PipeA Panel Power Control Register ([DevCL, DevCTG, DevCDV]) PP Control (dplrreg.v pnl\_pwr\_cntl)

##### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [GTTMMADR\_LSB + 180000h] + 61204h

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR\_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h

| 31:16     | 0b<br>RW         | <b>WRITE_PROTECT_KEY:</b> ABCD Write protect off<br>When this field is programmed to anything except the write protect off setting and the panel is either powered up or in the process of a power up sequence, a set of registers involved in generation of panel timing or control become write protected. Any write cycles to those write protected registers, while they will complete as normal, will not change the value of the register when write protected. When this register field contains the write protect off key value, write protect will be unconditionally disabled. In situations where the embedded panel port is unused, the port should remain powered down and the write protect will be inactive. This field in normal operation should be left to all zeros and never programmed with the key value. It exists only to allow testing and workarounds.<br>List of Write protected registers:<br>(LVDS and Panel sequencing Registers):<br>LVDS Digital Display Port Control Address: 61180h 61183h<br>Pipe A Panel power on sequencing delays - Address: 61208-6120Bh<br>Pipe A Panel power off sequencing delays Address: 6120Ch 6120Fh<br>Pipe A Panel power cycle delay and Reference Divisor Address: 61210h 61213<br>(DPLL registers):<br>DPLL Control Registers<br>FPA0 DPLL Divisor Register<br>FPA1 DPLL Divisor Register 1<br>FPB0 DPLL Divisor Register<br>FPB1 DPLL Divisor Register 1<br>(Display Pipe timing registers except source size)<br>HTOTAL Horizontal Total Register<br>HBLANK Horizontal Blank Register<br>HSYNC_ Horizontal Sync Register<br>VTOTAL_ Vertical Total Register<br>VBLANK_ Vertical Blank Register<br>VSYNC_ Vertical Sync Register |

| 31:16     | 0b<br>RW         | <b>BACKLIGHT_MODULATION_FREQUENCY:</b> This field determines the number of time base events in total for a complete cycle of modulated backlight control. This field is normally set once during initialization based on the frequency of the clock that is being used and the desired PWM frequency. This value represents the period of the PWM stream in display core clocks ([DevCTG] 100MHz HRAW clocks) multiplied by 128 or 25MHz S0IX clocks multiplied by 16.                                                                                                                                                                  |
| 15:0      | 0b<br>RW         | <b>BACKLIGHT_DUTY_CYCLE:</b> This field determines the number of time base events for the active portion of the PWM backlight control. This should never be larger than the frequency field. A value of zero will turn the backlight off. A value equal to the backlight modulation frequency field will be full on. This field gets updated when it is desired to change the intensity of the backlight, it will take affect at the end of the current PWM cycle. This value represents the active time of the PWM stream in display core clock ([DevCTG] HRAW clock) periods multiplied by 128 or 25MHz S0IX clocks multiplied by 16. |

| 4:0       | 00100b<br>RW                           | <b>POWER_CYCLE_DELAY:</b> Programmable value of time panel must remain in a powered down state after powering down. For devices coming out of reset, the default values will define how much time must pass before a power on sequence can be started. This field uses the .1 S time base unit from the divider. If the panel power on sequence is attempted during this delay, the power on sequence will commence once the power cycle delay is complete. Writing a value of 0 selects no delay or is used to abort the delay if it is active.<br>During the initial power up reset, a D3 cold power cycle, or a user instigated system reset, the timer will be set to the default value and the count down will begin after the de-assertion of reset. Writing this field to a zero while the count is active will abort this portion of the sequence. This corresponds to the T4 of the SPWG specification. Note: Even if the panel is not enabled, the T4 count happens after reset.<br>This register needs to be programmed to a +1 value. For instance for meeting the SPWG specification of 400mS, program 5 to achieve at least 400mS delay prior to powerup. |

| 15:0      | 0b<br>RW         | <b>BACKLIGHT_DUTY_CYCLE:</b> This field determines the number of time base events for the active portion of the PWM backlight control. This should never be larger than the frequency field. A value of zero will turn the backlight off. A value equal to the backlight modulation frequency field will be full on. This field gets updated when it is desired to change the intensity of the backlight, it will take affect at the end of the current PWM cycle. This value represents the active time of the PWM stream in display core clock ([DevCTG] HRAW clock) periods multiplied by 128 or 25MHz S0IX clocks multiplied by 16. |

#### 14.11.60 PIPEB\_BLM\_HIST\_CTL—Offset 61360h

## PipeB Image Enhancement Histogram Control Register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [GTTMMADR\_LSB + 180000h] + 61360h

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR\_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h

#### 14.11.71 AUD HDMIW HDMIEDID A—Offset 62050h

HDMI Data EDID Block Pipe A

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [GTTMMADR\_LSB + 180000h] + 62050h

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR** **LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h

| 31        | 0b<br>RW         | <b>DPB_AUX_BUFFER_LOOPBACK_TEST_ENABLE:</b> Project: All<br>Default Value: 0b<br>Enables test for the DPB-AUX I/O buffer. A 16 cycle clock pattern is output to the I/O buffer and compared against the looped back buffer output. The input clock is cdclk. With input clock at 512MHz the pattern will be a 1 MHz clock. It scales down with lower clock frequencies. The result is found in DP-AUX Buffer Loopback Test Result after DP-AUX Buffer Loopback Test Done is set. Clear this bit to 0 after test is done to return DP-AUX to normal operation. Loopback Test can be run simultaneously on all AUX buffers. Do not enable DP-AUX Buffer Loopback Test and DP-AUX Full Test simultaneously.<br>Value Name Description Project<br>0b Disable Test disabled All<br>1b Enable Enable test. All |

| 28        | 0b<br>RW         | <b>DPB_AUX_FULL_TEST_ENABLE:</b> Project: All<br>Default Value: 0b<br>Enables test for the DPB-AUX core logic transmit and receive functions through the DPB-AUX and DPC-AUX buffers. DPB-AUX and DPC-AUX are interconnected through I/O buffer loopbacks. DPB-AUX is programmed as source to output a 20 byte test pattern. DPC-AUX is programmed as sink to receive the test pattern and reply with a different 20 byte test pattern. Test pattern 1 = 0xA55CC33E E770080C 0E0F0F8F CFEFF81C 3E77E3C8 Test pattern 2 = 0X183C7EE7 C381FF7F 3F1F0F07 030100EE 77CC33A5<br>Programming sequence: 1. Set DPB-AUX Full Test Enable to 1. 2. Program DPB_AUX_CH_DATA[1-5] with test pattern 1 to transmit as the source. 3. Program DPC_AUX_CH_DATA[1-5] with test pattern 2 to reply with as the sink. 4. Program all DPC_AUX_CH_CTL fields and set Send to 1. 5. Program all DPB_AUX_CH_CTL fields and set Send to 1. Then the test will start. Results checking sequence: 1. Poll DPB_AUX_CH_CTL for Done. To pass, Done must be set within 500us. 2. Read DPB_AUX_CH_CTL register. To pass, Timeout Error and Receive Error must be 0. 3. Read DPC_AUX_CH_CTL register. To pass, Receive Error must be 0. 4. Read DPB_AUX_CH_DATA[1-5] registers. To pass, they must contain test pattern 2. 5. Read DPC_AUX_CH_DATA[1-5] registers. To pass, they must contain test pattern 1. Clear this bit to 0 after test is done to return DP-AUX to normal operation. Test must be repeated with and without lane reversal to verify DPB-AUX buffer combinations. Only enable one DP-AUX Full Test at a time. To abort a test in progress, write the AUX_CH_CTL Send bits to 0 and Full Test Enable to 0.<br>Value Name Description Project<br>0b Disable Test disabled All<br>1b Enable Enable test All |

### 14.11.171 PIPEACONF—Offset 70008h

Pipe A Configuration Register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [GTTMMADR\_LSB + 180000h] + 70008h

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR\_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h

| 31        | 0b<br>RW         | <b>PIPE_A_ENABLE:</b> Setting this bit to the value of one, turns on pipe A. This must be done before any planes are enabled on this pipe. Changing it to a zero should only be done when all planes that are assigned to this pipe have been disabled. Turning the pipe enable bit off disables the timing generator in this pipe. Plane disable occurs after the next VBLANK event after the plane is disabled. Synchronization pulses to the display are not maintained if the timing generator is disabled. Power consumption will be at its lowest state when disabled. A separate bit controls the DPLL enable for this pipe. Pipe timing registers should contain valid values before this bit is enabled.<br>0 = Disable<br>1 = Enable                                                                                                                    |
| 30        | 0b<br>RO         | <b>PIPE_STATE:</b> This bit indicates the actual state of the pipe. Since there can be some delay between disabling the pipe and the pipe actually shutting off, this bit indicates the true current state of the pipe.<br>0 = Disabled<br>1 = Enabled<br>AccessType: Read Only                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

This bit should only be used when this pipe is in an interlaced display timing. For synchronization with register updates, the actual event will occur one line after the start of VBLANK. To use this bit in a polling manner, clear the bit by writing a one to it followed by the polling loop waiting for it to become set.<br>Note: This bit will not be set when pipe is in Interlaced with Field 0 Only using legacy vertical sync shift mode.<br>0 = Even Field Vertical Blank has not occurred<br>1 = Even Field Vertical Blank has occurred<br>AccessType: One to Clear |

### 14.11.178 DSPARB—Offset 70030h

Display Arbitration Control

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [GTTMMADR\_LSB + 180000h] + 70030h

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR\_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 80008000h

### 14.11.179 FW1—Offset 70034h

## Access Method

**GTTMMADR** **LSB Reference:** [B:0, D:2, F:0] + 10h

Intel Atom® Processor E3800 Product Family  
Datasheet  
855

### 14.11.180 FW2—Offset 70038h

## Display FIFO Watermark Control 2

| 31:6      | 0b<br>RW         | <p><b>CURSOR_BASE_ADDRESS:</b> . This field specifies bits 31:6 of the graphics address of the base of the cursor. On [DevBW] and [DevCL] if the cursor is a popup, this field specifies bits 31:6 of the physical address of the base of the cursor, and bits 35:32 of the address are specified in the LSBs of this register. Popup cursor mode is selected within the CURACNTR register. The cursor surface address must be 4K byte aligned. The cursor must be in linear memory, it cannot be tiled. When performing 180 rotation, this offset must be the difference between the last pixel of the last line of the cursor data in its unrotated orientation and the cursor surface address.</p> <p>A write to this register also acts as a trigger event to force the update of active registers from the staging registers on the next display event. Each cursor register is double-buffered. The CPU writes to a set of holding registers. The active registers are updated from the holding registers following the leading edge of the vertical blank pulse. The update is postponed until the next vblank if a write cycle is active to any of the cursor registers at the time of the vblank. The update is also postponed if a write sequence is in progress.</p> <p>It is assumed that if the cursor mode is changed, the cursor image will also be changed. To prevent the cursor from appearing when it is only partially programmed, the active registers will not be updated until both the cursor control and base address registers have been programmed. If the cursor control register is written, the cursor base address must also be written before the change will be effective. However, the base address register may be changed (e.g., to change the shape of the cursor) without also writing to the control register. If both are to be written, the control register must be written first.</p> |

| 31:6      | 0b<br>RW         | <p><b>CURSOR_BASE_ADDRESS:</b> This register specifies the graphics address of the entire cursor. It also acts as a trigger event to force the update of active registers on the next display event.</p> <p>The cursor surface address must be 4K byte aligned. The cursor must be in linear memory, it cannot be tiled. When performing 180 rotation, this offset must be the difference between the last pixel of the last line of the cursor data in its unrotated orientation and the cursor surface address.</p> <p>A write to this register also acts as a trigger event to force the update of active registers from the staging registers on the next display event. Each cursor register is double-buffered. The CPU writes to a set of holding registers. The active registers are updated from the holding registers following the leading edge of the vertical blank pulse. The update is postponed until the next vblank if a write cycle is active to any of the cursor registers at the time of the vblank. The update is also postponed if a write sequence is in progress.</p> <p>It is assumed that if the cursor mode is changed, the cursor image will also be changed. To prevent the cursor from appearing when it is only partially programmed, the active registers will not be updated until both the cursor control and base address registers have been programmed. If the cursor control register is written, the cursor base address must also be written before the change will be effective. However, the base address register may be changed (e.g., to change the shape of the cursor) without also writing to the control register. If both are to be written, the control register must be written first.</p> |

This bit is only allowed to change on a synchronous flip, but once set with a synchronous flip, the bit can remain set while using asynchronous flips. This value is loaded into the surface base address register of the associated plane. Usage must conform to the rules outlined in the plane surface base address register.</p> <p>0 = Decryption request disabled (default)<br/>1 = Decryption request enabled</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### 14.11.211 DSPACNTR—Offset 70180h

Display A Plane Control Register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [GTTMMADR\_LSB + 180000h] + 70180h

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR\_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h

| 31:0      | 0b<br>RW         | <b>DISPLAY_A_OFFSET:</b> This register provides the panning offset into the display A plane. This value is added to the surface address to get the graphics address of the first pixel to be displayed. This offset must be at least pixel aligned. This offset is the difference between the address of the upper left pixel to be displayed and the display surface address. When performing 180 rotation, this offset must be the difference between the last pixel of the last line of the display data in its unrotated orientation and the display surface address. |

| 31:6      | 0b<br>RW         | <p><b>DISPLAY_A_STRIDE:</b> This is the stride for display A in bytes. When using linear memory, this must be 64 byte aligned. When using tiled memory, this must be 512 byte aligned. This value is used to determine the line to line increment for the display. This register is updated either through a command packet passed through the command stream or writes to this register. When it is desired to update both this and the start register, the stride register must be written first because the write to the start register is the trigger that causes the update of both registers on the next VBLANK event. When using tiled memory, the actual memory buffer stride is limited to a maximum of 16K bytes.</p> <p>[DevBW, DevCL, DevCDV] The display stride must be power of 2 when doing Async Flips.</p> <p>[DevBW, DevCL, DevCDV] The display stride must be 8KB or greater when doing Async Flips together with 180 rotation.</p> <p>The value in this register is updated through the command streamer during a synchronous flip.</p> |

| 31:12     | 0b<br>RW         | <b>DISPLAY_A_SURFACE_BASE_ADDRESS:</b> . This address specifies the surface base address. When the surface is tiled, panning is specified using (x, y) offsets in the DSPATILEOFF register. When the surface is in linear memory, panning is specified using a linear offset in the DSPALINOFF register. This address must be 4K aligned. When performing asynchronous flips and the display surface is in tiled memory, this address must be 256K aligned. This register can be written directly through software or by command packets in the command stream. It represents an offset from the graphics memory aperture base and is mapped to physical pages through the global GTT. [DevBW] and [DevCL]: This address must be 128K aligned for linear memory. |

### 14.11.220 CBR2—Offset 70404h

Chicken2 Bit Register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [GTTMMADR\_LSB + 180000h] + 70404h

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR\_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h

| 31        | 0b<br>RW         | <b>PIPE_B_ENABLE:</b> Setting this bit to the value of one, turns on pipe B. This must be done before any planes are enabled on this pipe. Changing it to a zero should only be done when all planes that are assigned to this pipe have been disabled. Turning the pipe enable bit off disables the timing generator in this pipe. Plane disable occurs after the next VBLANK event after the plane is disabled. Synchronization pulses to the display are not maintained if the timing generator is disabled. Power consumption will be at its lowest state when disabled. A separate bit controls the DPLL enable for this pipe. Pipe timing registers should contain valid values before this bit is enabled. Disabling the Pipe and changing the timing registers and re-enabling the pipe before the next VBLANK will cause the mode change to occur at the end of the current frame. This requires no wait on the software s part. On the other hand, if this is the disabling of the pipe, that does require a software wait for VBLANK to occur. Synchronization pulses to the display are not maintained if the timing generator is disabled. Power consumption is at it s lowest state.<br>1 = Enable<br>0 = Disable |
| 30        | 0b<br>RO         | <b>PIPE_STATE:</b> This bit indicates the actual state of the pipe. Since there can be some delay between disabling the pipe and the pipe actually shutting off, this bit indicates the true current state of the pipe.<br>0 = Disabled<br>1 = Enabled<br>AccessType: Read Only                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 2         | 0b<br>RW         | <b>DECRYPTION_REQUEST:</b> Project:<br>All<br><br>Default Value:<br>0b<br><br>This bit requests decryption to be enabled for this plane. This request will be qualified with the separate decryption allow message in order to create the decryption enable. This bit is only allowed to change on a synchronous flip, but once set with a synchronous flip, the bit can remain set while using asynchronous flips. This value is loaded into the surface base address register of the associated plane. Usage must conform to the rules outlined in the plane surface base address register.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

#### 14.11.251 DSPBCNTR—Offset 71180h

### Display B/Sprite Plane Control Register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [GTTMMADR LSB + 180000h] + 71180h

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR\_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 01000000h

[illegible]

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31        | 0b<br>RW         | <b>DISPLAY_B_SPRITE_PRIMARY_B_ENABLE:</b> This bit will enable or disable the display B/sprite. When this bit is set, the plane will generate pixels for display. When set to zero, memory fetches cease and display is blanked (from this plane) at the next VBLANK event from the pipe that this plane is assigned. At least one of the display pipes must be enabled to enable this plane. There is an override for the enable of this plane in the Pipe Configuration register.<br>1 = Enable<br>0 = Disable |
| 30        | 0b<br>RW         | <b>DISPLAY_B_SPRITE_GAMMA_ENABLE:</b> This bit should only be changed after the plane has been disabled. It controls the bypassing of the display pipe gamma unit for this display plane pixel data only. For 8-bit indexed display data, this bit should be set to a one.<br>0 = Display B pixel data bypasses the pipe gamma correction logic (default).<br>1 = Display B pixel data is gamma corrected in the pipe gamma correction logic                                                                     |

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 14.11.252 DSPBLINOFFSET—Offset 71184h

Display B/Sprite Linear Offset Register

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [GTTMMADR\_LSB + 180000h] + 71184h

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR\_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h

#### 14.11.253 DSPBSTRIDE—Offset 71188h

### 14.11.255 DSPBKEYMSK—Offset 71198h

Sprite Color Key Mask Register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [GTTMMADR\_LSB + 180000h] + 71198h

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR\_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h

| 27:16     | 0b<br>RW         | <b>PLANE_START_Y_POSITION:</b> These 12 bits specify the vertical position in lines of the beginning of the active display plane relative to the display surface. When performing 180 rotation, this field specifies the vertical position of the lower right corner relative to the start of the active display plane in the unrotated orientation. |

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31        | 0b<br>RW         | <b>VGA_DISPLAY_DISABLE:</b> This bit will disable the VGA compatible display mode. It has no effect on VGA register or A0000-BFFFF memory aperture accesses which are controlled by the PCI configuration and VGA register settings. VGA display should only be enabled if all display planes other than VGA are disabled. After enabling the VGA, most display planes need to stay disabled, only the VGA popup (cursor A) can be enabled. The VGA display is never trusted. No secrets are allowed in the pre-allocated memory and VGA is limited to access only that memory. During trusted operation (when registers are locked via Lock), this bit will always act as if it was set to a one (disabled VGA display).<br>VGA 132 Column text mode is not supported.<br>0 = VGA Display Enabled<br>1 = VGA Display Disabled                                                                                                                              |
| 30        | 0b<br>RW         | <b>VGA_POP_UP_2X_CENTERED_MODE_SCALING:</b> When this bit is set to a one, the VGA and pop-up data is scaled using pixel doubling in both the horizontal and vertical direction for use on un-scaled flat panel displays. Setting this bit allows the VGA to run at higher dot clock frequencies and creates a larger (4x the size) image for better quality on larger displays. It is intended for use in one of the centering modes when not using the internal panel fitting. Do not use it for native VGA modes or when internal panel fitting is used to scale VGA.<br>In the situations where it is used, for 1280 wide or larger panels this bit should be set. For exactly 1280 wide panels, the Nine-dot disable bit should also be set. This operation is in addition to the VGA functions that double the pixels and lines.<br>0 = VGA display is normal size<br>1 = VGA and VGA popup data is doubled in the horizontal and vertical direction. |
| 29        | 0b<br>RW         | <b>VGA_PIPE_SELECT:</b> This bit only applies to devices with dual pipe support. For devices with a single display pipe, this bit will be ignored. For dual pipe devices, this bit determines which pipe is to receive the VGA display data. This must be changed only when the VGA display is in the disabled state via the VGA display disable bit or during the write to enable VGA display.<br>0 = Selects Assigns the VGA display to Pipe A<br>1 = Selects Assigns the VGA display to Pipe B                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| 26        | 0b<br>RW         | <p><b>VGA_BORDER_ENABLE:</b> This bit determines if the VGA border areas during VGA centering modes are included in the active display area and do or do not appear on integrated TV encoder output and devices that use centering such as on DVO connected flat panel, TV displays, or integrated panels.</p> <p>For use with the internal panel fitting logic, the border if enabled will be scaled along with the pixel data. Setting this bit allows the popup to be positioned overlapping the border area of the image.</p> <p>0 = VGA Border areas are not included in the image size calculations for centering only active area.</p> <p>1 = VGA Border areas are enabled and is passed to the display pipe for display and used in the image size calculation for centering modes</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 25:24     | 0b<br>RW         | <p><b>VGA_CENTERING_ENABLE:</b> VGA centering modes use the pipe timing generators to determine the actual display timings. This would normally correspond to the display panel size and timings. The VGA registers determine the centered VGA image height and width. The VGA border may or may not be considered in the calculation selected by the VGA Border Enable bit. For a proper image, the VGA image size should not exceed the pipe timing generator active rectangle. When using the internal panel fitting logic, the horizontal image size needs to be less than or equal to 2048 pixels to generate a proper image. The VGA image will either be centered within the pipe timing rectangle or appear in the upper left corner.</p> <p>Upper left corner centered mode is generally used for external panel scaling where the DVO stall signal is used and is always used for internal panel fitting operation. When panel fitter is enabled on the same pipe as VGA this register setting is ignored and upper left corner centered mode is always selected. When centering is disabled, the VGA CRTC registers determine the display timing compatible with legacy VGA devices for driving CRT like devices.</p> <p>00 = VGA centering is disabled, VGA operates in Native VGA mode or when driving integrated TV</p> <p>01 = VGA centering is enabled, VGA image appears in the center of the larger rectangle</p> <p>10 = VGA centering is enabled, VGA image appears in the upper left corner of the larger rectangle</p> <p>11 = VGA centering is enabled, VGA image appears in the upper left corner of the larger rectangle</p> |
| 23        | 0b<br>RW         | <p><b>VGA_PALETTE_READ_SELECT:</b> This bit only applies to dual display pipe devices and determines which palette VGA palette read accesses will occur from.</p> <p>0 = VGA palette reads will access Palette A (default).</p> <p>1 = VGA palette reads will access Palette B</p> <p>VGA palette reads are reads from I/O address 0x3c9.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |  |  |  |  |  |  |  |  |  |  |  |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |  |  |  |  |  |  |  |  |  |  |  | |-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31        | 0b<br>RW         | <b>SPRITE_A_ENABLE:</b> This bit will enable or disable the Sprite A. When this bit is set, the plane will generate pixels for display to be combined by the blender for the target pipe. When set to zero, memory fetches cease and display is blanked (from this plane) at the next VBLANK event from the pipe that this plane is assigned. At least one of the display pipes must be enabled to enable this plane. There is an override for the enable of this plane in the Pipe Configuration register. This bit only has an effect when the plane is not trusted. When the plane is marked trusted, this bit will be overridden and the display disabled when the registers are unlocked.<br>1 = Enable<br>0 = Disable                                                                                                                                                                                                                                                                                        |
| 30        | 0b<br>RW         | <b>SPRITE_A_GAMMA_ENABLE:</b> There are two gamma adjustments possible in the Sprite A data path. This bit controls the gamma correction in the display pipe not the gamma control in this plane. It affects only the pixel data from this display plane. For pixel format of 8-bit indexed, this bit should be set to a one. Gamma correction logic that is contained in the Sprite A logic is disabled by loading the default values into those registers.<br>When this plane is marked as trusted, this bit should always be set to zero to force the pipe gamma to be always be bypassed.<br>0 = Sprite A pixel data bypasses the display pipe gamma correction logic (default).<br>1 = Sprite A pixel data is gamma corrected in the pipe gamma correction logic                                                                                                                                                                                                                                              |
| 29:26     | 0b<br>RW         | <b>SPRITE_A_SOURCE_PIXEL_FORMAT:</b> This field selects the pixel format for the sprite/Sprite A. Pixel formats with an alpha channel should not use source keying. Before entering the blender, each source format is converted to 10 bits per pixel (details are described in the intermediate precision for the blender section of the Display Functions chapter).<br>0000 = YUV 4:2:2 packed (see byte order below).<br>0001 = Reserved<br>0010 = 8-bpp Indexed.<br>0011 = Reserved.<br>0100 = Reserved.<br>0101 = 16-bit BGRX (5:6:5:0) pixel format (XGA compatible).<br>0110 = 32-bit BGRX (8:8:8:8) pixel format. ### 14.11.283 SPAKEYMSK—Offset 72198h

## Sprite A Color Key Mask Register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [GTTMMADR\_LSB + 180000h] + 72198h

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR\_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h

| 31:12     | 0b<br>RW         | <b>SPRITE_A_SURFACE_BASE_ADDRESS:</b> This address specifies the surface base address. When the surface is tiled, panning is specified using (x, y) offsets in the DSPCTILEOFF register. When the surface is in linear memory, panning is specified using a linear offset in the DSPCLINOFF register. This address must be 4K aligned. This register can be written directly through software or by command packets in the command stream. It represents an offset from the graphics memory aperture base and is mapped to physical pages through the global GTT.<br>If the device supports trusted operation and this plane is not marked trusted, the memory pages must not be marked NoDMA .<br>The value in this register is updated through the command streamer during synchronous flips.<br>[DevBW] and [DevCL]: This address must be 128K aligned for linear memory. |

| 2         | 0b<br>RW         | <p><b>DECRYPTION_REQUEST:</b> Project:<br/>All</p> <p>Default Value:<br/>0b</p> <p>This bit requests decryption to be enabled for this plane. This request will be qualified with the separate decryption allow message in order to create the decryption enable. This bit is only allowed to change on a synchronous flip, but once set with a synchronous flip, the bit can remain set while using asynchronous flips. This value is loaded into the surface base address register of the associated plane. Usage must conform to the rules outlined in the plane surface base address register.</p> <p>ValueNameDescriptionProject<br/>0b<br/>Not requested<br/>Decryption not requested<br/>All</p> <p>1b<br/>Requested<br/>Decryption requested<br/>All</p> |

This request will be qualified with the separate decryption allow message in order to create the decryption enable. This bit is only allowed to change on a synchronous flip, but once set with a synchronous flip, the bit can remain set while using asynchronous flips. This value is loaded into the surface base address register of the associated plane. Usage must conform to the rules outlined in the plane surface base address register.</p> <p>ValueNameDescriptionProject<br/>0b<br/>Not requested<br/>Decryption not requested<br/>All</p> <p>1b<br/>Requested<br/>Decryption requested<br/>All</p> |

#### 14.11.289 SPACLR0—Offset 721D0h

### Sprite A Color Correction 0 Register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [GTTMMADR LSB + 180000h] + 721D0h

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR\_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 01000000h

| 31        | 0b<br>RW         | <b>SPRITE_B_ENABLE:</b> This bit will enable or disable the Sprite B. When this bit is set, the plane will generate pixels for display to be combined by the blender for the target pipe. When set to zero, memory fetches cease and display is blanked (from this plane) at the next VBLANK event from the pipe that this plane is assigned. At least one of the display pipes must be enabled to enable this plane. There is an override for the enable of this plane in the Pipe Configuration register. This bit only has an effect when the plane is not trusted. When the plane is marked trusted, this bit will be overridden and the display disabled when the registers are unlocked.<br>1 = Enable<br>0 = Disable |

| 31        | 0b<br>RW         | <b>SPRITE_C_ENABLE:</b> This bit will enable or disable the Sprite C. When this bit is set, the plane will generate pixels for display to be combined by the blender for the target pipe. When set to zero, memory fetches cease and display is blanked (from this plane) at the next VBLANK event from the pipe that this plane is assigned. At least one of the display pipes must be enabled to enable this plane. There is an override for the enable of this plane in the Pipe Configuration register. This bit only has an effect when the plane is not trusted. When the plane is marked trusted, this bit will be overridden and the display disabled when the registers are unlocked.<br>1 = Enable<br>0 = Disable |

### 14.11.332 SPCGAMC4—Offset 723E4h

Sprite C Gamma Correction Registers

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [GTTMMADR\_LSB + 180000h] + 723E4h

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR\_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00808080h

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |  |  |  |  |  |  |  |  |  |  |  |  |   | 31        | 0b<br>RW         | <b>SPRITE_D_ENABLE:</b> This bit will enable or disable the Sprite D. When this bit is set, the plane will generate pixels for display to be combined by the blender for the target pipe. When set to zero, memory fetches cease and display is blanked (from this plane) at the next VBLANK event from the pipe that this plane is assigned. At least one of the display pipes must be enabled to enable this plane. There is an override for the enable of this plane in the Pipe Configuration register. This bit only has an effect when the plane is not trusted. When the plane is marked trusted, this bit will be overridden and the display disabled when the registers are unlocked.<br>1 = Enable<br>0 = Disable                                                                                                                                                                                                                                                                                         |
| 30        | 0b<br>RW         | <b>SPRITE_D_GAMMA_ENABLE:</b> There are two gamma adjustments possible in the Sprite D data path. This bit controls the gamma correction in the display pipe not the gamma control in this plane. It affects only the pixel data from this display plane. For pixel format of 8-bit indexed, this bit should be set to a one. Gamma correction logic that is contained in the Sprite D logic is disabled by loading the default values into those registers.<br>When this plane is marked as trusted, this bit should always be set to zero to force the pipe gamma to be always be bypassed.<br>0 = Sprite D pixel data bypasses the display pipe gamma correction logic (default).<br>1 = Sprite D pixel data is gamma corrected in the pipe gamma correction logic                                                                                                                                                                                                                                               |

| 31:12     | 0b<br>RW         | <b>SPRITE_D_SURFACE_BASE_ADDRESS:</b> This address specifies the surface base address. When the surface is tiled, panning is specified using (x, y) offsets in the DSPCTILEOFF register. When the surface is in linear memory, panning is specified using a linear offset in the DSPCLINOFF register. This address must be 4K aligned. This register can be written directly through software or by command packets in the command stream. It represents an offset from the graphics memory aperture base and is mapped to physical pages through the global GTT.<br>If the device supports trusted operation and this plane is not marked trusted, the memory pages must not be marked NoDMA .<br>The value in this register is updated through the command streamer during synchronous flips.<br>[DevBW] and [DevCL]: This address must be 128K aligned for linear memory. |

| 31        | 0b<br>RW         | <b>ENABLE_CONSTANT_ALPHA:</b> Sprite D Sprite constant alpha provides a way to apply an alpha value to all video sprite pixels. Each pixel color channel is multiplied by the constant alpha before proceeding to the blender. This can be used to create fade out effects. This is intended for CE device use where the video sprite might still be used to generate video output.<br>0 Sprite D Constant Alpha is disabled<br>1 Sprite D Constant Alpha is enabled |

### 14.11.360 PCSRC—Offset 73000h

Performance Counter Source Register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [GTTMMADR\_LSB + 180000h] + 73000h

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR\_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h

| 15:0      | 0b<br>RW         | <b>PERFORMANCE_COUNTER_THRESHOLD_VALUE:</b> This value is used to compare against the performance counter. If the performance counter matches this value, an interrupt is generated if the interrupt bit is enabled. When the source selected is DDB FIFO status, the threshold value is used to program the value needed to monitor in the DDB FIFO. No interrupt is generated in this condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### 14.11.361 PCSTAT—Offset 73004h

Performance Counter Status Register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [GTTMMADR\_LSB + 180000h] + 73004h

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR\_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h

| 15:0      | 0b<br>RW         | <b>PERFORMANCE_COUNTER_THRESHOLD_VALUE:</b> This value is used to compare against the performance counter. If the performance counter matches this value, an interrupt is generated if the interrupt bit is enabled. When the source selected is DDB FIFO status, the threshold value is used to program the value needed to monitor in the DDB FIFO. No interrupt is generated in this condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### 14.11.363 PCSTAT2—Offset 7300Ch

Performance Counter Status2 Register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [GTTMMADR\_LSB + 180000h] + 7300Ch

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR\_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00000000h

## 14.12 Memory Mapped Registers (Read Only)

**Table 174. Summary of Display Memory Mapped I/O Registers—GTTMMADR\_LSB**

| Offset   | Size (Bytes) | Register Name (Register Symbol)            | Default Value |
|----------|--------------|--------------------------------------------|---------------|
| 3BA–3BAh | 1            | "ST01 (ST01_MDA)—Offset 3BAh" on page 1035 | 00h           |
| 3C2–3C2h | 1            | "ST00—Offset 3C2h" on page 1036            | 00h           |
| 3C7–3C7h | 1            | "DACSTATE—Offset 3C7h" on page 1037        | 00h           |
| 3DA–3DAh | 1            | "ST01 (ST01_CGA)—Offset 3DAh" on page 1038 | 00h           |

### 14.12.1 ST01 (ST01\_MDA)—Offset 3BAh

Input Status 1

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [GTTMMADR\_LSB + 180000h] + 3BAh

**GTTMMADR\_LSB Type:** PCI Configuration Register (Size: 32 bits)

**GTTMMADR\_LSB Reference:** [B:0, D:2, F:0] + 10h

**Default:** 00h

| 5:4       | 0b<br>RO         | <b>VIDEO_FEEDBACK_1_0:</b> These are diagnostic video bits that are selected by the Color Plane Enable Register. These bits that are programmably connected to 2 of the 8 color bits sent to the palette. Bits 4 and 5 of the Color Plane Enable Register (AR12) selects which two of the 8 possible color bits become connected to these 2 bits of this register. The current software normally does not use these 2 bits. They exist for EGA compatibility. |

|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3         | 0b<br>RO         | <b>VER_TI_CAL_RETRACE_VIDEO:</b> 0 = VSYNC inactive (Indicates that a vertical retrace interval is not taking place).<br>1 = VSYNC active (Indicates that a vertical retrace interval is taking place).<br>Note:<br>VGA pixel generation is not locked to the display output but is loosely coupled. A VSYNC indication may not occur during the actual VSYNC going to the display but during the VSYNC that is generated as part of the VGA pixel generation. The exact relationship will vary with the VGA display operational mode. This status bit will remain active when the VGA is disabled and the device is running in high resolution modes (non-VGA) to allow for applications that (now it is incorrect) use these status registers bits. In this case, the status will come from the pipe that the VGA is assigned to.<br>Bits 4 and 5 of the Vertical Retrace End Register (CR11) previously could program this bit to generate an interrupt at the start of the vertical retrace interval. This ability to generate interrupts at the start of the vertical retrace interval is a feature that is largely unused by legacy software. Interrupts are not supported through the VGA register bits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 0         | 0b<br>RO         | <b>DIS_PLAY_ENA_BLE_OUTPUT:</b> Display Enable is a status bit (bit 0) in VGA Input Status Register 1 that indicates when either a horizontal retrace interval or a vertical retrace interval is taking place. This was used with the IBM* EGA graphics system (and the ones that preceded it, including MDA and CGA). In those cases, it was important to check the status of this bit to ensure that one or the other retrace intervals was taking place before reading from or writing to the frame buffer. In these earlier systems, reading from or writing to frame buffer at times outside the retrace intervals meant that the CRT controller would be denied access to the frame buffer. This resulted in either snow or a flickering display. This bit provides compatibility with software designed for those early graphics controllers. This bit is currently used in DOS applications that access the palette to prevent the sparkle associated with read and write accesses to the palette ram with the same address on the same clock cycle.<br>This status bit will remain active when the VGA display is disabled and the device is running in high resolution modes (non-VGA) to allow for applications that (now considered incorrect) use these status registers bits. In this case, the status will come from the pipe that the VGA is assigned to. When in panel fitting VGA or centered VGA operation, the meaning of these bits will not be consistent with native VGA timings.<br>0 = Active display data is being sent to the display. Neither a horizontal retrace interval or a vertical retrace interval is currently taking place.<br>1 = Either a horizontal retrace interval (horizontal blanking) or a vertical retrace interval (vertical blanking) is currently taking place. |

## 14.12.2 ST00—Offset 3C2h

Input Status 0

### Access Method

**Type:** Memory Mapped I/O Register

| 4         | 0b<br>RO         | <b>RGB_COMPARATOR_SENSE:</b> This bit returns the state of the output of the RGB output comparator(s). Video BIOS uses this bit during POST to determine whether the display is connected and if it is a color or monochrome CRT. BIOS blanks the screen or clears the frame buffer to display only black. Next, BIOS outputs a ramp to the D-to-A converters to test for the presence of a color display by determining which code cause the comparator to switch. Finally, if the BIOS does not detect any termination resistors on Red or Blue, it tests for the presence of a display using the Green signal. The result of each such test is read via this bit.<br>0 = Below threshold<br>1 = Above threshold |

|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3         | 0b<br>RO         | <b>VER_TI_CAL_RETRACE_VIDEO:</b> 0 = VSYNC inactive (Indicates that a vertical retrace interval is not taking place).<br>1 = VSYNC active (Indicates that a vertical retrace interval is taking place).<br>Note:<br>VGA pixel generation is not locked to the display output but is loosely coupled. A VSYNC indication may not occur during the actual VSYNC going to the display but during the VSYNC that is generated as part of the VGA pixel generation. The exact relationship will vary with the VGA display operational mode. This status bit will remain active when the VGA is disabled and the device is running in high resolution modes (non-VGA) to allow for applications that (now it is incorrect) use these status registers bits. In this case, the status will come from the pipe that the VGA is assigned to.<br>Bits 4 and 5 of the Vertical Retrace End Register (CR11) previously could program this bit to generate an interrupt at the start of the vertical retrace interval. This ability to generate interrupts at the start of the vertical retrace interval is a feature that is largely unused by legacy software. Interrupts are not supported through the VGA register bits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 0         | 0b<br>RO         | <b>DIS_PLAY_ENA_BLE_OUTPUT:</b> Display Enable is a status bit (bit 0) in VGA Input Status Register 1 that indicates when either a horizontal retrace interval or a vertical retrace interval is taking place. This was used with the IBM* EGA graphics system (and the ones that preceded it, including MDA and CGA). In those cases, it was important to check the status of this bit to ensure that one or the other retrace intervals was taking place before reading from or writing to the frame buffer. In these earlier systems, reading from or writing to frame buffer at times outside the retrace intervals meant that the CRT controller would be denied access to the frame buffer. This resulted in either snow or a flickering display. This bit provides compatibility with software designed for those early graphics controllers. This bit is currently used in DOS applications that access the palette to prevent the sparkle associated with read and write accesses to the palette ram with the same address on the same clock cycle.<br>This status bit will remain active when the VGA display is disabled and the device is running in high resolution modes (non-VGA) to allow for applications that (now considered incorrect) use these status registers bits. In this case, the status will come from the pipe that the VGA is assigned to. When in panel fitting VGA or centered VGA operation, the meaning of these bits will not be consistent with native VGA timings.<br>0 = Active display data is being sent to the display. Neither a horizontal retrace interval or a vertical retrace interval is currently taking place.<br>1 = Either a horizontal retrace interval (horizontal blanking) or a vertical retrace interval (vertical blanking) is currently taking place. |

## 14.13 Memory Mapped Registers (Write Only)

**Table 175. Summary of Display Memory Mapped I/O Registers—GTTMMADR\_LSB**

| Offset   | Size (Bytes) | Register Name (Register Symbol)                | Default Value |
|----------|--------------|------------------------------------------------|---------------|
| 3BA–3BAh | 1            | "FCR (FCR_MDA_Write)—Offset 3BAh" on page 1041 | 00h           |
| 3C2–3C2h | 1            | "MSR (MSR_Write)—Offset 3C2h" on page 1042     | 00h           |
| 3C7–3C7h | 1            | "DACRX—Offset 3C7h" on page 1043               | 00h           |
| 3DA–3DAh | 1            | "FCR (FCR_CGA_Write)—Offset 3DAh" on page 1044 | 00h           |

### 14.13.1 FCR (FCR\_MDA\_Write)—Offset 3BAh

Feature Control

#### Access Method

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3:2       | 0b<br>RW         | <b>CLOCK_SELECT:</b> These bits can select the dot clock source for the CRT interface. The bits should be used to select the dot clock in standard native VGA modes only. When in the centering or upper left corner modes, these bits should be set to have no effect on the clock rate. The actual frequencies that these bits select, if they have any affect at all, is programmable through the DPLL registers that default to the standard values used for VGA.<br>00 = CLK0, 25.175 MHz (for standard VGA modes with 640 pixel (8-dot) horizontal resolution) (default)<br>01 = CLK1, 28.322 MHz. (for standard VGA modes with 720 pixel (9-dot) horizontal resolution)<br>10 = Was used to select an external clock (now unused)<br>11 = Reserved                     |
| 1         | 0b<br>RW         | <b>A0000_BFFFFH_MEMORY_ACCESS_ENABLE:</b> VGA Compatibility bit enables access to local video memory (frame buffer) at A0000(BFFFFh). When disabled, accesses to VGA memory are blocked in this region. This bit is independent of and does not block CPU access to the video linear frame buffer at other addresses. Note that it is typical for AGP chipsets to shadow this register to allow proper steering of memory accesses to the proper bus.<br>0 = Prevent CPU access to memory/registers/ROM through the A0000-BFFFF VGA memory aperture (default).<br>1 = Allow CPU access to memory/registers/ROM through the A0000-BFFFF VGA memory aperture. This memory must be mapped as UC by the CPU; see VGA Host Access Memory Munging in Display and Overlay Functions. |
| 0         | 0b<br>RW         | <b>I_O_ADDRESS_SELECT:</b> This bit selects 3Bxh or 3Dxh as the I/O address for the CRT Controller registers, the Feature Control Register (FCR), and Input Status Register 1 (ST01). Presently ignored (whole range is claimed), but will ignore 3Bx for color configuration or 3Dx for monochrome. Note that it is typical in AGP chipsets to shadow this bit and properly steer I/O cycles to the proper bus for operation where a MDA exists on another bus such as ISA.<br>0 = Select 3Bxh I/O address (MDA emulation) (default).<br>1 = Select 3Dxh I/O address (CGA emulation).                                                                                                                                                                                        |

# 15 MIPI-Camera Serial Interface (CSI) and ISP

**Note:** The MIPI CSI and controller front end interfaces with three sensors and is capable of simultaneously acquiring three streams, one from each sensor. These three streams are presented to the ISP.

**Note:** If a 1-lane sensor needs to be connected to a MIPI-CSI port, that port must use a 1-lane port configuration.

## 15.1 Signal Descriptions

See [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

Table 176. CSI Signals

| Signal Name            | Direction<br>Plat. Power | Description                                                                                                                                            |
|------------------------|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MCSI1_CLKP/N</b>    | I<br>V1P24S              | <b>Clock Lane:</b> MIPI CSI input clock lane 0 for port 1.                                                                                             |
| <b>MCSI1_DP/N[3:0]</b> | I<br>V1P24S              | <b>Data Lanes:</b> Four MIPI CSI Data Lanes (0-3) for port 1. Lanes 2 and 3 can optionally used as data lanes for port 3.                              |
| <b>MCSI2_CLKP/N</b>    | I<br>V1P24S              | <b>Clock Lane:</b> MIPI CSI input clock lane 0 for port 2.                                                                                             |

**Figure 94. Camera Connectivity**

## 15.2 Features

- Integrated MIPI-CSI 2.0 interface
- Image Signal Processor (ISP) with DMA and local SRAM
- Imaging data is received by the MIPI-CSI interface and is relayed to the ISP for processing
- Up to five MIPI-CSI 2.0 data lanes
  - Each lane can operate at up to 1GT/s. resulting in roughly 800 Mbit/s of actual pixels
- The MIPI-CSI interface supports lossless compressed image streams to increase the effective bandwidth without losing data

- Up to 24MP sensors supported, and full HD 1080p60
  - Can also support Stereo HD 1080p30
- Up to 3 cameras can be operated simultaneously
  - Stereoscopic Captures
  - Front + Back Camera Usage

### 15.2.1 Imaging Capabilities

The following table summarizes imaging capabilities.

**Table 178. Imaging Capabilities**

| Feature                           | Capabilities                                                                                                                                                                                                                                            |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sensor interface                  | Configurable MIPI-CSI2 interfaces.<br>3 sensors: x2, x2, x1 or x3, x1, x1<br>2 sensors: x4, x1                                                                                                                                                          |
| Simultaneous sensors              | Up to 3 simultaneous sensors                                                                                                                                                                                                                            |
| 2D Image capture                  | 24MP @ 15fps                                                                                                                                                                                                                                            |
| 2D video capture                  | Up to 1080p60                                                                                                                                                                                                                                           |
| Input formats<br>(Sensor -> SoC)  | RAW 8, 10, 12, 14, RGB444, 565, 888, YUV420, 422, JPEG.                                                                                                                                                                                                 |
| Output formats<br>(SoC -> Sensor) | YUV422, YUV420, RAW                                                                                                                                                                                                                                     |

### 15.2.2 Simultaneous Acquisition

All three cameras can be active at the same time.

SoC will support on-the-fly processing for only one image at a time. While this image is being processed on-the-fly, images from the other two cameras are saved to DRAM for later processing.

### 15.2.3 Primary Camera Still Image Resolution

Maximum still image resolution for the primary camera in post-processing mode is limited by the resolution of the sensors. Currently 24 Mpixel sensors are supported.

Maximum primary camera on-the-fly still image resolution for primary camera is 16 Mpixel at 18 fps.

Higher resolution, or higher frame rates are supported as long as the product of resolution and frame rate does not exceed 288 Mpixels/s (= 16 Mpixels \* 18 fps).

Maximum primary camera on-the-fly stereoscopic still image resolution for primary camera is 8 Mpixel for each of the left and right images at 18 fps. The number of Mpixels can be increased by decreasing the frame rate.

#### **15.2.4 Burst Mode Support**

The SoC supports capturing multiple images back to back at maximum sensor resolution. At least 5 images must be captured in burst mode. The maximum number of images that can be so captured is limited only by available system memory. These images need not be processed on-the-fly.

#### **15.2.5 Continuous Mode Capture**

SoC supports capturing images and saving them to DRAM in a ring of frame buffers continuously at maximum sensor resolution. These images must then be fetched and processed on-the-fly by the ISP. This adds a round trip to memory for every frame and increases the bandwidth requirements.

#### **15.2.6 Secondary Camera Still Image Resolution**

Maximum secondary camera still image resolution is 4 Mpixel at 15 fps.

#### **15.2.7 Primary Camera Video Resolution**

Maximum primary camera video resolution is 1080p60.

Maximum primary camera dual video resolution is 1080p30.

Maximum stereo resolution is 1080p30.

#### **15.2.8 Secondary Camera Video Resolution**

Maximum secondary camera video resolution is 1080p30.

#### **15.2.9 Bit Depth**

Capable of processing 14-bit images at the stated performance levels.

Capable of processing 18-bit images at half the performance levels, i.e. process on-the-fly 16 Mpixel 18-bit images at 7 fps instead of 15 fps.

Capable of processing up to 18-bit precision.

The higher precision processing will be employed mainly for high dynamic range imaging (HDR).

## 15.3 Imaging Subsystem Integration

**Figure 95. Image Processing Components**

### 15.3.1 CPU Core

The CPU core augments the signal processing capabilities of the hardware to perform post-processing on images such as auto focus, auto white balance, and auto exposure. The CPU also runs the drivers that control the GPIOs and I<sup>2</sup>C for sensor control.

### 15.3.2 Imaging Signal Processor (ISP)

The ISP (Imaging Signal Processor) includes a 64-way vector processor enabling high quality camera functionality. Key features include support of three camera sensors.

### 15.3.2.1 MIPI-CSI-2 Ports

The SoC has three MIPI clock lanes and five MIPI data lanes. The Analog Front End (AFE) and Digital Physical Layer (DPHY) take these lanes and connects them to three virtual ports. Two data lanes are dedicated to each of the rear facing cameras and the remaining one data lane is connected to the front facing camera. The MIPI interfaces follow the MIPI-CSI-2 specifications as defined by the MIPI Alliance. They support YUV420, YUV422, RGB444, RGB555, RGB565, RGB 888 and RAW 8b/10b/12b. Both MIPI ports support compression settings specified in MIPI-CSI-2 draft specification 1.01.00 Annex E. The compression is implemented in Hardware with support for Predictor 1 and Predictor 2. Supported compression schemes:

- 12-8-12
- 12-7-12
- 12-6-12
- 10-8-10
- 10-7-10
- 10-6-10

The data compression schemes above use an X-Y-Z naming convention where X is the number of bits per pixel in the original image, Y is the encoded (compressed) bits per pixel and Z is the decoded (uncompressed) bits per pixel.

### 15.3.2.2 Camera Sideband for Camera Interface

Twelve (12) GPIO signals are allocated for camera functions, refer to [Table 177](#) for signal names. These GPIOs are multiplexed and are available for other usages without powering on the ISP. The ISP provides a timing control block through which the GPIOs can be controlled to support assertion, de-assertion, pulse widths and delay. The configuration below of camera GPIOs is just an example of how the GPIOs can be used. Several of these functions could be implemented using I<sup>2</sup>C, depending on the sensor implementation for the platform.

- Sensor Reset signals
  - Force hardware reset on one or more of the sensors.
- Sensor Single Shot Trigger signal
  - Indicate that the target sensor needs to send a full frame in a single shot mode, or to capture the full frame for flash synchronization.
- PreLight Trigger signal
  - Light up a pilot lamp prior to firing the flash for preventing red-eye.
- Flash Trigger signal
  - Indicate that a full frame is about to be captured. The Flash fires when it detects an assertion of the signal.
- Sensor Strobe Trigger signal
  - Asserted by the target sensor to indicate the start of a full frame, when it is configured in the single shot mode, or to indicate a flash exposed frame for flash synchronization.

## **15.4 Functional Description**

At a high level, the Camera Subsystem supports the following modes:

- Preview
- Image capture
- Video capture

### **15.4.1 Preview Mode**

Once the ISP and the camera subsystem is enabled, the ISP goes into the preview mode where very low resolution frames, such as VGA/480p (programmable), are being processed.

### **15.4.2 Image Capture**

During the image capture mode, the camera subsystem can acquire at a peak throughput of 24 Mpixels @ 15fps. While doing this, it continues to output preview frames simultaneously.

- The ISP can output RAW, RGB or YUV formats. The ISP can capture one full frame at a time or perform burst mode capture, where up to five full back-to-back frames are recorded.
- The ISP will not limit the number of back-to-back full frames captured, but the number is programmable and determined on how much memory can be allocated dynamically.
- The ISP can process all the frames on the fly and writes to memory only after fully processing the frames, without requiring download of any part of the frame for further processing.
  - The exceptions to this approach are image stabilization and some other advanced functions requiring temporal information over multiple frames.

The ISP can support image stabilization in image capture model.

- The ISP initially outputs preview frames.
- When the user decides to capture the picture, image stabilization is enabled. The ISP checks the previous frame for motion and compensates for it appropriately.

Auto Exposure (AE), Auto Focus (AF), and Auto White Balance (AWB), together known as 3A, are implemented in the CPU to provide flexibility.

### **15.4.3 Video Capture**

During video recording, the ISP can capture video up to 1080p @ 60 fps and output preview frames concurrently. The ISP output video frames to memory in YUV420 or YUV422 format.

### **15.4.4 ISP Overview**

The Camera Subsystem consists of 2 parts, the hardware subsystem and a software stack that implements the ISP functionality on top of this hardware.

The core of the ISP is a vector processor. The vector processor is supported by the following components:

- Interfaces for data and control
- A small input formatter that parallelizes the data
- A scalar (RISC) processor, for system control and low-rate processing
- An accelerator for scaling, digital zoom, and lens distortion correction
- A DMA engine transfers large amounts of data such as input and output image data or large parameter sets between LPDDR2 and the ISP block.

### **15.4.5 Memory Management Unit (MMU)**

The camera subsystem has capabilities to deal with a virtual address space, since a contiguous memory range in the order 16–32MB cannot be guaranteed by the OS.

#### **15.4.5.1 Interface**

The MMU performs the lookup required for address translation from a virtual to physical 32-bit address. The lookup tables are stored external to the system. The MMU performs the lookup through a master interface without burst support that is connected to the Open Core Protocol (OCP) master of the subsystem. The MMU configuration registers can be accessed through a 32-bit Core I/O (CIO) slave interface. Additionally there is a 32-bit CIO slave interface connected to the address translator.

## 15.5 MIPI-CSI-2 Receiver

MIPI-CSI-2 devices are camera serial interface devices. They are categorized into two types, a CSI transmitter device with Camera Control Interface (CCI) slave and CSI receiver device with CCI master.

Data transfer by means of MIPI-CSI is unidirectional that is, from transmitter to receiver. CCI data transfer is bidirectional between the CCI slave and master.

Camera Serial Interface Bus (CSI) is a type of serial bus that enables transfer of data between a Transmitter device and a receiver device. The CSI device has a point-to-point connections with another CSI device by means of D-PHYs and as shown in Figure 96.

Similarly, CCI (Camera Control Interface bus) is a type of serial bus that enables transfer back and forth between the master CCI and a Slave CCI Unit.

**Figure 96. MIPI-CSI Bus Block Diagram**

D-PHY data lane signals are transferred point-to-point differentially using two signal lines and a clock lane. There are two signaling modes, a high speed mode that operates at 1000Mbps and a low power mode that works at 10Mbps. The mode is set to low power mode and a stop state at start up/power up. Depending on the desired data transfer type, the lanes switch between high and low power modes.

The CCI interface consists of an I<sup>2</sup>C bus which has a clock line and a bidirectional data line.

The MIPI-CSI-2 devices operate in a layered fashion. There are 5 layers identified at the receiver and transmitter ends.

MIPI-CSI-2 Functional Layers:

- **PHY Layer:**
  - An embedded electrical layer sends and detects start of packet signalling and end of packet signalling on the data lanes. It contains a serializer and deserializer unit to interface with the PPI / lane management unit. There is also a clock divider unit to source and receive the clock during different modes of operation.
- **PPI/Lane Management Unit:**
  - This layer does the lane buffering and distributes the data in the lanes as programmed in a round robin manner and also merges them for the PLI/Low Level Protocol unit.
- **PLI/Low Level Protocol Unit:**
  - This layer packetizes as well as de-packetizes the data with respect to channels, frames, colors and line formats. There are ECC generator and corrector units to recover the data free from errors in the packet headers. There is also a CRC checker or CRC generator unit to pack the payload data with CRC checksum bits for payload data protection.
- **Pixel/Byte to Byte/Pixel Packing Formats:**
  - Conversion of pixel formats to data bytes in the payload data is done depending on the type of image data supported by the application. It also re-converts the raw data bytes to pixel format understandable to the application layer.
- **Application:**
  - Depending on the type of formats, camera types, capability of the camera used by the transmitter, the application layer recovers the image formats and reproduces the image in the display unit. It also works on de-framing the data into pixel-to-packing formats. High level encoding and decoding of image data is handled in the application unit.

### 15.5.1 MIPI-CSI-2 Receiver Features

CSI Features:

- Compliant to CSI-2 MIPI specification for Camera Serial Interface (Version 1.00)
- Supports standard D-PHY transceiver compliant to the MIPI Specification
- Supports PHY data programmability up to four lanes.
- Supports PHY data time-out programming.
- Has controls to start and re-start the CSI-2 data transmission for synchronization failures and to support recovery.

- The ISP may not support all the data formats that the CSI-2 receiver can handle.  
—Refer to [Table 178](#) for formats supported by the ISP
- Supports all generic short packet data types.
- Single Image Signal Processor interface for pixel transfers to support multiple image streams for all virtual channel numbers.

**D-PHY Features:**

- Supports synchronous transfer in high speed mode with a bit rate of 80-1000Mb/s
- Supports asynchronous transfer in low power mode with a bit rate of 10Mb/s.
- Differential signalling for HS data
- Spaced one-hot encoding for Low Power [LP] data
- Data lanes support transfer of data in high speed as well as low power modes.
- Supports ultra low power mode, escape mode, and high speed mode
- Has a clock divider unit to generate clock for parallel data reception and transmission from and to the PPI unit.
- Activates and disconnects high speed terminators for reception and control mode.
- Activates and disconnects low power terminators for reception and transmission.

## **15.6 Register Map**

Refer to [Chapter 3, “Register Access Methods”](#) and [Chapter 4, “Mapping Address Spaces”](#) for additional information.

**Figure 97. MIPI CSI Register Map**

§

## 15.7 Image Signal Processor PCI Configuration Registers

**Table 179. Summary of Image Signal Processor PCI Configuration Registers—0/2/0**

| Offset | Size | Register ID—Description                                                                | Default Value |
|--------|------|----------------------------------------------------------------------------------------|---------------|
| 0h     | 4    | "iunit_ID_type (ID)—Offset 0h" on page 1059                                            | 0F388086h     |
| 4h     | 4    | "iunit_PCICMDSTS_type (PCICMDSTS)—Offset 4h" on page 1059                              | 00100000h     |
| 8h     | 4    | "iunit_RIDCC_type (RIDCC)—Offset 8h" on page 1060                                      | 04800001h     |
| Ch     | 4    | "iunit_HDR_type (HDR)—Offset Ch" on page 1061                                          | 00000000h     |
| 10h    | 4    | "iunit_ISPMADR_type (ISPMADR)—Offset 10h" on page 1061                                 | 00000000h     |
| 2Ch    | 4    | "iunit_SSID_type (SSID)—Offset 2Ch" on page 1062                                       | 00000000h     |
| 34h    | 4    | "iunit_CAPPOINT_type (CAPPOINT)—Offset 34h" on page 1062                               | 00000080h     |
| 3Ch    | 4    | "iunit_INTR_type (INTR)—Offset 3Ch" on page 1062                                       | 00000000h     |
| 80h    | 4    | "iunit_PMCAP_type (PMCAP)—Offset 80h" on page 1063                                     | 00229001h     |
| 84h    | 4    | "iunit_PMCS_type (PMCS)—Offset 84h" on page 1064                                       | 00000000h     |
| 90h    | 4    | "iunit_MSI_CAPID_type (MSI_CAPID)—Offset 90h" on page 1064                             | 00000005h     |
| 94h    | 4    | "iunit_MSI_ADDRESS_type (MSI_ADDRESS)—Offset 94h" on page 1065                         | 00000000h     |
| 98h    | 4    | "iunit_MSI_DATA_type (MSI_DATA)—Offset 98h" on page 1066                               | 00000000h     |
| 9Ch    | 4    | "iunit_INTERRUPT_CONTROL_type (INTERRUPT_CONTROL)—Offset 9Ch" on page 1066             | 00000100h     |
| B0h    | 4    | "iunit_PERF0_type (PERF0)—Offset B0h" on page 1067                                     | 00000000h     |
| B4h    | 4    | "iunit_PERF1_type (PERF1)—Offset B4h" on page 1068                                     | 00000000h     |
| B8h    | 4    | "iunit_PERF2_type (PERF2)—Offset B8h" on page 1068                                     | 00000000h     |
| BCh    | 4    | "iunit_PERF3_type (PERF3)—Offset BCh" on page 1069                                     | 00000000h     |
| C0h    | 4    | "iunit_MISR0_type (MISR0)—Offset C0h" on page 1069                                     | FFFFFFFFh     |
| C4h    | 4    | "iunit_MISR1_type (MISR1)—Offset C4h" on page 1070                                     | FFFFFFFFh     |
| C8h    | 4    | "iunit_MISR2_type (MISR2)—Offset C8h" on page 1070                                     | FFFFFFFFh     |
| CCh    | 4    | "iunit_MISR3_type (MISR3)—Offset CCh" on page 1071                                     | FFFFFFFFh     |
| D0h    | 4    | "iunit_MANUFACTURING_ID_type (MANUFACTURING_ID)—Offset D0h" on page 1071               | 00000000h     |
| D4h    | 4    | "iunit_IUNIT_ACCESS_CTRL_VIOL_type (IUNIT_ACCESS_CTRL_VIOL)—Offset D4h" on page 1071   | 00000000h     |
| D8h    | 4    | "iunit_IUNIT_DEADLINE_STATUS_type (IUNIT_DEADLINE_STATUS)—Offset D8h" on page 1072     | 00000000h     |
| DCh    | 4    | "iunit_IUNIT_AFE_HS_CONTROL_type (IUNIT_AFE_HS_CONTROL)—Offset DCh" on page 1073       | 64000A00h     |
| E0h    | 4    | "iunit_IUNIT_AFE_RCOMP_CONTROL_type (IUNIT_AFE_RCOMP_CONTROL)—Offset E0h" on page 1074 | 00000000h     |
| E4h    | 4    | "iunit_IUNIT_AFE_TRIM_CONTROL_type (IUNIT_AFE_TRIM_CONTROL)—Offset E4h" on page 1075   | 00000000h     |
| E8h    | 4    | "iunit_IUNIT_CSI_CONTROL_type (IUNIT_CSI_CONTROL)—Offset E8h" on page 1076             | 000003F8h     |
| ECh    | 4    | "iunit_IUNIT_DEADLINE_CONTROL_type (IUNIT_DEADLINE_CONTROL)—Offset ECh" on page 1077   | 040A0100h     |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| 24        | 0h<br>RW         | <b>IIR:</b> IER: This is an enable bit that allows the sending of an interrupt to the CPU using either MSI or INTR mechanisms. The interrupt is sent immediately to the CPU. The firmware running on the ISP guarantees ordering by reading the last data write from memory before raising the interrupt. 1 = If MSI_ENABLE is set, then an MSI is sent to the CPU when the IIR bit is set, or if the IIR bit remains set after software writes to this register. If INTERRUPT_DISABLE is not set, then an ASSERT_INTA message is sent to the Intel Legacy Block (ILB) when the IIR bit is set by hardware, or if the IIR bit remains set after software writes to this register. If software clears the IIR bit, and INTERRUPT_DISABLE is not set then a DEASSERT_INTA message is sent to the ILB. 0 = Do not generate an MSI even if the MSI_ENABLE bit is set. Do not send ASSERT_INTA or DEASSERT_INTA messages to the ILB even if the INTERRUPT_DISABLE bit is not set. |
| 23:17     | 0h<br>RO         | <b>RSVD_23_17:</b> Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16        | 0h<br>RW/1C      | <b>IIR:</b> IIR: This is the persistent value of the interrupt bit. It is set by hardware, and cleared by software. Software must write a 1 to clear this bit. Writing a 0 is a NOP. If both software and hardware attempt to write to this field in the same clock cycle, hardware wins. 1 = An interrupt was received from the vendor IP when the IMR bit was not set, and software has not yet cleared it. 0 = There is no pending interrupt.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0      | 0h<br>RW/SE      | <b>CRIFLO:</b> IUNIT has four performance counters. When counting is enabled, the 11-bit reads_in_flight counter keeps track of the number of outstanding reads that have been requested, but not yet returned back at the OCP master interface. The 11-bit max_reads_in_flight counter keeps track of the maximum number of reads in flight in any given clock cycle. Each clock cycle, if there are any reads in flight, the reads_in_flight counter is added to a 64-bit cumulative_reads_in_flight counter, and the 48-bit active_cycles counter is incremented by 1. Reading this register returns bits 31:0 of the cumulative_reads_in_flight counter. This counter should be read only after counting is disabled. Reading while the counters are enabled will return undefined values. All four counters are disabled at reset. Writing (any value) to this register, will enable all four counters. |

| 28:24     | 0h<br>RW         | <b>PERF_MASK:</b> PERF_MASK: This field determines the amount of performance throttling applied to ispclock. The value of this field determines how many beat periods of ispclock are killed, where a beat period is defined as 16 ispclock cycles. A 16 cycle period was chosen to make the throttling independent of the actual clock ratio between ispclock and coreclock. Note that clock gating should be enabled when thermal throttling is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 15.8.5 reg\_gpd\_gp\_reg\_reg\_gp\_sp\_stream\_stat\_type (gpd\_gp\_reg\_reg\_gp\_sp\_stream\_stat)—Offset 10h

Indicate the status of the streaming ports of the scalar processor. All valid and accept signals of the scalar processor are reflected in this register and in reg\_gp\_sp\_stream\_stat\_b.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gp\_reg\_reg\_gp\_sp\_stream\_stat:** [ISPMMADR] + 10h

**ISPMMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00022022h

## 15.8.8 reg\_gpd\_gp\_reg\_reg\_gp\_mod\_stream\_stat\_type (gpd\_gp\_reg\_reg\_gp\_mod\_stream\_stat)—Offset 1Ch

Indicate the status of the streaming ports of the modules. All module's valid and accept ports used for control are reflected in this register.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gp\_reg\_reg\_gp\_mod\_stream\_stat:** [ISPMADDR] + 1Ch

**ISPMADDR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADDR Reference:** [B:0, D:3, F:0] + 10h

**Default:** AA88A222h

| 15:0      | 0h<br>RW         | <b>reg_gp_sp_stream_stat_irq_enable:</b> This register enables the SP streaming stat irq output for each of the 16 ports |

**15.8.14** reg\_gpd\_gp\_reg\_reg\_gp\_sp\_stream\_stat\_b\_irq\_enable\_type  
(gpd\_gp\_reg\_reg\_gp\_sp\_stream\_stat\_b\_irq\_enable)—Offset  
34h

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gp\_reg\_reg\_gp\_sp\_stream\_stat\_b\_irq\_enable:**  
[ISPMMAADR] + 34h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

**15.8.15** **reg\_gpd\_gp\_reg\_reg\_gp\_isp\_stream\_stat\_irq\_enable\_type**  
(gpd\_gp\_reg\_reg\_gp\_isp\_stream\_stat\_irq\_enable)—Offset  
38h

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gp\_reg\_reg\_gp\_isp\_stream\_stat\_irq\_enable:**  
[ISPMADR] + 38h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

### 15.8.21 reg\_gpd\_gp\_reg\_reg\_gp\_slv\_reg\_srst\_type (gpd\_gp\_reg\_reg\_gp\_slv\_reg\_srst)—Offset 50h

Soft reset for the slave accessible registers in some blocks. If '1' is written to a bit, the attached registers get their default value. They can only be overwritten after writing a '0' to this bit

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**gpd\_gp\_reg\_reg\_gp\_slv\_reg\_srst:** [ISPMADR] + 50h

**ISPMADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h
