code

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**BCC:** [B:0, D:27, F:0] + Bh

**Default:** 04h

|     |   |   |   |   |   |   |   |   |   |
|-----|---|---|---|---|---|---|---|---|---|
| 7   |   |   |   | 4 |   |   |   |   | 0 |
| 0   | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |   |
| BCC |   |   |   |   |   |   |   |   |   |

| Bit Range | Default & Access | Description                 |

| 7:0       | 04h<br>RO        | <b>BCC:</b> Base Class Code |

## 20.5.9 CLS—Offset Ch

Cache line size

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**CLS:** [B:0, D:27, F:0] + Ch

**Default:** 00h

|     |   |   |   |   |   |   |   |   |   |
|-----|---|---|---|---|---|---|---|---|---|
| 7   |   |   |   | 4 |   |   |   |   | 0 |
| 0   | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |   |
| CLS |   |   |   |   |   |   |   |   |   |

| Bit Range | Default & Access | Description                 |
|-----------|------------------|-----------------------------|
| 7:0       | 0h<br>RW         | <b>CLS:</b> Cache line size |

### 20.5.10 LT—Offset Dh

Latency timer

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**LT:** [B:0, D:27, F:0] + Dh

**Default:** 00h

|    |   |   |
|----|---|---|
| 7  | 4 | 0 |
| 0  | 0 | 0 |
| LT |   |   |

| Bit Range | Default & Access | Description              |
|-----------|------------------|--------------------------|
| 7:0       | 0h<br>RO         | <b>LT:</b> Latency timer |

### 20.5.11 HTYPE—Offset Eh

Header type

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**HTYPE:** [B:0, D:27, F:0] + Eh

**Default:** 00h

|       |   |   |
|-------|---|---|
| 7     | 4 | 0 |
| 0     | 0 | 0 |
| HTYPE |   |   |

| Bit Range | Default & Access | Description               |
|-----------|------------------|---------------------------|
| 7:0       | 0h<br>RO         | <b>HTYPE:</b> Header type |

### 20.5.12 BIST—Offset Fh

Built in self test. Not implemented.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**BIST:** [B:0, D:27, F:0] + Fh

**Default:** 00h

|      |   |   |
|------|---|---|
| 7    | 4 | 0 |
| 0    | 0 | 0 |
| BIST |   |   |

### 20.5.15 SVID—Offset 2Ch

subsystem vendor ID

## Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**SVID:** [B:0, D:27, F:0] + 2Ch

**Default:** 0000h

|      |   |   |   |    |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|------|---|---|---|----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| 0    | 0 | 0 | 0 | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| SVID |   |   |   |    |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

| Bit Range | Default & Access | Description                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------|
| 15:0      | 0h<br>RWO        | <b>SVID</b> : subsystem vendor ID. This field is written by BIOS. No hardware action is taken according to this register |

### 20.5.16 SID—Offset 2Eh

subsystem ID

## Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**SID:** [B:0, D:27, F:0] + 2Eh

**Default:** 0000h

|     |   |   |   |    |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|-----|---|---|---|----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 15  |   |   |   | 12 |   |   |   |   | 8 |   |   |   |   | 4 |   |   |   |   | 0 |
| 0   | 0 | 0 | 0 | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| SID |   |   |   |    |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

| Bit Range | Default & Access | Description                                                                                                     |
|-----------|------------------|-----------------------------------------------------------------------------------------------------------------|
| 15:0      | 0h<br>RWO        | <b>SID:</b> subsystem ID. This field is written by BIOS. No hardware action is taken according to this register |

### 20.5.17 CAPPTR—Offset 34h

## Capabilities pointer

## Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**CAPPTR:** [B:0, D:27, F:0] + 34h

**Default:** 50h

|        |   |   |   |   |   |   |   |
|--------|---|---|---|---|---|---|---|
| 7      |   |   | 4 |   |   |   | 0 |

## 20.5.20 AZCTL—Offset 40h

Azalia controller

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**AZCTL:** [B:0, D:27, F:0] + 40h

**Default:** 01h

|          |   |         |
|----------|---|---------|
| 7        | 4 | 0       |
| 0        | 0 | 1       |
| Reserved |   | AZ_AC97 |

| Bit Range | Default & Access | Description                                                               |
|-----------|------------------|---------------------------------------------------------------------------|
| 7:1       | 0h<br>RO         | <b>Reserved:</b> Reserved                                                 |
| 0         | 1h<br>RO         | <b>AZ_AC97# (AZ_AC97):</b> This register is always 1'b1 indicating Azalia |

## 20.5.21 IOBC—Offset 42h

IO Buffer control

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**IOBC:** [B:0, D:27, F:0] + 42h

**Default:** 00h

|            |      |            |

| 1:0       | 0h<br>RW         | <b>PS:</b> Power State (PS): This field is used both to determine the current power state of the Intel HD Audio controller and to set a new power state. The values are: 00 D0 state 11 D3HOT state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally; however, the data is discarded and no state change occurs. When in the D3HOT states, the Intel HD Audio controllers configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked. When software changes this value from the D3HOT state to the D0 state, an internal warm (soft) reset is generated, and software must re-initialize the function. |

| 0         | 01h<br>RW        | <b>BIT_ADDRESS_SUPPORTED:</b> A 1 indicates that the Intel HD Audio controller supports 64 bit addressing for BDL addresses data buffer addresses and command buffer addresses. |

## 20.6.2 VMIN—Offset 2h

Minor Version

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**VMIN:** [AZLBAR] + 2h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00h

|               |   |   |

| 1         | 0h<br>RW         | <b>FLUSH_CONTROL:</b> Writing a 1 to this bit initiates a flush. When the flush completion is received by the controller hardware sets the Flush Status bit and clears this Flush Control bit. Before a flush cycle is initiated the DMA Position Buffer must be programmed with a valid memory address by software but the DMA Position Buffer bit 0 need not be set to enable the position reporting mechanism. Also all streams must be stopped the associated RUN bit must be 0 . When the flush is initiated the controller will flush pipelines to memory to guarantee that the hardware is ready to transition to a D3 state. Setting this bit is not a critical step in the power state transition if the content of the FIFOs is not critical.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 0         | 0h<br>RW         | <b>CONTROLLER_RESET:</b> Writing a 0 to this bit causes the Intel HD Audio controller to be reset. All state machines FIFO s and non Suspend well memory mapped configuration registers except ECAP and PCI Configuration Registers in the controller will be reset. The Intel HD Audio link RESET signal will be asserted and all other link signals will be driven to their reset values. After the hardware has completed sequencing into the reset state it will report a 0 in this bit. Software must read a 0 from this bit to verify that the controller is in reset. Writing a 1 to this bit causes the controller to exit its reset state and de assert the Intel HD Audio link RESET signal. Software is responsible for setting clearing this bit such that the minimum Intel HD Audio link RESET signal assertion pulse width specification is met. When the controller hardware is ready to begin operation it will report a 1 in this bit. Software must read a 1 from this bit before accessing any controller registers. The CRST bit defaults to a 0 after hardware reset therefore software needs to write a 1 to this bit to begin operation. Note that the CORB RIRB RUN bits and all Stream RUN bits must be verified cleared to zero before CRST is written to 0 asserted in order to assure a clean re start. When setting or clearing CRST software must ensure that minimum link timing requirements minimum RESET assertion time etc. are met. When CRST is 0 indicating that the controller is in reset writes to all Intel HD Audio memory mapped registers are ignored as if the device is not present. The only exception is the Global Control register containing the CRST bit itself. The Global Control register is write able as a DWord Word or Byte even when CRST is 0 if the byte enable for the byte containing the CRST bit Byte Enable 0 is active. If Byte Enable 0 is not active writes to the Global Control register will be ignored when CRST is 0. When CRST is 0 reads to Intel HD Audio memory mapped registers will return their default value except for registers that are not reset with PLTRST or on a D3hot to D0 transition. |

## 20.6.7 WAKEEN—Offset Ch

Wake Enable

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**WAKEEN:** [AZLBAR] + Ch

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

| 7:0       | 00h<br>RW        | <b>STREAM_SYNCHRONIZATION_BITS:</b> The Stream Synchronization bits when set to 1 block data from being sent on or received from the link. Each bit controls the associated Stream Descriptor bit 0 corresponds to the first Stream Descriptor etc. To synchronously start a set of DMA engines the bits in the SSYNC register are first set to a 1. The RUN bits for the associated Stream Descriptors are then set to a 1 to start the DMA engines. When all streams are ready FIFORDY 1 the associated SSYNC bits can all be set to 0 at the same time and transmission or reception of bits to or from the link will begin together at the start of the next full link frame. To synchronously stop streams first the bits are set in the SSYNC register and then the individual RUN bits in the Stream Descriptors are cleared by software. The streams are numbered and the SSYNC bits assigned sequentially based on their order in the register set. Bit 0 Input Stream 1 Bit 1 Input Stream 2 Bit 2 Input Stream 3 Bit 3 Input Stream 4 Bit 4 Output Stream 1 Bit 5 Output Stream 2 Bit 6 Output Stream 3 Bit 7 Output Stream 4 Each bit can be reset by their respective stream reset. |

| 1         | 0h<br>RW         | <b>IMMEDIATE_RESULT_VALID:</b> This bit is set to a 1 by hardware when a new response is latched into the IRR register. This is a status flag indicating that software may read the response from the Immediate Response register. Software must clear this bit by writing a one to it before issuing a new command so that the software may determine when a new response has arrived.                                                                                                                                                                                                                                                                                                                                                                            |
| 0         | 0h<br>RW         | <b>IMMEDIATE_COMMAND_BUSY:</b> When this bit as read as a 0 it indicates that a new command may be issued using the Immediate Command mechanism. When this bit transitions from a 0 to a 1 via software writing a 1 the controller issues the command currently stored in the Immediate Command register to the codec over the link. When the corresponding response is latched into the Immediate Response register the controller hardware sets the IRV flag and clears the ICB bit back to 0. SW may write this bit to a 0 if the bit fails to return to 0 after a reasonable timeout period. Note that an Immediate Command must not be issued while the CORB RIRB mechanism is operating otherwise the responses conflict. This must be enforced by software. |

| 29        | 0h<br>RO         | <b>FIFO_READY:</b> For input streams the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set.                                                                                                                                                                                                                                                                                                                                                                                     |
| 28        | 0h<br>RW         | <b>DESCRIPTOR_ERROR:</b> Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort a Parity or ECC error on the bus or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it. |
| 27        | 0h<br>RW         | <b>FIFO_ERROR:</b> Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. For an input stream this indicates a FIFO overrun occurring while the RUN bit is set. When this happens the FIFO pointers don't increment and the incoming data is not written into the FIFO thereby being lost.                                                                                                                                                                                   |
| 26        | 0h<br>RW         | <b>BUFFER_COMPLETION_INTERRUPT_STATUS:</b> This bit is set to 1 by the hardware after the last sample of a buffer has been processed AND if the Interrupt on Completion IOC bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.                                                                                                                                                                                                                                         |

| 3         | 0h<br>RW         | <b>FIFO_ERROR_INTERRUPT_ENABLE:</b> This bit controls whether the occurrence of a FIFO error overrun for input will cause an interrupt or not. If this bit is not set bit 3 in the Status register will be set but the interrupt will not occur. Either way the samples will be dropped.                                                                                                                                                                                                                                                                                                                                                                                |
| 2         | 0h<br>RW         | <b>INTERRUPT_ON_COMPLETION_ENABLE:</b> This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set bit 2 in the Status register will be set but the interrupt will not occur.                                                                                                                                                                                                                                                                                                                                                                                                           |
| 1         | 0h<br>RW         | <b>STREAM_RUN:</b> When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.                                                                                                                                                                  |
| 0         | 0h<br>RW         | <b>STREAM_RESET:</b> Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers except the SRST bit itself and FIFO s for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted. |

### 20.6.36 ISDLPB—Offset 84h

Input Stream Descriptor 0 Link Position in Buffer

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ISDLPB:** [AZLBAR] + 84h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

Input Stream Descriptor 0 Cyclic Buffer Length

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ISDOCBL:** [AZLBAR] + 88h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

If this bit is not set bit 3 in the Status register will be set but the interrupt will not occur. Either way the samples will be dropped.                                                                                                                                                                                                                                                                                                                                                                                |
| 2         | 0h<br>RW         | <b>INTERRUPT_ON_COMPLETION_ENABLE:</b> This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set bit 2 in the Status register will be set but the interrupt will not occur.                                                                                                                                                                                                                                                                                                                                                                                                           |
| 1         | 0h<br>RW         | <b>STREAM_RUN:</b> When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.                                                                                                                                                                  |
| 0         | 0h<br>RW         | <b>STREAM_RESET:</b> Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers except the SRST bit itself and FIFO s for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted. |

## 20.6.45 ISD1LPIB—Offset A4h

Input Stream Descriptor 1 Link Position in Buffer

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ISD1LPIB:** [AZLBAR] + A4h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

Input Stream Descriptor 1 Cyclic Buffer Length

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ISD1CBL:** [AZLBAR] + A8h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:7      | 0h<br>RW         | <b>BUFFER_DESCRIPTOR_LIST_LOWER_BASE_ADDRESS:</b> Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted. Intel Reserved comment This field becomes WO and 0 s will be read when the Protect bit is set to 1.                                                                                           |
| 6:1       | 00h<br>RO        | <b>RESERVED0:</b> reserved                                                                                                                                                                                                                                                                                                                                                               |
| 0         | 0h<br>RW         | <b>PROTECT:</b> When this bit is set to 1 bits 31 7 0 of this register are WO and will return 0 s when read. When this bit is cleared to 0 bits 31 7 0 are RW. Note that this bit can only be changed when all four bytes of this register are written in a single write operation. If less than four bytes are written this bit retains its previous value. This bit is Intel Reserved. |

## 20.6.52 ISD1BDLPUBA—Offset BCh

Input Stream Descriptor 1 Buffer Descriptor List Pointer Upper Base Address

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ISD1BDLPUBA:** [AZLBAR] + BCh

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

Input Stream Descriptor 2 Cyclic Buffer Length

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ISD2CBL:** [AZLBAR] + C8h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

Diagram illustrating the structure of the `CYCLIC_BUFFER_LENGTH` field, which is 32 bits long. The field is divided into four 8-bit segments, each containing the value 0. The bit positions 31, 28, 24, 20, 16, 12, 8, 4, and 0 are marked above the segments.

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0      | 0h<br>RW         | <b>CYCLIC_BUFFER_LENGTH:</b> Indicates the number of bytes in the complete cyclic buffer. CBL must represent an integer number of samples. Link Position in Buffer LPIB will be reset when it reaches this value. Software may only write to this register after Global Reset Controller Reset or Stream Reset has occurred. This value should only be modified when the RUN bit is 0 . Once the RUN bit has been set to enable the engine software must not write to this register until after the next reset is asserted or transfers may be corrupted. |

### 20.6.56 ISD2LVI—Offset CCh

Input Stream Descriptor 2 Last Valid Index

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**ISD2LVI:** [AZLBAR] + CCh

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

## 20.6.62 ISD3CTL\_STS—Offset E0h

Input Stream Descriptor 3 Control and status

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ISD3CTL\_STS:** [AZLBAR] + E0h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00040000h

| 29        | 0h<br>RO         | <b>FIFO_READY:</b> For input streams the controller hardware will set this bit to 1 when a valid descriptor is loaded and the engine is ready for the RUN bit to be set.                                                                                                                                                                                                                                                                                                                                                                                     |
| 28        | 0h<br>RW         | <b>DESCRIPTOR_ERROR:</b> Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort a Parity or ECC error on the bus or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it. |
| 27        | 0h<br>RW         | <b>FIFO_ERROR:</b> Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. For an input stream this indicates a FIFO overrun occurring while the RUN bit is set. When this happens the FIFO pointers don't increment and the incoming data is not written into the FIFO thereby being lost.                                                                                                                                                                                   |
| 26        | 0h<br>RW         | <b>BUFFER_COMPLETION_INTERRUPT_STATUS:</b> This bit is set to 1 by the hardware after the last sample of a buffer has been processed AND if the Interrupt on Completion IOC bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.                                                                                                                                                                                                                                         |

| 3         | 0h<br>RW         | <b>FIFO_ERROR_INTERRUPT_ENABLE:</b> This bit controls whether the occurrence of a FIFO error overrun for input will cause an interrupt or not. If this bit is not set bit 3 in the Status register will be set but the interrupt will not occur. Either way the samples will be dropped.                                                                                                                                                                                                                                                                                                                                                                                |
| 2         | 0h<br>RW         | <b>INTERRUPT_ON_COMPLETION_ENABLE:</b> This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set bit 2 in the Status register will be set but the interrupt will not occur.                                                                                                                                                                                                                                                                                                                                                                                                           |
| 1         | 0h<br>RW         | <b>STREAM_RUN:</b> When set to 1 the DMA engine associated with this input stream will be enabled to transfer data in the FIFO to main memory. The SSYNC bit must also be cleared in order for the DMA engine to run. When cleared to 0 the DMA engine associated with this input stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.                                                                                                                                                                  |
| 0         | 0h<br>RW         | <b>STREAM_RESET:</b> Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers except the SRST bit itself and FIFO s for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted. |

### 20.6.63 ISD3LPB—Offset E4h

Input Stream Descriptor 3 Link Position in Buffer

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ISD3LPB:** [AZLBAR] + E4h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description                                                                                                                                                                                               |

## 20.6.69 ISD3BDLPLBA—Offset F8h

Input Stream Descriptor 3 Buffer Descriptor List Pointer Lower Base Address

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ISD3BDLPLBA:** [AZLBAR] + F8h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:7      | 0h<br>RW         | <b>BUFFER_DESCRIPTOR_LIST_LOWER_BASE_ADDRESS:</b> Lower address of the Buffer Descriptor List. This value should only be modified when the RUN bit is 0 or DMA transfers may be corrupted. Intel Reserved comment This field becomes WO and 0 s will be read when the Protect bit is set to 1.                                                                                           |

## 20.6.80 OSD1CTL\_STS—Offset 120h

Output Stream Descriptor 1 Control and status

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**OSD1CTL\_STS:** [AZLBAR] + 120h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00040000h

| 29        | 0h<br>RO         | <b>FIFO_READY:</b> For output streams the controller hardware will set this bit to a 1 while the output DMA FIFO contains enough data to maintain the stream on then link. This bit defaults to 0 on reset because the FIFO is cleared on a reset.                                                                                                                                                                                                                                                                                                           |
| 28        | 0h<br>RW         | <b>DESCRIPTOR_ERROR:</b> Indicates that a serious error occurred during the fetch of a descriptor. This could be a result of a Master Abort a Parity or ECC error on the bus or any other error which renders the current Buffer Descriptor or Buffer Descriptor List useless. This error is treated as a fatal stream error as the stream cannot continue running. The RUN bit will be cleared and the stream will stop. Software may attempt to restart the stream engine after addressing the cause of the error and writing a 1 to this bit to clear it. |
| 27        | 0h<br>RW         | <b>FIFO_ERROR:</b> Set when a FIFO error occurs. Bit is cleared by writing a 1 to this bit position. This bit is set even if an interrupt is not enabled. For an output stream this indicates a FIFO under run when there are still buffers to send. The hardware should not transmit anything on the link for the associated stream if there is not valid data to send.                                                                                                                                                                                     |
| 26        | 0h<br>RW         | <b>BUFFER_COMPLETION_INTERRUPT_STATUS:</b> This bit is set to 1 by the hardware after the last sample of a buffer has been processed AND if the Interrupt on Completion IOC bit is set in the command byte of the buffer descriptor. It remains active until software clears it by writing a 1 to this bit position.                                                                                                                                                                                                                                         |

| 3         | 0h<br>RW         | <b>FIFO_ERROR_INTERRUPT_ENABLE:</b> This bit controls whether the occurrence of a FIFO error under run for output will cause an interrupt or not. If this bit is not set bit 3 in the Status register will be set but the interrupt will not occur. Either way the samples will be dropped.                                                                                                                                                                                                                                                                                                                                                                             |
| 2         | 0h<br>RW         | <b>INTERRUPT_ON_COMPLETION_ENABLE:</b> This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set bit 2 in the Status register will be set but the interrupt will not occur.                                                                                                                                                                                                                                                                                                                                                                                                           |
| 1         | 0h<br>RW         | <b>STREAM_RUN:</b> When set to 1 the DMA engine associated with this output stream will be enabled to transfer data in the main memory to FIFO. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this output stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.                                                                                 |
| 0         | 0h<br>RW         | <b>STREAM_RESET:</b> Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers except the SRST bit itself and FIFO s for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted. |

## 20.6.81 OSD1LPB—Offset 124h

Output Stream Descriptor 1 Link Position in Buffer

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**OSD1LPB:** [AZLBAR] + 124h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 00000000h

Output Stream Descriptor 1 Cyclic Buffer Length

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**OSD1CBL:** [AZLBAR] + 128h

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

Intel Atom® Processor E3800 Product Family  
Datasheet  
2782

## 20.6.83 OSD1LVI—Offset 12Ch

Output Stream Descriptor 1 Last Valid Index

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**OSD1LVI:** [AZLBAR] + 12Ch

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

**Default:** 0000h

| 3         | 0h<br>RW         | <b>FIFO_ERROR_INTERRUPT_ENABLE:</b> This bit controls whether the occurrence of a FIFO error under run for output will cause an interrupt or not. If this bit is not set bit 3 in the Status register will be set but the interrupt will not occur. Either way the samples will be dropped.                                                                                                                                                                                                                                                                                                                                                                             |
| 2         | 0h<br>RW         | <b>INTERRUPT_ON_COMPLETION_ENABLE:</b> This bit controls whether or not an interrupt occurs when a buffer completes with the IOC bit set in its descriptor. If this bit is not set bit 2 in the Status register will be set but the interrupt will not occur.                                                                                                                                                                                                                                                                                                                                                                                                           |
| 1         | 0h<br>RW         | <b>STREAM_RUN:</b> When set to 1 the DMA engine associated with this output stream will be enabled to transfer data in the main memory to FIFO. The SSYNC bit must also be cleared in order for the DMA engine to run. For output streams the cadence generator is reset whenever the RUN bit is set. When cleared to 0 the DMA engine associated with this output stream will be disabled. Hardware will report a 0 in this bit when the DMA engine is actually stopped. Software must read a 0 from this bit before modifying related control registers or restarting the DMA engine.                                                                                 |
| 0         | 0h<br>RW         | <b>STREAM_RESET:</b> Writing a 1 causes the corresponding stream to be reset. The Stream Descriptor registers except the SRST bit itself and FIFO s for the corresponding stream are reset. After the stream hardware has completed sequencing into the reset state it will report a 1 in this bit. Software must read a 1 from this bit to verify that the stream is in reset. Writing a 0 causes the corresponding stream to exit reset. When the stream hardware is ready to begin operation it will report a 0 in this bit. Software must read a 0 from this bit before accessing any of the stream registers. The RUN bit must be cleared before SRST is asserted. |

### 20.6.90 OSD2LPIB—Offset 144h

### Output Stream Descriptor 2 Link Position in Buffer

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**OSD2LPIB: [AZLBAR] + 144h**

**AZLBAR Type:** PCI Configuration Register (Size: 32 bits)

|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:0      | 00h<br>RW        | <b>FIFO_SIZE:</b> Indicates the maximum number of bytes that could be fetched by the controller at one time. This is the maximum number of bytes that may have been DMA'd into memory but not yet transmitted on the link and is also the maximum possible value that the PICB count will increase by at one time. The FIFO size is calculated based on factors including the stream format programmed in OSD2FMT register. As the default value is zero, SW must write to the OSD2FMT register to kick off the FIFO size calculation and read back to find out the HW allocated FIFO size. |

### 20.6.95 OSD2FMT—Offset 152h

## Access Method

**OSD2FMT:** [AZLBAR] + 152h

**AZLBAR Reference:** [B:0, D:27, F:0] + 10h

## 21 Low Power Engine (LPE) for Audio (I<sup>2</sup>S)

The Low Power Engine for Audio provides acceleration for common audio and voice functions. The voice and audio engine provides a mechanism for rendering audio and voice streams and tones from the operating system, applications to an audio or voice codec, and ultimately to the speaker, headphones, or Bluetooth headsets.

Audio streams in the SoC can be encoded and decoded by the Low Power Engine (LPE) in the Audio subsystem.

LPE Audio provides three external I<sup>2</sup>S audio interfaces.

**Note:** LPE\_I2S[1:0] are multiplexed on the same balls as High Definition Audio.

**Note:** When LPE is active, the High Definition Audio functionality is disabled.

### 21.1 Signal Descriptions

See [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

**Table 226. LPE Signals**

| Signal Name                  | Direction<br>Plat. Power | Description                              |
|------------------------------|--------------------------|------------------------------------------|
| <b>LPE_I2S2[0:2]_CLK</b>     | I/O<br>V1P8S             | Clock signal for I <sup>2</sup> S        |
| <b>LPE_I2S2[0:2]_FRM</b>     | I/O<br>V1P8S             | Frame select signal for I <sup>2</sup> S |
| <b>LPE_I2S2[0:2]_DATAIN</b>  | I<br>V1P8S               | RX data for I <sup>2</sup> S             |
| <b>LPE_I2S2[0:2]_DATAOUT</b> | O<br>V1P8S               | TX data for I <sup>2</sup> S             |

† All LPE signals are muxed and may be used by other functions.

## 21.2 Features

The LPE Audio Subsystem consists of the following:

- Integrated, power-efficient 32-bit architecture core with 24-bit audio processing instructions
- Core processing speeds up to 343 MHz
- Closely Coupled Memories (CCMs)
  - 80KB Instruction RAM
  - 160KB Data RAM
  - 48KB Instruction Cache
  - 96KB Data Cache
- Very low-power consumption coupled with high-fidelity 24-bit audio
- Dual-issue, static, super-scalar VLIW processing engine
- Mode-less switching between 16-, 24-, and 64-bit dual-issue instructions
- Dual MACs which can operate with 32 x 16-bit and/or 24 x 24-bit operands
- Inter-Process Communication (IPC) mechanism to communicate with the SoC Processor Core including 4KB mailbox memory
- Flexible audio interfaces include three SSPs with I<sup>2</sup>S port functionality for I-directional audio transfers
  - I<sup>2</sup>S mode supports PCM payloads
  - Frame counters for all I<sup>2</sup>S ports
- High Performance DMA
  - DMA IP to support multiple outstanding transactions
  - Interleaved scatter-gather support for Audio DMA transfers
- Clock switching logic including new frequency increments

- External timer function with an always running clock.

The LPE core runs at a peak clock frequency of 343 MHz and has dedicated on-chip program and data memories and caches. The LPE core can access shared SRAM blocks, and external DRAM through OCP fabric. It communicates with audio peripherals using the audio sub-fabric, and employs Inter-Processor Communication (IPC) mechanism to communicate with the SoC Processor Core.

The Audio subsystem includes two OCP-based DMA engines. These DMA engines support single and multi-block transfers. They can be configured to transfer data between DRAM and audio CCMs or transfer data between CCMs and the audio peripheral interfaces

All these interfaces are peripherals in the Audio subsystem. LPE, LPE DMA, or the SoC processor core may access the peripherals during normal operation. The PMC may access all peripherals during specific tasks such as at boot time or during power state changes. A complete audio solution based on an internal audio processing engine which includes several I<sup>2</sup>S-based output ports.

The audio core used is a dedicated audio DSP core designed specifically for audio processing (decoding, post-processing, mixing, etc.)

**Note:** LPE requires systems with more than 512MB memory. This is required since the LPE firmware must reside at a stolen memory location on 512MB boundaries below 3 GiB. The LPE firmware itself is ~1MB, and is reserved by BIOS for LPE use.

## **21.3 Detailed Block Level Description**

### **21.3.1 LPE Core**

The LPE core in the SoC runs at maximum frequency of 343 MHz and interfaces with the rest of the SoC system through the OCP bus. It is one of the masters on the Audio Sub-Fabric. The SoC Processor Core and LPE DMA engines are the other masters on the fabric. The following figure shows the LPE core and its interfaces.

### Figure 106.Audio Cluster Block Diagram

The main DSP hardware is a two-multiplier, multiply/accumulate unit, a register file LPE\_PR to hold pairs of 24-bit data items, a register file LPE\_OR to hold 56-bit accumulator values, an arithmetic/logic unit to operate on the LPE\_PR and LPE\_OR values, and a shift unit to operate on the LPE\_PR and LPE\_OR values. The multiply/accumulate unit also supports multiplication of 32-bit values from LPE\_OR registers by 16-bit values from LPE\_PR registers, with the 48-bit result written or accumulated in the LPE\_OR register. The instructions for the DSP subsystems are built from operations that are divided into two sets: the slot 0 set and the slot 1 set. In each execution cycle, zero or one operations from each set can be executed independently according to the static bundling expressed in the machine code.

### 21.3.2 Memory Architecture

The LPE core is configured to use local memory and local caches. It has 80KB of Instruction Closely Coupled Memory (CCM), 160KB of Data CCM, 48KB of Instruction Cache and 96KB of Data Cache. The LPE core also has access to 4KB of mailbox memory and external DRAM.

**Figure 107. Memory Connections for LPE**

### 21.3.3 Instruction Closely Coupled Memory (CCM)

Instruction CCM for the core is used for loading commonly used routines as well as time-critical processing. Examples of time critical processing are acoustic echo cancellation and noise cancellation during voice calls.

Instruction CCM is initialized after reset by an external DMA controller. Runtime update of instruction CCM can be done either using explicit instructions or using an external DMA controller with inbound access.

### 21.3.4 Data Closely Coupled Memory (CCM)

Data CCM can be initialized after reset by an external DMA controller using inbound access. Runtime update of data CCM can be done either using stores to Data CCM or using an external DMA controller with inbound access.

### 21.3.5 Mailbox Memory and Data Exchange

The mailbox memory is a shared memory region in LPE address space that is accessible by the SoC Processor Core, PMC, and LPE. It is used when Doorbell registers cannot hold all the information that one processor wishes to communicate to the other. A typical example of such data blocks are audio stream related parameters when starting a new stream. The structures of data communicated through the mailbox are not defined in hardware so that software may partition the mailbox memory in any desired way and create any meaningful structures required.

## 21.4 Software Implementation Considerations

### 21.4.1 SoC Processor Core Cache Coherence

Traffic generated by the LPE core is considered non-cacheable and non-coherent with respect to the SoC Processor Core cache. DMA traffic is considered cacheable and checked for coherency with the SoC Processor Core cache.

Implications of this implementation are as follows:

- All code and tables for the LPE core need to be explicitly flushed from the SoC Processor Core cache if they are ever accessed.
- If the LPE core directly accesses data buffers in system DDR, the driver must explicitly flush the buffer from the SoC Processor Core cache
- If DMA accesses data buffers from system DRAM, the driver need not flush the data buffer from the SoC Processor Core cache.

## **21.4.2 Interrupts**

### **21.4.2.1 LPE Peripheral Interrupts**

Each of the LPE peripherals generates its own interrupts. SSP0, SSP1, and SSP2 have one interrupt each. Each of the DMA channels have individual interrupt lines. These interrupts are connected to the LPE core through the PISR register. The same interrupts are routed to IOAPIC through the ISRX register. The LPE core and SoC Processor Core have individual masks to enable these interrupts.

### **21.4.2.2 Interrupts Between SoC Processor Core and the LPE**

The interrupts between the SoC Processor Core and the LPE are handled through the inter-processor communication registers. Whenever the SoC Processor Core writes to the IPCX communication register an interrupt is generated to the LPE. The LPE firmware sees there is a message waiting from the SoC Processor Core, and reads the IPCX register for the data. This data is a pre-configured message, where the message structure has been decided beforehand between the SoC Processor Core and the LPE. Similarly we have the IPCD register for the communication between the LPE and SoC Processor Core. Once the LPE writes to the IPCD register, an interrupt should be generated for the SoC Processor Core and the SoC Processor Core should read the message from the IPCD register and act accordingly. From a software viewpoint, the mechanism remains the same as before. From a hardware view point, the interrupt to IA-32 gets routed by means of the IOAPIC block. The IPC from Audio to SoC Processor Core gets a dedicated interrupt line to the IOAPIC.

### **21.4.2.3 Interrupts between PMC and LPE**

The interrupts between PMC and LPE are also handled using Inter Process Communication registers.

## **21.4.3 Power Management Options for the LPE Core**

- WAITI
  - Allows the LPE core to suspend operation until an interrupt occurs by executing the optional WAITI instruction.
- External Run/Stall Control Signal
  - This processor input allows external logic to stall large portions of the LPE pipeline by shutting off the clock to much of the processor's logic to reduce operating power when the LPE computational capabilities are not immediately needed by the system.

**Note:** Using the WAITI instruction to power down the processor will save more power than use of the external run/stall signal because the WAITI instruction disables more of the LPE's internal clocks.

## 21.4.4 External Timer

This timer always runs from SSP clock (before M/N divider) at 19.2/25MHz. The timer starts running once the run bit (refer to the External timer register definition for details) is set and the clear bit is cleared.

The timer generates an Interrupt pulse when the counter value matches the “match” value. The interrupt does not get generated if the match value is set to “0”. The timer runs in free running mode and rolls over after all 32 bits have become all 1’s.

The timer continues to run as long as the run bit is set. Once the run bit is cleared the timer holds the current value. The clear bit needs to be set to restart the timer from “0”.

## 21.5 Clocks

### 21.5.1 Clock Frequencies

Table 227 shows the clock frequency options for the Audio functional blocks.

**Table 227. Clock Frequencies**

| Clock              | Frequency                                              | Notes                                                                    |
|--------------------|--------------------------------------------------------|--------------------------------------------------------------------------|

### 21.5.2 50 MHz Clock for LPE

50 MHz, the 2X OSC clock, is added to increase MIPS for low power MP3 mode. This frequency will be supplied by the clock doubler internal to the SoC’s Clock Control Unit.

### 21.5.3 Cache and CCM Clocking

Data CCM, Data cache, Instruction CCM, and Instruction Cache run off of the LPE clock. These memories are in a single clock domain.

**Note:** All Data CCM and Instruction CCM run in the same clock domain.

## 21.5.4 SSP Clocking

SSP could be used as either clock masters or clock slaves. Consequently, these IP have dual clock domains.

The first clock domain is clocked from an internal clock (e.g., fabric clock) and is used for generic logic like interrupt generation and register access.

The second clock domain drives the serial shift register (either driven internally or externally). When driven internally, this clock can be sourced from XTAL clock 25 MHz or PLL 19.2 MHz. These clocks are then divided down within the serial interface IP to generate the final bit clock for the interface.

After power on, if the SSP input IO clock is in high state, first transition of the clock from high to low may be missing due to the Soc clock gating logic.

**Note:** “Frame Master” mode cannot be used when operating as clock slave and “Frame Slave” mode cannot be used when operating as clock master.

## 21.5.5 M/N Divider

LPE SSP in master mode uses the SSP CCLK to drive the serial clock. It has very limited option to divide CCLK. An M/N divider is added between the 19.2/25 MHz clock (XOSC) from CCU to each SSP CCLK input as shown in following diagram:

**Figure 108.SSP CCLK Structure**

**Note:** The maximum SSP CCLK frequency is listed in Table 132.

The LPE M/N divider is designed to produce a clock signal for the SSP block used in master mode. The divider is based on a generic NOM/DENOM divider. The supplied Master clock is 25 MHz (XTAL) or 19.2 MHz (LPPLL), but usually be used by the 25 MHz clock.

This mechanism is good for a wide spectrum of generated clocks. Two registers must be configured to get the target SSP clock. The values for the Nominator and Denominator registers are the smallest divider of:

$$\frac{\text{Nominator}}{\text{Denominator}} = \frac{\text{Source\_clock}}{\text{Target\_clock}}$$

#### 21.5.5.1 Example

If we want to generate 17.64 MHz (=400x44.1 KHz) output clock out of 25 MHz clock, we need to program "NOM = 441" and "DENOM = 625":

$$17.64 \text{ MHz} = (441/625) \times 25 \text{ MHz}$$

In general the M over N can generate fractional divisor that could be used for generating the required clocks for Audio codec. [Table 228](#) describes some configuration options of this generic divider:

**Table 228. M/N Values, Examples**

| Source Clock Frequency | Requested Clock         | M/N Value  |
|------------------------|-------------------------|------------|
| 25 MHz                 | 48 KHz                  | 6/3125     |
|                        | 48K x 24 = 1.152 MHz    | 1152/25000 |
|                        | 48K x 32 = 1.536 MHz    | 1536/25000 |
|                        | 48K x 64 = 3.072 MHz    | 3072/25000 |
|                        | 44.1 KHz                | 441/250000 |
|                        | 48K x 400 = 19.2 MHz    | 96/125     |
|                        | 44.1K x 400 = 17.64 MHz | 441/625    |

#### 21.5.5.2 Accuracy and Jitter

The output of the M/N is equal to the desired clock in average with Jitter of 20nTXE for 25 MHz input clock.

#### 21.5.5.3 Configuration

Following configurable fields per M/N divider/SSP are in LPE shim registers:

**Table 229. M/N Configurable Fields**

| Field   | Width   | Description                                                                      |
|---------|---------|----------------------------------------------------------------------------------|
| Bypass  | 1 bit   | When set M/N divider is bypass. Clock from CCU is connected directly to SSP CCLK |
| EN      | 1 bit   | Enable the divider                                                               |
| Update  | 1 bit   | Update divider parameters                                                        |
| M Value | 20 bits | Nominator value                                                                  |
| N Value | 20 bits | Denominator value                                                                |

## 21.6 SSP (I<sup>2</sup>S)

The SoC audio subsystem consists of the LPE Audio Engine and three Synchronous Serial Protocol (SSP) ports. These ports are used in PCM mode and enable simultaneous support of voice and audio streams over I<sup>2</sup>S. The SoC audio subsystem also includes two DMA controllers dedicated to the LPE. The LPE DMA controllers are used for transferring data between external memory and CCMs, between CCMs and the SSP ports, and between CCMs. All peripheral ports can operate simultaneously.

### 21.6.1 Introduction

The Enhanced SSP Serial Ports are full-duplex synchronous serial interfaces. They can connect to a variety of external analog-to-digital (A/D) converters, audio, and telecommunication codecs, and many other devices which use serial protocols for transferring data. Formats supported include National\* Microwire, Texas Instruments\* Synchronous Serial Protocol (SSP), Motorola\* Serial Peripheral Interface (SPI) protocol and a flexible Programmable Serial Port protocol (PSP).

The Enhanced SSPs operate in master mode (the attached peripheral functions as a slave) or slave mode (the attached peripheral functions as a master), and support serial bit rates from 0 to 25 Mbps, dependent on the input clock. Serial data formats range from 4 to 32-bits in length. Two on-chip register blocks function as independent FIFOs for transmit and receive data.

FIFOs may be loaded or emptied by the system processor using single transfers or DMA burst transfers of up to the FIFO depth. Each 32-bit word from the bus fills one entry in a FIFO using the lower significant bits of a 32-bit word.

### 21.6.2 SSP Features

The SSP port features are:

- Inter-IC Sound (I<sup>2</sup>S) protocols, are supported by programming the Programmable Serial Protocol (PSP).
- One FIFO for transmit data (TXFIFO) and a second, independent, FIFO for receive data (RXFIFO), where each FIFO is 16 samples deep x 32 bits wide
- Data sample sizes from 8, 16, 18 and 24bits

- 12.5 Mbps maximum serial bit-rate in both modes: master and slave.
- Clock master or slave mode operations
- Receive-without-transmit operation
- Network mode with up to eight time slots for PSP formats, and independent transmit/receive in any/all/none of the time slots.
- After updating SSP configuration, for example active slot count, the SSP will need to be disabled and enabled again. In other words, a SSP will not function correctly if a user changes the configuration setting on the fly.

### 21.6.3 Operation

Serial data is transferred between the LPE core or the SoC Processor Core and an external peripheral through FIFOs in one of the SSP ports. Data transfers between an SSP port and memory are initiated by either the LPE core or the SoC Processor Core using programmed I/O, or by DMA bursts. Although it is possible to initiate transfers directly from the SoC Processor Core, current driver design uses LPE for all PCM operations. Separate transmit and receive FIFOs and serial data paths permit simultaneous transfers in both directions to and from the external peripheral, depending on the protocols chosen.

Programmed I/O can transfer data between:

- The LPE core and the FIFO Data register for the TXFIFO
- The SoC Processor Core and the FIFO Data register for the TXFIFO
- The LPE core and the FIFO Data register for the RXFIFO
- The SoC Processor Core and the FIFO Data register for the RXFIFO
- The SoC Processor Core and the control or status registers
- The LPE core and the control or status registers

DMA bursts can transfer data between:

- Universal memory and the FIFO Data register for the TXFIFO
- Universal memory and the FIFO Data register for the RXFIFO
- Universal memory and the sequentially addressed control or status registers

### 21.6.4 LPE and DMA FIFO Access

The LPE or DMA access data through the Enhanced SSP Port's Transmit and Receive FIFOs. An LPE access takes the form of programmed I/O, transferring one FIFO entry per access. LPE accesses would normally be triggered off of an SSSR Interrupt and must always be 32 bits wide. LPE Writes to the FIFOs are 32 bits wide, but the serializing logic will ignore all bits beyond the programmed FIFO data size (EDSS/DSS value). LPE Reads to the FIFOs are also 32 bits wide, but the Receive data written into the RX FIFO (from the RXD line) is stored with zeroes in the MSBs down to the programmed data size. The FIFOs can also be accessed by DMA bursts, which must be

in multiples of 1, 2 or 4 bytes, depending upon the EDSS value, and must also transfer one FIFO entry per access. When the SSCR0.EDSS bit is set, DMA bursts must be in multiples of 4 bytes (the DMA must have the Enhanced SSP configured as a 32-bit peripheral). The DMA's width register must be at least the SSP data size programmed into the SSP control registers EDSS and DSS. The FIFO is seen as one 32-bit location by the processor. For Writes, the Enhanced SSP port takes the data from the Transmit FIFO, serializes it, and sends it over the serial wire (I2S[2:0]\_DATAOUT) to the external peripheral. Receive data from the external peripheral (on I2S[2:0]\_DATAIN) is converted to parallel words and stored in the Receive FIFO.

A programmable FIFO trigger threshold, when exceeded, generates an Interrupt or DMA service request that, if enabled, signals the CPU or DMA respectively to empty the Receive FIFO or to refill the Transmit FIFO.

The Transmit and Receive FIFOs are differentiated by whether the access is a Read or a Write transfer. Reads automatically target the Receive FIFO, while Writes will write data to the Transmit FIFO. From a memory-map perspective, they are at the same address. FIFOs are 16 samples deep by 32 bits wide. Each read or write is to 1 SSP sample.

### 21.6.5 Supported Formats

The SSP consists of four pins that are used to transfer data between the SoC and external Audio codecs, modems, or other peripherals. Although four serial-data formats exist, each has the same basic structure, and in all cases the following pins are used in the following manner:

- I2Sx\_CLK—Defines the bit rate at which serial data is driven onto and sampled from the port
- I2Sx\_FRM—Defines the boundaries of a basic data "unit," comprised of multiple serial bits
- I2Sx\_DATAIN—The serial data path for transmitted data, from system to peripheral
- I2Sx\_DATAOUT—The serial data path for received data, from peripheral to system

A data frame can contain from 4 to 32 bits, depending on the selected format. Serial data is transmitted most significant bit first. The Programmable Serial Protocol (PSP) format is used to implement I<sup>2</sup>S.

Master and Slave modes are supported. When driven by the Enhanced SSP, the I2Sx\_CLK only toggles during active transfers (not continuously) unless ECRA/ECRB functions are used. When the I2Sx\_CLK is driven by another device, it is allowed to be either continuous or only driven during transfers, but certain restrictions on PSP parameters apply.

Normally, the serial clock (I2Sx\_CLK), if driven by the Enhanced SSP Port, only toggles while an active data transfer is underway. There are several conditions, however, that may cause the clock to run continuously. If the Receive With Out Transmit mode is enabled by setting the SSCR1.RWOT bit to 1, the I2Sx\_CLK will toggle regardless of whether Transmit data exists within the Transmit FIFO. The I2Sx\_CLK will also toggle continuously if the Enhanced SSP is in Network mode, or if ECRA, or ECRB is enabled. At other times, I2Sx\_CLK will be held in an inactive I2Sx\_FRM or idle state, as defined by the specified protocol under which it operates.

#### 21.6.5.1 Programmable Serial Protocol (PSP)

There are many variations of the frame behavior for different codecs and protocol formats. To allow flexibility the PSP format allows I2Sx\_FRM to be programmable in direction, delay, polarity, and width. Master and Slave modes are supported. PSP can be programmed to be either full or half duplex.

The I2Sx\_CLK function behavior varies between each format. PSP lets programmers choose which edge of I2Sx\_CLK to use for switching Transmit data, and for sampling Receive data. In addition, programmers can control the idle state for I2Sx\_CLK and the number of active clocks that precede and follow the data transmission.

The PSP format provides programmability for several parameters that determine the transfer timings between data samples. There are four possible serial clock sub-modes, depending on the I2Sx\_CLK edges selected for driving data and sampling received data, and the selection of idle state of the clock.

For the PSP format, the Idle and Disable modes of the I2Sx\_DATAOUT, I2Sx\_CLK, and I2Sx\_FRM are programmable by means of the SSPSP.ETDS, SSPSP.SCMODE and SSPSP.SFRMP bits. When Transmit data is ready, the I2Sx\_CLK will remain in its Idle state for the number of serial clock (I2Sx\_CLK) clock periods programmed within the Start Delay (SSPSP.STRTDLY) field. I2Sx\_CLK will then start toggling, I2Sx\_DATAOUT will remain in the idle state for the number of cycles programmed within the Dummy Start (SSPSP.DMYSTRT) field. The I2Sx\_FRM signal will be asserted after the number of half-clocks programmed in the SSPSP.SFRDLY field. The I2Sx\_FRM signal will remain asserted for the number of clocks programmed within the SSPSP.SFRMWDTH then de-assert. Four to 32 bits can be transferred per frame. Once the last bit (LSB) is transferred, the I2Sx\_CLK will continue toggling based off the Dummy Stop (SSPSP.DMYSTOP) field. I2Sx\_DATAOUT either retains the last value transmitted or is forced to zero, depending on the value programmed within the End of Transfer Data State (SSPSP.ETDS) field, when the controller goes into Idle mode, unless the Enhanced SSP port is disabled or reset (which forces I2Sx\_DATAOUT to zero).

With the assertion of I2Sx\_FRM, Receive data is simultaneously driven from the peripheral on I2Sx\_DATAIN, most significant bit first. Data transitions on I2Sx\_CLK based on the Serial Clock Mode selected and is sampled by the controller on the opposite edge. When the Enhanced SSP is a master to the frame synch (I2Sx\_FRM) and a slave to the clock (I2Sx\_CLK), then at least three extra clocks (I2Sx\_CLKs) will be needed at the beginning and end of each block of transfers to synchronize control signals from the APB clock domain into the SSP clock domain (a block of transfers is a group of back-to-back continuous transfers).

**Figure 109. Programmable Serial Protocol Format**

**Figure 110. Programmable Serial Protocol Format (Consecutive Transfers)**

**Table 230. Programmable Protocol Parameters**

| Symbol | Definition<br>(Register.Bit Field)         | Range                                                                                                                           | Units                |
|--------|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|----------------------|

|        | Serial Frame Polarity<br>(SSPSP.SFRMP)     | High or Low                                                                                                                     |                      |
| T1     | Start Delay<br>(SSPSP.STRTDLY)             | 0–7                                                                                                                             | Clock Period         |
| T2     | Dummy Start<br>(SSPSP.DMYSTRT)             | 0–3                                                                                                                             | Clock Period         |
| T3     | Data Size<br>(SSCRO.EDSS AND SSCRO.DSS)    | 4–32                                                                                                                            | Clock Period         |
| T4     | Dummy Stop<br>(SSPSP.DMYSTOP)              | 0–3                                                                                                                             | Clock Period         |
| T5     | I2Sx_FRM Delay<br>(SPSP.SFRMDLY)           | 0–88                                                                                                                            | Half Clock<br>Period |
| T6     | I2Sx_FRM Width<br>(SSPSP.SFRMWDTH)         | 1–44                                                                                                                            | Clock Period         |
|        | End of Transfer Data State<br>(SSPSP.ETDS) | Low or [bit 0]                                                                                                                  |                      |

**Note:** The I2Sx\_FRM Delay must not extend beyond the end of T4. I2Sx\_FRM Width must be asserted for at least 1 I2Sx\_CLK, and should be de-asserted before the end of the T4 cycle (for example, in terms of time, not bit values,  $(T5 + T6) \leq (T1 + T2 + T3 + T4)$ ,  $1 \leq T6 < (T2 + T3 + T4)$ , and  $(T5 + T6) \geq (T1 + 1)$  to ensure that I2Sx\_FRM is asserted for at least 2 edges of the I2Sx\_CLK). The T1 Start Delay value should be programmed to 0 when the I2Sx\_CLK is enabled by either of the SSCR1.ECRA or SSCR1.ECRB bits. While the PSP can be programmed to generate the assertion of I2Sx\_FRM during the middle of the data transfer (after the MSB was sent), the Enhanced SSP will not be able to receive data in Frame slave mode (SSCR1SFRMDIR = 1) if the assertion of Frame is not before the MSB is sent (i.e.  $T5 \leq T2$  if SSCR1.SFRMDIR = 1). Transmit Data will transition from the “End of Transfer Data State” to the next MSB value upon the assertion of Frame. The Start Delay field should be programmed to 0 whenever I2Sx\_CLK or I2Sx\_FRM is configured as an input. Clock state is not defined between two active frame periods. Clock can be active or inactive between two active frame periods.

## 21.7 Programming Model

The CPU or DMA access data through the Enhanced SSP Port’s Transmit and Receive FIFOs. A CPU access takes the form of programmed I/O, transferring one FIFO entry per access. CPU accesses would normally be triggered off of an SSSR Interrupt and

must always be 32 bits wide. The CPU Writes to the FIFOs are 32 bits wide, but the serializing logic will ignore all bits beyond the programmed FIFO data size (EDSS/DSS value). CPU Reads to the FIFOs are also 32 bits wide, but the Receive data written into the RX FIFO (from the RXD line) is stored with zeroes in the MSBs down to the programmed data size. The FIFOs can also be accessed by DMA bursts, which must be in multiples of 1, 2, or 4 bytes, depending upon the EDSS value, and must also transfer one FIFO entry per access. When the SSCR0.EDSS bit is set, DMA bursts must be in multiples of 4 bytes (the DMA must have the Enhanced SSP configured as a 32-bit peripheral). The DMA DCMD.width register must be at least the SSP data size programmed into the SSP control registers EDSS and DSS. The FIFO is seen as one 32-bit location by the processor. For Writes, the Enhanced SSP port takes the data from the Transmit FIFO, serializes it, and sends it over the serial wire (I2Sx\_DATAOUT) to the external peripheral. Receive data from the external peripheral (on I2Sx\_DATAIN) is converted to parallel words and stored in the Receive FIFO.

A programmable FIFO trigger threshold, when exceeded, generates an Interrupt or DMA service request that, if enabled, signals the IA-32 CPU or DMA respectively to empty the Receive FIFO or to refill the Transmit FIFO. The Transmit and Receive FIFOs are differentiated by whether the access is a Read or a Write transfer. Reads automatically target the Receive FIFO, while Writes will write data to the Transmit FIFO. From a memory-map perspective, they are at the same address. Each read or write is 1 SSP sample.

### **21.7.1 PIO and DMA Programming Considerations**

All CPU and DMA accesses transfer one FIFO entry per access. Data in the FIFOs is always stored with one 32-bit value per data sample, regardless of the format data word length. Within each 32-bit field, the stored data sample is right-justified, with the least significant bit of the word in bit 0. In the Receive FIFO, unused bits are packed as zeroes above the most significant bit. In the Transmit FIFO, unused don't-care bits are above the most significant bit (i.e., DMA and CPU access do not have to write to the unused bit locations). Logic in the Enhanced SSP automatically formats data in the Transmit FIFO so that the sample is properly transmitted on I2Sx\_DATAOUT in the selected frame format.

Two separate and independent FIFOs are present for Transmit (to peripheral) and Receive (from peripheral) serial data. FIFOs are filled or emptied by programmed I/O or DMA bursts.

#### **21.7.1.1 Programmed IO Considerations**

FIFO filling and emptying can be performed by the processor in response to an Interrupt from the FIFO logic. Each FIFO has a programmable FIFO trigger threshold at which an Interrupt is triggered. When the number of entries in the Receive FIFO exceeds the SSCR1.RFT value, an interrupt is generated (if enabled), which signals the CPU to empty the Receive FIFO. When the number of entries in the Transmit FIFO is less than or equal to the SSCR1.TFT value plus 1, an Interrupt is generated (if enabled), which signals the CPU to refill the Transmit FIFO.

Users can also poll the Enhanced SSP Status register to determine how many samples are in a FIFO, and whether the FIFO is full or empty. Software is responsible for ensuring that the proper RFT and TFT values are chosen to prevent ROR and TUR error conditions.

**Note:** If the software attempts to read from an empty Receive FIFO, it will receive a duplicate of the previously read value.

### 21.7.1.2 DMA Considerations

The DMA controller can also be programmed to transfer data to and from the Enhanced SSP FIFOs. To prevent over-runs of the Transmit FIFO or under-runs of the Receive FIFO when using the DMA, be careful when setting the Transmit and Receive FIFO trigger threshold levels.

There are restrictions on how the DMA can be programmed when used with the SSP Controller.

- The DMA Transfer Width must be greater than or equal to the SSP data size. For example if the SSP Data Size is 16b then the DMA Transfer Width should be 16b.
- The DMA may not support the DMA Transfer Width of the SSP Data Size and therefore the DMA Transfer Width must be larger than the SSP Data Size. If this is the case then software must manage any extra data bits.
- The DMA Burst Transaction Length for RX must be less than or equal to the RX Threshold.
- The DMA Burst Transaction Length for TX must be less than or equal to the number of empty locations in the TX FIFO. A safe value is the Total TX FIFO Size - TX Threshold.
- DMA must be in Fixed Address mode to read or write the SSP Data Register.

In full-duplex formats where the Enhanced SSP always receives the same number of data samples as it transmits, the DMA should be set up to transmit and receive the same number of bytes.

**Note:** A TFT value of 0 means that there is one sample left in the TX FIFO.

Because the Enhanced SSP is not flow controlled, software must program the TX FIFO Threshold (TFT), RX FIFO Threshold (RFT), and the DMA burst size to ensure that a TX FIFO overflow or RX FIFO underflow does not occur. Software must also ensure that the Enhanced SSP DMA requests are properly prioritized in the system to prevent fatal overruns and under-runs.

The programming model for using the DMA is as follows:

- Program the total number of Transmit/Receive byte lengths, DMA burst, and DMA Width in the DMA.
- Set the preferred values in the Enhanced SSP Control registers.
- Enable the Enhanced SSP by setting SSCR0.SSE.
- Set the run bit in DMA Command Register.

- The DMA will wait for either the Transmit or Receive Service requests.
- If the Transmit/Receive byte length is not an even multiple of the transfer burst size, a trailing byte condition may occur.

## **21.7.2 Trailing Bytes in the Receive FIFO**

When the number of samples in the Receive FIFO is less than its FIFO trigger threshold level, and no additional data is received, the remaining bytes are called trailing bytes. Trailing bytes can be handled by either the DMA or the processor, as indicated by the SSCR1.TRAIL bit. Trailing bytes are identified by means of a timeout mechanism and the existence of data within the Receive FIFO.

### **21.7.2.1 Timeout**

A timeout condition exists when the Receive FIFO has been idle for a period of time (in APB clocks) defined by the value programmed within the Timeout register (SSTO). When a timeout occurs, the receiver timeout interrupt SSSR.TINT bit will be set to a 1, and if the Timeout Interrupt is enabled SSCR1.TINTE=1, a Timeout Interrupt will occur to signal the processor that a timeout condition has occurred. The timeout timer is reset after a new sample is received. Once the SSSR.TINT bit is set it must be cleared by software by writing a 1 to it. Clearing this bit also causes the Timeout Interrupt, if enabled, to be de-asserted.

### **21.7.2.2 Peripheral Trailing Byte Interrupt**

It is possible for the DMA to reach the end of its Descriptor chain while removing Receive FIFO data. When this happens, the processor is forced to take over because the DMA can no longer service the Enhanced SSP request until a new chain is linked. When the DMA has reached the end of its Descriptor chain, and there is data in the receive FIFO, the Enhanced SSP will do the following:

- Sets the peripheral trailing byte interrupt SSSR.PINT bit to 1
- Asserts the Enhanced SSP Interrupt to signal to the processor that a Peripheral Trailing Byte Interrupt condition has occurred (if SSCR1.PINTE=1 to enable the interrupt).
- Sets the SSSR.EOC status bit which must be cleared by software. If more data is received after the EOC bit was set (and EOC bit is still set), then the SSSR.PINT bit will be set to a 1.

Once the SSSR.PINT bit is set, it must be cleared by software by writing a 1 to it. Clearing the SSSR.PINT bit also de-asserts the Peripheral Interrupt if it has been enabled (SSCR1.PINTE=1).

The remaining bytes must then be removed by means of a processor I/O as described in the processor-based method below, or by reprogramming a new Descriptor chain and restarting the DMA. Programmers need to be aware of this possibility. Refer to the DMA chapter for details on Descriptor programming and “end of chain” events.

### 21.7.2.3 Removing Trailing Bytes (Processor Based SSCR1.TRAIL=0)

This is the default method indicated by a zero in the SSCR1.TRAIL bit. In this case, no Receive DMA service request is generated. To read out the trailing bytes, software should wait for the timeout Interrupt and then read all remaining entries as indicated by the SSSR.RFL and SSSR.RNE bits within the Enhanced SSP Status register (SSSR).

**Note:** To use the Trailing bytes feature through the CPU, the Timeout Interrupt must be enabled by setting SSCR1.TINTE=1 (to enable the interrupt).

### 21.7.2.4 Removing Trailing Bytes (DMA Based SSCR1.TRAIL=1)

When the DMA is to handle trailing bytes (SSCR1.TRAIL = 1) a DMA service request is automatically issued for the remaining number of samples left in the Receive buffer. The DMA will then empty the contents of the Receive buffer unless the DMA reaches the end of its Descriptor chain. If a timeout occurs, the processor is only interrupted by means of a Timeout Interrupt if it has been enabled by setting SSCR1.TINTE=1. When handling trailing bytes by means of the DMA, if a timeout occurs and the receive FIFO is empty, an End-of-Receive (EOR) will be sent to the DMA Controller. If an EOC occurs at the time that the last sample is read out of the FIFO (the DMA descriptor chain was just exactly long enough), and the timeout counter is still running (that is, a time out has not occurred and the SSTS register is non-zero), then, when the time out does occur, the Enhanced SSP will generate a DMA request which will create an RAS interrupt from the DMA. When this occurs, software must re-program the DMA registers and re-enable the channel for the Enhanced SSP to send its EOR to the DMA controller.

### 21.9.6 reg\_BAR1\_type (BAR1)—Offset 14h

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

October 2018  
Document Number: 538136, Rev. 4.3

## Access Method

**EXPANSION ROM BASEADDR:** [0/21/0] + 30h

|                    |    |    |    |    |    |   |   |   |
|--------------------|----|----|----|----|----|---|---|---|
| 31                 | 28 | 24 | 20 | 16 | 12 | 8 | 4 | 0 |
| 0                  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 |
| EXPANSTON_ROM_BASE |    |    |    |    |    |   |   |   |

| Bit Range | Default & Access | Description                                                                          |
|-----------|------------------|--------------------------------------------------------------------------------------|
| 31:0      | 00000000h<br>RO  | <b>EXPANSION_ROM_BASE:</b> Value of all zeros indicates no support for Expansion ROM |

### 21.9.9 reg\_CAPABILITYPTR\_type (CAPABILITYPTR)—Offset 34h

## CAPABILITYPTR - Capabilities Pointer

## Access Method

**CAPABILITYPTR:** [0/21/0] + 34h

|           |    |    |    |    |    |   |              |   |
|-----------|----|----|----|----|----|---|--------------|---|
| 31        | 28 | 24 | 20 | 16 | 12 | 8 | 4            | 0 |
| 0         | 0  | 0  | 0  | 0  | 0  | 0 | 0            | 0 |
| Reserved0 |    |    |    |    |    |   | CAPPTR_POWER |   |

| Bit Range | Default & Access | Description                                                                                                               |
|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------|
| 31:8      | 000000h<br>RO    | <b>Reserved0:</b> reserved                                                                                                |
| 7:0       | 80h<br>RO        | <b>CAPPTR_POWER:</b> Indicates what the next capability is. This capability points to the PM Capability, 0x80, structure. |

## 21.9.10 reg\_INTERRUPTREG\_type (INTERRUPTREG)—Offset 3Ch

INTERRUPTREG - Interrupt Register

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**INTERRUPTREG:** [0/21/0] + 3Ch

**Default:** 00000100h

|         |    |    |    |           |    |   |   |         |
|---------|----|----|----|-----------|----|---|---|---------|
| 31      | 28 | 24 | 20 | 16        | 12 | 8 | 4 | 0       |
| 0       | 0  | 0  | 0  | 0         | 0  | 0 | 0 | 0       |
| 0       | 0  | 0  | 0  | 0         | 0  | 0 | 1 | 0       |

### 21.11.1 reg\_CSR\_type (CSR)—Offset 0h

This register controls clock and reset of the block, various configurations of the block and reflects general status of the block.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 64 bits)

**CSR:** [BAR + 140000h] + 0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000001E40001h

### 21.11.7 reg\_IMRD\_type (IMRD)—Offset 30h

IMRD

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 64 bits)

**IMRD:** [BAR + 140000h] + 30h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

### 21.11.8 reg\_IPCX\_type (IPCX)—Offset 38h

## Access Method

**IPCX:** [BAR + 140000h] + 38h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

Timing diagram showing the relationship between IA\_LPE\_BUSY and IA\_LPE\_DONE signals. The x-axis represents time in nanoseconds (ns), ranging from 0 to 20 ns. The y-axis shows the signal levels for IA\_LPE\_BUSY and IA\_LPE\_DONE.

- IA\_LPE\_BUSY** (Active Low): Starts high (inactive) at 0 ns, transitions to low (active) at 63 ns, and returns to high (inactive) at 12 ns.
- IA\_LPE\_DONE** (Active Low): Starts high (inactive) at 0 ns, transitions to low (active) at 60 ns, and returns to high (inactive) at 12 ns.

The diagram illustrates that IA\_LPE\_BUSY becomes active (low) before IA\_LPE\_DONE becomes active (low), and both signals return to their inactive (high) state at the same time (12 ns).

### 21.11.9 reg\_IPCD\_type (IPCD)—Offset 40h

Inter-process Status and Message register for LPE contains a message sent from LPE to IA-32 CPU. The format of the CPU message bits 29:0 is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When software writes the message is in this register, it should set bit 63 to indicate that the new data is written. When IA-32 CPU reads the message code from the register, and writes back with the bit 63 cleared. When the IA-32 CPU processes the message sent by LPE, it may set bit 63 in IPCD to assert interrupt request to LPE. The LPE must not attempt to write into IPCLPEIA if bit 63 is set.

#### Access Method

#### 21.11.14 reg\_IPCSC\_type (IPCSC)—Offset 68h

The Inter-process Status and Message register for SC contains a message sent from the SC CPU to LPE. The format of the CPU message bits (29:0) is not defined in the HW specs. It is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When the message is written in this register, the software must set bit 63 to indicate that the IPCSC is not empty. Setting Busy also asserts interrupt request to LPE if the interrupt is enabled in the IMRLPESC. After LPE reads the message code from the register, it must perform a write with bit 63 cleared. The SC CPU must not attempt to write into IPCIA if bit 63 is set.

## Access Method

### 21.11.15 reg\_IPCLPESC\_type (IPCLPESC)—Offset 70h

Inter-process Status and Message register for LPE contains a message sent from LPE to SC. The format of the CPU message bits 29:0 is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When software writes the message is in this register, it should set bit 63 to indicate that the new data is written. When SC reads the message code from the register, and writes back with the bit 63 cleared. When the SC CPU processes the message sent by LPE, it may set bit 62 in IPCLPESC to assert interrupt request to LPE. The LPE must not attempt to write into IPCD if bit 63 is set.

#### Access Method

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

Diagram illustrating the structure of a 64-bit IPv6 address, showing the bit positions (0 to 63) and the corresponding bit values (0 or 1). The address is divided into 8 groups of 8 bits each. The first group is labeled '63' and the last group is labeled '0'. The address is shown as a sequence of 64 bits, with the first 63 bits being '0' and the last bit being '0'. The address is labeled 'RSVD0'.

### 21.11.23 reg\_IPCPSH\_type (IPCPSH)—Offset B0h

The Inter-process Status and Message register for PSH contains a message sent from the PSH CPU to LPE. The format of the CPU message bits (29:0) is not defined in the HW specs. It is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When the message is written in this register, the software must set bit 63 to indicate that the IPCPSH is not empty. Setting Busy also asserts interrupt request to LPE if the interrupt is enabled in the IMRLPEPSH. After LPE reads the message code from the register, it must perform a write with bit 63 cleared. The PSH CPU must not attempt to write into IPCIA if bit 63 is set.

### 21.11.24 reg\_IPCLPEPSH\_type (IPCLPEPSH)—Offset B8h

Inter-process Status and Message register for LPE contains a message sent from LPE to PSH. The format of the CPU message bits 29:0 is defined in the LPE Firmware specifications. The message may contain optional data fields stored in the shared memory region (mailbox). When software writes the message is in this register, it should set bit 63 to indicate that the new data is written. When PSH reads the message code from the register, and writes back with the bit 63 cleared. When the PSH CPU processes the message sent by LPE, it may set bit 62 in IPCLPEPSH to assert interrupt request to LPE. The LPE must not attempt to write into IPCD if bit 63 is set.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 64 bits)

**IPCLPEPSH:** [BAR + 140000h] + B8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000000h

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |  |  |  |  |  |  |  |  |  |  |  |  |  | |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| Bit Range | Default & Access | Description                                                                                                                                                                        |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 63        | 0b<br>RW         | <b>Ext_Timer_Run:</b> Timer Run bit. The timer runs only when this bit is set. It resumes running from the current value in the readvalue bits. Clearing the bit pauses the timer. |
| 62        | 0b<br>RW/S       | <b>Ext_Timer_Clear:</b> Timer Clear bit. Clears the timer and sets the value back to zero. This should also be reflected in the readvalue bits                                     |

| 31:0      | 0b<br>RW         | <b>Ext_Timer_Matchvalue:</b> The timer will generate a pulse when the Readvalue reaches Matchvalue. The pulse causes a level interrupt to get set in the PISR register. The PISR interrupt needs to be cleared before the next pulse is generated. The timer keeps counting beyond the Readvalue. Setting the Matchvalue to zero makes this a free running timer and no interrupt will be generated in this case. For correct operation, the ISR should either set a new Matchvalue or set it to zero. If nothing is done, the timer will roll over and trigger an interrupt again when it reaches the Matchvalue. |

### 21.12.1 SSP Control 0 Register (SSCR0)—Offset 0h

The Enhanced SSP Control 0 registers contain twelve different bit fields that control various functions within the Enhanced SSP. All bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits must be zeroes, and Read values of these bits is undetermined.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSCR0:** [BAR + 0A0000h] + 0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.12.3 SSP Status Register (SSSR)—Offset 8h

The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSSR:** [BAR + 0A0000h] + 8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0000F004h

| Bit Range | Default & Access | Description            |
|-----------|------------------|------------------------|
| 1:0       | 00b<br>RO        | <b>RSVD3:</b> Reserved |

## 21.12.4 SSP Interrupt Test Register (SSITR)—Offset Ch

The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

## 21.12.5 SSP Data Register (SSDR)—Offset 10h

The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the

register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.TFL, SSSR.RFL, SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32-bits is automatically right-justified in the Receive FIFO. When the Enhanced SSP is programmed for National Semiconductor Microwire\* frame format and if the size for Transmit data is 8-bits as selected by SSCR1.MWDS=0, then the most significant 24-bits are ignored. Similarly, if the size for the Transmit data is 16-bit as selected by SSCR1.MWDS=1, then most significant 16-bits are ignored. The SSCR0.DSS field controls the Receive data size.

### Access Method

## 21.12.6 SSP Time-Out Register (SSTO)—Offset 28h

The Enhanced SSP Time-Out registers have single bit fields that specify the time-out value used to signal a period of inactivity within the Receive FIFO. Note that Writes to reserved bits must be zeroes and reads are undetermined.

### 21.12.8 SSM TX Time Slot Active Register (SSTSA)—Offset 30h

The Enhanced SSP TX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will transmit data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSTSA:** [BAR + 0A0000h] + 30h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

Figure 1 illustrates the bitstream structure of the proposed scheme. The bitstream is 32 bits long, divided into two main sections: RSVD (Reserved) and TTSA (Test and Training Sequence). The RSVD section occupies the first 24 bits, and the TTSA section occupies the remaining 8 bits. The bitstream is represented as a sequence of 32 bits, with the first 24 bits grouped into six 4-bit blocks and the last 8 bits grouped into two 4-bit blocks.

| Bit Range | Default & Access | Description                                                                                                                      |

| 7:0       | 00h<br>RW        | <b>TX Time Slot Active (TTSA):</b> 0 = SSP will not transmit data in this time slot 1 = SSP will transmit data in this time slot |

### 21.12.9 SSP RX Time Slot Active Register (SSRSA)—Offset 34h

The Enhanced SSP RX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will receive data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSRSA:** [BAR + 0A0000h] + 34h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

[illegible]

### 21.12.10 SSP Time Slot Status Register (SSTSS)—Offset 38h

The Enhanced SSP Time Slot Status registers are read only registers that indicate which Time Slot the Enhanced SSP is currently in when the Enhanced SSP is in Network Mode (SSCR0.MOD = 1). This register is not valid when the Enhanced SSP is not in Network Mode. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSTSS:** [BAR + 0A0000h] + 38h

### 21.12.11 SSP Audio Clock Divider (SSACD)—Offset 3Ch

The Enhanced SSP Audio Clock Divider registers are read-write registers that indicate which clock frequency is sent to the Enhanced SSP and to the SYSCLK pin. If SSCR0.SCR is not 0, then there is no guaranteed phase relationship between SYSCLK and SSPSCLK. The SSPSFRM Frame Synch Sampling Frequency is calculated by dividing the chosen PLL output clock frequency (SSACD.ACPS) by the chosen divider (SSACD.ACDS) which gives the SYSCLK frequency. The SYSCLK is then divided by 4 (or by 1) to get the SSPSCLK. The SSPSCLK is divided by the data size (EDSS, DSS values) and by the number of time slots being used (SSCR0.FRDC value), if any, to give the

SSPSFRM frequency. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined. It's important to note that this feature is only available if implemented by the project instantiation. A clock source and mux must be instantiated outside of the SSP controller for this feature to work. Only this register is designed into the SSP Controller.

## Access Method

### 21.12.13 SSP Frame Select Register (SSFS)—Offset 44h

The SSP Frame select register is used to choose which frame signal to assert when accessing a slave device. SW drivers should set this register to assert the correct frame select to the targetted device.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSFS:** [BAR + 0A0000h] + 44h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000001h

#### 21.12.14 SSP Slot Frame Counter Register[0-7] (FRAME\_CNT[0-7])—Offset 48h, Count 8, Stride 4h

The slot frame counter is typically used in Audio modes and increments the counter every two SSPCLKs. This allows the OS to check the progress of a transfer. Since the SSP can support upto 8 slots in network mode there are 8 slot frame counters.

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**FRAME\_CNT[0-7]:** [BAR + 0A0000h] + 48h + [0-7]\*4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.12.15 SSP FIFO Level Register (SFIFOL)—Offset 68h

The SFIFOL register describes the current state of the RX and TX FIFOs. Not all bits of the TFL and RFL fields are used and depends on the actual hardware FIFO depth used in the instantiation of the SSP controller. This FIFO level register is meant to replace the SSSR.TFL and SSR.RFL fields.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SFIFOL:** [BAR + 0A0000h] + 68h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** FFFF0000h

|     |    |    |    |     |    |   |   |   |

| RFL |    |    |    | TFL |    |   |   |   |

| Bit Range | Default & Access | Description                                                                                                                                                                                                     |
|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:16     | FFFFh<br>RO      | <b>Receive FIFO Level (RFL):</b> Number of entries minus one in Receive FIFO. Note: When the value of all 0xF's are read, the FIFO is either empty or full and the programmer should refer to the SSSR.RNE bit. |
| 15:0      | 0000h<br>RO      | <b>Transmit FIFO Level (TFL):</b> Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the SSSR.TNF bit.                   |

### 21.12.16 SSP FIFO Trigger Threshold Register (SFIFOTT)—Offset 6Ch

The SFIFOTT is a register that determines when the the FIFOs will assert an interrupt for FIFO full indication. This is meant to replace the SSCR1.RFT and SSCR1.TFT legacy registers. The max size of these registers is based on the actualy FIFO depth in hardware and not the actual size of the bit field.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SFIFOTT:** [BAR + 0A0000h] + 6Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

## 21.12.18 SSP Control 4 Register (SSCR4)—Offset 74h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSCR4:** [BAR + 0A0000h] + 74h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

### 21.13.1 SSP Control 0 Register (SSCR0)—Offset 0h

The Enhanced SSP Control 0 registers contain twelve different bit fields that control various functions within the Enhanced SSP. All bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits must be zeroes, and Read values of these bits is undetermined.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSCR0:** [BAR + 0A1000h] + 0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.13.2 SSP Control 1 Register (SSCR1)—Offset 4h

The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSCR1:** [BAR + 0A1000h] + 4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 43000000h

### 21.13.3 SSP Status Register (SSSR)—Offset 8h

The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSSR:** [BAR + 0A1000h] + 8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

| 1:0       | 00b<br>RO        | <b>RSVD3:</b> Reserved |

## 21.13.4 SSP Interrupt Test Register (SSITR)—Offset Ch

The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 to it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

## 21.13.5 SSP Data Register (SSDR)—Offset 10h

The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the

register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.TFL, SSSR.RFL, SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32-bits is automatically right-justified in the Receive FIFO. When the Enhanced SSP is programmed for National Semiconductor Microwire\* frame format and if the size for Transmit data is 8-bits as selected by SSCR1.MWDS=0, then the most significant 24-bits are ignored. Similarly, if the size for the Transmit data is 16-bit as selected by SSCR1.MWDS=1, then most significant 16-bits are ignored. The SSCR0.DSS field controls the Receive data size.

## 21.13.7 SSP Programmable Protocol Register (SSPSP)—Offset 2Ch

The Enhanced SSP Programmable Protocol registers are read-write registers that contain eight fields that are used to program the various programmable serial-protocol parameters. When using PSP format in Network mode, the parameters SFRMDLY, STRTDLY, DMYSTP, DMYSTRT must be set to 0. Other parameters (such as FRMPOL, SCMODE, FSRT, SFRMDWDTH) are programmable. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

### Access Method

### 21.13.11 SSP Audio Clock Divider (SSACD)—Offset 3Ch

The Enhanced SSP Audio Clock Divider registers are read-write registers that indicate which clock frequency is sent to the Enhanced SSP and to the SYSCLK pin. If SSCR0.SCR is not 0, then there is no guaranteed phase relationship between SYSCLK and SSPSCLK. The SSPSFRM Frame Synch Sampling Frequency is calculated by dividing the chosen PLL output clock frequency (SSACD.ACPS) by the chosen divider (SSACD.ACDS) which gives the SYSCLK frequency. The SYSCLK is then divided by 4 (or by 1) to get the SSPSCLK. The SSPSCLK is divided by the data size (EDSS, DSS values) and by the number of time slots being used (SSCR0.FRDC value), if any, to give the

### 21.13.13 SSP Frame Select Register (SSFS)—Offset 44h

The SSP Frame select register is used to choose which frame signal to assert when accessing a slave device. SW drivers should set this register to assert the correct frame select to the targetted device.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSFS:** [BAR + 0A1000h] + 44h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000001h

| RFL |    |    |    | TFL |    |   |   |   |

| Bit Range | Default & Access | Description                                                                                                                                                                                                     |
|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:16     | FFFFh<br>RO      | <b>Receive FIFO Level (RFL):</b> Number of entries minus one in Receive FIFO. Note: When the value of all 0xF's are read, the FIFO is either empty or full and the programmer should refer to the SSSR.RNE bit. |
| 15:0      | 0000h<br>RO      | <b>Transmit FIFO Level (TFL):</b> Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the SSSR.TNF bit.                   |

### 21.13.16 SSP FIFO Trigger Threshold Register (SFIFOTT)—Offset 6Ch

The SFIFOTT is a register that determines when the the FIFOs will assert an interrupt for FIFO full indication. This is meant to replace the SSCR1.RFT and SSCR1.TFT legacy registers. The max size of these registers is based on the actualy FIFO depth in hardware and not the actual size of the bit field.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SFIFOTT:** [BAR + 0A1000h] + 6Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

| 31:16     | 0000h<br>RW      | <b>Receive FIFO Trigger Threshold (RFT):</b> Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. Notes on setting the RFT value. This applies to cases where SSP is receiving data from a device and is interfaced with a DMA channel via the hardware handshake mechanism. Please follow the following recommendations: 1. Number of bits denoted by the (DSS, EDSS) parameters in the SSP should match the SRC_TR_WIDTH programmed in the DMA channel. 2. (RFT+1) should be equal to (SRC_MSIZ). 3. Another option to 2 is to keep the BLOCK_TS in the DMA to be a multiple of (RFT+1) |
| 15:0      | 0000h<br>RW      | <b>Transmit FIFO Trigger Threshold (TFT):</b> Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### 21.13.17 SSP Control 3 Register (SSCR3)—Offset 70h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSCR3:** [BAR + 0A1000h] + 70h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 0002C604h

| 17        | 1b<br>RW         | <b>Sync Fix Enable (SYN_FIX_EN):</b> This is a chicken bit for enabling the synchronizer fix for clr_underrun_ssp signal. SW should preserve this bit at its default value.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 16        | 0b<br>RW         | <b>Master Mode Clock Enable (MST_CLK_EN):</b> When in single slot master mode (which is the mode used for emulating I2S or LJ master mode), the SSP core can stop the clock on a Tx underflow condition, preventing the Rx side from receiving data. This bit, when set, forces the clock to run when a Tx underflow happens, thereby allowing Rx side to continue functioning while Tx side is in underflow. SW should set this bit when I2S or LJ master mode is enabled i.e. bits 0 and 1 in this register are both set or when using 1-slot PCM (SFS or LFS) master mode operation. Otherwise, SW should leave this at 0. |
| 15        | 1b<br>RW         | <b>Stretch RX Pulse (STRETCH_RX):</b> HW uses this as a chicken bit to stretch the RX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value.                                                                                                                                                                                                                                                                                                                                                             |

This bit should be set for I2S and PCM master mode operations and cleared for all other modes. SW should select the proper value in this bit before enabling SSP controller. 0 = Disabled 1 = Enabled                                                            |

### 21.13.18 SSP Control 4 Register (SSCR4)—Offset 74h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSCR4:** [BAR + 0A1000h] + 74h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

### 21.14.1 SSP Control 0 Register (SSCR0)—Offset 0h

The Enhanced SSP Control 0 registers contain twelve different bit fields that control various functions within the Enhanced SSP. All bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits must be zeroes, and Read values of these bits is undetermined.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSCR0:** [BAR + 0A2000h] + 0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

## 21.14.2 SSP Control 1 Register (SSCR1)—Offset 4h

The Enhanced SSP Control 1 registers contain bit fields that control various SSP functions. Bits must be set to the preferred value before enabling the Enhanced SSP. Note that Writes to reserved bits should be zeroes, and Read value of these bits are undetermined.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSCR1:** [BAR + 0A2000h] + 4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 43000000h

### 21.14.3 SSP Status Register (SSSR)—Offset 8h

The Enhanced SSP Status registers contain bits that signal overrun errors as well as the Transmit and Receive FIFO service requests. Each of these hardware-detected events signals an Interrupt request to the Interrupt controller. The Status register also contains flags that indicate when the Enhanced SSP is actively transmitting data, when the Transmit FIFO is not full, and when the Receive FIFO is not empty. One Interrupt signal is sent to the Interrupt Controller for each SSP. These events can cause an Interrupt: End-of-Chain, Receiver Time-out, Peripheral Trailing Byte, Receive FIFO overrun, Receive FIFO request, and Transmit FIFO request.

|-----------|------------------|------------------------|
| 1:0       | 00b<br>RO        | <b>RSVD3:</b> Reserved |

#### 21.14.4 SSP Interrupt Test Register (SSITR)—Offset Ch

The read-write SSP Interrupt Test registers should be used only for testing purposes. Writing a 1 to the test transmit FIFO request SSITR.TTFS, bit 5, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Transmit FIFO. Writing a 1 to the test receive FIFO request SSITR.TRFS, bit 6, will generate a non-maskable Interrupt strobe signal to the Interrupt controller, and a DMA request for the Receive FIFO. Writing a 1 to the test receive FIFO overrun bit SSITR.TROR, bit 7, will generate a non-maskable Interrupt strobe signal to the Interrupt controller only, no DMA request will be made. Setting any of these bits will also cause the corresponding status bit(s) to be set in the Enhanced SSP Status register (SSSR). The Interrupt and/or service request, caused by the setting of one of these test bits, will remain active until the test bit is cleared by writing a 0 it. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

### 21.14.5 SSP Data Register (SSDR)—Offset 10h

The Enhanced SSP Data registers are single address locations that Read-Write data transfers can access. The SSDR represents two physical registers: the first is temporary storage for data on its way out through the Transmit FIFO, the other is temporary storage for data coming in through the Receive FIFO. As the system accesses the

register, FIFO Control logic transfers data automatically between register and FIFO as fast as the system moves it. Data in the FIFO shifts up or down to accommodate the new word (unless it's an attempted Write to a full Transmit FIFO). Status bits (such as SSSR.TFL, SSSR.RFL, SSSR.RNE, and SSSR.TNF) show users whether the FIFO is full, above/below a programmable FIFO trigger threshold, or empty. For Transmit data transfers (Write from system to SSP peripheral), the register can be loaded (written) by the system processor anytime it falls below its threshold level when using programmed I/O. When a data size of less than 32-bits is selected, users should not left-justify data written to the Transmit FIFO. Transmit logic left-justifies the data and ignores any unused bits. Received data of less than 32-bits is automatically right-justified in the Receive FIFO. When the Enhanced SSP is programmed for National Semiconductor Microwire\* frame format and if the size for Transmit data is 8-bits as selected by SSCR1.MWDS=0, then the most significant 24-bits are ignored. Similarly, if the size for the Transmit data is 16-bit as selected by SSCR1.MWDS=1, then most significant 16-bits are ignored. The SSCR0.DSS field controls the Receive data size.

## 21.14.7 SSP Programmable Protocol Register (SSPSP)—Offset 2Ch

The Enhanced SSP Programmable Protocol registers are read-write registers that contain eight fields that are used to program the various programmable serial-protocol parameters. When using PSP format in Network mode, the parameters SFRMDLY, STRTDLY, DMYSTP, DMYSTRT must be set to 0. Other parameters (such as FRMPOL, SCMODE, FSRT, SFRMDWDTH) are programmable. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

### Access Method

### 21.14.8 SSM TX Time Slot Active Register (SSTSA)—Offset 30h

The Enhanced SSP TX Time Slot Active registers are read-write registers that indicate which Time Slot the Enhanced SSP will transmit data in and are ignored if the Enhanced SSP is not in Network Mode (SSCR0.MOD = 1). Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSTSA:** [BAR + 0A2000h] + 30h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

Figure 1 illustrates the bitstream structure of the proposed scheme. The bitstream is 32 bits long, divided into two 16-bit segments. The first segment, labeled 'RSVD', contains 16 zeros. The second segment, labeled 'TTSA', contains 16 zeros. The bit positions are numbered from 31 down to 0.

| Bit Range | Default & Access | Description                                                                                                                      |

#### 21.14.10 SSP Time Slot Status Register (SSTSS)—Offset 38h

The Enhanced SSP Time Slot Status registers are read only registers that indicate which Time Slot the Enhanced SSP is currently in when the Enhanced SSP is in Network Mode (SSCR0.MOD = 1). This register is not valid when the Enhanced SSP is not in Network Mode. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined.

### 21.14.11 SSP Audio Clock Divider (SSACD)—Offset 3Ch

The Enhanced SSP Audio Clock Divider registers are read-write registers that indicate which clock frequency is sent to the Enhanced SSP and to the SYSCLK pin. If SSCR0.SCR is not 0, then there is no guaranteed phase relationship between SYSCLK and SSPSCLK. The SSPSFRM Frame Synch Sampling Frequency is calculated by dividing the chosen PLL output clock frequency (SSACD.ACPS) by the chosen divider (SSACD.ACDS) which gives the SYSCLK frequency. The SYSCLK is then divided by 4 (or by 1) to get the SSPSCLK. The SSPSCLK is divided by the data size (EDSS, DSS values) and by the number of time slots being used (SSCR0.FRDC value), if any, to give the

SSPSFRM frequency. Note that Writes to reserved bits must be zeroes, and Read value of these bits are undetermined. It's important to note that this feature is only available if implemented by the project instantiation. A clock source and mux must be instantiated outside of the SSP controller for this feature to work. Only this register is designed into the SSP Controller.

#### Access Method

### 21.14.13 SSP Frame Select Register (SSFS)—Offset 44h

The SSP Frame select register is used to choose which frame signal to assert when accessing a slave device. SW drivers should set this register to assert the correct frame select to the targetted device.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSFS:** [BAR + 0A2000h] + 44h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000001h

#### 21.14.14 SSP Slot Frame Counter Register[0-7] (FRAME\_CNT[0-7])—Offset 48h, Count 8, Stride 4h

The slot frame counter is typically used in Audio modes and increments the counter every two SSPCLKs. This allows the OS to check the progress of a transfer. Since the SSP can support upto 8 slots in network mode there are 8 slot frame counters.

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**FRAME\_CNT[0-7]:** [BAR + 0A2000h] + 48h + [0-7]\*4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

### 21.14.15 SSP FIFO Level Register (SFIFOL)—Offset 68h

The SFIFOL register describes the current state of the RX and TX FIFOs. Not all bits of the TFL and RFL fields are used and depends on the actual hardware FIFO depth used in the instantiation of the SSP controller. This FIFO level register is meant to replace the SSSR.TFL and SSR.RFL fields.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SFIFOL:** [BAR + 0A2000h] + 68h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** FFFF0000h

|     |    |    |    |     |    |   |   |   |

| RFL |    |    |    | TFL |    |   |   |   |

| Bit Range | Default & Access | Description                                                                                                                                                                                                     |
|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:16     | FFFFh<br>RO      | <b>Receive FIFO Level (RFL):</b> Number of entries minus one in Receive FIFO. Note: When the value of all 0xF's are read, the FIFO is either empty or full and the programmer should refer to the SSSR.RNE bit. |
| 15:0      | 0000h<br>RO      | <b>Transmit FIFO Level (TFL):</b> Number of entries in Transmit FIFO. Note: When the value 0x0 is read, the FIFO is either empty or full and the programmer should refer to the SSSR.TNF bit.                   |

### 21.14.16 SSP FIFO Trigger Threshold Register (SFIFOTT)—Offset 6Ch

The SFIFOTT is a register that determines when the the FIFOs will assert an interrupt for FIFO full indication. This is meant to replace the SSCR1.RFT and SSCR1.TFT legacy registers. The max size of these registers is based on the actualy FIFO depth in hardware and not the actual size of the bit field.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SFIFOTT:** [BAR + 0A2000h] + 6Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

| 31:16     | 0000h<br>RW      | <b>Receive FIFO Trigger Threshold (RFT):</b> Sets threshold level at which receive FIFO asserts interrupt. This level should be set to the desired threshold value minus 1. Notes on setting the RFT value. This applies to cases where SSP is receiving data from a device and is interfaced with a DMA channel via the hardware handshake mechanism. Please follow the following recommendations: 1. Number of bits denoted by the (DSS, EDSS) parameters in the SSP should match the SRC_TR_WIDTH programmed in the DMA channel. 2. (RFT+1) should be equal to (SRC_MSIZ). 3. Another option to 2 is to keep the BLOCK_TS in the DMA to be a multiple of (RFT+1) |
| 15:0      | 0000h<br>RW      | <b>Transmit FIFO Trigger Threshold (TFT):</b> Sets threshold level at which transmit FIFO asserts interrupt. This level should be set to the desired threshold value minus 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### 21.14.17 SSP Control 3 Register (SSCR3)—Offset 70h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSCR3:** [BAR + 0A2000h] + 70h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

| 17        | 1b<br>RW         | <b>Sync Fix Enable (SYN_FIX_EN)</b> : This is a chicken bit for enabling the synchronizer fix for clr_underrun_ssp signal. SW should preserve this bit at its default value.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 16        | 0b<br>RW         | <b>Master Mode Clock Enable (MST_CLK_EN)</b> : When in single slot master mode (which is the mode used for emulating I2S or LJ master mode), the SSP core can stop the clock on a Tx underflow condition, preventing the Rx side from receiving data. This bit, when set, forces the clock to run when a Tx underflow happens, thereby allowing Rx side to continue functioning while Tx side is in underflow. SW should set this bit when I2S or LJ master mode is enabled i.e. bits 0 and 1 in this register are both set or when using 1-slot PCM (SFS or LFS) master mode operation. Otherwise, SW should leave this at 0. |
| 15        | 1b<br>RW         | <b>Stretch RX Pulse (STRETCH_RX)</b> : HW uses this as a chicken bit to stretch the RX pulse for proper clock crossing between SSP and APB domains. Note this bit is not tied to any specific SSP/PCM/I2S modes. SW should preserve this bit as the default value.                                                                                                                                                                                                                                                                                                                                                             |

This bit should be set for I2S and PCM master mode operations and cleared for all other modes. SW should select the proper value in this bit before enabling SSP controller. 0 = Disabled 1 = Enabled                                                            |

## 21.14.18 SSP Control 4 Register (SSCR4)—Offset 74h

Software should only program this register if configuring the SSP in I2S/LJ mode or PCM master mode with the Tangier fixes. If neither is being enabled, SW can leave this register at the default power on value.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSCR4:** [BAR + 0A2000h] + 74h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                 |

### 21.15.1 reg\_SAR\_type (SAR0)—Offset 0h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SAR0:** [BAR + 98000h] + 0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.15.2 reg\_DAR\_type (DAR0)—Offset 8h

## 21.15.4 reg\_CTL\_LO\_type (CTL\_LO0)—Offset 18h

This register contains fields that control the DMA transfer. The CTL\_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_LO0:** [BAR + 98000h] + 18h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.15.5 reg\_CTL\_HI\_type (CTL\_HI0)—Offset 1Ch

This register contains fields that control the DMA transfer. The CTL\_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL\_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_HI0:** [BAR + 98000h] + 1Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| 31:29     | 0h<br>RW         | <b>CH_CLASS:</b> Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28:18     | 0h<br>RW         | <b>CH_WEIGHT:</b> Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to $(2^{11}-1)=2047$ , Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17        | 0h<br>RW         | <b>DONE:</b> If status write-back is enabled, the upper word of the control register, CTL_HI, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0      | 0h<br>RW         | <b>BLOCK_TS:</b> Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to $(2^{17}-1) = (128\text{ KB} - 1)$ .                                                                                                                                                                                                                                                                                                                                |

### 21.15.6 reg\_SSTAT\_type (SSTAT0)—Offset 20h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

#### Access Method

**Type:** Memory Mapped I/O Register

### 21.15.12 reg\_SGR\_type (SGR0)—Offset 48h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC\_TR\_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC\_TR\_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

| 31:0      | 0h<br>RW         | <b>DAR:</b> Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length ) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

### 21.15.16 reg\_LLP\_type (LLP1)—Offset 68h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled. The LLP register has two functions: The logical result of the equation  $LLP.LOC \neq 0$  is used to set up the type of DMA transfer—single or multi-block. Table shows how the method of updating the channel registers is a function of  $LLP.LOC \neq 0$ . If  $LLP.LOC$  is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type.  $LLP.LOC \neq 0$  contains the pointer to the next LLI for block chaining using linked lists. The  $LLPx$  register can also point to the address where write-back of the control and source/destination status information occur after block completion.

### 21.15.18 reg\_CTL\_HI\_type (CTL\_HI1)—Offset 74h

This register contains fields that control the DMA transfer. The CTL\_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL\_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_HI1:** [BAR + 98000h] + 74h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28:18     | 0h<br>RW         | <b>CH_WEIGHT:</b> Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to $(2^{11}-1)=2047$ , Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17        | 0h<br>RW         | <b>DONE:</b> If status write-back is enabled, the upper word of the control register, CTL_HI, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0      | 0h<br>RW         | <b>BLOCK_TS:</b> Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to $(2^{17}-1) = (128\text{ KB} - 1)$ .                                                                                                                                                                                                                                                                                                                                |

### 21.15.19 reg\_SSTAT\_type (SSTAT1)—Offset 78h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

### 21.15.25 reg\_SGR\_type (SGR1)—Offset A0h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC\_TR\_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC\_TR\_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

### 21.15.26 reg\_DSR\_type (DSR1)—Offset A8h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST\_TR\_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST\_TR\_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

### 21.15.27 reg\_SAR\_type (SAR2)—Offset B0h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SAR2:** [BAR + 98000h] + B0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.15.30 reg\_CTL\_LO\_type (CTL\_LO2)—Offset C8h

This register contains fields that control the DMA transfer. The CTL\_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_LO2:** [BAR + 98000h] + C8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.15.31 reg\_CTL\_HI\_type (CTL\_HI2)—Offset CCh

This register contains fields that control the DMA transfer. The CTL\_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL\_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_HI2:** [BAR + 98000h] + CCh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| 31:29     | 0h<br>RW         | <b>CH_CLASS:</b> Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28:18     | 0h<br>RW         | <b>CH_WEIGHT:</b> Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to $(2^{11}-1)=2047$ , Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17        | 0h<br>RW         | <b>DONE:</b> If status write-back is enabled, the upper word of the control register, CTL_HI, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0      | 0h<br>RW         | <b>BLOCK_TS:</b> Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to $(2^{17}-1) = (128\text{ KB} - 1)$ .                                                                                                                                                                                                                                                                                                                                |

### 21.15.32 reg\_SSTAT\_type (SSTAT2)—Offset D0h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

### 21.15.38 reg\_SGR\_type (SGR2)—Offset F8h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC\_TR\_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC\_TR\_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

### 21.15.39 reg\_DSR\_type (DSR2)—Offset 100h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST\_TR\_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST\_TR\_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**DSR2:** [BAR + 98000h] + 100h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.15.40 reg\_SAR\_type (SAR3)—Offset 108h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SAR3:** [BAR + 98000h] + 108h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0      | 0h<br>RW         | <b>DAR:</b> Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

#### 21.15.42 reg\_LLP\_type (LLP3)—Offset 118h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled. The LLP register has two functions: The logical result of the equation  $LLP.LOC \neq 0$  is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of  $LLP.LOC \neq 0$ . If  $LLP.LOC$  is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type.  $LLP.LOC \neq 0$  contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

### 21.15.43 reg\_CTL\_LO\_type (CTL\_LO3)—Offset 120h

This register contains fields that control the DMA transfer. The CTL\_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_LO3:** [BAR + 98000h] + 120h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

#### 21.15.44 reg\_CTL\_HI\_type (CTL\_HI3)—Offset 124h

This register contains fields that control the DMA transfer. The CTL\_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL\_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_HI3:** [BAR + 98000h] + 124h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| 31:29     | 0h<br>RW         | <b>CH_CLASS:</b> Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28:18     | 0h<br>RW         | <b>CH_WEIGHT:</b> Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to $(2^{11}-1)=2047$ , Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17        | 0h<br>RW         | <b>DONE:</b> If status write-back is enabled, the upper word of the control register, CTL_HI, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0      | 0h<br>RW         | <b>BLOCK_TS:</b> Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to $(2^{17}-1) = (128\text{ KB} - 1)$ .                                                                                                                                                                                                                                                                                                                                |

#### 21.15.45 reg\_SSTAT\_type (SSTAT3)—Offset 128h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

##### Access Method

**Type:** Memory Mapped I/O Register

This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

### 21.15.51 reg\_SGR\_type (SGR3)—Offset 150h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC\_TR\_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC\_TR\_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

### 21.15.52 reg\_DSR\_type (DSR3)—Offset 158h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST\_TR\_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST\_TR\_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

### 21.15.53 reg\_SAR\_type (SAR4)—Offset 160h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SAR4:** [BAR + 98000h] + 160h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

## 21.15.56 reg\_CTL\_LO\_type (CTL\_LO4)—Offset 178h

This register contains fields that control the DMA transfer. The CTL\_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_LO4:** [BAR + 98000h] + 178h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

## 21.15.57 reg\_CTL\_HI\_type (CTL\_HI4)—Offset 17Ch

This register contains fields that control the DMA transfer. The CTL\_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL\_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_HI4:** [BAR + 98000h] + 17Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28:18     | 0h<br>RW         | <b>CH_WEIGHT:</b> Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to $(2^{11}-1)=2047$ , Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17        | 0h<br>RW         | <b>DONE:</b> If status write-back is enabled, the upper word of the control register, CTL_HI, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0      | 0h<br>RW         | <b>BLOCK_TS:</b> Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to $(2^{17}-1) = (128\text{ KB} - 1)$ .                                                                                                                                                                                                                                                                                                                                |

### 21.15.58 reg\_SSTAT\_type (SSTAT4)—Offset 180h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

#### Access Method

#### 21.15.64 reg\_SGR\_type (SGR4)—Offset 1A8h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC\_TR\_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC\_TR\_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

### 21.15.65 reg\_DSR\_type (DSR4)—Offset 1B0h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST\_TR\_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST\_TR\_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

### 21.15.66 reg\_SAR\_type (SAR5)—Offset 1B8h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SAR5:** [BAR + 98000h] + 1B8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

Intel Atom® Processor E3800 Product Family  
Datasheet  
2995

## 21.15.69 reg\_CTL\_LO\_type (CTL\_LO5)—Offset 1D0h

This register contains fields that control the DMA transfer. The CTL\_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_LO5:** [BAR + 98000h] + 1D0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.15.70 reg\_CTL\_HI\_type (CTL\_HI5)—Offset 1D4h

This register contains fields that control the DMA transfer. The CTL\_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL\_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

| 31:29     | 0h<br>RW         | <b>CH_CLASS:</b> Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28:18     | 0h<br>RW         | <b>CH_WEIGHT:</b> Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to $(2^{11}-1)=2047$ , Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17        | 0h<br>RW         | <b>DONE:</b> If status write-back is enabled, the upper word of the control register, CTL_HI, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0      | 0h<br>RW         | <b>BLOCK_TS:</b> Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to $(2^{17}-1) = (128\text{ KB} - 1)$ .                                                                                                                                                                                                                                                                                                                                |

### 21.15.71 reg\_SSTAT\_type (SSTAT5)—Offset 1D8h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSTAT5:** [BAR + 98000h] + 1D8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.15.75 reg\_CFG\_LO\_type (CFG\_LO5)—Offset 1F8h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CFG\_LO5:** [BAR + 98000h] + 1F8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000203h

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                           |
|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8         | 0h<br>RW         | <b>CH_SUSP:</b> Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source. |
| 7         | 0h<br>RW         | <b>SS_UPD_EN:</b> Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)                                        |
| 6         | 0h<br>RW         | <b>DS_UPD_EN:</b> Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)                              |
| 5         | 0h<br>RW         | <b>CTL_HI_UPD_EN:</b> CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HI location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)                                                                                                                                                                    |

### 21.15.77 reg\_SGR\_type (SGR5)—Offset 200h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC\_TR\_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC\_TR\_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

#### 21.15.78 reg\_DSR\_type (DSR5)—Offset 208h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST\_TR\_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST\_TR\_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

### 21.15.79 reg\_SAR\_type (SAR6)—Offset 210h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SAR6:** [BAR + 98000h] + 210h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

## Access Method

**DAR6:** [BAR + 98000h] + 218h

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

Diagram illustrating the structure of the 32-bit DAR field. The field is divided into eight 4-bit segments, each containing four zeros. The bit positions 31, 28, 24, 20, 16, 12, 8, 4, and 0 are marked above the segments. The label 'DAR' is centered below the field.

## 21.15.82 reg\_CTL\_LO\_type (CTL\_LO6)—Offset 228h

This register contains fields that control the DMA transfer. The CTL\_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_LO6:** [BAR + 98000h] + 228h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.15.83 reg\_CTL\_HI\_type (CTL\_HI6)—Offset 22Ch

This register contains fields that control the DMA transfer. The CTL\_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL\_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_HI6:** [BAR + 98000h] + 22Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28:18     | 0h<br>RW         | <b>CH_WEIGHT:</b> Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to $(2^{11}-1)=2047$ , Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17        | 0h<br>RW         | <b>DONE:</b> If status write-back is enabled, the upper word of the control register, CTL_HI, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0      | 0h<br>RW         | <b>BLOCK_TS:</b> Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to $(2^{17}-1) = (128\text{ KB} - 1)$ .                                                                                                                                                                                                                                                                                                                                |

#### 21.15.84 reg\_SSTAT\_type (SSTAT6)—Offset 230h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSTATAR6:** [BAR + 98000h] + 240h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

Intel Atom® Processor E3800 Product Family  
Datasheet  
3013

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                           |
|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8         | 0h<br>RW         | <b>CH_SUSP:</b> Channel Suspend. Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source. |
| 7         | 0h<br>RW         | <b>SS_UPD_EN:</b> Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)                                        |
| 6         | 0h<br>RW         | <b>DS_UPD_EN:</b> Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)                              |
| 5         | 0h<br>RW         | <b>CTL_HI_UPD_EN:</b> CTL_HI Update Enable. If set, the CTL_HI register is written out to the CTL_HI location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)                                                                                                                                                                    |
| 4         | 0h<br>RO         | <b>RSVD_4_4:</b> Reserved                                                                                                                                                                                                                                                                                                                             |

### 21.15.89 reg\_CFG\_HI\_type (CFG\_HI6)—Offset 254h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CFG\_HI6:** [BAR + 98000h] + 254h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.15.90 reg\_SGR\_type (SGR6)—Offset 258h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC\_TR\_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC\_TR\_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0      | 0h<br>RW         | <b>DAR:</b> Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length ) 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

#### 21.15.94 reg\_LLp\_type (LLP7)—Offset 278h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled The LLP register has two functions: The logical result of the equation  $LLP.LOC \neq 0$  is used to set up the type of DMA transfer-single or multi-block. Table shows how the method of updating the channel registers is a function of  $LLP.LOC \neq 0$ . If  $LLP.LOC$  is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type.  $LLP.LOC \neq 0$  contains the pointer to the next LLI for block chaining using linked lists, The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

## 21.15.95 reg\_CTL\_LO\_type (CTL\_LO7)—Offset 280h

This register contains fields that control the DMA transfer. The CTL\_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_LO7:** [BAR + 98000h] + 280h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.15.96 reg\_CTL\_HI\_type (CTL\_HI7)—Offset 284h

This register contains fields that control the DMA transfer. The CTL\_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL\_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

#### Access Method

**Type:** Memory Mapped I/O Register

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28:18     | 0h<br>RW         | <b>CH_WEIGHT:</b> Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to $(2^{11}-1)=2047$ , Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17        | 0h<br>RW         | <b>DONE:</b> If status write-back is enabled, the upper word of the control register, CTL_HIin, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 16:0      | 0h<br>RW         | <b>BLOCK_TS:</b> Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to $(2^{17}-1) = (128\text{ KB} - 1)$ .                                                                                                                                                                                                                                                                                                                                 |

## 21.15.97 reg\_SSTAT\_type (SSTAT7)—Offset 288h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

### Access Method

## 21.15.102 reg\_CFG\_HI\_type (CFG\_HI7)—Offset 2ACh

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CFG\_HI7:** [BAR + 98000h] + 2ACh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.15.103 reg\_SGR\_type (SGR7)—Offset 2B0h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC\_TR\_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC\_TR\_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

#### 21.15.115 reg\_Mask\_type (MaskTfr)—Offset 310h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int\_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int\_combined(\_n) signal. A channel INT\_MASK bit will be written only if the corresponding mask write enable bit in the INT\_MASK\_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged.

Writing a 1 to any bit in these registers unmask the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int\_\* port signals.

### 21.15.137 req GLOBAL\_CFG type (GLOBAL\_CFG)—Offset 418h

GLOBAL\_CFG: GLOBAL DMA Configuration Register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**GLOBAL CFG:** [BAR + 98000h] + 418h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

|                                                            |    |    |    |    |    |   |   |   |   |

### 21.16.1 reg\_SAR\_type (SAR0)—Offset 0h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SAR0:** [BAR + 9C000h] + 0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

Intel Atom® Processor E3800 Product Family  
Datasheet  
3053

|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0      | 0h<br>RW         | <b>DAR:</b> Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

### 21.16.3 reg\_LLPType (LLP0)—Offset 10h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled. The LLP register has two functions: The logical result of the equation  $LLP.LOC \neq 0$  is used to set up the type of DMA transfer—single or multi-block. Table shows how the method of updating the channel registers is a function of  $LLP.LOC \neq 0$ . If  $LLP.LOC$  is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type.  $LLP.LOC \neq 0$  contains the pointer to the next LLI for block chaining using linked lists. The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

#### Access Method

**Type:** Memory Mapped I/O Register

## 21.16.4 reg\_CTL\_LO\_type (CTL\_LO0)—Offset 18h

This register contains fields that control the DMA transfer. The CTL\_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_LO0:** [BAR + 9C000h] + 18h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.16.5 reg\_CTL\_HI\_type (CTL\_HI0)—Offset 1Ch

This register contains fields that control the DMA transfer. The CTL\_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL\_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_HI0:** [BAR + 9C000h] + 1Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| 31:29     | 0h<br>RW         | <b>CH_CLASS:</b> Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28:18     | 0h<br>RW         | <b>CH_WEIGHT:</b> Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to $(2^{11}-1)=2047$ , Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17        | 0h<br>RW         | <b>DONE:</b> If status write-back is enabled, the upper word of the control register, CTL_HI, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI.CTL_HI.DONE bit to see when a block transfer is complete. The LLI.CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0      | 0h<br>RW         | <b>BLOCK_TS:</b> Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to $(2^{17}-1) = (128\text{ KB} - 1)$ .                                                                                                                                                                                                                                                                                                                                |

### 21.16.6 reg\_SSTAT\_type (SSTAT0)—Offset 20h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSTAT0:** [BAR + 9C000h] + 20h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.16.11 reg\_CFG\_HI\_type (CFG\_HI0)—Offset 44h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CFG\_HI0:** [BAR + 9C000h] + 44h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.16.12 reg\_SGR\_type (SGR0)—Offset 48h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC\_TR\_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC\_TR\_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

#### Access Method

| 31:0      | 0h<br>RW         | <b>SAR:</b> Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length > 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

### 21.16.15 reg\_DAR\_type (DAR1)—Offset 60h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

### 21.16.17 reg\_CTL\_LO\_type (CTL\_LO1)—Offset 70h

This register contains fields that control the DMA transfer. The CTL\_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

## 21.16.18 reg\_CTL\_HI\_type (CTL\_HI1)—Offset 74h

This register contains fields that control the DMA transfer. The CTL\_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL\_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_HI1:** [BAR + 9C000h] + 74h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28:18     | 0h<br>RW         | <b>CH_WEIGHT:</b> Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to $(2^{11}-1)=2047$ , Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17        | 0h<br>RW         | <b>DONE:</b> If status write-back is enabled, the upper word of the control register, CTL_HI, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0      | 0h<br>RW         | <b>BLOCK_TS:</b> Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to $(2^{17}-1) = (128\text{ KB} - 1)$ .                                                                                                                                                                                                                                                                                                                                |

### 21.16.19 reg\_SSTAT\_type (SSTAT1)—Offset 78h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA slave interface. |

## 21.16.21 reg\_SSTATAR\_type (SSTATAR1)—Offset 88h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSTATAR1:** [BAR + 9C000h] + 88h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description                                                                                                                                                                                                                     |
|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0      | 0h<br>RW         | <b>SSTATAR</b> : Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block. |

### 21.16.22 reg\_DSTATAR\_type (DSTATAR1)—Offset 90h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**DSTATAR1:** [BAR + 9C000h] + 90h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description                                                                                                                                                                                                                         |

### 21.16.25 reg\_SGR\_type (SGR1)—Offset A0h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC\_TR\_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC\_TR\_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SGR1:** [BAR + 9C000h] + A0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.16.30 reg\_CTL\_LO\_type (CTL\_LO2)—Offset C8h

This register contains fields that control the DMA transfer. The CTL\_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_LO2:** [BAR + 9C000h] + C8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.16.31 reg\_CTL\_HI\_type (CTL\_HI2)—Offset CCh

This register contains fields that control the DMA transfer. The CTL\_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL\_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_HI2:** [BAR + 9C000h] + CCh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| 31:29     | 0h<br>RW         | <b>CH_CLASS:</b> Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28:18     | 0h<br>RW         | <b>CH_WEIGHT:</b> Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to $(2^{11}-1)=2047$ , Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17        | 0h<br>RW         | <b>DONE:</b> If status write-back is enabled, the upper word of the control register, CTL_HI, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0      | 0h<br>RW         | <b>BLOCK_TS:</b> Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to $(2^{17}-1) = (128\text{ KB} - 1)$ .                                                                                                                                                                                                                                                                                                                                |

### 21.16.32 reg\_SSTAT\_type (SSTAT2)—Offset D0h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

### 21.16.38 reg\_SGR\_type (SGR2)—Offset F8h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC\_TR\_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC\_TR\_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

### 21.16.39 reg\_DSR\_type (DSR2)—Offset 100h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST\_TR\_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST\_TR\_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0      | 0h RW            | <p><b>SAR:</b> Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length = 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported.</p> |

#### 21.16.41 reg\_DAR\_type (DAR3)—Offset 110h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**DAR3:** [BAR + 9C000h] + 110h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

Diagram illustrating the structure of the 32-bit DAR field. The field is divided into eight 4-bit segments, each containing four zeros. The bit positions 31, 28, 24, 20, 16, 12, 8, and 4 are marked above the segments. The label 'DAR' is positioned below the first segment.

### 21.16.43 reg\_CTL\_LO\_type (CTL\_LO3)—Offset 120h

This register contains fields that control the DMA transfer. The CTL\_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

#### Access Method

## 21.16.44 reg\_CTL\_HI\_type (CTL\_HI3)—Offset 124h

This register contains fields that control the DMA transfer. The CTL\_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL\_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_HI3:** [BAR + 9C000h] + 124h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| 31:29     | 0h<br>RW         | <b>CH_CLASS:</b> Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28:18     | 0h<br>RW         | <b>CH_WEIGHT:</b> Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to $(2^{11}-1)=2047$ , Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17        | 0h<br>RW         | <b>DONE:</b> If status write-back is enabled, the upper word of the control register, CTL_HI, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0      | 0h<br>RW         | <b>BLOCK_TS:</b> Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to $(2^{17}-1) = (128\text{ KB} - 1)$ .                                                                                                                                                                                                                                                                                                                                |

#### 21.16.45 reg\_SSTAT\_type (SSTAT3)—Offset 128h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

##### Access Method

**Type:** Memory Mapped I/O Register

### 21.16.51 reg\_SGR\_type (SGR3)—Offset 150h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC\_TR\_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC\_TR\_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

#### Access Method

| 31:0      | 0h<br>RW         | <b>DAR:</b> Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length = 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

### 21.16.55 reg\_LLQ\_type (LLP4)—Offset 170h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled. The LLP register has two functions: The logical result of the equation  $LLP.LOC \neq 0$  is used to set up the type of DMA transfer—single or multi-block. Table shows how the method of updating the channel registers is a function of  $LLP.LOC \neq 0$ . If  $LLP.LOC$  is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type.  $LLP.LOC \neq 0$  contains the pointer to the next LLI for block chaining using linked lists. The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

## 21.16.56 reg\_CTL\_LO\_type (CTL\_LO4)—Offset 178h

This register contains fields that control the DMA transfer. The CTL\_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

### Access Method

### 21.16.57 reg\_CTL\_HI\_type (CTL\_HI4)—Offset 17Ch

This register contains fields that control the DMA transfer. The CTL\_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL\_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_HI4:** [BAR + 9C000h] + 17Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28:18     | 0h<br>RW         | <b>CH_WEIGHT:</b> Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to $(2^{11}-1)=2047$ , Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17        | 0h<br>RW         | <b>DONE:</b> If status write-back is enabled, the upper word of the control register, CTL_HI, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0      | 0h<br>RW         | <b>BLOCK_TS:</b> Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to $(2^{17}-1) = (128\text{ KB} - 1)$ .                                                                                                                                                                                                                                                                                                                                |

## 21.16.58 reg\_SSTAT\_type (SSTAT4)—Offset 180h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

### Access Method

This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note : This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA slave interface.

#### 21.16.64 reg\_SGR\_type (SGR4)—Offset 1A8h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC\_TR\_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC\_TR\_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SGR4:** [BAR + 9C000h] + 1A8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

## 21.16.69 reg\_CTL\_LO\_type (CTL\_LO5)—Offset 1D0h

This register contains fields that control the DMA transfer. The CTL\_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

If set, then all interrupt-generating sources are enabled.                                                                                                                                                                                                                                                                                                                                       |

## 21.16.70 reg\_CTL\_HI\_type (CTL\_HI5)—Offset 1D4h

This register contains fields that control the DMA transfer. The CTL\_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL\_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_HI5:** [BAR + 9C000h] + 1D4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| 31:29     | 0h<br>RW         | <b>CH_CLASS:</b> Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28:18     | 0h<br>RW         | <b>CH_WEIGHT:</b> Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to $(2^{11}-1)=2047$ , Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17        | 0h<br>RW         | <b>DONE:</b> If status write-back is enabled, the upper word of the control register, CTL_HI, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0      | 0h<br>RW         | <b>BLOCK_TS:</b> Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to $(2^{17}-1) = (128\text{ KB} - 1)$ .                                                                                                                                                                                                                                                                                                                                |

### 21.16.71 reg\_SSTAT\_type (SSTAT5)—Offset 1D8h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

#### Access Method

### 21.16.76 reg\_CFG\_HI\_type (CFG\_HI5)—Offset 1FCh

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

#### Access Method

### 21.16.77 reg\_SGR\_type (SGR5)—Offset 200h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC\_TR\_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC\_TR\_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

| 31:0      | 0h<br>RW         | <b>DAR:</b> Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length = 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported |

### 21.16.81 reg\_LLQ\_type (LLP6)—Offset 220h

Note: You need to program this register to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled. The LLP register has two functions: The logical result of the equation  $LLP.LOC \neq 0$  is used to set up the type of DMA transfer—single or multi-block. Table shows how the method of updating the channel registers is a function of  $LLP.LOC \neq 0$ . If  $LLP.LOC$  is set to 0x0, then transfers using linked lists are not enabled. This register must be programmed prior to enabling the channel in order to set up the transfer type.  $LLP.LOC \neq 0$  contains the pointer to the next LLI for block chaining using linked lists. The LLPx register can also point to the address where write-back of the control and source/destination status information occur after block completion.

## 21.16.82 reg\_CTL\_LO\_type (CTL\_LO6)—Offset 228h

This register contains fields that control the DMA transfer. The CTL\_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_LO6:** [BAR + 9C000h] + 228h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.16.83 reg\_CTL\_HI\_type (CTL\_HI6)—Offset 22Ch

This register contains fields that control the DMA transfer. The CTL\_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL\_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_HI6:** [BAR + 9C000h] + 22Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| 31:29     | 0h<br>RW         | <b>CH_CLASS:</b> Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior. ** See restriction in CH_WEIGHT below |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28:18     | 0h<br>RW         | <b>CH_WEIGHT:</b> Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to $(2^{11}-1)=2047$ , Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17        | 0h<br>RW         | <b>DONE:</b> If status write-back is enabled, the upper word of the control register, CTL_HI, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0      | 0h<br>RW         | <b>BLOCK_TS:</b> Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to $(2^{17}-1) = (128\text{ KB} - 1)$ .                                                                                                                                                                                                                                                                                                                                |

## 21.16.84 reg\_SSTAT\_type (SSTAT6)—Offset 230h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SSTAT6:** [BAR + 9C000h] + 230h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.16.87 req\_DSTATAR\_type (DSTATAR6)—Offset 248h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTARx register.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**DSTATAR6:** [BAR + 9C000h] + 248h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

[illegible]

### 21.16.88 reg\_CFG\_LO\_type (CFG\_LO6)—Offset 250h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CFG\_LO6:** [BAR + 9C000h] + 250h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000203h

## 21.16.89 reg\_CFG\_HI\_type (CFG\_HI6)—Offset 254h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CFG\_HI6:** [BAR + 9C000h] + 254h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

### 21.16.90 reg\_SGR\_type (SGR6)—Offset 258h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC\_TR\_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC\_TR\_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**SGR6:** [BAR + 9C000h] + 258h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

## 21.16.95 reg\_CTL\_LO\_type (CTL\_LO7)—Offset 280h

This register contains fields that control the DMA transfer. The CTL\_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_LO7:** [BAR + 9C000h] + 280h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

## 21.16.96 reg\_CTL\_HI\_type (CTL\_HI7)—Offset 284h

This register contains fields that control the DMA transfer. The CTL\_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled. If status write-back is enabled, CTL\_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**CTL\_HI7:** [BAR + 9C000h] + 284h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

**Default:** 00000000h

| 28:18     | 0h<br>RW         | <b>CH_WEIGHT:</b> Channel Weight : Value of K assigns a weight of (K+1) in the round-robin arbitration between channels of the same class. A value of 0x7FF assigns an arbitration weight of 2048. Since K is from 0 to $(2^{11}-1)=2047$ , Arbitration Weight ranges from 1 to 2048 **Restrictions : 1. CH_CLASS and CH_WEIGHT cannot be changed on the fly. Changes to either values for ANY channel require that ALL channels be quiescent in order to propagate those changes to the read and write arbiters without affecting their functionality. 2. Another possible way of achieving the quiescence requirement is to suspend ALL channels before changing the CH_CLASS and CH_WEIGHT. 3. Caution must be taken in descriptor-based (linked-list) multi-block transfers since the LLI.CTL_HI is one of the DW that needs to be read and loaded into the CTL_HI internal register. Hence, user needs to ensure that the CH_CLASS and CH_WEIGHT fields do not change from one descriptor to another nor do they disturb the aforementioned quiescence requirement. |
| 17        | 0h<br>RW         | <b>DONE:</b> If status write-back is enabled, the upper word of the control register, CTL_HI, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16:0      | 0h<br>RW         | <b>BLOCK_TS:</b> Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesn't mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register. Theoretical Byte Size range is from 0 to $(2^{17}-1) = (128\text{ KB} - 1)$ .                                                                                                                                                                                                                                                                                                                                |

### 21.16.97 reg\_SSTAT\_type (SSTAT7)—Offset 288h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block. Note : This register is a temporary placeholder for the source status information on its way to the SSTATx register location of the LLI. The source status information should be retrieved by software from the SSTATx register location of the LLI, and not by a read of this register over the DMA slave interface.

#### Access Method

### 21.16.103 reg\_SGR\_type (SGR7)—Offset 2B0h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC\_TR\_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC\_TR\_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

### 21.16.110 reg\_Status\_type (StatusTfr)—Offset 2E8h

All interrupt events from all channels are stored in these Interrupt Status registers after masking: `statusBlock`, `StatusDstTran`, `StatusErr`, `StatusSrcTran`, and `StatusTfr`. Each Interrupt Status register has a bit allocated per channel, for example, `StatusTfr(2)` is the Channel 2 status transfer complete interrupt. The contents of these registers are used to generate the interrupt signals (`int` or `int_n` bus, depending on interrupt polarity) leaving the DMA.

### 21.16.112 reg\_Status\_type (StatusSrcTran)—Offset 2F8h

All interrupt events from all channels are stored in these Interrupt Status registers after masking: statusBlock, StatusDstTran, StatusErr, StatusSrcTran, and StatusTfr. Each Interrupt Status register has a bit allocated per channel, for example, StatusTfr(2) is the Channel 2 status transfer complete interrupt. The contents of these registers are used to generate the interrupt signals (int or int\_n bus, depending on interrupt polarity) leaving the DMA.

### 21.16.115 reg\_Mask\_type (MaskTfr)—Offset 310h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel i is memory, then the source transaction complete interrupt, MaskSrcTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int\_combined signal. Similarly, when the destination peripheral of DMA channel i is memory, then the destination transaction complete interrupt, MaskDstTran(i), must be masked to prevent an erroneous triggering of an interrupt on the int\_combined(\_n) signal. A channel INT\_MASK bit will be written only if the corresponding mask write enable bit in the INT\_MASK\_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged.

Writing a 1 to any bit in these registers unmask the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int\_\* port signals.

## 21.16.116 reg\_Mask\_type (MaskBlock)—Offset 318h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel, for example, MaskTfr(2) is the mask bit for the Channel 2 transfer complete interrupt. When the source peripheral of DMA channel *i* is memory, then the source transaction complete interrupt, MaskSrcTran(*i*), must be masked to prevent an erroneous triggering of an interrupt on the int\_combined signal. Similarly, when the destination peripheral of DMA channel *i* is memory, then the destination transaction complete interrupt, MaskDstTran(*i*), must be masked to prevent an erroneous triggering of an interrupt on the int\_combined(\_n) signal. A channel INT\_MASK bit will be written only if the corresponding mask write enable bit in the INT\_MASK\_WE field is asserted on the same OCP write transfer. This allows software to set a mask bit without performing a read-modified write operation. For example, writing hex 01x1 to the MaskTfr register writes a 1 into MaskTfr(0), while MaskTfr(7:1) remains unchanged. Writing hex 00xx leaves MaskTfr(7:0) unchanged. Writing a 1 to any bit in these registers unmask the corresponding interrupt, thus allowing the DMA to set the appropriate bit in the Status registers and int\_\* port signals.

### 21.16.123 reg\_Clear\_type (ClearDstTran)—Offset 350h

Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel, for example, ClearTfr(2) is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

#### Access Method

### 21.16.126 reg\_DmaCfgReg\_type (DmaCfgReg)—Offset 398h

This register is used to enable the DMA, which must be done before any channel activity can begin. If the global channel enable bit is cleared while any channel is still active, then `DmaCfgReg.DMA_EN` still returns 1 to indicate that there are channels still active until hardware has terminated all activity on all channels, at which point the `DmaCfgReg.DMA_EN` bit returns 0.

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**DmaCfgReg:** [BAR + 9C000h] + 398h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:21, F:0] + 10h

### 21.16.127 reg\_ChEnReg\_type (ChEnReg)—Offset 3A0h

This is the DMA Channel Enable Register. If software needs to set up a new channel, then it can read this register in order to find out which channels are currently inactive, it can then enable an inactive channel with the required priority. All bits of this register are cleared to 0 when the global DMA channel enable bit, `DmaCfgReg(0)`, is 0. When the global channel enable bit is 0, then a write to the `ChEnReg` register is ignored and a read will always read back 0. The channel enable bit, `ChEnReg.CH_EN`, is written only if the corresponding channel write enable bit, `ChEnReg.CH_EN_WE`, is asserted on the

**Type:** Memory Mapped I/O Register

## 22 Intel® Trusted Execution Engine (TXE)

---

This section describes the security components and capabilities of the Intel® Trusted Execution Engine (TXE) security co-processor.

**Note:** TXE firmware is required on the Bay Trail Platform as part of the PCU SPI flash image. PCU SPI must be setup in descriptor mode. For security reasons, primarily to lock PCU SPI flash access permission and OTP fuse programming, TXE Manufacturing Mode must be Disabled before shipping to customers. See your Intel® representative for details.

### 22.1 Features

#### 22.1.1 Security Feature

The Intel® TXE is a security co-processor responsible for supporting and handling security. Features include:

- 32-bit RISC processor
- 256KB Data/Code RAM accessible only to the Intel® TXE
- 128KB On Chip Mask ROM for storage of Intel® TXE code
- Common Timer 1-100  $\mu$ S granularity, configurable interrupt (under FW control)
- Inter-Processor Communication for message passing between the Host CPU and Intel® TXE
- 64 byte input and output command buffers
- 256 byte shared payload (enables 2048-bit keys to be exchanged as part of the command)
- No Host CPU address domain access to the Intel® TXE address domain by any Host CPU address domain units
- Security controller has direct access to Host CPU address domain (Some Restrictions Apply). Multiple context DMA engine to transfer data between Host CPU address domain (System memory) and the Intel® TXE; programmable by the Intel® TXE CPU only.
- One multi-tiered FW Key Ladder and one Intel Key ladder.
- Paging DMA operations includes encryption/decryption and integrity check value (ICV) calculation. Auxiliary GPIOs to support input alert and two GP Outputs.

##### 22.1.1.1 HW Accelerators

- DES/3DES (ECB, CBC) – 128b ABA key for 3DES Key Ladder Operations
- Three AES engines - Two fast -128 and one slow- 128/256

- Exponentiation Acceleration Unit (EAU) for modular exponentiation, modular reduction, large number addition, subtraction, and multiplication
- SHA1, SHA256/384/512, MD5

#### **22.1.1.2 FW Utilities and Ciphers**

- RSA (with EAU acceleration)
- Flash Write Enable/Disable
- Comprehensive IPC Command Set
- Chip Unique Key encryption key wrapping of other platform keys (Flash)

#### **22.1.1.3 Downloadable FW Utilities and Ciphers**

- Integrated Theft Deterrence Technology - Intel® Anti-Theft Technology (Intel® AT)
- Media Vault - content protection and distribution product specifically focused on online content for streaming and download
- One Time Programmable (OTP)

## **22.2 Register Map**

See Chapters [Section 3, "Register Access Methods"](#) on page 69 and [Section 4, "Mapping Address Spaces"](#) on page 75 for additional information.

## 22.3 Intel® TXE PCI Configuration Registers

**Table 239. Summary of TXE PCI Configuration Registers—0/26/0**

| Offset         | Size (Bytes) | Register Name (Register Symbol)                                                                                  | Default Value |
|----------------|--------------|------------------------------------------------------------------------------------------------------------------|---------------|
| 0–3h           | 4            | "Device/Vendor ID (DEVVENDID)—Offset 0h" on page 3166                                                            | 00108086h     |
| 4–7h           | 4            | "Status Command (STATUSCOMMAND)—Offset 4h" on page 3166                                                          | 00100000h     |
| 8–Bh           | 4            | "Revision ID and Class Code (REVCLASSCODE)—Offset 8h" on page 3167                                               | 10800000h     |
| C–Fh           | 4            | "CLLATHEADERBISTR (CLLATHEADERBIST)—Offset Ch" on page 3168                                                      | 00000000h     |
| 10–13h         | 4            | "SAP Agent Memory BAR (SAPAGENTBAR)—Offset 10h" on page 3168                                                     | 00000000h     |
| 14–17h         | 4            | "Bridge Memory BAR (BRIDGEBAR)—Offset 14h" on page 3169                                                          | 00000000h     |

| 31:28     | X<br>RW          | <b>INF_PROG_CODE:</b> This field identifies the infrastructure progress code. For example, when firmware comes out of reset, this field would identify the infrastructure moving from ROM to BRINGUP to Micro Kernel to Policy module, etc. Note that this field is specific to infrastructure and does not represent the entire firmware. Refer to the Working State and Error Code fields to identify current state of the firmware. Values are as follows: 0: ROM. 1: Bringup. 2: uKernel. 3: Policy module. 4: Module loading. 6: Host communication. SeC is up and running, and host communication is established. |
| 27:24     | X<br>RW          | <b>CURR_PM_EV:</b> Status of current SeC power management event. Values as follows: 0x00: Clean Moff --) M0 wake. 0x01: M0 wake after error. 0x02: Clean global reset. 0x03: Global Reset after an error. 0x04: Clean SeC reset. 0x05: SeC reset due to exception. 0x06: Pseudo-global reset. 0x07: Reserved. 0x08: Reserved. 0x09: Reserved. 0x0A: Reserved. 0x0B: Power cycle reset through MOFF. 0x0C: Reserved. 0x0D: S0/M0 --) S0/MOFF.                                                                                                                                                                            |

### 22.3.13 SEC\_MEM\_REQ—Offset 44h

SeC Firmware Memory Request. SeC FW uses this register in order to pass its main memory request to BIOS. Register access control: FW=RW PMC=RO Host=RO

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:26, F:0] + 44h

**Default:** 00000000h

|               |                 |                 |    |    |    |          |   |   |
|---------------|-----------------|-----------------|----|----|----|----------|---|---|
| 31            | 28              | 24              | 20 | 16 | 12 | 8        | 4 | 0 |
| 0             | 0               | 0               | 0  | 0  | 0  | 0        | 0 | 0 |
