### 15.8.834 **reg\_inp\_sys\_gpreg\_isys\_slv\_reg\_srst\_type** (inp\_sys\_gpreg\_isys\_slv\_reg\_srst)—Offset 8A020h

Soft resets the slave accessible registers of certain input system modules. Writing a 1 to a field brings the registers for a module to their default value, writing a 0 allows them to be overwritten

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**inp\_sys\_gpreg\_isys\_slv\_reg\_srst:** [ISPMMAADR] + 8A020h

**ISPMMAADR Type:** PCI Configuration Register (Size: 32 bits)

**ISPMMAADR Reference:** [B:0, D:3, F:0] + 10h

**Default:** 00000000h

| 0         | 0h<br>RO         | <b>check_send_to_ISP:</b> Check for potential stalling for sending data to ISP streaming input port. Returns 1 if a send to ISP would lead to a stall. Returns 0 when there is space left in the ISP token FIFO |

## 16 Storage Control Cluster (eMMC, SDIO, SD Card)

The Storage Control Cluster (SCC) consists of SDIO, SD Card and eMMC controllers to support mass storage and IO devices.

- One eMMC 4.5 interface
- One SD Card 3.0 interface
- One SDIO 3.0 interface for SDIO-based WIFI

**Note:** All units in the SCC support both PCI mode and ACPI mode of operation. A level shifter may be needed on the platform for SDIO 3.0 compliance. An eMMC 4.41 controller also exists but shouldn't be used.

**Note:** eMMC\* 5.0 is functional and backward compatible on the Bay Trail platform for features included in eMMC 4.5, with no guarantees the performance is as good as eMMC\* 4.5.

### 16.1 Signal Descriptions

See [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

Table 181. eMMC Signals

| Signal Name        | Direction Power | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MMC1_CLK</b>    | O<br>V1P8S      | <b>eMMC Clock</b><br>The frequency may vary between 400 kHz and 200 MHz.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>MMC1_D[7:0]</b> | I/O<br>V1P8S    | <b>eMMC Port Data bits 0 to 7</b><br>Bidirectional port used to transfer data to and from eMMC device.<br>By default, after power up or reset, only D[0] is used for data transfer. A wider data bus can be configured for data transfer, using either D[0]-D[3] or D[0]-D[7], by the MultiMedia Card controller.<br>The MultiMedia Card includes internal pull-ups for data lines D[1]-D[7]. Immediately after entering the 4-bit mode, the card disconnects the internal pull ups of lines D[1], D[2], and D[3]. Correspondingly, immediately after entering to the 8-bit mode the card disconnects the internal pull-ups of lines D[1]-D[7]. |
| <b>MMC1_CMD</b>    | I/O<br>V1P8S    | <b>eMMC Port Command</b><br>This signal is used for card initialization and transfer of commands. It has two modes—open-drain for initialization, and push-pull for fast command transfer.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>MMC1_RCOMP</b>  | -               | <b>eMMC RCOMP</b><br>This signal is used for pre-driver slew rate compensation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>SD3_PWREN#</b> | O<br>V1P8S         | <b>SD Card Power Enable</b><br>This signal is used to enable power on a SD device.                                                                                                                                                                                                                    |

## 16.2 Features

### 16.2.1 eMMC Interface Features

- eMMC 4.5 controller supported
- Transfers the data in 1 bit, 4 bit and 8 bit modes.
- Transfers data in the following speed classes: Baseline (1, 4, 8 bit up to 25Mhz), HS SDR/DDR (4, 8 bit up to 50Mhz) and HS200 (4, 8 bit up to 200MHz - 4.5 controller only)
- Cyclic Redundancy Check CRC7 for command and CRC16 for data integrity.
- Supports MMC Plus and MMC mobile.
- Supports both round-robin and priority-based arbitration for transmit operation.
- Run-time configurability of channel ID bits.

## 16.2.2 SDIO/SD Card Interface Features

- Up to 400Mbps per second data rate using 4 parallel data lines.
- Transfers the data in 1 bit and 4 bit SD modes and SPI mode.
- Transfers the data in following UHS-I modes: HS ,DDR50 and SDR12/25.
- Cyclic Redundancy Check CRC7 for command and CRC16 for data integrity.
- Designed to work with I/O cards, Read-only cards and Read/Write cards.
- Supports Read wait Control, Suspend/Resume operation.

**Note:** SDIO only validated with WIFI devices.

## 16.2.3 Storage Interfaces Overview

This section provides a very high level overview of the SD, SDIO, eMMC 4.5 specification. Refer to the SD and eMMC specifications for complete details.

### 16.2.3.1 SD Card 3.0 Bus Interface

The SD Card bus has a single master, single slaves (card), synchronous topology (refer to [Figure 98](#)). During initialization process commands are sent to the card, allowing the application to detect the card and assign logical addresses to the physical slot. All data communication in the Card Identification Mode uses the command line (CMD) only.

SD bus allows dynamic configuration of the number of data lines. After power up, by default, the SD Card will use only SD3\_D[0] for data transfer. After initialization the host can change the bus width (number of active data lines). This feature allows easy trade off between hardware cost and system performance. Note that while DAT1-SD3\_D[3:1] are not in use, the SoC will tri-state those signals.

**Figure 98. SD Memory Card Bus Topology**

### 16.2.3.2 SDIO 3.0 Interface

The SDIO interface is the very much like the SD card interface. The SoC supports one SDIO device for wireless devices only (no memory card support).

**Note:** SDIO interface does not support WAKE function.

**Figure 99. SDIO Device Bus Topology**

### 16.2.3.3 eMMC4.5 Interface

**Figure 100.eMMC Interface**

## 16.3 References

The controller is configured to comply with:

| 23        | 0h<br>RO         | <b>Multifunction Device (MULFNDEV):</b> This bit is always 0 for non-fabric ports. For fabric ports it is driven from the fabric_mult_function strap. A value of 1 indicates a multifunction device; a value of 0 indicates a single function device. |
| 22:16     | 00h<br>RO        | <b>Header Type (HEADERTYPE):</b> Implements Type 0 Configuration header.                                                                                                                                                                              |
| 15:8      | 00h<br>RO        | <b>Latency Timer (LATTIMER):</b> Doesn't apply to PCI Express. Hardwired to 00h.                                                                                                                                                                      |
| 7:0       | 00h<br>RW        | <b>Cache Line Size (CACHELINE_SIZE):</b> Doesn't apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.                                                   |

### 16.5.5 Base Address Register (BAR)—Offset 10h

Each AHB device is a single function device with only a single BAR associated with it. Bits 31:4 indicate the Base Address register. Power-up software can determine how much address space the AHB Device requires by writing a value of all 1's to the register and then reading the value back. Bridge will return 0's in all don't-care address bits, effectively specifying the address space required. Unimplemented Base Address registers are hardwired to zero. This is the Size Indicator Read only bits of the register.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + 10h

**Default:** 00000000h

|          |               |              |      |               |    |   |   |   |

|-----------|------------------|-------------------------------------------------------------------------------------------------------------|
| 31:12     | 00000h<br>RW     | <b>Base Address (BASEADDR):</b> Base address of the AHB device memory space. Taken from Strap values as 1s. |

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                             |
|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11:4      | 00h<br>RO        | <b>Size Indicator (Read Only) (SIZEINDICATOR):</b> Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0s. |
| 3         | 0h<br>RO         | <b>Prefetchable (PREFETCHABLE):</b> Indicates that this bar is not prefetchable.                                                                                                                         |
| 2:1       | 0h<br>RO         | <b>Type (TYPE):</b> '00' indicates that the BAR lies in 32 bit address range.                                                                                                                            |
| 0         | 0h<br>RO         | <b>Memory Space Indicator (MESSAGE_SPACE):</b> 0 Indicates that this BAR is present in the memory space.                                                                                                 |

### 16.5.6 Base Address Register 1 (BAR1)—Offset 14h

Memory accesses to BAR1 region access the PCI configuration space for the LPIO device. BAR1 region is always 4K. However SW accesses through BAR1 should only access the regular PCI configuration space. BAR1 memory accesses which do not access a defined PCI configuration register are treated as accesses to a reserved register.

## Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:17, F:0] + 14h

**Default:** 00000000h

|           |  |  |  |         |  |  |  |         |  |  |  |         |  |  |  |                |  |  |  |         |  |  |  |         |  |  |  |         |  |  |  |               |  |  |  |       |  |  |  |                |  |  |  |

### 16.6.1 SDMA System Address / Argument 2 Register (SYS\_ADR)—Offset 0h

This register contains the physical system memory address used for DMA transfers or the second argument for the Auto CMD23.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 00000000h

Diagram illustrating the structure of the `sys_adr` register. The register is 32 bits wide, divided into eight 4-bit segments. The segments are labeled 31, 28, 24, 20, 16, 12, 8, and 4 from left to right. The bits are represented by circles, and the field is labeled `sys_adr`.

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0      | 00000000h<br>RW  | <b>SDMA System Address (sys_adr): (1) SDMA System Address</b><br>This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value.<br>The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register.<br>The SDMA transfer waits at each boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates a DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register.<br>When the uppermost byte of this register (003h) is written, the Host Controller restarts the SDMA transfer.<br>When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register. <b>(2)</b><br><b>Argument 2</b><br>This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23.<br>If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without ADMA, the available block count value is limited by the Block Count register. 65535 blocks is the maximum value in this case. |

## 16.6.2 Block Size Register (BLK\_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 0000h

| 1         | 0b<br>RW         | <b>Block Count Enable (blk_count_en):</b> This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8). If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. <ul style="list-style-type: none"> <li>1 = Enable</li> <li>0 = Disable</li> </ul>                                                                               |
| 0         | 0b<br>RW         | <b>DMA Enable (dma_en):</b> This bit enables DMA functionality as described in section 1.4. DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). <ul style="list-style-type: none"> <li>1 = DMA Data transfer</li> <li>0 = No data transfer or Non DMA data transfer</li> </ul> |

## 16.6.6 Command Register (CMD)—Offset Eh

The Host Driver shall check the Command Inhibit (DAT) bit and Command Inhibit (CMD) bit in the Present State register before writing to this register. Writing to the upper byte of this register triggers SD command generation. The Host Driver has the responsibility to write this register because the Host Controller does not protect for writing when Command Inhibit (CMD) is set.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + Eh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 0000h

| 13:8      | 0h<br>RW         | <b>Command Index (cmd_index):</b> These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the Physical Layer Specification and SDIO Card Specification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 7:6       | 00b<br>RW        | <b>Command Type (cmd_type):</b> There are three types of special commands: Suspend, Resume and Abort. These bits shall be set to 00b for all other commands. <b>(1) Suspend Command</b> If the Suspend command succeeds, the Host Controller shall assume the SD Bus has been released and that it is possible to issue the next command, which uses the DAT line. The Host Controller shall de-assert Read Wait for read transactions and stop checking busy for write transactions. The interrupt cycle shall start, in 4-bit mode. If the Suspend command fails, the Host Controller shall maintain its current state, and the Host Driver shall restart the transfer by setting Continue Request in the Block Gap Control register. (Refer to 3.12.1 Suspend Sequence). <b>(2) Resume Command</b> The Host Driver re-starts the data transfer by restoring the registers in the range of 000-00Dh. (Refer to Figure 1-4 in section 1.6 for the register map.) The Host Controller shall check for busy before starting write transfers. <b>(3) Abort Command</b> If this command is set when executing a read transfer, the Host Controller shall stop reads to the buffer. If this command is set when executing a write transfer, the Host Controller shall stop driving the DAT line. After issuing the Abort command, the Host Driver should issue a software reset. (Refer to 3.8 Abort Transaction). <ul style="list-style-type: none"> <li>11b = Abort -- CMD12, CMD52 for writing 'I/O Abort' in CCCR</li> <li>10b = Resume -- CMD52 for writing 'Function Select' in CCCR</li> <li>01b = Suspend -- CMD52 for writing 'Bus Suspend' in CCCR</li> <li>00b = Normal -- Other commands</li> </ul> |
| 5         | 0b<br>RW         | <b>Data Present Select (data_pr_sel):</b> This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. It is set to 0 for the following: (1) Commands using only CMD line (ex. CMD52). (2) Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38). (3) Resume command. <ul style="list-style-type: none"> <li>1 = Data Present</li> <li>0 = No Data Present</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### 16.6.7 Response Register 0 (RESPONSE0)—Offset 10h

This register is used to store responses from SD cards.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 10h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 00000000h

| 31:0      | 0h<br>RO         | <b>Command Response (cmd_resp):</b> The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register |

### 16.6.11 Buffer Data Port Register (BUF\_DATA\_PORT)—Offset 20h

32-bit data port register to access internal buffer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 20h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 00000000h

| 16        | 1b<br>RO         | <p><b>Card Inserted (crd_ins):</b> This bit indicates whether a card has been inserted. The Host Controller shall debounce this signal so that the Host Driver will not need to wait for it to stabilize. Changing from 0 to 1 generates a Card Insertion interrupt in the Normal Interrupt Status register and changing from 1 to 0 generates a Card Removal interrupt in the Normal Interrupt Status register. The Software Reset For All in the Software Reset register shall not affect this bit. If a card is removed while its power is on and its clock is oscillating, the Host Controller shall clear SD Bus Power in the Power Control register (Refer to Section 2.2.11) and SD Clock Enable in the Clock Control register (Refer to Section 2.2.14). When this bit is changed from 1 to 0, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state). In addition, the Host Driver should clear the Host Controller by the Software Reset For All in Software Reset register. The card detect is active regardless of the SD Bus Power.</p> <ul style="list-style-type: none"> <li>1 = Card Inserted</li> <li>0 = Reset or Debouncing or No Card</li> </ul> |

| 2         | 0b<br>RO         | <p><b>DAT Line Active (dat_ln_active):</b> This bit indicates whether one of the DAT lines on SD Bus is in use. (a) In the case of read transactions This status indicates whether a read transfer is executing on the SD Bus. Changing this value from 1 to 0 generates a Block Gap Event interrupt in the Normal Interrupt Status register, as the result of the Stop At Block Gap Request being set. Refer to Section 3.12.3 for details on timing. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> <li>After the end bit of the read command.</li> <li>When writing a 1 to Continue Request in the Block Gap Control register to restart a read transfer.</li> </ul> <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> <li>When the end bit of the last data block is sent from the SD Bus to the Host Controller. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table.</li> <li>When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request.</li> </ul> <p>The Host Controller shall stop read operation at the start of the interrupt cycle of the next block gap by driving Read Wait or stopping SD clock. If the Read Wait signal is already driven (due to data buffer cannot receive data), the Host Controller can continue to stop read operation by driving the Read Wait signal. It is necessary to support Read Wait in order to use suspend / resume function. (b) In the case of write transactions This status indicates that a write transfer is executing on the SD Bus. Changing this value from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer to Section 3.12.4 for sequence details. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> <li>After the end bit of the write command.</li> <li>When writing to 1 to Continue Request in the Block Gap Control register to continue a write transfer.</li> </ul> <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> <li>When the SD card releases write busy of the last data block. If SD card does not drive busy signal for 8 SD Clocks, the Host Controller shall consider the card drive 'Not Busy'. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table.</li> <li>When the SD card releases write busy prior to waiting for write transfer as a result of a Stop At Block Gap Request.</li> </ul> <p>(c) Command with busy This status indicates whether a command indicates busy (ex. erase command for memory) is executing on the SD Bus. This bit is set after the end bit of the command with busy and cleared when busy is de-asserted. Changing this bit from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer Figure 2-11 to Figure 2-13.</p> <ul style="list-style-type: none"> <li>1 = DAT Line Active</li> <li>0 = DAT Line Inactive</li> </ul> |

| 1         | 0b<br>RO         | <b>Command Inhibit (DAT) (cmd_inhibit_dat):</b> This status bit is generated if either the DAT Line Active or the Read Transfer Active is set to 1. If this bit is 0, it indicates the Host Controller can issue the next SD Command. Commands with busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). Changing from 1 to 0 generates a Transfer Complete interrupt in the Normal Interrupt Status register. <b>Note:</b> The SD Host Driver can save registers in the range of 000-00Dh for a suspend transaction after this bit has changed from 1 to 0. <ul style="list-style-type: none"> <li>1 Cannot issue command which uses the DAT line</li> <li>0 Can issue command which uses the DAT line</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 0         | 0b<br>RO         | <b>Command Inhibit (CMD) (cmd_inhibit_cmd):</b> Command Inhibit (CMD) If this bit is 0, it indicates the CMD line is not in use and the Host Controller can issue a SD Command using the CMD line. cleared when the command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the response of CMD12 or CMD23 but cleared by the response of a read/write command. Status issuing Auto CMD12 is not read from this bit. So if a command is issued during Auto CMD12 operation, Host Controller shall manage to issue two commands: CMD12 and a command set by Command register. Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0. Changing from 1 to 0 generates a Command Complete Interrupt in the Normal Interrupt Status register. If the Host Controller cannot issue the command because of a command conflict error (Refer to Command CRC Error in Section 2.2.18) or because of Command Not Issued By Auto CMD12 Error (Refer to Section 2.2.23), this bit shall remain 1 and the Command Complete is not set. <ul style="list-style-type: none"> <li>1 Cannot issue command</li> <li>0 Can issue command using only CMD line</li> </ul> |

### 16.6.13 Host Control 1 Register (HOST\_CTL)—Offset 28h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 28h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 00h

| 0         | 0b<br>RW         | <b>SD Bus Power (sd_bus_pwr):</b> Before setting this bit, the SD Host Driver shall set SD Bus Voltage Select. If the Host Controller detects the No Card state, this bit shall be cleared. If this bit is cleared, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state) and drive SDCLK to low level (Refer to Section 2.2.14) For SD Controller, this bit controls the bus voltage to SDMMC3. For SDIO Controller, power to SDIO device on SDMMC2 is not controlled by this bit. GPIO register and pin can be used to controller the SDIO device power. For eMMC Controller, power to eMMC device on SDMMC1 is not controlled by this bit. GPIO register and pin or alternative solutions can be used. <ul style="list-style-type: none"> <li>1 = Power on</li> <li>0 = Power off</li> </ul> |

### 16.6.15 Block Gap Control Register (\_BLK\_GAP\_CTL)—Offset 2Ah

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 2Ah

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 00h

| 3         | 0b<br>RW         | <b>Interrupt at Block Gap (int_blk_gap):</b> This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Setting to 0 disables interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. <ul style="list-style-type: none"> <li>1 = Enabled</li> <li>0 = Disabled</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 2         | 0b<br>RW         | <b>Read Wait Control (rd_wait_ctl):</b> The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using the DAT[2] line. Otherwise, the Host Controller has to stop the SD Clock to hold read data, which restricts commands generation. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. If the card does not support read wait, this bit shall never be set to 1, otherwise DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported. <ul style="list-style-type: none"> <li>1 = Enable Read Wait Control</li> <li>0 = Disable Read Wait Control</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 1         | 0b<br>RW         | <b>Continue Request (cont_req):</b> This bit is used to restart a transaction, which was stopped using the Stop At Block Gap Request. To cancel stop at the block gap, set Stop At Block Gap Request to 0 and set this bit 1 to restart the transfer. The Host Controller automatically clears this bit in either of the following cases: <ul style="list-style-type: none"> <li>In the case of a read transaction, the DAT Line Active changes from 0 to 1 as a read transaction restarts.</li> <li>In the case of a write transaction, the Write Transfer Active changes from 0 to 1 as the write transaction restarts.</li> </ul> Therefore, it is not necessary for Host Driver to set this bit to 0. If Stop At Block Gap Request is set to 1, any write to this bit is ignored. <ul style="list-style-type: none"> <li>1 = Restart</li> <li>0 = Not affect</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 0         | 0b<br>RW         | <b>Stop at Block Gap Request (stp_blk_gap_req):</b> This bit is used to stop executing read and write transaction at the next block gap for non-DMA, SDMA and ADMA transfers. The Host Driver shall leave this bit set Copyright 2002-2011 SD Association SD Host Controller Simplified Specification Version 3.00 44 to 1 until the Transfer Complete is set to 1. Clearing both Stop At Block Gap Request and Continue Request shall not cause the transaction to restart. When Host Controller version is 1.00, the Host Driver can set this bit if the card supports Read Wait Control. When Host Controller version is 2.00 or later, the Host Driver can set this bit regardless of the card supports Read Wait Control. The Host Controller shall stop read transfer by using Read Wait or stopping SD clock. In case of write transfers in which the Host Driver writes data to the Buffer Data Port register, the Host Driver shall set this bit after all block data is written. If this bit is set to 1, the Host Driver shall not write data to Buffer Data Port register. This bit affects Read Transfer Active, Write Transfer Active, DAT Line Active and Command Inhibit (DAT) in the Present State register. Regarding detailed control of bits D01 and D00, refer to Section 3.8 and 3.12. <ul style="list-style-type: none"> <li>1 = Stop</li> <li>0 = Transfer</li> </ul> |

### 16.6.16 Wakeup Control Register (WAKEUP\_CTL)—Offset 2Bh

This register is mandatory for the Host Controller, but wakeup functionality depends on the Host Controller system hardware and software. The Host Driver shall maintain voltage on the SD Bus, by setting SD Bus Power to 1 in the Power Control register, when wakeup event via Card Interrupt is desired. Wakeup Event is not supported by Host Controller. Sideband wake via GPIO pin and register shall be used instead. During RTD3, GPIO register is readable and GPIO signal is routed to APIC.

#### Access Method

| 15:8      | 00h<br>RW        | <p><b>SDCLK Frequency Select (sdclk_freq_sel):</b> This register is used to select the frequency of the SDCLK pin. The definition of this field is dependent on the Host Controller Version. <b>(1) 8-bit Divided Clock Mode</b> This mode is supported by the Host Controller Version 1.00 and 2.00. The frequency is not programmed directly, rather, this register holds the divisor of the Base Clock Frequency For SD Clock in the capabilities register. Only the following settings are allowed. <b>(1) 8-bit Divided Clock Mode</b></p> <ul style="list-style-type: none"> <li>• 80h = base clock divided by 256</li> <li>• 40h = base clock divided by 128</li> <li>• 20h = base clock divided by 64</li> <li>• 10h = base clock divided by 32</li> <li>• 08h = base clock divided by 16</li> <li>• 04h = base clock divided by 8</li> <li>• 02h = base clock divided by 4</li> <li>• 01h = base clock divided by 2</li> <li>• 00h = base clock(10MHz and up)</li> </ul> <p>Setting 00h specifies the highest frequency of the SD Clock. When setting multiple bits, the most significant bit is used as the divisor, but it should not be set. The three default divider values can be calculated by the frequency that is defined by the Base Clock Frequency For SD Clock in the Capabilities register.</p> <ul style="list-style-type: none"> <li>• 400KHz divider value</li> <li>• 25MHz divider value</li> <li>• 50MHz divider value</li> </ul> <p>According to the Physical Layer Specification, the maximum SD Clock frequency is 25 MHz in normal speed mode and 50MHz in high speed mode, and shall never exceed this limit. The frequency of the SDCLK is set by the following formula: Clock Frequency = (Base Clock) / divisor Thus, choose the smallest possible divisor which results in a clock frequency that is less than or equal to the target frequency. For example, if the Base Clock Frequency For SD Clock in the Capabilities register has the value 33MHz, and the target frequency is 25MHz, then choosing the divisor value of 01h will yield 16.5MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400KHz, the divisor value of 40h yields the optimal clock value of 258KHz.</p> <p><b>(2) 10-bit Divided Clock Mode</b> Host Controller Version 3.00 supports this mandatory mode instead of the 8-bit Divided Clock Mode. The length of divider is extended to 10 bits, and all divider values shall be supported.</p> <ul style="list-style-type: none"> <li>• 3FFh = 1/2046 Divided Clock</li> <li>• N = 1/2N Divided Clock (Duty 50%)</li> <li>• 002h = 1/4 Divided Clock</li> <li>• 001h = 1/2 Divided Clock</li> <li>• 000h = Base Clock (10MHz and up)</li> <li>• 3FFh = Base Clock * M / 1024</li> <li>• ..... = Base Clock * M / N</li> <li>• N - 1 = Base Clock * M / N</li> <li>• ..... = Base Clock * M / 3</li> <li>• 002h = Base Clock * M / 3</li> <li>• 001h = Base Clock * M / 2</li> <li>• 000h = Base Clock * M</li> </ul> <p>This field depends on setting of Preset Value Enable in the Host Control 2 register. If Preset Value Enable = 0, this field is set by Host Driver. If the Preset Value Enable = 1, this field is automatically set to a value specified in one of Preset Value registers.</p> |

| 2         | 0b<br>RW         | <b>SD Clock Enable (sd_clk_en):</b> The Host Controller shall stop SDCLK when writing this bit to 0. SDCLK Frequency Select can be changed when this bit is 0. Then, the Host Controller shall maintain the same clock frequency until SDCLK is stopped (Stop at SDCLK=0). If the Card Inserted in the Present State register is cleared, this bit shall be cleared.<br><ul style="list-style-type: none"> <li>1 = Enable</li> <li>0 = Disable</li> </ul>                                                                                                                                                             |
| 1         | 0b<br>RO         | <b>Internal Clock Stable (int_clk_stable):</b> This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1. The SD Host Driver shall wait to set SD Clock Enable until this bit is set to 1. <b>Note:</b> This is useful when using PLL for a clock oscillator that requires setup time.<br><ul style="list-style-type: none"> <li>1 = Ready</li> <li>0 = Not Ready</li> </ul>                                                                                                                                                                                          |
| 0         | 0b<br>RW         | <b>Internal Clock Enable (int_clk_en):</b> This bit is set to 0 when the Host Driver is not using the Host Controller, or when the Host Controller awaits a wakeup event. The Host Controller should stop its internal clock to go to a very low power state. Still, registers shall be able to be read and written. Clock starts to oscillate when this bit is set to 1. When clock oscillation is stable, the Host Controller shall set Internal Clock Stable in this register to 1. This bit shall not affect card detection.<br><ul style="list-style-type: none"> <li>1 = Oscillate</li> <li>0 = Stop</li> </ul> |

### 16.6.18 Timeout Control Register (TIMEOUT\_CTL)—Offset 2Eh

At the initialization of the Host Controller, the Host Driver shall set the Data Timeout Counter Value according to the Capabilities register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 2Eh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 00h

| 0         | 0b<br>RW         | <p><b>Software Reset For All (sw_rst_all):</b> This reset affects the entire Host Controller except for the card detection circuit. Register bits of type ROC, RW, RW1C, RWAC are cleared to 0. During its initialization, the Host Driver shall set this bit to 1 to reset the Host Controller. The Host Controller shall reset this bit to 0 when Capabilities registers are valid and the Host Driver can read them. Additional use of Software Reset For All may not affect the value of the Capabilities registers. If this bit is set to 1, the host driver should issue reset command and reinitialize the SD card.</p> <ul style="list-style-type: none"> <li>1 = Reset</li> <li>0 = Work</li> </ul> <p>When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.</p>                                                                                                                                                                                                                                                                                     |

## 16.6.20 Normal Interrupt Status Register (NML\_INT\_STATUS)—Offset 30h

The Normal Interrupt Status Enable affects reads of this register, but Normal Interrupt Signal Enable does not affect these reads. An interrupt is generated when the Normal Interrupt Signal Enable is enabled and at least one of the status bits is set to 1. Writing 1 to a bit of RW1C attribute clears it; writing 0 keeps the bit unchanged. Writing 1 to a bit of ROC attribute keeps the bit unchanged. More than one status can be cleared with a single register write. The Card Interrupt is cleared when the card stops asserting the interrupt; that is, when the Card Driver services the interrupt condition.

### Access Method

| 8         | 0b<br>RO         | <p><b>Card Interrupt (crd_int):</b> Writing this bit to 1 does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the Host Controller shall detect the Card Interrupt without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the Host System. When this status has been set and the Host Driver needs to start this interrupt service, Card Interrupt Status Enable in the Normal Interrupt Status Enable register may be set to 0 in order to clear the card interrupt statuses latched in the Host Controller and to stop driving the interrupt signal to the Host System. After completion of the card interrupt service (It should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set Card Interrupt Status Enable to 1 and start sampling the interrupt signal again. Interrupt detected by DAT[1] is supported when there is a card per slot. In case of shared bus, interrupt pins are used to detect interrupts. If 000b is set to Interrupt Pin Select in the Shared Bus Control register, this status is effective. Non-zero value is set to Interrupt Pin Select, INT_A, INT_B or INT_C is then used to device interrupts.</p> <ul style="list-style-type: none"> <li>1 = Generate Card Interrupt</li> <li>0 = No Card Interrupt</li> </ul> |
| 7         | 0b<br>RW/1C      | <p><b>Card Removal (crd_rm):</b> This status is set if the Card Inserted in the Present State register changes from 1 to 0. | 1         | 0b<br>RW/1C      | <p><b>Transfer Complete (tx_comp):</b> This bit is set when a read / write transfer and a command with busy is completed. <b>(1) In the case of a Read Transaction</b> This bit is set at the falling edge of Read Transfer Active Status. This interrupt is generated in two cases. The first is when a data transfer is completed as specified by data length (After the last data has been read to the Host System). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request in the Block Gap Control register (After valid data has been read to the Host System). Refer to Section 3.12.3 for more details on the sequence of events. <b>(2) In the case of a Write Transaction</b> This bit is set at the falling edge of the DAT Line Active Status. This interrupt is generated in two cases. The first is when the last data is written to the SD card as specified by data length and the busy signal released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request in the Block Gap Control register and data transfers completed. (After valid data is written to the SD card and the busy signal released). Refer to Section 3.12.4 for more details on the sequence of events. <b>(3) In the case of a command with busy</b> This bit is set when busy is de-asserted. Refer to DAT Line Active and Command Inhibit (DAT) in the Present State register. Refer to the spec for the relationship between Transfer Complete and Data Timeout Error.</p> <ul style="list-style-type: none"> <li>1 = Command execution is completed</li> <li>0 = Not complete</li> </ul> <p>While performing tuning procedure (Execute Tuning is set to 1), Transfer Complete is not set to 1.</p> |
| 0         | 0b<br>RW/1C      | <p><b>Command Complete (cmd_comp):</b> This bit is set when get the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23 but generated by the response of a read/write command. Refer to Command Inhibit (CMD) in the Present State register for how to control this bit. Command Timeout Error has higher priority than Command Complete. If both bits are set to 1, it can be considered that the response was not received correctly. For a tabular description of the relationship between these two bits, refer to the description of Command Complete in the spec.</p> <ul style="list-style-type: none"> <li>1 = Command complete</li> <li>0 = No command complete</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 16.6.21 Error Interrupt Status Register (ERR\_INT\_STATUS)—Offset 32h

Signals defined in this register can be enabled by the Error Interrupt Status Enable register, but not by the Error Interrupt Signal Enable register. The interrupt is generated when the Error Interrupt Signal Enable is enabled and at least one of the statuses is set to 1. Writing to 1 clears the bit, and writing to 0 keeps the bit unchanged. More than one status can be cleared at the one register write.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 32h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 0000h

| 1         | 0b<br>RW         | <b>Command CRC Error (cmd_crc_err):</b> <b>Command CRC Error</b> is generated in two cases. If a response is returned and the <b>Command Timeout Error</b> is set to 0 (indicating no timeout), this bit is set to 1 when detecting a CRC error in the command response. The Host Controller detects a CMD line conflict by monitoring the CMD line when a command is issued. If the Host Controller drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SD clock edge, then the Host Controller shall abort the command (Stop driving CMD line) and set this bit to 1. The Command Timeout Error shall also be set to 1 to distinguish CMD line conflict (refer to tabular data in the spec. that explains the relationship between <b>Command CRC Error</b> and <b>Command Timeout Error</b> ).<br><ul style="list-style-type: none"> <li>1 = CRC Error Generated.</li> <li>0 = no error</li> </ul> |
| 0         | 0b<br>RW         | <b>Command Timeout Error (cmd_timeout_err):</b> This bit is set only if no response is returned within 64 SD clock cycles from the end bit of the command. If the Host Controller detects a CMD line conflict (in which case <b>Command CRC Error</b> shall also be set, as shown in tabular data in the spec that explains the relationship between this bit and <b>Command CRC Error</b> ) this bit shall be set without waiting for 64 SD clock cycles, because the command will be aborted by the Host Controller.<br><ul style="list-style-type: none"> <li>1 = time out</li> <li>0 = no Error</li> </ul>                                                                                                                                                                                                                                                                                                                    |

## 16.6.22 Normal Interrupt Status Enable (NRM\_INT\_STATUS\_EN)—Offset 34h

Setting to 1 enables Interrupt Status. **Implementation Note:** The Host Controller may sample the card interrupt signal during interrupt period, and may hold its value in the flip-flop. If the **Card Interrupt Status Enable** is set to 0, the Host Controller shall clear all internal signals regarding Card Interrupt.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 34h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 0000h

## 16.6.23 Error Interrupt Status Enable Register (ERR\_INT\_STAT\_EN)—Offset 36h

Setting to 1 enables interrupt status. **Implementation Note:** To detect CMD line conflict, the Host Driver must set both **Command Timeout Error Status Enable** and **Command CRC Error Status Enable** to 1.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 36h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 0000h

### 16.6.26 Auto CMD12 Error Status Register and Host Control 2 Register (CMD12\_ERR\_STAT\_HOST\_CTRL\_2)—Offset 3Ch

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 3Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 00000000h

[illegible]

|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31        | 0b<br>RW         | <p><b>Preset Value (preset_value):</b> Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set to automatic This bit enables the functions defined in the Preset Value registers.</p> <ul style="list-style-type: none"> <li>1 = Automatic Selection by Preset Value are Enabled</li> <li>0 SDCLK and Driver Strength are controlled by Host Driver</li> </ul> <p>If this bit is set to 0, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Driver. If this bit is set to 1, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Controller as specified in the Preset Value registers.</p> |
| 30        | 0b<br>RW         | <p><b>Asynchronous Interrupt (async_int):</b> This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode (and zero is set to Interrupt Pin Select in the Shared Bus Control register). If this bit is set to 1, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver Card Interrupt to the host when it is asserted by the Card. Usage: It is recommended that Synchronous Interrupt mode be used for SDIO Controller by setting this be to '0'. If Asynchronous Interrupt Enable mode is used, it is required that this bit remain '0' until SD initialization sequence is complete.</p> <ul style="list-style-type: none"> <li>1 = Enabled</li> <li>0 = Disabled</li> </ul>                                                |

### 16.6.27 Capabilities Register (CAPABILITIES)—Offset 40h

This register provides the HD with information specific to the HC implementation. The HC may implement these values as fixed or loaded from flash memory during power on initialization.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 40h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 00000000h

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |  |  |  |  |  |  |  |  |  |  | ### 16.6.28 Capabilities Register 2 (CAPABILITIES\_2)—Offset 44h

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 44h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 00000000h

### 16.6.29 Maximum Current Capabilities Register (MAX\_CUR\_CAP)—Offset 48h

These registers indicate maximum current capability for each voltage. The value is meaningful if Voltage Support is set in the Capabilities register. If this information is supplied by the Host System via another method, all Maximum Current Capabilities register shall be 0.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 48h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 00000000h

### 16.6.31 Force Event Register for Error Interrupt Status (FORCE\_EVENT\_ERR\_INT\_STAT)—Offset 52h

Error Interrupt Status register can be written. The effect of a write to this address will be reflected in the Error Interrupt Status Register if the corresponding bit of the Error Interrupt Status Enable Register is set.

- Writing 1 : set each bit of the Error Interrupt Status Register
- Writing 0 : no effect

**Note:** By setting this register, the Error Interrupt can be set in the Error Interrupt Status register. In order to generate interrupt signal, both the Error Interrupt Status Enable and Error Interrupt Signal Enable shall be set.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 52h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 0000h

### 16.6.32 ADMA Error Status Register (ADMA\_ERR\_STAT)—Offset 54h

When ADMA Error Interrupt occurs, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address Register holds the address around the error descriptor. To recover from the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows:

- ST\_STOP: Previous location set in the ADMA System Address register is the error descriptor address
- ST\_FDS: Current location set in the ADMA System Address register is the error descriptor address
- ST\_CADR: This state is never set because do not generate ADMA error in this state.

- ST\_TFR: Previous location set in the ADMA System Address register is the error descriptor address

The Host Controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) at the ST\_FDS state. In this case, ADMA Error State indicates that an error occurs at ST\_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

### Access Method

Refer to the spec for tabular information about the relationship between this field and SYS_SDR register.                                                                                                                      |

## 16.6.33 ADMA System Address Register (ADMA\_SYS\_ADDR)—Offset 58h

This register contains the physical Descriptor address used for ADMA data transfer.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 58h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description                          |
|-----------|------------------|-------------------------------------------------------|
| 31:0      | 00000000h<br>RW  | <b>ADMA System Address (adma_sys_addr):</b> Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description                    |
|-----------|------------------|-------------------------------------------------|
| 31:0      | 00000001h<br>RO  | <b>Preset Values (Preset_Values):</b> Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description                    |
|-----------|------------------|-------------------------------------------------|
| 31:0      | 00010000h<br>RO  | <b>Preset Values (Preset_Values):</b> Reserved. |

### 16.6.34 Boot Timeout Control (BOOT\_TIMEOUT\_CTRL)—Offset 70h

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**BAR Type:** PCI Configuration Register (Size: 32 bits)  
**BAR Reference:** [B:0, D:17, F:0] + 10h

31 28 24 20 16 12 8 4 0

| 31:0      | 00000000h<br>RW  | <b>Boot Data Timeout Counter Value (time_cnt_val):</b> Reserved. |

### 16.6.35 Debug Selection Register (DEBUG\_SEL)—Offset 74h

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 74h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 00h

### 16.6.36 Shared Bus Control Register (SHARED\_BUS)—Offset E0h

This register is optional. The devices on shared bus are not intended to be controlled by the Standard Host Driver. This is because shared bus configuration depends on a host system; the devices on shared bus may be controlled by a specific driver of a host system.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + E0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:17, F:0] + 10h

**Default:** 00000000h

### 16.7.3 Revision ID and Class Code Register (REVCLASSCODE)—Offset 8h

## Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 8h

**Default:** 00000000h

|             |    |    |    |    |    |   |     |   |
|-------------|----|----|----|----|----|---|-----|---|
| 31          | 28 | 24 | 20 | 16 | 12 | 8 | 4   | 0 |
| 0           | 0  | 0  | 0  | 0  | 0  | 0 | 0   | 0 |
| CLASS_CODES |    |    |    |    |    |   | RID |   |

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:8      | 000000h<br>RO    | <b>Class Code (CLASS_CODES):</b> This register is read-only and is used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level. |
| 7:0       | 00h<br>RO        | <b>Revision ID (RID):</b> Identifies the revision of a particular AHB device. This is tied to a strap at the top level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

#### 16.7.4 Cache Line Size, Latency Timer, and Header Type Register (CLLATHEADERBIST)—Offset Ch

## Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + Ch

**Default:** 00000000h

|           |          |            |          |                |    |   |   |   |

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                          |
|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:24     | 00h<br>RO        | <b>Reserved0:</b> Reserved.                                                                                                                                                                                                                           |
| 23        | 0h<br>RO         | <b>Multifunction Device (MULFNDEV):</b> This bit is always 0 for non-fabric ports. For fabric ports it is driven from the fabric_mult_function strap. A value of 1 indicates a multifunction device; a value of 0 indicates a single function device. |
| 22:16     | 00h<br>RO        | <b>Header Type (HEADERTYPE):</b> Implements Type 0 Configuration header.                                                                                                                                                                              |
| 15:8      | 00h<br>RO        | <b>Latency Timer (LATTIMER):</b> Doesnt apply to PCI Express. Hardwired to 00h.                                                                                                                                                                       |
| 7:0       | 00h<br>RW        | <b>Cache Line Size (CACHELINE_SIZE):</b> Doesnt apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.                                                    |

### 16.7.5 Base Address Register (BAR)—Offset 10h

Each AHB device is a single function device with only a single BAR associated with it. Bits 31:4 indicate the Base Address register. Power-up software can determine how much address space the AHB Device requires by writing a value of all 1's to the register and then reading the value back. Bridge will return 0's in all don't-care address bits, effectively specifying the address space required. Unimplemented Base Address registers are hardwired to zero. This is the Size Indicator Read only bits of the register.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 10h

**Default:** 00000000h

|          |               |              |      |               |    |   |   |   |
|----------|---------------|--------------|------|---------------|----|---|---|---|
| 31       | 28            | 24           | 20   | 16            | 12 | 8 | 4 | 0 |
| 0        | 0             | 0            | 0    | 0             | 0  | 0 | 0 | 0 |
| 0        | 0             | 0            | 0    | 0             | 0  | 0 | 0 | 0 |
| 0        | 0             | 0            | 0    | 0             | 0  | 0 | 0 | 0 |
| BASEADDR | SIZEINDICATOR | PREFETCHABLE | TYPE | MESSAGE_SPACE |    |   |   |   |

| Bit Range | Default & Access | Field Name (ID): Description                                                                                |
|-----------|------------------|-------------------------------------------------------------------------------------------------------------|
| 31:12     | 00000h<br>RW     | <b>Base Address (BASEADDR):</b> Base address of the AHB device memory space. Taken from Strap values as 1s. |

### 16.7.6 Base Address Register 1 (BAR1)—Offset 14h

**Type:** PCI Configuration Register  
(Size: 32 bits)

|             |    |    |    |    |                   |   |   |   |  |
|-------------|----|----|----|----|-------------------|---|---|---|--|
| 31          | 28 | 24 | 20 | 16 | 12                | 8 | 4 | 0 |  |
| 0           | 0  | 0  | 0  | 0  | 0                 | 0 | 0 | 0 |  |
| SUBSYSTEMID |    |    |    |    | SUBSYSTEMVENDORID |   |   |   |  |

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                                                                               |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:16     | 0000h<br>RW/O    | <b>Subsystem ID (SUBSYSTEMID):</b> This register should be implemented for any function that could be instantiated more than once in a given system. Th is register makes it possible for the operating environment to distinguish one audio subsystem from the other. This is a Read Write Once register. |
| 15:0      | 0000h<br>RW/O    | <b>Subsystem Vendor ID (SUBSYSTEMVENDORID):</b> This register should be implemented for any function that could be instantiated more than once in a given system. This register enables the operating environment to distinguish one subsystem from the other. This is a Read Write Once register.         |

### 16.7.8 Expansion ROM Base Address Register (EXPANSION\_ROM\_BASEADDR)—Offset 30h

**Type:** PCI Configuration Register  
(Size: 32 bits) **Offset:** [B:0, D:18, F:0] + 30h

|                    |    |    |    |    |    |   |   |   |
|--------------------|----|----|----|----|----|---|---|---|
| 31                 | 28 | 24 | 20 | 16 | 12 | 8 | 4 | 0 |
| 0                  | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 |
| EXPANSTON_ROM_BASE |    |    |    |    |    |   |   |   |

| Bit Range | Default & Access | Field Name (ID): Description                                                                                    |
|-----------|------------------|-----------------------------------------------------------------------------------------------------------------|
| 31:0      | 00000000h<br>RO  | <b>Expansion ROM Base Address (EXPANSION_ROM_BASE):</b> Value of all 0s indicates no support for Expansion ROM. |

## 16.7.9 Capabilities Pointer Register (CAPABILITYPTR)—Offset 34h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 34h

**Default:** 00000080h

|           |    |    |    |    |    |   |              |   |
|-----------|----|----|----|----|----|---|--------------|---|
| 31        | 28 | 24 | 20 | 16 | 12 | 8 | 4            | 0 |
| 0         | 0  | 0  | 0  | 0  | 0  | 0 | 1            | 0 |
| 0         | 0  | 0  | 0  | 0  | 0  | 0 | 0            | 0 |
| 0         | 0  | 0  | 0  | 0  | 0  | 0 | 0            | 0 |
| Reserved0 |    |    |    |    |    |   | CAPPTR_POWER |   |

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                             |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:8      | 000000h<br>RO    | <b>Reserved0:</b> Reserved.                                                                                                                                                                                                              |
| 7:0       | 80h<br>RO        | <b>Capabilities Pointer (CAPPTR_POWER):</b> Indicates what the next capability is. This capability can be programmed to be PM Capability (0x80) if PM Capability is enabled in SB. When PM capability is disabled, this register is 00h. |

## 16.7.10 Interrupt Register (INTERRUPTREG)—Offset 3Ch

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:18, F:0] + 3Ch

**Default:** 00000100h

|         |    |    |    |           |    |   |   |         |
|---------|----|----|----|-----------|----|---|---|---------|
| 31      | 28 | 24 | 20 | 16        | 12 | 8 | 4 | 0       |
| 0       | 0  | 0  | 0  | 0         | 0  | 0 | 0 | 0       |

### 16.8.1 SDMA System Address / Argument 2 Register (SYS\_ADR)—Offset 0h

This register contains the physical system memory address used for DMA transfers or the second argument for the Auto CMD23.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 00000000h

Diagram illustrating the structure of the `sys_adr` register, which is 32 bits wide. The register is divided into eight 4-bit fields, labeled with bit ranges: 31, 28, 24, 20, 16, 12, 8, 4, and 0. The label `sys_adr` is positioned vertically below the 16-12 bit range.

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0      | 00000000h<br>RW  | <b>SDMA System Address (sys_adr): (1) SDMA System Address</b><br>This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value.<br>The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register.<br>The SDMA transfer waits at each boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates a DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register.<br>When the uppermost byte of this register (003h) is written, the Host Controller restarts the SDMA transfer.<br>When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register. <b>(2)</b><br><b>Argument 2</b><br>This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23.<br>If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without ADMA, the available block count value is limited by the Block Count register. 65535 blocks is the maximum value in this case. |

## 16.8.2 Block Size Register (BLK\_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 0000h

| 1         | 0b<br>RW         | <b>Block Count Enable (blk_count_en):</b> This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8). If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. <ul style="list-style-type: none"> <li>1 = Enable</li> <li>0 = Disable</li> </ul>                                                                               |
| 0         | 0b<br>RW         | <b>DMA Enable (dma_en):</b> This bit enables DMA functionality as described in section 1.4. DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). <ul style="list-style-type: none"> <li>1 = DMA Data transfer</li> <li>0 = No data transfer or Non DMA data transfer</li> </ul> |

## 16.8.6 Command Register (CMD)—Offset Eh

The Host Driver shall check the Command Inhibit (DAT) bit and Command Inhibit (CMD) bit in the Present State register before writing to this register. Writing to the upper byte of this register triggers SD command generation. The Host Driver has the responsibility to write this register because the Host Controller does not protect for writing when Command Inhibit (CMD) is set.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + Eh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 0000h

| 13:8      | 0h<br>RW         | <b>Command Index (cmd_index):</b> These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the Physical Layer Specification and SDIO Card Specification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 7:6       | 00b<br>RW        | <b>Command Type (cmd_type):</b> There are three types of special commands: Suspend, Resume and Abort. These bits shall be set to 00b for all other commands. <b>(1) Suspend Command</b> If the Suspend command succeeds, the Host Controller shall assume the SD Bus has been released and that it is possible to issue the next command, which uses the DAT line. The Host Controller shall de-assert Read Wait for read transactions and stop checking busy for write transactions. The interrupt cycle shall start, in 4-bit mode. If the Suspend command fails, the Host Controller shall maintain its current state, and the Host Driver shall restart the transfer by setting Continue Request in the Block Gap Control register. (Refer to 3.12.1 Suspend Sequence). <b>(2) Resume Command</b> The Host Driver re-starts the data transfer by restoring the registers in the range of 000-00Dh. (Refer to Figure 1-4 in section 1.6 for the register map.) The Host Controller shall check for busy before starting write transfers. <b>(3) Abort Command</b> If this command is set when executing a read transfer, the Host Controller shall stop reads to the buffer. If this command is set when executing a write transfer, the Host Controller shall stop driving the DAT line. After issuing the Abort command, the Host Driver should issue a software reset. (Refer to 3.8 Abort Transaction). <ul style="list-style-type: none"> <li>11b = Abort -- CMD12, CMD52 for writing 'I/O Abort' in CCCR</li> <li>10b = Resume -- CMD52 for writing 'Function Select' in CCCR</li> <li>01b = Suspend -- CMD52 for writing 'Bus Suspend' in CCCR</li> <li>00b = Normal -- Other commands</li> </ul> |
| 5         | 0b<br>RW         | <b>Data Present Select (data_pr_sel):</b> This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. It is set to 0 for the following: (1) Commands using only CMD line (ex. CMD52). (2) Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38). (3) Resume command. <ul style="list-style-type: none"> <li>1 = Data Present</li> <li>0 = No Data Present</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### 16.8.7 Response Register 0 (RESPONSE0)—Offset 10h

This register is used to store responses from SD cards.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 10h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 00000000h

| 31:0      | 0h<br>RO         | <b>Command Response (cmd_resp):</b> The Table 2-12 describes the mapping of command responses from the SD Bus to this register for each response type. In the table, R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit range within the Response register |

### 16.8.11 Buffer Data Port Register (BUF\_DATA\_PORT)—Offset 20h

32-bit data port register to access internal buffer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 20h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 00000000h

| 16        | 1b<br>RO         | <p><b>Card Inserted (crd_ins):</b> This bit indicates whether a card has been inserted. The Host Controller shall debounce this signal so that the Host Driver will not need to wait for it to stabilize. Changing from 0 to 1 generates a Card Insertion interrupt in the Normal Interrupt Status register and changing from 1 to 0 generates a Card Removal interrupt in the Normal Interrupt Status register. The Software Reset For All in the Software Reset register shall not affect this bit. If a card is removed while its power is on and its clock is oscillating, the Host Controller shall clear SD Bus Power in the Power Control register (Refer to Section 2.2.11) and SD Clock Enable in the Clock Control register (Refer to Section 2.2.14). When this bit is changed from 1 to 0, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state). In addition, the Host Driver should clear the Host Controller by the Software Reset For All in Software Reset register. The card detect is active regardless of the SD Bus Power.</p> <ul style="list-style-type: none"> <li>1 = Card Inserted</li> <li>0 = Reset or Debouncing or No Card</li> </ul> |

| 2         | 0b<br>RO         | <p><b>DAT Line Active (dat_ln_active):</b> This bit indicates whether one of the DAT lines on SD Bus is in use. (a) In the case of read transactions This status indicates whether a read transfer is executing on the SD Bus. Changing this value from 1 to 0 generates a Block Gap Event interrupt in the Normal Interrupt Status register, as the result of the Stop At Block Gap Request being set. Refer to Section 3.12.3 for details on timing. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> <li>After the end bit of the read command.</li> <li>When writing a 1 to Continue Request in the Block Gap Control register to restart a read transfer.</li> </ul> <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> <li>When the end bit of the last data block is sent from the SD Bus to the Host Controller. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table.</li> <li>When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request.</li> </ul> <p>The Host Controller shall stop read operation at the start of the interrupt cycle of the next block gap by driving Read Wait or stopping SD clock. If the Read Wait signal is already driven (due to data buffer cannot receive data), the Host Controller can continue to stop read operation by driving the Read Wait signal. It is necessary to support Read Wait in order to use suspend / resume function. (b) In the case of write transactions This status indicates that a write transfer is executing on the SD Bus. Changing this value from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer to Section 3.12.4 for sequence details. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> <li>After the end bit of the write command.</li> <li>When writing to 1 to Continue Request in the Block Gap Control register to continue a write transfer.</li> </ul> <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> <li>When the SD card releases write busy of the last data block. If SD card does not drive busy signal for 8 SD Clocks, the Host Controller shall consider the card drive 'Not Busy'. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table.</li> <li>When the SD card releases write busy prior to waiting for write transfer as a result of a Stop At Block Gap Request.</li> </ul> <p>(c) Command with busy This status indicates whether a command indicates busy (ex. erase command for memory) is executing on the SD Bus. This bit is set after the end bit of the command with busy and cleared when busy is de-asserted. Changing this bit from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer Figure 2-11 to Figure 2-13.</p> <ul style="list-style-type: none"> <li>1 = DAT Line Active</li> <li>0 = DAT Line Inactive</li> </ul> |

| 1         | 0b<br>RO         | <b>Command Inhibit (DAT) (cmd_inhibit_dat):</b> This status bit is generated if either the DAT Line Active or the Read Transfer Active is set to 1. If this bit is 0, it indicates the Host Controller can issue the next SD Command. Commands with busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). Changing from 1 to 0 generates a Transfer Complete interrupt in the Normal Interrupt Status register. <b>Note:</b> The SD Host Driver can save registers in the range of 000-00Dh for a suspend transaction after this bit has changed from 1 to 0. <ul style="list-style-type: none"> <li>1 Cannot issue command which uses the DAT line</li> <li>0 Can issue command which uses the DAT line</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 0         | 0b<br>RO         | <b>Command Inhibit (CMD) (cmd_inhibit_cmd):</b> Command Inhibit (CMD) If this bit is 0, it indicates the CMD line is not in use and the Host Controller can issue a SD Command using the CMD line. cleared when the command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the response of CMD12 or CMD23 but cleared by the response of a read/write command. Status issuing Auto CMD12 is not read from this bit. So if a command is issued during Auto CMD12 operation, Host Controller shall manage to issue two commands: CMD12 and a command set by Command register. Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0. Changing from 1 to 0 generates a Command Complete Interrupt in the Normal Interrupt Status register. If the Host Controller cannot issue the command because of a command conflict error (Refer to Command CRC Error in Section 2.2.18) or because of Command Not Issued By Auto CMD12 Error (Refer to Section 2.2.23), this bit shall remain 1 and the Command Complete is not set. <ul style="list-style-type: none"> <li>1 Cannot issue command</li> <li>0 Can issue command using only CMD line</li> </ul> |

### 16.8.13 Host Control 1 Register (HOST\_CTL)—Offset 28h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 28h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 00h

| 0         | 0b<br>RW         | <b>SD Bus Power (sd_bus_pwr):</b> Before setting this bit, the SD Host Driver shall set SD Bus Voltage Select. If the Host Controller detects the No Card state, this bit shall be cleared. If this bit is cleared, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state) and drive SDCLK to low level (Refer to Section 2.2.14) For SD Controller, this bit controls the bus voltage to SDMMC3. For SDIO Controller, power to SDIO device on SDMMC2 is not controlled by this bit. GPIO register and pin can be used to controller the SDIO device power. For eMMC Controller, power to eMMC device on SDMMC1 is not controlled by this bit. GPIO register and pin or alternative solutions can be used. <ul style="list-style-type: none"> <li>1 = Power on</li> <li>0 = Power off</li> </ul> |

### 16.8.15 Block Gap Control Register (\_BLK\_GAP\_CTL)—Offset 2Ah

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 2Ah

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 00h

| 3         | 0b<br>RW         | <b>Interrupt at Block Gap (int_blk_gap):</b> This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Setting to 0 disables interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. <ul style="list-style-type: none"> <li>1 = Enabled</li> <li>0 = Disabled</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 2         | 0b<br>RW         | <b>Read Wait Control (rd_wait_ctl):</b> The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using the DAT[2] line. Otherwise, the Host Controller has to stop the SD Clock to hold read data, which restricts commands generation. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. If the card does not support read wait, this bit shall never be set to 1, otherwise DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported. <ul style="list-style-type: none"> <li>1 = Enable Read Wait Control</li> <li>0 = Disable Read Wait Control</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 1         | 0b<br>RW         | <b>Continue Request (cont_req):</b> This bit is used to restart a transaction, which was stopped using the Stop At Block Gap Request. To cancel stop at the block gap, set Stop At Block Gap Request to 0 and set this bit 1 to restart the transfer. The Host Controller automatically clears this bit in either of the following cases: <ul style="list-style-type: none"> <li>In the case of a read transaction, the DAT Line Active changes from 0 to 1 as a read transaction restarts.</li> <li>In the case of a write transaction, the Write Transfer Active changes from 0 to 1 as the write transaction restarts.</li> </ul> Therefore, it is not necessary for Host Driver to set this bit to 0. If Stop At Block Gap Request is set to 1, any write to this bit is ignored. <ul style="list-style-type: none"> <li>1 = Restart</li> <li>0 = Not affect</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 0         | 0b<br>RW         | <b>Stop at Block Gap Request (stp_blk_gap_req):</b> This bit is used to stop executing read and write transaction at the next block gap for non-DMA, SDMA and ADMA transfers. The Host Driver shall leave this bit set Copyright 2002-2011 SD Association SD Host Controller Simplified Specification Version 3.00 44 to 1 until the Transfer Complete is set to 1. Clearing both Stop At Block Gap Request and Continue Request shall not cause the transaction to restart. When Host Controller version is 1.00, the Host Driver can set this bit if the card supports Read Wait Control. When Host Controller version is 2.00 or later, the Host Driver can set this bit regardless of the card supports Read Wait Control. The Host Controller shall stop read transfer by using Read Wait or stopping SD clock. In case of write transfers in which the Host Driver writes data to the Buffer Data Port register, the Host Driver shall set this bit after all block data is written. If this bit is set to 1, the Host Driver shall not write data to Buffer Data Port register. This bit affects Read Transfer Active, Write Transfer Active, DAT Line Active and Command Inhibit (DAT) in the Present State register. Regarding detailed control of bits D01 and D00, refer to Section 3.8 and 3.12. <ul style="list-style-type: none"> <li>1 = Stop</li> <li>0 = Transfer</li> </ul> |

### 16.8.16 Wakeup Control Register (WAKEUP\_CTL)—Offset 2Bh

This register is mandatory for the Host Controller, but wakeup functionality depends on the Host Controller system hardware and software. The Host Driver shall maintain voltage on the SD Bus, by setting SD Bus Power to 1 in the Power Control register, when wakeup event via Card Interrupt is desired. Wakeup Event is not supported by Host Controller. Sideband wake via GPIO pin and register shall be used instead. During RTD3, GPIO register is readable and GPIO signal is routed to APIC.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 2Bh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 00h

| 15:8      | 00h<br>RW        | <p><b>SDCLK Frequency Select (sdclk_freq_sel):</b> This register is used to select the frequency of the SDCLK pin. The definition of this field is dependent on the Host Controller Version. <b>(1) 8-bit Divided Clock Mode</b> This mode is supported by the Host Controller Version 1.00 and 2.00. The frequency is not programmed directly, rather, this register holds the divisor of the Base Clock Frequency For SD Clock in the capabilities register. Only the following settings are allowed. <b>(1) 8-bit Divided Clock Mode</b></p> <ul style="list-style-type: none"> <li>• 80h = base clock divided by 256</li> <li>• 40h = base clock divided by 128</li> <li>• 20h = base clock divided by 64</li> <li>• 10h = base clock divided by 32</li> <li>• 08h = base clock divided by 16</li> <li>• 04h = base clock divided by 8</li> <li>• 02h = base clock divided by 4</li> <li>• 01h = base clock divided by 2</li> <li>• 00h = base clock(10MHz and up)</li> </ul> <p>Setting 00h specifies the highest frequency of the SD Clock. When setting multiple bits, the most significant bit is used as the divisor, but it should not be set. The three default divider values can be calculated by the frequency that is defined by the Base Clock Frequency For SD Clock in the Capabilities register.</p> <ul style="list-style-type: none"> <li>• 400KHz divider value</li> <li>• 25MHz divider value</li> <li>• 50MHz divider value</li> </ul> <p>According to the Physical Layer Specification, the maximum SD Clock frequency is 25 MHz in normal speed mode and 50MHz in high speed mode, and shall never exceed this limit. The frequency of the SDCLK is set by the following formula: Clock Frequency = (Base Clock) / divisor Thus, choose the smallest possible divisor which results in a clock frequency that is less than or equal to the target frequency. For example, if the Base Clock Frequency For SD Clock in the Capabilities register has the value 33MHz, and the target frequency is 25MHz, then choosing the divisor value of 01h will yield 16.5MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400KHz, the divisor value of 40h yields the optimal clock value of 258KHz.</p> <p><b>(2) 10-bit Divided Clock Mode</b> Host Controller Version 3.00 supports this mandatory mode instead of the 8-bit Divided Clock Mode. The length of divider is extended to 10 bits, and all divider values shall be supported.</p> <ul style="list-style-type: none"> <li>• 3FFh = 1/2046 Divided Clock</li> <li>• N = 1/2N Divided Clock (Duty 50%)</li> <li>• 002h = 1/4 Divided Clock</li> <li>• 001h = 1/2 Divided Clock</li> <li>• 000h = Base Clock (10MHz and up)</li> <li>• 3FFh = Base Clock * M / 1024</li> <li>• ..... = Base Clock * M / N</li> <li>• N - 1 = Base Clock * M / N</li> <li>• ..... = Base Clock * M / 3</li> <li>• 002h = Base Clock * M / 3</li> <li>• 001h = Base Clock * M / 2</li> <li>• 000h = Base Clock * M</li> </ul> <p>This field depends on setting of Preset Value Enable in the Host Control 2 register. If Preset Value Enable = 0, this field is set by Host Driver. If the Preset Value Enable = 1, this field is automatically set to a value specified in one of Preset Value registers.</p> |

| 2         | 0b<br>RW         | <b>SD Clock Enable (sd_clk_en):</b> The Host Controller shall stop SDCLK when writing this bit to 0. SDCLK Frequency Select can be changed when this bit is 0. Then, the Host Controller shall maintain the same clock frequency until SDCLK is stopped (Stop at SDCLK=0). If the Card Inserted in the Present State register is cleared, this bit shall be cleared.<br><ul style="list-style-type: none"> <li>1 = Enable</li> <li>0 = Disable</li> </ul>                                                                                                                                                             |
| 1         | 0b<br>RO         | <b>Internal Clock Stable (int_clk_stable):</b> This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1. The SD Host Driver shall wait to set SD Clock Enable until this bit is set to 1. <b>Note:</b> This is useful when using PLL for a clock oscillator that requires setup time.<br><ul style="list-style-type: none"> <li>1 = Ready</li> <li>0 = Not Ready</li> </ul>                                                                                                                                                                                          |
| 0         | 0b<br>RW         | <b>Internal Clock Enable (int_clk_en):</b> This bit is set to 0 when the Host Driver is not using the Host Controller, or when the Host Controller awaits a wakeup event. The Host Controller should stop its internal clock to go to a very low power state. Still, registers shall be able to be read and written. Clock starts to oscillate when this bit is set to 1. When clock oscillation is stable, the Host Controller shall set Internal Clock Stable in this register to 1. This bit shall not affect card detection.<br><ul style="list-style-type: none"> <li>1 = Oscillate</li> <li>0 = Stop</li> </ul> |

### 16.8.18 Timeout Control Register (TIMEOUT\_CTL)—Offset 2Eh

At the initialization of the Host Controller, the Host Driver shall set the Data Timeout Counter Value according to the Capabilities register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 2Eh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 00h

| 0         | 0b<br>RW         | <p><b>Software Reset For All (sw_rst_all):</b> This reset affects the entire Host Controller except for the card detection circuit. Register bits of type ROC, RW, RW1C, RWAC are cleared to 0. During its initialization, the Host Driver shall set this bit to 1 to reset the Host Controller. The Host Controller shall reset this bit to 0 when Capabilities registers are valid and the Host Driver can read them. Additional use of Software Reset For All may not affect the value of the Capabilities registers. If this bit is set to 1, the host driver should issue reset command and reinitialize the SD card.</p> <ul style="list-style-type: none"> <li>• 1 = Reset</li> <li>• 0 = Work</li> </ul> <p>When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.</p>                                                                                                                                                                                                                                                                                                                 |

## 16.8.20 Normal Interrupt Status Register (NML\_INT\_STATUS)—Offset 30h

The Normal Interrupt Status Enable affects reads of this register, but Normal Interrupt Signal Enable does not affect these reads. An interrupt is generated when the Normal Interrupt Signal Enable is enabled and at least one of the status bits is set to 1. Writing 1 to a bit of RW1C attribute clears it; writing 0 keeps the bit unchanged. Writing 1 to a bit of ROC attribute keeps the bit unchanged. More than one status can be cleared with a single register write. The Card Interrupt is cleared when the card stops asserting the interrupt; that is, when the Card Driver services the interrupt condition.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 30h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 0000h

| 8         | 0b<br>RO         | <p><b>Card Interrupt (crd_int):</b> Writing this bit to 1 does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the Host Controller shall detect the Card Interrupt without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the Host System. When this status has been set and the Host Driver needs to start this interrupt service, Card Interrupt Status Enable in the Normal Interrupt Status Enable register may be set to 0 in order to clear the card interrupt statuses latched in the Host Controller and to stop driving the interrupt signal to the Host System. After completion of the card interrupt service (It should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set Card Interrupt Status Enable to 1 and start sampling the interrupt signal again. Interrupt detected by DAT[1] is supported when there is a card per slot. In case of shared bus, interrupt pins are used to detect interrupts. If 000b is set to Interrupt Pin Select in the Shared Bus Control register, this status is effective. Non-zero value is set to Interrupt Pin Select, INT_A, INT_B or INT_C is then used to device interrupts.</p> <ul style="list-style-type: none"> <li>1 = Generate Card Interrupt</li> <li>0 = No Card Interrupt</li> </ul> |
| 7         | 0b<br>RW/1C      | <p><b>Card Removal (crd_rm):</b> This status is set if the Card Inserted in the Present State register changes from 1 to 0. | 1         | 0b<br>RW/1C      | <p><b>Transfer Complete (tx_comp):</b> This bit is set when a read / write transfer and a command with busy is completed. <b>(1) In the case of a Read Transaction</b> This bit is set at the falling edge of Read Transfer Active Status. This interrupt is generated in two cases. The first is when a data transfer is completed as specified by data length (After the last data has been read to the Host System). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request in the Block Gap Control register (After valid data has been read to the Host System). Refer to Section 3.12.3 for more details on the sequence of events. <b>(2) In the case of a Write Transaction</b> This bit is set at the falling edge of the DAT Line Active Status. This interrupt is generated in two cases. The first is when the last data is written to the SD card as specified by data length and the busy signal released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request in the Block Gap Control register and data transfers completed. (After valid data is written to the SD card and the busy signal released). Refer to Section 3.12.4 for more details on the sequence of events. <b>(3) In the case of a command with busy</b> This bit is set when busy is de-asserted. Refer to DAT Line Active and Command Inhibit (DAT) in the Present State register. Refer to the spec for the relationship between Transfer Complete and Data Timeout Error.</p> <ul style="list-style-type: none"> <li>1 = Command execution is completed</li> <li>0 = Not complete</li> </ul> <p>While performing tuning procedure (Execute Tuning is set to 1), Transfer Complete is not set to 1.</p> |
| 0         | 0b<br>RW/1C      | <p><b>Command Complete (cmd_comp):</b> This bit is set when get the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23 but generated by the response of a read/write command. Refer to Command Inhibit (CMD) in the Present State register for how to control this bit. Command Timeout Error has higher priority than Command Complete. If both bits are set to 1, it can be considered that the response was not received correctly. For a tabular description of the relationship between these two bits, refer to the description of Command Complete in the spec.</p> <ul style="list-style-type: none"> <li>1 = Command complete</li> <li>0 = No command complete</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 16.8.21 Error Interrupt Status Register (ERR\_INT\_STATUS)—Offset 32h

Signals defined in this register can be enabled by the Error Interrupt Status Enable register, but not by the Error Interrupt Signal Enable register. The interrupt is generated when the Error Interrupt Signal Enable is enabled and at least one of the statuses is set to 1. Writing to 1 clears the bit, and writing to 0 keeps the bit unchanged. More than one status can be cleared at the one register write.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 32h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 0000h

| 1         | 0b<br>RW         | <b>Command CRC Error (cmd_crc_err):</b> <b>Command CRC Error</b> is generated in two cases. If a response is returned and the <b>Command Timeout Error</b> is set to 0 (indicating no timeout), this bit is set to 1 when detecting a CRC error in the command response. The Host Controller detects a CMD line conflict by monitoring the CMD line when a command is issued. If the Host Controller drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SD clock edge, then the Host Controller shall abort the command (Stop driving CMD line) and set this bit to 1. The Command Timeout Error shall also be set to 1 to distinguish CMD line conflict (refer to tabular data in the spec. that explains the relationship between <b>Command CRC Error</b> and <b>Command Timeout Error</b> ).<br><ul style="list-style-type: none"> <li>1 = CRC Error Generated.</li> <li>0 = no error</li> </ul> |
| 0         | 0b<br>RW         | <b>Command Timeout Error (cmd_timeout_err):</b> This bit is set only if no response is returned within 64 SD clock cycles from the end bit of the command. If the Host Controller detects a CMD line conflict (in which case <b>Command CRC Error</b> shall also be set, as shown in tabular data in the spec that explains the relationship between this bit and <b>Command CRC Error</b> ) this bit shall be set without waiting for 64 SD clock cycles, because the command will be aborted by the Host Controller.<br><ul style="list-style-type: none"> <li>1 = time out</li> <li>0 = no Error</li> </ul>                                                                                                                                                                                                                                                                                                                    |

## 16.8.22 Normal Interrupt Status Enable (NRM\_INT\_STATUS\_EN)—Offset 34h

Setting to 1 enables Interrupt Status. **Implementation Note:** The Host Controller may sample the card interrupt signal during interrupt period, and may hold its value in the flip-flop. If the **Card Interrupt Status Enable** is set to 0, the Host Controller shall clear all internal signals regarding Card Interrupt.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 34h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 0000h

### 16.8.23 Error Interrupt Status Enable Register (ERR\_INT\_STAT\_EN)—Offset 36h

Setting to 1 enables interrupt status. **Implementation Note:** To detect CMD line conflict, the Host Driver must set both **Command Timeout Error Status Enable** and **Command CRC Error Status Enable** to 1.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 36h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 0000h

## 16.8.24 Normal Interrupt Signal Enable Register (NRM\_INT\_SIG\_EN)—Offset 38h

This register is used to select which interrupt status is indicated to the Host System as the interrupt. These status bits all share the same 1 bit interrupt line. Setting any of these bits to 1 enables interrupt generation.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 38h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 0000h

### 16.8.25 Error Interrupt Signal Enable Register (ERR\_INT\_SIG\_EN)—Offset 3Ah

This register is used to select which interrupt status is sent to the Host System as the interrupt. These status bits all share the same 1 bit interrupt line. Setting any of these bits to 1 enables interrupt generation.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 3Ah

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 0000h

|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31        | 0b<br>RW         | <p><b>Preset Value (preset_value):</b> Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set to automatic This bit enables the functions defined in the Preset Value registers.</p> <ul style="list-style-type: none"> <li>1 = Automatic Selection by Preset Value are Enabled</li> <li>0 SDCLK and Driver Strength are controlled by Host Driver</li> </ul> <p>If this bit is set to 0, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Driver. If this bit is set to 1, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Controller as specified in the Preset Value registers.</p> |
| 30        | 0b<br>RW         | <p><b>Asynchronous Interrupt (async_int):</b> This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode (and zero is set to Interrupt Pin Select in the Shared Bus Control register). If this bit is set to 1, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver Card Interrupt to the host when it is asserted by the Card. Usage: It is recommended that Synchronous Interrupt mode be used for SDIO Controller by setting this be to '0'. If Asynchronous Interrupt Enable mode is used, it is required that this bit remain '0' until SD initialization sequence is complete.</p> <ul style="list-style-type: none"> <li>1 = Enabled</li> <li>0 = Disabled</li> </ul>                                                |

## 16.8.27 Capabilities Register (CAPABILITIES)—Offset 40h

This register provides the HD with information specific to the HC implementation. The HC may implement these values as fixed or loaded from flash memory during power on initialization.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 40h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 00000000h

### 16.8.31 Force Event Register for Error Interrupt Status (FORCE\_EVENT\_ERR\_INT\_STAT)—Offset 52h

Error Interrupt Status register can be written. The effect of a write to this address will be reflected in the Error Interrupt Status Register if the corresponding bit of the Error Interrupt Status Enable Register is set.

- Writing 1 : set each bit of the Error Interrupt Status Register
- Writing 0 : no effect

**Note:** By setting this register, the Error Interrupt can be set in the Error Interrupt Status register. In order to generate interrupt signal, both the Error Interrupt Status Enable and Error Interrupt Signal Enable shall be set.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 52h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 0000h

### 16.8.32 ADMA Error Status Register (ADMA\_ERR\_STAT)—Offset 54h

When ADMA Error Interrupt occurs, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address Register holds the address around the error descriptor. To recover from the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows:

- ST\_STOP: Previous location set in the ADMA System Address register is the error descriptor address
- ST\_FDS: Current location set in the ADMA System Address register is the error descriptor address
- ST\_CADR: This state is never set because do not generate ADMA error in this state.

- ST\_TFR: Previous location set in the ADMA System Address register is the error descriptor address

The Host Controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) at the ST\_FDS state. In this case, ADMA Error State indicates that an error occurs at ST\_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

### Access Method

| 14:8      | 0h<br>RO         | <b>Bus Width Preset (bus_width):</b> Shared bus supports mixing of 4-bit and 8-bit bus width devices. Each bit of this field specifies the bus width for each embedded device. The number of devices supported is specified by Number of Clock Pins, and a maximum of 7 devices are supported. This field is effective when multiple devices are connected to a shared bus (Slot Type is set to 10b in the Capabilities register). In the other case, Extended Data Transfer Width in the Host Control 1 register is used to select 8-bit bus width. As use of 1-bit mode is not intended for shared bus, Data Transfer Width in the Host Control 1 register should be set to 1. <ul style="list-style-type: none"> <li>D24 = Bus width preset for Device 1</li> <li>D25 = Bus width preset for Device 2</li> <li>D26 = Bus width preset for Device 3</li> <li>D27 = Bus width preset for Device 4</li> <li>D28 = Bus width preset for Device 5</li> <li>D29 = Bus width preset for Device 6</li> <li>D30 = Bus width preset for Device 7</li> </ul> The function of each bit is defined as follows: <ul style="list-style-type: none"> <li>0 = 4 bit buswidth mode</li> <li>1 = 8 bit buswidth mode</li> </ul> |

### 16.8.37 SPI Interrupt Support Register (SPI\_INT\_SUP)—Offset F0h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + F0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:18, F:0] + 10h

**Default:** 00h

## Revision ID and Class Code Register (REVCLASSCODE)—Offset 8h

**Offset:** [B:0, D:23, F:0] + 8h

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:8      | 000000h<br>RO    | <b>Class Code (CLASS_CODES):</b> This register is read-only and is used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level. |
| 7:0       | 00h<br>RO        | <b>Revision ID (RID):</b> Identifies the revision of a particular AHB device. This is tied to a strap at the top level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:24     | 00h<br>RO        | <b>Reserved0:</b> Reserved.                                                                                                                                                                                                                           |
| 23        | 0h<br>RO         | <b>Multifunction Device (MULFNDEV):</b> This bit is always 0 for non-fabric ports. For fabric ports it is driven from the fabric_mult_function strap. A value of 1 indicates a multifunction device; a value of 0 indicates a single function device. |
| 22:16     | 00h<br>RO        | <b>Header Type (HEADERTYPE):</b> Implements Type 0 Configuration header.                                                                                                                                                                              |
| 15:8      | 00h<br>RO        | <b>Latency Timer (LATTIMER):</b> Doesnt apply to PCI Express. Hardwired to 00h.                                                                                                                                                                       |
| 7:0       | 00h<br>RW        | <b>Cache Line Size (CACHELINE_SIZE):</b> Doesnt apply to PCI Express. PCI Express spec requires this to be implemented as a R/W register but has no functional impact on the AHB Device connected.                                                    |

### 16.9.5 Base Address Register (BAR)—Offset 10h

Each AHB device is a single function device with only a single BAR associated with it. Bits 31:4 indicate the Base Address register. Power-up software can determine how much address space the AHB Device requires by writing a value of all 1's to the register and then reading the value back. Bridge will return 0's in all don't-care address bits, effectively specifying the address space required. Unimplemented Base Address registers are hardwired to zero. This is the Size Indicator Read only bits of the register.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 10h

**Default:** 00000000h

|          |               |              |      |               |    |   |   |   |
|----------|---------------|--------------|------|---------------|----|---|---|---|
| 31       | 28            | 24           | 20   | 16            | 12 | 8 | 4 | 0 |
| 0        | 0             | 0            | 0    | 0             | 0  | 0 | 0 | 0 |
| 0        | 0             | 0            | 0    | 0             | 0  | 0 | 0 | 0 |
| 0        | 0             | 0            | 0    | 0             | 0  | 0 | 0 | 0 |
| BASEADDR | SIZEINDICATOR | PREFETCHABLE | TYPE | MESSAGE_SPACE |    |   |   |   |

| Bit Range | Default & Access | Field Name (ID): Description                                                                                |
|-----------|------------------|-------------------------------------------------------------------------------------------------------------|
| 31:12     | 00000h<br>RW     | <b>Base Address (BASEADDR):</b> Base address of the AHB device memory space. Taken from Strap values as 1s. |

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                             |
|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11:4      | 00h<br>RO        | <b>Size Indicator (Read Only) (SIZEINDICATOR):</b> Always returns zero. The size of this register depends on the size of the Memory space. This size is determined by a top level of STRAP values as 0s. |
| 3         | 0h<br>RO         | <b>Prefetchable (PREFETCHABLE):</b> Indicates that this bar is not prefetchable.                                                                                                                         |
| 2:1       | 0h<br>RO         | <b>Type (TYPE):</b> '00' indicates that the BAR lies in 32 bit address range.                                                                                                                            |
| 0         | 0h<br>RO         | <b>Memory Space Indicator (MESSAGE_SPACE):</b> 0 Indicates that this BAR is present in the memory space.                                                                                                 |

### 16.9.6 Base Address Register 1 (BAR1)—Offset 14h

Memory accesses to BAR1 region access the PCI configuration space for the LPIO device. BAR1 region is always 4K. However SW accesses through BAR1 should only access the regular PCI configuration space. BAR1 memory accesses which do not access a defined PCI configuration register are treated as accesses to a reserved register.

## Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:23, F:0] + 14h

**Default:** 00000000h

|           |    |    |    |    |    |                |   |   |
|-----------|----|----|----|----|----|----------------|---|---|
| 31        | 28 | 24 | 20 | 16 | 12 | 8              | 4 | 0 |
| 0         | 0  | 0  | 0  | 0  | 0  | 0              | 0 | 0 |
| BASEADDR1 |    |    |    |    |    | SIZEINDICATOR1 |   |   |
|           |    |    |    |    |    | PREFETCHABLE1  |   |   |
|           |    |    |    |    |    | TYPE1          |   |   |
|           |    |    |    |    |    | MESSAGE_SPACE1 |   |   |

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                         |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:12     | 00000h<br>RW     | <b>Base Address Register1 (BASEADDR1):</b> This field is present if BAR1 is enabled through private config space. If this register is disabled then this is RO and always returns 0. |
| 11:4      | 00h<br>RO        | <b>Size Indicator1 (SIZEINDICATOR1):</b> Always will be zero as minimum size is 4K.                                                                                                  |
| 3         | 0h<br>RO         | <b>Prefetchable (PREFETCHABLE1):</b> Indicates that this bar is not prefetchable.                                                                                                    |
| 2:1       | 0h<br>RO         | <b>Type (TYPE1):</b> '00' indicates that the BAR lies in 32 bit address range.                                                                                                       |
| 0         | 0h<br>RO         | <b>Memory Space Indicator (MESSAGE_SPACE1):</b> 0 Indicates that this BAR is present in the memory space.                                                                            |

**Type:** PCI Configuration Register  
(Size: 32 bits)

|             |    |    |    |    |                   |   |   |   |
|-------------|----|----|----|----|-------------------|---|---|---|

### 16.10.1 SDMA System Address / Argument 2 Register (SYS\_ADR)—Offset 0h

## Access Method

**Offset:** [BAR] + 0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 00000000h

October 2018  
Document Number: 538136, Rev. 4.3

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:0      | 00000000h<br>RW  | <b>SDMA System Address (sys_adr): (1) SDMA System Address</b><br>This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value.<br>The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register.<br>The SDMA transfer waits at each boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates a DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register.<br>When the uppermost byte of this register (003h) is written, the Host Controller restarts the SDMA transfer.<br>When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register. <b>(2)</b><br><b>Argument 2</b><br>This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23.<br>If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without ADMA, the available block count value is limited by the Block Count register. 65535 blocks is the maximum value in this case. |

## 16.10.2 Block Size Register (BLK\_SIZE)—Offset 4h

This register is used to configure the number of bytes in a data block.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 0000h

| 15:0      | 0000h<br>RW      | <p><b>Blocks Count For Current Transfer (blk_count):</b> This register is enabled when Block Count Enable in the Transfer Mode register is set to 1, and is valid only for multiple block transfers. The Host Driver shall set this register to a value between 1 and the maximum block count. The HC decrements the block count after each block transfer, and stops when the count reaches zero. Setting the block count to 0 results in no data blocks being transferred. This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored. When saving transfer context as a result of a Suspend command, the number of blocks yet to be transferred can be determined by reading this register. When restoring transfer context prior to issuing a Resume command, the HD shall restore the previously saved block count.</p> <ul style="list-style-type: none"> <li>• 0000h = Stop Count</li> <li>• 0001h = 1 block</li> <li>• 0002h = 2 blocks</li> <li>• . . .</li> <li>• FFFFh = 65535 blocks</li> </ul> |

#### 16.10.4 Argument 1 Register (ARGUMENT)—Offset 8h

This register contains the SD Command Argument.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 00000000h

| 31:0      | 0h<br>RW         | <b>Command Argument 1 (argument):</b> The SD Command Argument is specified as bit39-8 of Command-Format in the Physical Layer Specification. |

### 16.10.5 Transfer Mode Register (TX\_MODE)—Offset Ch

This register is used to control the operation of data transfers. The Host Driver shall set this register before issuing a command which transfers data (Refer to Data Present Select in the Command register), or before issuing a Resume command. The Host Driver shall save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, the Host Controller shall implement write protection for this register during data transactions. Writes to this register shall be ignored when the Command Inhibit (DAT) in the Present State register is 1.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 0000h

| 1         | 0b<br>RW         | <b>Block Count Enable (blk_count_en):</b> This bit is used to enable the Block Count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. (Refer to Table 2-8). If ADMA2 data transfer is more than 65535 blocks, this bit shall be set to 0. In this case, data transfer length is designated by Descriptor Table. <ul style="list-style-type: none"> <li>1 = Enable</li> <li>0 = Disable</li> </ul>                                                                               |
| 0         | 0b<br>RW         | <b>DMA Enable (dma_en):</b> This bit enables DMA functionality as described in section 1.4. DMA can be enabled only if it is supported as indicated in the Capabilities register. One of the DMA modes can be selected by DMA Select in the Host Control register. If DMA is not supported, this bit is meaningless and shall always read 0. If this bit is set to 1, a DMA operation shall begin when the Host Driver writes to the upper byte of Command register (00Fh). <ul style="list-style-type: none"> <li>1 = DMA Data transfer</li> <li>0 = No data transfer or Non DMA data transfer</li> </ul> |

## 16.10.6 Command Register (CMD)—Offset Eh

The Host Driver shall check the Command Inhibit (DAT) bit and Command Inhibit (CMD) bit in the Present State register before writing to this register. Writing to the upper byte of this register triggers SD command generation. The Host Driver has the responsibility to write this register because the Host Controller does not protect for writing when Command Inhibit (CMD) is set.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + Eh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 0000h

| 13:8      | 0h<br>RW         | <b>Command Index (cmd_index):</b> These bits shall be set to the command number (CMD0-63, ACMD0-63) that is specified in bits 45-40 of the Command-Format in the Physical Layer Specification and SDIO Card Specification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 7:6       | 00b<br>RW        | <b>Command Type (cmd_type):</b> There are three types of special commands: Suspend, Resume and Abort. These bits shall be set to 00b for all other commands. <b>(1) Suspend Command</b> If the Suspend command succeeds, the Host Controller shall assume the SD Bus has been released and that it is possible to issue the next command, which uses the DAT line. The Host Controller shall de-assert Read Wait for read transactions and stop checking busy for write transactions. The interrupt cycle shall start, in 4-bit mode. If the Suspend command fails, the Host Controller shall maintain its current state, and the Host Driver shall restart the transfer by setting Continue Request in the Block Gap Control register. (Refer to 3.12.1 Suspend Sequence). <b>(2) Resume Command</b> The Host Driver re-starts the data transfer by restoring the registers in the range of 000-00Dh. (Refer to Figure 1-4 in section 1.6 for the register map.) The Host Controller shall check for busy before starting write transfers. <b>(3) Abort Command</b> If this command is set when executing a read transfer, the Host Controller shall stop reads to the buffer. If this command is set when executing a write transfer, the Host Controller shall stop driving the DAT line. After issuing the Abort command, the Host Driver should issue a software reset. (Refer to 3.8 Abort Transaction). <ul style="list-style-type: none"> <li>11b = Abort -- CMD12, CMD52 for writing 'I/O Abort' in CCCR</li> <li>10b = Resume -- CMD52 for writing 'Function Select' in CCCR</li> <li>01b = Suspend -- CMD52 for writing 'Bus Suspend' in CCCR</li> <li>00b = Normal -- Other commands</li> </ul> |
| 5         | 0b<br>RW         | <b>Data Present Select (data_pr_sel):</b> This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. It is set to 0 for the following: (1) Commands using only CMD line (ex. CMD52). (2) Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38). (3) Resume command. <ul style="list-style-type: none"> <li>1 = Data Present</li> <li>0 = No Data Present</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### 16.10.7 Response Register 0 (RESPONSE0)—Offset 10h

This register is used to store responses from SD cards.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 10h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 00000000h

| 16        | 1b<br>RO         | <p><b>Card Inserted (crd_ins):</b> This bit indicates whether a card has been inserted. The Host Controller shall debounce this signal so that the Host Driver will not need to wait for it to stabilize. Changing from 0 to 1 generates a Card Insertion interrupt in the Normal Interrupt Status register and changing from 1 to 0 generates a Card Removal interrupt in the Normal Interrupt Status register. The Software Reset For All in the Software Reset register shall not affect this bit. If a card is removed while its power is on and its clock is oscillating, the Host Controller shall clear SD Bus Power in the Power Control register (Refer to Section 2.2.11) and SD Clock Enable in the Clock Control register (Refer to Section 2.2.14). When this bit is changed from 1 to 0, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state). In addition, the Host Driver should clear the Host Controller by the Software Reset For All in Software Reset register. The card detect is active regardless of the SD Bus Power.</p> <ul style="list-style-type: none"> <li>1 = Card Inserted</li> <li>0 = Reset or Debouncing or No Card</li> </ul> |

| 2         | 0b<br>RO         | <p><b>DAT Line Active (dat_ln_active):</b> This bit indicates whether one of the DAT lines on SD Bus is in use. (a) In the case of read transactions This status indicates whether a read transfer is executing on the SD Bus. Changing this value from 1 to 0 generates a Block Gap Event interrupt in the Normal Interrupt Status register, as the result of the Stop At Block Gap Request being set. Refer to Section 3.12.3 for details on timing. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> <li>After the end bit of the read command.</li> <li>When writing a 1 to Continue Request in the Block Gap Control register to restart a read transfer.</li> </ul> <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> <li>When the end bit of the last data block is sent from the SD Bus to the Host Controller. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table.</li> <li>When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request.</li> </ul> <p>The Host Controller shall stop read operation at the start of the interrupt cycle of the next block gap by driving Read Wait or stopping SD clock. If the Read Wait signal is already driven (due to data buffer cannot receive data), the Host Controller can continue to stop read operation by driving the Read Wait signal. It is necessary to support Read Wait in order to use suspend / resume function. (b) In the case of write transactions This status indicates that a write transfer is executing on the SD Bus. Changing this value from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer to Section 3.12.4 for sequence details. This bit shall be set in either of the following cases:</p> <ul style="list-style-type: none"> <li>After the end bit of the write command.</li> <li>When writing to 1 to Continue Request in the Block Gap Control register to continue a write transfer.</li> </ul> <p>This bit shall be cleared in either of the following cases:</p> <ul style="list-style-type: none"> <li>When the SD card releases write busy of the last data block. If SD card does not drive busy signal for 8 SD Clocks, the Host Controller shall consider the card drive 'Not Busy'. In case of ADMA2, the last block is designated by the last transfer of Descriptor Table.</li> <li>When the SD card releases write busy prior to waiting for write transfer as a result of a Stop At Block Gap Request.</li> </ul> <p>(c) Command with busy This status indicates whether a command indicates busy (ex. erase command for memory) is executing on the SD Bus. This bit is set after the end bit of the command with busy and cleared when busy is de-asserted. Changing this bit from 1 to 0 generate a Transfer Complete interrupt in the Normal Interrupt Status register. Refer Figure 2-11 to Figure 2-13.</p> <ul style="list-style-type: none"> <li>1 = DAT Line Active</li> <li>0 = DAT Line Inactive</li> </ul> |

| 1         | 0b<br>RO         | <b>Command Inhibit (DAT) (cmd_inhibit_dat):</b> This status bit is generated if either the DAT Line Active or the Read Transfer Active is set to 1. If this bit is 0, it indicates the Host Controller can issue the next SD Command. Commands with busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). Changing from 1 to 0 generates a Transfer Complete interrupt in the Normal Interrupt Status register. <b>Note:</b> The SD Host Driver can save registers in the range of 000-00Dh for a suspend transaction after this bit has changed from 1 to 0. <ul style="list-style-type: none"> <li>1 Cannot issue command which uses the DAT line</li> <li>0 Can issue command which uses the DAT line</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 0         | 0b<br>RO         | <b>Command Inhibit (CMD) (cmd_inhibit_cmd):</b> Command Inhibit (CMD) If this bit is 0, it indicates the CMD line is not in use and the Host Controller can issue a SD Command using the CMD line. cleared when the command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the response of CMD12 or CMD23 but cleared by the response of a read/write command. Status issuing Auto CMD12 is not read from this bit. So if a command is issued during Auto CMD12 operation, Host Controller shall manage to issue two commands: CMD12 and a command set by Command register. Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0. Changing from 1 to 0 generates a Command Complete Interrupt in the Normal Interrupt Status register. If the Host Controller cannot issue the command because of a command conflict error (Refer to Command CRC Error in Section 2.2.18) or because of Command Not Issued By Auto CMD12 Error (Refer to Section 2.2.23), this bit shall remain 1 and the Command Complete is not set. <ul style="list-style-type: none"> <li>1 Cannot issue command</li> <li>0 Can issue command using only CMD line</li> </ul> |

### 16.10.13 Host Control 1 Register (HOST\_CTL)—Offset 28h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 28h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 00h

| 0         | 0b<br>RW         | <b>SD Bus Power (sd_bus_pwr):</b> Before setting this bit, the SD Host Driver shall set SD Bus Voltage Select. If the Host Controller detects the No Card state, this bit shall be cleared. If this bit is cleared, the Host Controller shall immediately stop driving CMD and DAT[3:0] (tri-state) and drive SDCLK to low level (Refer to Section 2.2.14) For SD Controller, this bit controls the bus voltage to SDMMC3. For SDIO Controller, power to SDIO device on SDMMC2 is not controlled by this bit. GPIO register and pin can be used to controller the SDIO device power. For eMMC Controller, power to eMMC device on SDMMC1 is not controlled by this bit. GPIO register and pin or alternative solutions can be used. <ul style="list-style-type: none"> <li>1 = Power on</li> <li>0 = Power off</li> </ul> |

### 16.10.15 Block Gap Control Register (\_BLK\_GAP\_CTL)—Offset 2Ah

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 2Ah

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 00h

| 3         | 0b<br>RW         | <b>Interrupt at Block Gap (int_blk_gap):</b> This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. Setting to 0 disables interrupt detection during a multiple block transfer. If the SD card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. <ul style="list-style-type: none"> <li>1 = Enabled</li> <li>0 = Disabled</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 2         | 0b<br>RW         | <b>Read Wait Control (rd_wait_ctl):</b> The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using the DAT[2] line. Otherwise, the Host Controller has to stop the SD Clock to hold read data, which restricts commands generation. When the Host Driver detects an SD card insertion, it shall set this bit according to the CCCR of the SDIO card. If the card does not support read wait, this bit shall never be set to 1, otherwise DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported. <ul style="list-style-type: none"> <li>1 = Enable Read Wait Control</li> <li>0 = Disable Read Wait Control</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 1         | 0b<br>RW         | <b>Continue Request (cont_req):</b> This bit is used to restart a transaction, which was stopped using the Stop At Block Gap Request. To cancel stop at the block gap, set Stop At Block Gap Request to 0 and set this bit 1 to restart the transfer. The Host Controller automatically clears this bit in either of the following cases: <ul style="list-style-type: none"> <li>In the case of a read transaction, the DAT Line Active changes from 0 to 1 as a read transaction restarts.</li> <li>In the case of a write transaction, the Write Transfer Active changes from 0 to 1 as the write transaction restarts.</li> </ul> Therefore, it is not necessary for Host Driver to set this bit to 0. If Stop At Block Gap Request is set to 1, any write to this bit is ignored. <ul style="list-style-type: none"> <li>1 = Restart</li> <li>0 = Not affect</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 0         | 0b<br>RW         | <b>Stop at Block Gap Request (stp_blk_gap_req):</b> This bit is used to stop executing read and write transaction at the next block gap for non-DMA, SDMA and ADMA transfers. The Host Driver shall leave this bit set Copyright 2002-2011 SD Association SD Host Controller Simplified Specification Version 3.00 44 to 1 until the Transfer Complete is set to 1. Clearing both Stop At Block Gap Request and Continue Request shall not cause the transaction to restart. When Host Controller version is 1.00, the Host Driver can set this bit if the card supports Read Wait Control. When Host Controller version is 2.00 or later, the Host Driver can set this bit regardless of the card supports Read Wait Control. The Host Controller shall stop read transfer by using Read Wait or stopping SD clock. In case of write transfers in which the Host Driver writes data to the Buffer Data Port register, the Host Driver shall set this bit after all block data is written. If this bit is set to 1, the Host Driver shall not write data to Buffer Data Port register. This bit affects Read Transfer Active, Write Transfer Active, DAT Line Active and Command Inhibit (DAT) in the Present State register. Regarding detailed control of bits D01 and D00, refer to Section 3.8 and 3.12. <ul style="list-style-type: none"> <li>1 = Stop</li> <li>0 = Transfer</li> </ul> |

### 16.10.16 Wakeup Control Register (WAKEUP\_CTL)—Offset 2Bh

This register is mandatory for the Host Controller, but wakeup functionality depends on the Host Controller system hardware and software. The Host Driver shall maintain voltage on the SD Bus, by setting SD Bus Power to 1 in the Power Control register, when wakeup event via Card Interrupt is desired. Wakeup Event is not supported by Host Controller. Sideband wake via GPIO pin and register shall be used instead. During RTD3, GPIO register is readable and GPIO signal is routed to APIC.

|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:8      | 00h<br>RW        | <p><b>SDCLK Frequency Select (sdclk_freq_sel):</b> This register is used to select the frequency of the SDCLK pin. The definition of this field is dependent on the Host Controller Version. <b>(1) 8-bit Divided Clock Mode</b> This mode is supported by the Host Controller Version 1.00 and 2.00. The frequency is not programmed directly, rather, this register holds the divisor of the Base Clock Frequency For SD Clock in the capabilities register. Only the following settings are allowed. <b>(1) 8-bit Divided Clock Mode</b></p> <ul style="list-style-type: none"> <li>80h = base clock divided by 256</li> <li>40h = base clock divided by 128</li> <li>20h = base clock divided by 64</li> <li>10h = base clock divided by 32</li> <li>08h = base clock divided by 16</li> <li>04h = base clock divided by 8</li> <li>02h = base clock divided by 4</li> <li>01h = base clock divided by 2</li> <li>00h = base clock(10MHz and up)</li> </ul> <p>Setting 00h specifies the highest frequency of the SD Clock. When setting multiple bits, the most significant bit is used as the divisor, but it should not be set. The three default divider values can be calculated by the frequency that is defined by the Base Clock Frequency For SD Clock in the Capabilities register.</p> <ul style="list-style-type: none"> <li>400KHz divider value</li> <li>25MHz divider value</li> <li>50MHz divider value</li> </ul> <p>According to the Physical Layer Specification, the maximum SD Clock frequency is 25 MHz in normal speed mode and 50MHz in high speed mode, and shall never exceed this limit. The frequency of the SDCLK is set by the following formula: Clock Frequency = (Base Clock) / divisor Thus, choose the smallest possible divisor which results in a clock frequency that is less than or equal to the target frequency. For example, if the Base Clock Frequency For SD Clock in the Capabilities register has the value 33MHz, and the target frequency is 25MHz, then choosing the divisor value of 01h will yield 16.5MHz, which is the nearest frequency less than or equal to the target. Similarly, to approach a clock value of 400KHz, the divisor value of 40h yields the optimal clock value of 258KHz.</p> <p><b>(2) 10-bit Divided Clock Mode</b> Host Controller Version 3.00 supports this mandatory mode instead of the 8-bit Divided Clock Mode. The length of divider is extended to 10 bits, and all divider values shall be supported.</p> <ul style="list-style-type: none"> <li>3FFh = 1/2046 Divided Clock</li> <li>N = 1/2N Divided Clock (Duty 50%)</li> <li>002h = 1/4 Divided Clock</li> <li>001h = 1/2 Divided Clock</li> <li>000h = Base Clock (10MHz and up)</li> <li>3FFh = Base Clock * M / 1024</li> <li>.....</li> <li>N - 1 = Base Clock * M / N</li> <li>.....</li> <li>002h = Base Clock * M / 3</li> <li>001h = Base Clock * M / 2</li> <li>000h = Base Clock * M</li> </ul> <p>This field depends on setting of Preset Value Enable in the Host Control 2 register. If Preset Value Enable = 0, this field is set by Host Driver. If the Preset Value Enable = 1, this field is automatically set to a value specified in one of Preset Value registers.</p> |

| 2         | 0b<br>RW         | <b>SD Clock Enable (sd_clk_en):</b> The Host Controller shall stop SDCLK when writing this bit to 0. SDCLK Frequency Select can be changed when this bit is 0. Then, the Host Controller shall maintain the same clock frequency until SDCLK is stopped (Stop at SDCLK=0). If the Card Inserted in the Present State register is cleared, this bit shall be cleared.<br><ul style="list-style-type: none"> <li>1 = Enable</li> <li>0 = Disable</li> </ul>                                                                                                                                                             |
| 1         | 0b<br>RO         | <b>Internal Clock Stable (int_clk_stable):</b> This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1. The SD Host Driver shall wait to set SD Clock Enable until this bit is set to 1. <b>Note:</b> This is useful when using PLL for a clock oscillator that requires setup time.<br><ul style="list-style-type: none"> <li>1 = Ready</li> <li>0 = Not Ready</li> </ul>                                                                                                                                                                                          |
| 0         | 0b<br>RW         | <b>Internal Clock Enable (int_clk_en):</b> This bit is set to 0 when the Host Driver is not using the Host Controller, or when the Host Controller awaits a wakeup event. The Host Controller should stop its internal clock to go to a very low power state. Still, registers shall be able to be read and written. Clock starts to oscillate when this bit is set to 1. When clock oscillation is stable, the Host Controller shall set Internal Clock Stable in this register to 1. This bit shall not affect card detection.<br><ul style="list-style-type: none"> <li>1 = Oscillate</li> <li>0 = Stop</li> </ul> |

### 16.10.18 Timeout Control Register (TIMEOUT\_CTL)—Offset 2Eh

At the initialization of the Host Controller, the Host Driver shall set the Data Timeout Counter Value according to the Capabilities register.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**Offset:** [BAR] + 2Eh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 00h

| 0         | 0b<br>RW         | <p><b>Software Reset For All (sw_rst_all):</b> This reset affects the entire Host Controller except for the card detection circuit. Register bits of type ROC, RW, RW1C, RWAC are cleared to 0. During its initialization, the Host Driver shall set this bit to 1 to reset the Host Controller. The Host Controller shall reset this bit to 0 when Capabilities registers are valid and the Host Driver can read them. Additional use of Software Reset For All may not affect the value of the Capabilities registers. If this bit is set to 1, the host driver should issue reset command and reinitialize the SD card.</p> <ul style="list-style-type: none"> <li>• 1 = Reset</li> <li>• 0 = Work</li> </ul> <p>When Auto or Dynamic Clock Gating is enabled for this controller, the Software Reset bit may require several reads before the bit clears.</p>                                                                                                                                                                                                                                                                                                                 |

### 16.10.20 Normal Interrupt Status Register (NML\_INT\_STATUS)—Offset 30h

The Normal Interrupt Status Enable affects reads of this register, but Normal Interrupt Signal Enable does not affect these reads. An interrupt is generated when the Normal Interrupt Signal Enable is enabled and at least one of the status bits is set to 1. Writing 1 to a bit of RW1C attribute clears it; writing 0 keeps the bit unchanged. Writing 1 to a bit of ROC attribute keeps the bit unchanged. More than one status can be cleared with a single register write. The Card Interrupt is cleared when the card stops asserting the interrupt; that is, when the Card Driver services the interrupt condition.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 30h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 0000h

| 8         | 0b<br>RO         | <p><b>Card Interrupt (crd_int):</b> Writing this bit to 1 does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the Host Controller shall detect the Card Interrupt without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the Host System. When this status has been set and the Host Driver needs to start this interrupt service, Card Interrupt Status Enable in the Normal Interrupt Status Enable register may be set to 0 in order to clear the card interrupt statuses latched in the Host Controller and to stop driving the interrupt signal to the Host System. After completion of the card interrupt service (It should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set Card Interrupt Status Enable to 1 and start sampling the interrupt signal again. Interrupt detected by DAT[1] is supported when there is a card per slot. In case of shared bus, interrupt pins are used to detect interrupts. If 000b is set to Interrupt Pin Select in the Shared Bus Control register, this status is effective. Non-zero value is set to Interrupt Pin Select, INT_A, INT_B or INT_C is then used to device interrupts.</p> <ul style="list-style-type: none"> <li>1 = Generate Card Interrupt</li> <li>0 = No Card Interrupt</li> </ul> |
| 7         | 0b<br>RW/1C      | <p><b>Card Removal (crd_rm):</b> This status is set if the Card Inserted in the Present State register changes from 1 to 0. When the Host Driver writes this bit to 1 to clear this status, the status of the Card Inserted in the Present State register should be confirmed. Because the card detect state may possibly be changed when the Host Driver clear this bit and interrupt event may not be generated.</p> <ul style="list-style-type: none"> <li>1 = Card removed</li> <li>0 = Card state stable or Debouncing</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 2         | 0b<br>RW/1C      | <p><b>Block Gap Event (blk_gap_event):</b> If the Stop At Block Gap Request in the Block Gap Control register is set, this bit is set when both a read / write transaction is stopped at a block gap. If Stop At Block Gap Request is not set to 1, this bit is not set to 1. <b>(1) In the case of a Read Transaction</b> This bit is set at the falling edge of the DAT Line Active Status, when the transaction is stopped at SD Bus timing. The Read Wait shall be supported in order to use this function. Refer to Section 3.12.3 for timing details. p1<b>(1)</b> <b>In the case of a Write Transaction</b> This bit is set at the falling edge of Write Transfer Active Status (after getting CRC status at SD Bus timing). Refer to Section 3.12.4 for more details on the sequence of events.</p> <ul style="list-style-type: none"> <li>1 = Transaction stopped at block gap</li> <li>0 = No Block Gap Event</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1         | 0b<br>RW/1C      | <p><b>Transfer Complete (tx_comp):</b> This bit is set when a read / write transfer and a command with busy is completed. <b>(1) In the case of a Read Transaction</b> This bit is set at the falling edge of Read Transfer Active Status. This interrupt is generated in two cases. The first is when a data transfer is completed as specified by data length (After the last data has been read to the Host System). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request in the Block Gap Control register (After valid data has been read to the Host System). Refer to Section 3.12.3 for more details on the sequence of events. <b>(2) In the case of a Write Transaction</b> This bit is set at the falling edge of the DAT Line Active Status. This interrupt is generated in two cases. The first is when the last data is written to the SD card as specified by data length and the busy signal released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request in the Block Gap Control register and data transfers completed. (After valid data is written to the SD card and the busy signal released). Refer to Section 3.12.4 for more details on the sequence of events. <b>(3) In the case of a command with busy</b> This bit is set when busy is de-asserted. Refer to DAT Line Active and Command Inhibit (DAT) in the Present State register. Refer to the spec for the relationship between Transfer Complete and Data Timeout Error.</p> <ul style="list-style-type: none"> <li>1 = Command execution is completed</li> <li>0 = Not complete</li> </ul> <p>While performing tuning procedure (Execute Tuning is set to 1), Transfer Complete is not set to 1.</p> |
| 0         | 0b<br>RW/1C      | <p><b>Command Complete (cmd_comp):</b> This bit is set when get the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23 but generated by the response of a read/write command. Refer to Command Inhibit (CMD) in the Present State register for how to control this bit. Command Timeout Error has higher priority than Command Complete. If both bits are set to 1, it can be considered that the response was not received correctly. For a tabular description of the relationship between these two bits, refer to the description of Command Complete in the spec.</p> <ul style="list-style-type: none"> <li>1 = Command complete</li> <li>0 = No command complete</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### 16.10.21 Error Interrupt Status Register (ERR\_INT\_STATUS)—Offset 32h

Signals defined in this register can be enabled by the Error Interrupt Status Enable register, but not by the Error Interrupt Signal Enable register. The interrupt is generated when the Error Interrupt Signal Enable is enabled and at least one of the statuses is set to 1. Writing to 1 clears the bit, and writing to 0 keeps the bit unchanged. More than one status can be cleared at the one register write.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 32h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 0000h

| 1         | 0b<br>RW         | <b>Command CRC Error (cmd_crc_err):</b> <b>Command CRC Error</b> is generated in two cases. If a response is returned and the <b>Command Timeout Error</b> is set to 0 (indicating no timeout), this bit is set to 1 when detecting a CRC error in the command response. The Host Controller detects a CMD line conflict by monitoring the CMD line when a command is issued. If the Host Controller drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SD clock edge, then the Host Controller shall abort the command (Stop driving CMD line) and set this bit to 1. The Command Timeout Error shall also be set to 1 to distinguish CMD line conflict (refer to tabular data in the spec. that explains the relationship between <b>Command CRC Error</b> and <b>Command Timeout Error</b> ).<br><ul style="list-style-type: none"> <li>1 = CRC Error Generated.</li> <li>0 = no error</li> </ul> |
| 0         | 0b<br>RW         | <b>Command Timeout Error (cmd_timeout_err):</b> This bit is set only if no response is returned within 64 SD clock cycles from the end bit of the command. If the Host Controller detects a CMD line conflict (in which case <b>Command CRC Error</b> shall also be set, as shown in tabular data in the spec that explains the relationship between this bit and <b>Command CRC Error</b> ) this bit shall be set without waiting for 64 SD clock cycles, because the command will be aborted by the Host Controller.<br><ul style="list-style-type: none"> <li>1 = time out</li> <li>0 = no Error</li> </ul>                                                                                                                                                                                                                                                                                                                    |

## 16.10.22 Normal Interrupt Status Enable (NRM\_INT\_STATUS\_EN)—Offset 34h

Setting to 1 enables Interrupt Status. **Implementation Note:** The Host Controller may sample the card interrupt signal during interrupt period, and may hold its value in the flip-flop. If the **Card Interrupt Status Enable** is set to 0, the Host Controller shall clear all internal signals regarding Card Interrupt.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 34h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 0000h

### 16.10.23 Error Interrupt Status Enable Register (ERR\_INT\_STAT\_EN)— Offset 36h

Setting to 1 enables interrupt status. **Implementation Note:** To detect CMD line conflict, the Host Driver must set both **Command Timeout Error Status Enable** and **Command CRC Error Status Enable** to 1.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 36h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 0000h

### 16.10.27 Capabilities Register (CAPABILITIES)—Offset 40h

This register provides the HD with information specific to the HC implementation. The HC may implement these values as fixed or loaded from flash memory during power on initialization.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 40h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 00000000h

### 16.10.28 Capabilities Register 2 (CAPABILITIES\_2)—Offset 44h

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 44h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 00000000h

[illegible]

### 16.10.29 Maximum Current Capabilities Register (MAX\_CUR\_CAP)—Offset 48h

These registers indicate maximum current capability for each voltage. The value is meaningful if Voltage Support is set in the Capabilities register. If this information is supplied by the Host System via another method, all Maximum Current Capabilities register shall be 0.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 48h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 00000000h

### 16.10.31 Force Event Register for Error Interrupt Status (FORCE\_EVENT\_ERR\_INT\_STAT)—Offset 52h

Error Interrupt Status register can be written. The effect of a write to this address will be reflected in the Error Interrupt Status Register if the corresponding bit of the Error Interrupt Status Enable Register is set.

- Writing 1 : set each bit of the Error Interrupt Status Register
- Writing 0 : no effect

**Note:** By setting this register, the Error Interrupt can be set in the Error Interrupt Status register. In order to generate interrupt signal, both the Error Interrupt Status Enable and Error Interrupt Signal Enable shall be set.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**Offset:** [BAR] + 52h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 0000h

### 16.10.32 ADMA Error Status Register (ADMA\_ERR\_STAT)—Offset 54h

When ADMA Error Interrupt occurs, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address Register holds the address around the error descriptor. To recover from the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows:

- ST\_STOP: Previous location set in the ADMA System Address register is the error descriptor address
- ST\_FDS: Current location set in the ADMA System Address register is the error descriptor address
- ST\_CADR: This state is never set because do not generate ADMA error in this state.

- ST\_TFR: Previous location set in the ADMA System Address register is the error descriptor address

The Host Controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) at the ST\_FDS state. In this case, ADMA Error State indicates that an error occurs at ST\_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

### Access Method

### 16.10.36 Shared Bus Control Register (SHARED\_BUS)—Offset E0h

This register is optional. The devices on shared bus are not intended to be controlled by the Standard Host Driver. This is because shared bus configuration depends on a host system; the devices on shared bus may be controlled by a specific driver of a host system.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + E0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:23, F:0] + 10h

**Default:** 00000000h

| 14:8      | 0h<br>RO         | <b>Bus Width Preset (bus_width):</b> Shared bus supports mixing of 4-bit and 8-bit bus width devices. Each bit of this field specifies the bus width for each embedded device. The number of devices supported is specified by Number of Clock Pins, and a maximum of 7 devices are supported. This field is effective when multiple devices are connected to a shared bus (Slot Type is set to 10b in the Capabilities register). In the other case, Extended Data Transfer Width in the Host Control 1 register is used to select 8-bit bus width. As use of 1-bit mode is not intended for shared bus, Data Transfer Width in the Host Control 1 register should be set to 1. <ul style="list-style-type: none"> <li>D24 = Bus width preset for Device 1</li> <li>D25 = Bus width preset for Device 2</li> <li>D26 = Bus width preset for Device 3</li> <li>D27 = Bus width preset for Device 4</li> <li>D28 = Bus width preset for Device 5</li> <li>D29 = Bus width preset for Device 6</li> <li>D30 = Bus width preset for Device 7</li> </ul> The function of each bit is defined as follows: <ul style="list-style-type: none"> <li>0 = 4 bit buswidth mode</li> <li>1 = 8 bit buswidth mode</li> </ul> |

## 17 Serial ATA (SATA)

The SoC has one integrated SATA host controller that supports independent DMA operation on up to 2 ports and supports data transfer rates of 1.5 Gb/s (150 MB/s) and 3.0 Gb/s (300 MB/s). The SATA controller contains two modes of operation—a legacy mode using I/O space, and an AHCI mode using memory space. Software that uses legacy mode will not have AHCI capabilities.

The SoC supports the Serial ATA Specification, Revision 2.6. The SoC also supports several optional sections of the SATA Revision 2.0 Specifications: Extensions to Serial ATA 1.0 Specification, Revision 1.0 (AHCI support is required for some elements).

The SATA controllers feature two sets of interface signals (ports) that can be independently enabled or disabled (they cannot be tri-stated or driven low). Each interface is supported by an independent DMA controller.

The SATA controllers interact with an attached mass storage device through a register interface that is equivalent to that presented by a traditional IDE host adapter. The host software follows existing standards and conventions when accessing the register interface and follows standard command protocol conventions.

**Note 1.** SATA DevSlp (**Device Sleep**) is not part of revision 2.6 of the SATA specification, with which this processor is compliant. As such, any DEVSLP functionality of this processor is not specification compliant and should not be used.

**Note 2.** SATA interface transfer rates are independent of UDMA mode settings. SATA interface transfer rates will operate at the bus's maximum speed, regardless of the UDMA mode reported by the SATA device or the system BIOS.

### 17.1 Signal Descriptions

Please see [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

**Table 190. Signals**

| Signal Name                    | Direction<br>Plat. Power | Description                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SATA_GP[0]                     | I<br>V1P8S               | <b>Serial ATA 0 General Purpose:</b> This is an input pin which can be configured as an interlock switch or as a general purpose I/O, depending on the platform. When used as an interlock switch status indication, this signal should be driven to '0' to indicate that the switch is closed, and to '1' to indicate that the switch is open. |
| SATA_GP[1]                     | I<br>V1P8S               | <b>Serial ATA 1 General Purpose:</b> Same as above.                                                                                                                                                                                                                                                                                             |
| SATA_LED#                      | O<br>V1P8S               | <b>Serial ATA LED:</b> This is an open-collector output pin driven during SATA command activity. It is to be connected to external circuitry that can provide the current to drive a platform LED. When active, the LED is on. When tristated, the LED is off.                                                                                  |
| SATA_TXP[1:0]<br>SATA_TXN[1:0] | O<br>VPCIESATA           | <b>Serial ATA Port 1 and 0:</b> These are outbound high-speed differential signals to Port 1 and 0.                                                                                                                                                                                                                                             |
| SATA_RXP[1:0]<br>SATA_RXN[1:0] | I<br>VPCIESATA           | <b>Serial ATA Port 1 and 0:</b> These are inbound high-speed differential signals to Port 1 and 0.                                                                                                                                                                                                                                              |
| SATA_RCOMP_P<br>SATA_RCOMP_N   | O                        | These pins are used to connect the external resistors used for Rcomp. Please contact your Intel representative for details.                                                                                                                                                                                                                     |

## 17.2 Features

### 17.2.1 Supported Features

**Table 191. SATA Feature List (Sheet 1 of 2)**

| Feature                         | Description                                                                                                                                    |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Native Command Queuing (NCQ)    | Allows the device to reorder commands for more efficient data transfers                                                                        |
| Auto Activate for DMA           | Collapses a DMA Setup then DMA Activate sequence into a DMA Setup only                                                                         |
| Hot Plug Support                | Allows for device detection without power being applied and ability to connect and disconnect devices without prior notification to the system |
| Asynchronous Signal Recovery    | Provides a recovery from a loss of signal or establishing communication after hot plug                                                         |
| 3 Gb/s Transfer Rate            | Capable of data transfers up to 3 Gb/s                                                                                                         |
| ATAPI Asynchronous Notification | A mechanism for a device to send a notification to the host that the device requires attention                                                 |

**Table 191. SATA Feature List (Sheet 2 of 2)**

| Feature                                | Description                                                                                                                                               |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host & Link Initiated Power Management | Capability for the host controller or device to request Partial and Slumber interface power states                                                        |
| Staggered Spin-Up                      | Enables the host to spin up hard drives sequentially to prevent power load problems on boot                                                               |
| Command Completion Coalescing          | Reduces interrupt and completion overhead by allowing a specified number of commands to complete and then generating an interrupt to process the commands |

**Table 192. SATA/AHCI Feature Matrix**

| Feature                                | AHCI Disabled | AHCI Enabled |
|----------------------------------------|---------------|--------------|
| Native Command Queuing (NCQ)           | N/A           | Supported    |
| Auto Activate for DMA                  | N/A           | Supported    |

## 17.2.2 Theory of Operation

### 17.2.2.1 Standard ATA Emulation

The SoC contains a set of registers that shadow the contents of the legacy IDE registers. The behavior of the Command and Control Block registers, PIO, and DMA data transfers, resets, and interrupts are all emulated.

**Note:** The SoC will assert INTR when the master device completes the EDD command regardless of the command completion status of the slave device. If the master completes EDD first, an INTR is generated and BSY will remain '1' until the slave completes the command. If the slave completes EDD first, BSY will be '0' when the master completes the EDD command and asserts INTR. Software must wait for busy to clear (0) before completing an EDD command, as required by the ATA5 through ATA7 (T13) industry standards.

### 17.2.2.2 48-Bit LBA Operation

The SATA host controller supports 48-bit LBA through the host-to-device register FIS when accesses are performed using writes to the task file. The SATA host controller will ensure that the correct data is put into the correct byte of the host-to-device FIS.

There are special considerations when reading from the task file to support 48-bit LBA operation. Software may need to read all 16-bits. Since the registers are only 8-bits wide and act as a FIFO, a bit must be set in the device/control register, which is at offset 3F6h for primary and 376h for secondary (or their native counterparts).

If software clears Bit 7 of the control register before performing a read, the last item written will be returned from the FIFO. If software sets Bit 7 of the control register before performing a read, the first item written will be returned from the FIFO.

### **17.2.3 AHCI Operation**

The SoC provides hardware support for Advanced Host Controller Interface (AHCI), a programming interface for SATA host controllers developed through a joint industry effort. AHCI defines transactions between the SATA controller and software and enables advanced performance and usability with SATA. Platforms supporting AHCI may take advantage of performance features such as no master/slave designation for SATA devices—each device is treated as a master—and hardware assisted native command queuing. AHCI also provides usability enhancements such as Hot-Plug. AHCI requires appropriate software support (such as, an AHCI driver) and for some features, hardware support in the SATA device or additional platform hardware.

The SoC supports all of the mandatory features of the *Serial ATA Advanced Host Controller Interface Specification*, Revision 1.3 and many optional features, such as hardware assisted native command queuing, aggressive power management, LED indicator support, and Hot-Plug through the use of interlock switch support (additional platform hardware and software may be required depending upon the implementation).

**Note:** For reliable device removal notification while in AHCI operation without the use of interlock switches (surprise removal), interface power management should be disabled for the associated port.

## 17.5.4 Revision ID (RID)—Offset 8h

### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**RID:** [B:0, D:19, F:0] + 8h

**Default:** 00h

|     |   |   |
|-----|---|---|
| 7   | 4 | 0 |
| 0   | 0 | 0 |
| RID |   |   |

| Bit Range | Default & Access | Description                                                                   |
|-----------|------------------|-------------------------------------------------------------------------------|
| 7:0       | 00h<br>RO        | <b>Revision ID (RID):</b> Indicates stepping of the host controller hardware. |

### 17.5.5 Programming Interface (PI)—Offset 9h

This register definition depends on the CC.SCC field. When the CC.SCC is 01h(IDE mode), register definition corresponds to 1st table. When CC.SCC is 06h(AHCI mode), register definition follows the 2nd table.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**PI:** [B:0, D:19, F:0] + 9h

**Default:** 8Ah

|     |   |       |   |     |
|-----|---|-------|---|-----|
| 7   |   | 4     |   | 0   |
| 1   | 0 | 0     | 0 | 1   |

### 17.5.6 Class Code (CC)—Offset Ah

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**CC:** [B:0, D:19, F:0] + Ah

**Default:** 0106h

|    |   |    |   |     |   |   |   |     |
|----|---|----|---|-----|---|---|---|-----|
| 15 |   | 12 |   | 8   |   | 4 |   | 0   |
| 0  | 0 | 0  | 0 | 0   | 0 | 0 | 1 | 0   |
|    |   |    |   | BCC |   |   |   | SCC |

| Bit Range | Default & Access | Description                                                                                                                                                                                                         |
|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:8      | 01h<br>RO        | <b>Base Class Code (BCC):</b> Indicates that this is a mass storage device.                                                                                                                                         |
| 7:0       | 06h<br>RO        | <b>Sub Class Code (SCC):</b> The value reported in this field is dependent on MAP.SMS and various fuses and configuration bits. The value is product specific. For VLV this field may read 01h (IDE) or 06h (AHCI). |

### 17.5.7 Cache Line Size (CLS)—Offset Ch

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**CLS:** [B:0, D:19, F:0] + Ch

**Default:** 00h

|     |   |   |   |   |   |   |   |
|-----|---|---|---|---|---|---|---|
| 7   |   |   | 4 |   |   |   | 0 |
| 0   | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| CLS |   |   |   |   |   |   |   |

| Bit Range | Default & Access | Description                                                                         |
|-----------|------------------|-------------------------------------------------------------------------------------|
| 7:0       | 00h<br>RO        | <b>Cache Line Size (CLS):</b> This register has no meaning for the SATA controller. |

### 17.5.8 Master Latency Timer (MLT)—Offset Dh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**MLT:** [B:0, D:19, F:0] + Dh

**Default:** 00h

|     |   |   |   |   |   |   |   |
|-----|---|---|---|---|---|---|---|
| 7   |   |   | 4 |   |   |   | 0 |
| 0   | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| MLT |   |   |   |   |   |   |   |

| Bit Range | Default & Access | Description                                                                              |
|-----------|------------------|------------------------------------------------------------------------------------------|
| 7:0       | 00h<br>RO        | <b>Master Latency Timer (MLT):</b> This register has no meaning for the SATA controller. |

### 17.5.9 Header Type (HTYPE)—Offset Eh

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**HTYPE:** [B:0, D:19, F:0] + Eh

**Default:** 00h

|     |    |   |
|-----|----|---|
| 7   | 4  | 0 |
| 0   | 0  | 0 |
| MFD | HL |   |

| Bit Range | Default & Access | Description                                                                                           |
|-----------|------------------|-------------------------------------------------------------------------------------------------------|
| 7         | 0h<br>RO         | <b>Multi-function Device (MFD):</b> Indicates this controller is not part of a multi-function device. |
| 6:0       | 00h<br>RO        | <b>Header Layout (HL):</b> Indicates that the controller uses a target device layout.                 |

### 17.5.10 Primary Command Block Base Address (PCMDBA)—Offset 10h

This 8-byte I/O space is used in Native Mode for the Primary Controller's Command Block.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**PCMDBA:** [B:0, D:19, F:0] + 10h

**Default:** 00000001h

|       |    |    |    |     |    |   |   |       |
|-------|----|----|----|-----|----|---|---|-------|
| 31    | 28 | 24 | 20 | 16  | 12 | 8 | 4 | 0     |
| 0     | 0  | 0  | 0  | 0   | 0  | 0 | 0 | 1     |
| RSVD0 |    |    |    | BAR |    |   |   | RSVD1 |
|       |    |    |    |     |    |   |   | RTE   |

| Bit Range | Default & Access | Description                                                                             |
|-----------|------------------|-----------------------------------------------------------------------------------------|
| 31:16     | 0b<br>RO         | <b>RSVD0:</b> Reserved                                                                  |
| 15:3      | 0h<br>RW         | <b>Base Address (BAR):</b> Base address of the I/O space (8 consecutive I/O locations). |
| 2:1       | 0b<br>RO         | <b>RSVD1:</b> Reserved                                                                  |
| 0         | 1h<br>RO         | <b>Resource Type Indicator (RTE):</b> Indicates a request for IO space.                 |

### 17.5.11 Primary Control Block Base Address (PCTLBA)—Offset 14h

This 4-byte I/O space is used in Native Mode for the Primary Controller's Control Block.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**PCTLBA:** [B:0, D:19, F:0] + 14h

**Default:** 00000001h

|       |    |    |    |     |    |   |   |       |     |
|-------|----|----|----|-----|----|---|---|-------|-----|

| 1         | 0b<br>RO         | <b>RSVD1:</b> Reserved                                                                  |
| 0         | 1h<br>RO         | <b>Resource Type Indicator (RTE):</b> Indicates a request for IO space.                 |

## 17.5.12 Secondary Command Block Base Address (SCMDBA)—Offset 18h

This 8-byte I/O space is used in Native Mode for the Secondary Controller's Command Block.

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**SCMDBA:** [B:0, D:19, F:0] + 18h

**Default:** 00000001h

|       |    |    |    |     |    |   |   |       |     |
|-------|----|----|----|-----|----|---|---|-------|-----|
| 31    | 28 | 24 | 20 | 16  | 12 | 8 | 4 | 0     |     |
| 0     | 0  | 0  | 0  | 0   | 0  | 0 | 0 | 1     |     |
| RSVD0 |    |    |    | BAR |    |   |   | RSVD1 | RTF |

| Bit Range | Default & Access | Description                                                                             |
|-----------|------------------|-----------------------------------------------------------------------------------------|
| 31:16     | 0b<br>RO         | <b>RSVD0:</b> Reserved                                                                  |
| 15:3      | 0h<br>RW         | <b>Base Address (BAR):</b> Base address of the I/O space (8 consecutive I/O locations). |
| 2:1       | 0b<br>RO         | <b>RSVD1:</b> Reserved                                                                  |
| 0         | 1h<br>RO         | <b>Resource Type Indicator (RTE):</b> Indicates a request for IO space.                 |

### 17.5.13 Secondary Control Block Base Address (SCTLBA)—Offset 1Ch

This 4-byte I/O space is used in Native Mode for the Secondary Controller's Control Block.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**SCTLBA:** [B:0, D:19, F:0] + 1Ch

**Default:** 00000001h

|       |    |    |    |     |    |   |   |       |     |
|-------|----|----|----|-----|----|---|---|-------|-----|
| 31    | 28 | 24 | 20 | 16  | 12 | 8 | 4 | 0     |     |
| 0     | 0  | 0  | 0  | 0   | 0  | 0 | 0 | 1     |     |
| RSVD0 |    |    |    | BAR |    |   |   | RSVD1 | RTE |

| Bit Range | Default & Access | Description                                                                             |

### 17.5.14 Legacy IDE Base Address / AHCI Index Data Pair Base Address (LBAR)—Offset 20h

This BAR is used to allocate I/O space for the SFF-8038i mode of operation (aka Bus Master IDE) and if CC.SCC is not 01h, it is used to allocate I/O space for the AHCI index/data pair mechanism as well. Note that hardware does not clear the BA bits (including BA4) when switching from IDE mode to non-IDE mode or vice versa. BIOS is responsible for clearing those bits to 0 since the number of writable bits changes after mode switching.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**LBAR:** [B:0, D:19, F:0] + 20h

**Default:** 00000001h

|       |    |    |    |    |    |   |   |       |     |

| Bit Range | Default & Access | Description            |
|-----------|------------------|------------------------|
| 31:16     | 0b<br>RO         | <b>RSVD0:</b> Reserved |

When the programming interface is not IDE (i.e. CC.SCC is not 01h), this register is named ABAR. When the programming interface is IDE, this register becomes SIDPBA. Note that hardware does not clear those BA bits when switching from IDE SKU to non-IDE SKU or vice versa. BIOS is responsible for clearing those bits to 0 since the number of writable bits changes after SKU switching (as indicated by a change in CC.SCC). In the case, this register will then have to be re-programmed to a proper value. When the programming interface is not IDE, the register represents a memory BAR allocating space for the AHCI memory registers. Note that bit[31:16] of this register must be programmed to a value greater than 0 to ensure the memory is mapped to an address of 1 MBytes and greater (i.e. ABAR must be 00010000h or greater). Otherwise, memory cycle targeting the ABAR range may not be accepted. When the programming interface is IDE, the register becomes an I/O BAR allocating 16 bytes of I/O space for the I/O mapped registers defined in Memory Registers. Note that although 16 bytes of locations are allocated, only 8 bytes are used as SINDX and SDATA registers; with the remaining 8 bytes preserved for future enhancement.

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Default:** 00000000h

### 17.5.35 Port Control and Status (PCS)—Offset 92h

By default, the SATA ports are set (by hardware) to the disabled state (e.g. bits[5:0] == 0) as a result of an initial power on reset. When enabled by software, the ports can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. Note: AHCI specific notes: If an AHCI-aware or RAID enabled operating system is being booted then system BIOS shall insure that all supported SATA ports are enabled prior to passing control to the OS. Once the AHCI aware OS is booted it becomes the enabling/disabling policy owner for the individual SATA ports. This is accomplished by manipulating a port's PxSCTL.DET and PxCMD.SUD fields. Because an AHCI or RAID aware OS will typically not have knowledge of the PxE bits and because the PxE bits act as master on/off switches for the ports, pre-boot software must insure that these bits are set to 1 prior to booting the OS, regardless as to whether or not a device is currently on the port.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**PCS:** [B:0, D:19, F:0] + 92h

**Default:** 0000h

| 8         | 0h<br>RO         | <b>Port 0 Present (POP):</b> When set, the SATA controller has detected the presence of a device on port 0. It may change at any time. Clearing P0E bit leads to clearing of this bit after implementation delay. Note: For system software that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again in two consecutive write cycles, software shall poll on this bit being 0 before setting P0E bit to 1.                                                                                                                                                                                                                                                                                                                                                                                                               |
| 7:2       | 0b<br>RO         | <b>RSVD1:</b> Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 1         | 0h<br>RW         | <b>Port 1 Enabled (P1E):</b> When MAP.SPD[1] is 1, this bit is reserved and read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 1 and takes precedence over P1CMD.SUD.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 0         | 0h<br>RW         | <b>Port 0 Enabled (P0E):</b> When MAP.SPD[0] is 1, this bit is reserved and read-only 0. When set, the port is enabled. When cleared, the port is disabled. When enabled, the port can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. This bit takes precedence over P0CMD.SUD. Note: The recommendation for software code that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again immediately shall refer to the polling requirement as described in P0P register bit. At any time that BIOS or software is clearing PCS.PxE from 1 to 0, due to time needed for port staggering hardware process (up to 2 ports) to complete, BIOS and software shall delay the write to set the TM.PCD register by 1.4us. |

### 17.5.36 Test Mode Register (TM)—Offset 94h

| 31        | 0h<br>RW/O       | <b>Register Lock (REGLOCK):</b> BIOS can set this bit to 1 to lock the following registers with RW/L attribute: CAP,CP, MID.NEXT, PIE.NEXT, SATACR0.NEXT. Once locked the register attribute of above list changes from RW/L to RO holding the existing value. BIOS is requested to program this field to 1 prior to hand off to OS. If BIOS needs the SATA host controller to change operation a few times (i.e. changing CC.SCC mode) and need different capability structures for each specific operation mode, BIOS need not activate the lock until BIOS is ready to hand off to OS. BIOS may need to separate write access to this byte offset (x9Fh) from write to the lower 3-byte of the dword (x9C-9Eh) if there is a need to program the lower 3-byte dword location early during boot process.                                                                                                                                              |
| 30:15     | 0b<br>RO         | <b>RSVD0:</b> Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 14:12     | 0h<br>RW         | <b>Write Request_Size Select/Max_Payload_Size (WRRSELMP):</b> These two bits select the max write request size that SATA host controller will initiate for DMA write to memory. SATA host controller will internally break up larger write request based on these bits. The request is address-aligned to the selected size. Defined encodings for this field are: 000b = 128 address aligned bytes max payload size; 111b = 64 address aligned bytes max payload size. All other values are reserved for SATA host controller.                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 9         | 0h<br>RW         | <b>Unsupported Request Reporting Enable (URRE):</b> If set to 1 by software, it allows reporting of an Unsupported Request as a system error. If both URRE and PCI configuration SERR# Enable registers are set to a 1, then the agent must set the Signaled System Error bit in the PCI Status register and send a DO_SERR message in IOSF-SB interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 8         | 0h<br>RW/1C      | <b>Unsupported Request Detected (URD):</b> Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal. Cleared to 0 by SW.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 7         | 0h<br>RW/O       | <b>Alternate ID Enable (AIE):</b> When programmed to 0, HW will report the following device id's: 2822h for desktop or 282Ah for mobile. When programmed to a 1, HW will not report these device id's. The value is product specific. Note: Programming this bit to a 1 will prevent the Windows in-box version of the Intel AHCI driver from loading on the platform - will require that the user perform an 'F6' install of the Intel driver that is appropriate for the reported DID. This field is applicable when the AHCI is configured for RAID mode of operation. It has no impact for AHCI and IDE modes of operation. Note: BIOS is recommended to program this bit prior to programming the MAP.SMS field to reflect RAID. This field is reset by Backbone Reset and BIOS is required to reprogram the value (either 0 or 1) after resuming from S3, S4 or S5. This insures that the value is properly and cannot be changed during runtime. |
| 6         | 0h<br>RW/O       | <b>AIE0 DevID Selection (DEVIDSEL):</b> This register allows BIOS to select Device ID when AIE=0 and Server Feature Disable Fuse 7 =0. This bit only has effect in Desktop SKU. In Mobile SKU this bit has no effect at all. Refer to config register offset 09h PI for usage. 0 : 2822h; 1 : 2826h. NOTE: When Server Feature (SATA AIE DEVIDSEL) Disable Fuse 7 is programmed to 1, this disables the writeability of this DEVIDSEL register bit, and becomes RO with a value of 0, which only allows a choice of 2822h.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 5         | 0h<br>RW/O       | <b>FLR Capability Selection (FLRCSEL):</b> This allows the FLR Capability to be bypassed. Refer to config offset B0h. BIOS is requested to program this bit to 1 and config offset A8h SATACR0.NEXT to 00h.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 4:0       | 0b<br>RO         | <b>RSVD2:</b> Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 31:0      | 00000000h<br>RW  | <b>Data (DTA):</b> 32-bit data value that is written to the register pointed to by SIRI, or read from the register pointed to by SIRI. |

### 17.5.40 Serial ATA Capability Register 0 (SATACR0)—Offset A8h

This register shall be read-only 0 when CC.SCC is 01h. Note that the SATACR0.NEXT is not changed from RO to become RWO because there is an existing method (SATAGC.FLRCSSEL bit) to bypass the FLR Capability structure. And FLR Capability ID.NEXT is already indicating end of capability structure, it does not need change to be RWO.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**SATACR0:** [B:0, D:19, F:0] + A8h

**Default:** 00100012h

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                              |

## 17.6 SATA Legacy IO Registers

**Table 194. Summary of SATA Legacy I/O Registers—LBAR**

| Offset | Size | Register ID—Description                                            | Default Value |
|--------|------|--------------------------------------------------------------------|---------------|
| 0h     | 1    | "Primary Command (PCMD)—Offset 0h" on page 1961                    | 00h           |
| 2h     | 1    | "Primary Status (PSTS)—Offset 2h" on page 1962                     | 00h           |
| 4h     | 4    | "Primary Descriptor Table Pointer (PDTP)—Offset 4h" on page 1962   | 00000000h     |
| 8h     | 1    | "Secondary Command (SCMD)—Offset 8h" on page 1963                  | 00h           |
| Ah     | 1    | "Secondary Status (SSTS)—Offset Ah" on page 1963                   | 00h           |
| Ch     | 4    | "Secondary Descriptor Table Pointer (SDTP)—Offset Ch" on page 1964 | 00000000h     |
| 10h    | 4    | "AHCI Index Register (INDEX)—Offset 10h" on page 1965              | 00000000h     |
| 14h    | 4    | "AHCI Data Register (DATA)—Offset 14h" on page 1966                | 00000000h     |

### 17.6.1 Primary Command (PCMD)—Offset 0h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**PCMD:** [LBAR] + 0h

**LBAR Type:** PCI Configuration Register (Size: 32 bits)

**LBAR Reference:** [B:0, D:19, F:0] + 20h

**Default:** 00h

|       |     |       |

| 0         | 0h RW            | <b>Start/Stop Bus Master (START):</b> Setting this bit enables bus master operation of the controller. Bus master operation does not actually start unless the Bus Master Enable bit in PCI configuration space is also set. Clearing it halts bus master operation. All state information is lost when this bit is written to 0; Master mode operation cannot be stopped and then resumed. If this bit is reset while bus master operation is still active and the device has not yet finished its data transfer, the bus master command is said to be aborted. If this bit is cleared to 0 prior to the DMA data transfer being initiated by the drive in a device to memory data transfer, then not DMAT will be sent to terminate the data transfer. SW intervention (e.g. sending SRST) is required to reset the interface in this condition. This bit is intended to be cleared by software after the data transfer is completed - as indicated by either the ACT bit being cleared in the status register, or the I bit being set in the status register, or both. |

## 17.6.7 AHCI Index Register (INDEX)—Offset 10h

This registers are only available if CC.SCC is not 01h to index into all memory registers defined in Memory Registers and the message buffer used for enclosure management. If CC.SCC is 01h, these AHCI Index Data Pair registers are not accessible and SINDEX/SDATA register pair shall be used to index into a subset of the memory registers defined in (See Memory Registers for more information on which registers could be indexed).

### Access Method

## 17.6.8 AHCI Data Register (DATA)—Offset 14h

This registers are only available if CC.SCC is not 01h to index into all memory registers defined in Memory Registers and the message buffer used for enclosure management. If CC.SCC is 01h, these AHCI Index Data Pair registers are not accessible and SINDEXT/SDATA register pair shall be used to index into a subset of the memory registers defined in (See Memory Registers for more information on which registers could be indexed).

### Access Method

**Type:** I/O Register  
(Size: 32 bits)

**DATA:** [LBAR] + 14h

**LBAR Type:** PCI Configuration Register (Size: 32 bits)

**LBAR Reference:** [B:0, D:19, F:0] + 20h

**Default:** 00000000h

### 17.8.1 HBA Capabilities (GHC\_CAP)—Offset 0h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon Backbone Reset.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**GHC\_CAP:** [ABAR] + 0h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** DF20FF02h

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                   |
|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31        | 1h<br>RW/O       | <b>Supports 64-bit Addressing (S64A):</b> Indicates the S-ATA controller can access 64-bit data structures. The 32-bit upper bits of the port DMA Descriptor, the PRD Base, and each PRD entry are read/write.                                                                                |
| 30        | 1h<br>RW/O       | <b>Supports Native Command Queuing Acceleration (SCQA):</b> Indicates the SATA controller supports Serial-ATA Native Command Queuing. The HBA will handle DMA Setup FISes in hardware, including support for auto-activate optimization through the FIS.                                      |
| 29        | 0h<br>RO         | <b>Supports SNotification Register (SNNTF):</b> When set to 1, indicates that the HBA supports the PxSNNTF (SNotification) register and its associated functionality. When cleared to 0, the HBA does not support the PxSNNTF (SNotification) register and its associated functionality.      |
| 28        | 1h<br>RW/O       | <b>Supports Mechanical Presence Switch (SMPS):</b> When set to 1, the HBA supports mechanical presence switches on its ports for use in hot plug operations. When cleared to 0, this function is not supported. This value is loaded by the BIOS prior to OS initialization.                  |
| 27        | 1h<br>RW/O       | <b>Supports Staggered Spin-up (SSS):</b> Indicates whether the S-ATA controller supports staggered spin-up on its ports, for use in balancing power spikes. This value is loaded by platform BIOS prior to OS initialization.                                                                 |
| 26        | 1h<br>RW/O       | <b>Supports Aggressive Link Power Management (SALP):</b> Indicates the S-ATA controller supports auto-generating link requests to the partial or slumber states when there are no commands to process. When cleared to 0, software shall treat the PxCMD.ALPE and PxCMD.ASP bits as reserved. |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 25        | 1h<br>RW/O       | <b>Supports Activity LED (SAL):</b> Indicates the S-ATA controller supports a single output pin (SATALED#) which indicates activity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 24        | 1h<br>RW/O       | <b>Supports Command List Override (SCLO):</b> When set to 1, indicates that the HBA supports the PxCMD.CLO bit and its associated function. When cleared to 0, The HBA is not capable of clearing the BSY and DRQ bits in the Status register in order to issue software reset if these bits are still set from a previous operation.                                                                                                                                                                                                                                                                                                                                                                                                  |
| 23:20     | 2h<br>RW/O       | <b>Interface Speed Support (ISS):</b> Indicates the maximum speed the S-ATA controller can support on its ports. These encodings match the system software programmable PxSCTL.DET.SPD field. 0000 = Reserved; 0001 = Gen 1 (1.5 Gbps); 0010 = Gen 2 (3 Gbps); 0011 = Gen 3 (6 Gbps); 0100 - 1111 = Reserved.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 19        | 0h<br>RO         | <b>Supports Non-Zero DMA Offsets (SNZO):</b> Reserved as per AHCI 1.3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 18        | 0h<br>RW/O       | <b>Supports AHCI mode only (SAM):</b> The SATA controller may optionally support AHCI access mechanism only. A value of 0 indicates that in addition to the native AHCI mechanism (via ABAR), the SATA controller implements a legacy, task-file based register interface such as SFF-8038i. A value of 1 indicates that the SATA controller does not implement a legacy, task-file based register interface.                                                                                                                                                                                                                                                                                                                          |

| 6         | 0h<br>RO         | <b>Enclosure Management Supported (EMS):</b> Not supported                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 5         | 0h<br>RW/O       | <b>Supports External SATA (SXS):</b> When set to 1, indicates that the HBA has one or more Serial ATA ports that has a signal only connector that is externally accessible. If this bit is set, software may refer to the PxCMD.ESP bit to determine whether a specific port has its signal connector externally accessible as a signal only connector (i.e. power is not part of that connector). When the bit is cleared to 0, indicates that the HBA has no Serial ATA ports that have a signal only connector externally accessible.                                                                                                                                                                                               |
| 4:0       | 02h<br>RO        | <b>Number of Ports (NP):</b> 0's based value indicating the maximum number of ports supported. Note that the number of ports indicated in this field may be more than the number of ports indicated in the PI register. Number of ports shall be dependent on MAP.SC and PCIe/SATA muxing configuration where if ANY of these parameter disable a particular port then that port is disabled and not counted. The maximum number of ports supported by SIP is 2 and the least is 0 (i.e. Function Disable). In the case of 0 port configuration, the value of NP is a don't care (while implementation has it fixed as 07h). Any combination in between is supported by SATA host controller. Indicates the number of supported ports. |

## 17.8.2 Global HBA Control (GHC)—Offset 4h

This register controls various global actions of the HBA.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**GHC:** [ABAR] + 4h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

| 31        | 0h<br>RW         | <b>AHCI Enable (AE):</b> When set, indicates that an AHCI driver is loaded and communication to the HBA shall be via AHCI mechanisms. This can be used by an HBA that supports both legacy mechanisms (such as SFF-8038i) and AHCI to know when the HBA is running under an AHCI driver. When set, software shall only talk to the HBA using AHCI. The HBA will not have to allow command processing via both AHCI and legacy mechanisms. When cleared, software will only communicate with the HBA using legacy mechanisms. Software shall set this bit to 1 before accessing other AHCI registers. Note: The implementation of this bit is dependent upon the value of the CAP.SAM bit. If CAP.SAM is 0, then GHC.AE should be RW and shall have a reset value of 0. If CAP.SAM is 1, then AE shall be read only and shall have a reset value of 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 30:3      | 0b<br>RO         | <b>RSVD0:</b> Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 2         | 0h<br>RO         | <b>MSI Revert to Single Message (MRSM):</b> When set to 1 by hardware, indicates that the HBA requested more than one MSI vector but has reverted to using the first vector only. When this bit is cleared to 0, the HBA has not reverted to single MSI mode (i.e. hardware is already in single MSI mode, software has allocated the number of messages requested, or hardware is sharing interrupt vectors if MC.MME ( MC.MMC). The HBA may revert to single MSI mode when the number of vectors allocated by the host is less than the number requested. This bit shall only be set to 1 when the following conditions hold: MC.MSIE = 1 (MSI is enabled); MC.MMC = 0 (multiple messages requested); MC.MME = 0 (more than one message allocated); MC.MME != MC.MMC (messages allocated not equal to number requested). When this bit is set to 1, single MSI mode operation is in use and software is responsible for clearing bits in the IS register to clear interrupts. This bit shall be cleared to 0 by hardware when any of the four conditions stated is false. This bit is also cleared to 0 when MC.MSIE = 1 and MC.MME = 0h. In this case, the hardware has been programmed to use single MSI mode, and is not reverting to that mode. The HBA shall always revert to single MSI mode when the number of vectors allocated by the host is less than the number requested. Value of MRSM is a don't care when GHC.HR=1. |
| 1         | 0h<br>RW         | <b>Interrupt Enable (IE):</b> This global bit enables interrupts from the HBA. When cleared (reset default), all interrupt sources from all ports are disabled. When set, interrupts are enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 0         | 0h<br>RW/1S      | <b>HBA Reset (HR):</b> When set by SW, this bit causes an internal reset of the HBA. All state machines that relate to data transfers and native command queuing will return to an idle condition, and all ports will be re-initialized via COMRESET. When the HBA has performed the reset action, it will reset this bit to 0. A software write of 0 will have no effect. For a description on which bits are reset when this bit is set, see the AHCI specification, section 10.3.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 17.8.14 Port-FIS Base Address (PxFB0)—Offset 108h

### Access Method

|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:28     | 0h<br>RW         | <b>Interface Communication Control (ICC):</b> This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect. Fh -9h Reserved. 8h DEVSLP: This shall cause the HBA to assert the DEVSLP signal associated with the port; the HBA shall ignore the DEVSLP Idle Timeout value specified by PxDEVSLP.DITO. Software shall only request DEVSLP when the interface is in an idle state (i.e. PxCI is cleared to 0h and PxSACT is cleared to 0h); if the interface is not idle at the time the register is written, then the HBA takes no action and the interface remains in its current state. If PxCAP2.DESO is set to '1' and PxSSTS.IPM is not set to '6h', then the HBA takes no action and the interface remains in its current state. Additionally, the HBA shall not assert the DEVSLP signal until PHYRDY has been achieved (after a previous de-assertion). 7h Reserved 6h Slumber: This shall cause the HBA to request a transition of the interface to the Slumber state. The SATA device may reject the request and the interface shall remain in its current state. 5h-3h Reserved. 2h Partial: This shall cause the HBA to request a transition of the interface to the Partial state. The SATA device may reject the request and the interface shall remain in its current state. 1h Active: This shall cause the HBA to request a transition of the interface into the active state. If the requested transition is from the DEVSLP state, then the HBA shall wait until PxDEVSLP.DMAT has expired before de-asserting the DEVSLP signal. 0h No-Op / Idle: When software reads this value, it indicates the HBA is ready to accept a new interface control command, although the transition to the previously selected state may not yet have occurred. When system software writes a non-reserved value other than No-Op (0h), the HBA shall perform the action and update this field back to Idle (0h). If software writes to this field to change the state to a state the link is already in (i.e. interface is in the active state and a request is made to go to the active state), the HBA shall take no action and return this field to Idle. If the interface is in a low power state and the software wants to transition to a different low power state, software must first bring the link to active and then initiate the transition to the desired low power state (with the exception of DEVSLP). The transition to DEVSLP may occur from any other state if CAP2.DESO is cleared to '0'. If CAP2.DESO is set to '1', then DEVSLP may only be transitioned to if the link is in Slumber. |
| 27        | 0h<br>RW         | <b>Aggressive Slumber Partial (ASP):</b> When set to 1, and the ALPE bit is set, the HBA shall aggressively enter Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter Partial state when it clears a bit in the PxCI or PxSACT register and the register values are both 0h. If CAP.SALP is cleared to 0, software shall treat this bit as reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 18        | 0h<br>RW/O       | <b>Hot Plug Capable Port (HPCP):</b> This indicates whether this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.                                                                                                                                                                                                                                                                                                                                                                                                          |

| 13        | 0h<br>RO         | <b>Mechanical Presence Switch State (MPSS):</b> The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.                                                                                                                                                                                                                                                                                                                        |
| 12:8      | 00h<br>RO        | <b>Current Command Slot (CCS):</b> Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1. |

| 31:0      | 00000000h<br>RW  | <b>Commands Issued (CI):</b> This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1. |

## 17.8.26 Port-Device Sleep (PxDEVSLP0)—Offset 144h

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxDEVSLP0:** [ABAR] + 144h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 1E022852h

|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:28     | 0h<br>RW         | <b>Interface Communication Control (ICC):</b> This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect. Fh -9h Reserved. 8h DEVSLP: This shall cause the HBA to assert the DEVSLP signal associated with the port; the HBA shall ignore the DEVSLP Idle Timeout value specified by PxDEVSLP.DITO. Software shall only request DEVSLP when the interface is in an idle state (i.e. PxCI is cleared to 0h and PxSACT is cleared to 0h); if the interface is not idle at the time the register is written, then the HBA takes no action and the interface remains in its current state. If PxCAP2.DESO is set to '1' and PxSSTS.IPM is not set to '6h', then the HBA takes no action and the interface remains in its current state. Additionally, the HBA shall not assert the DEVSLP signal until PHYRDY has been achieved (after a previous de-assertion). 7h Reserved 6h Slumber: This shall cause the HBA to request a transition of the interface to the Slumber state. The SATA device may reject the request and the interface shall remain in its current state. 5h-3h Reserved. 2h Partial: This shall cause the HBA to request a transition of the interface to the Partial state. The SATA device may reject the request and the interface shall remain in its current state. 1h Active: This shall cause the HBA to request a transition of the interface into the active state. If the requested transition is from the DEVSLP state, then the HBA shall wait until PxDEVSLP.DMAT has expired before de-asserting the DEVSLP signal. 0h No-Op / Idle: When software reads this value, it indicates the HBA is ready to accept a new interface control command, although the transition to the previously selected state may not yet have occurred. When system software writes a non-reserved value other than No-Op (0h), the HBA shall perform the action and update this field back to Idle (0h). If software writes to this field to change the state to a state the link is already in (i.e. interface is in the active state and a request is made to go to the active state), the HBA shall take no action and return this field to Idle. If the interface is in a low power state and the software wants to transition to a different low power state, software must first bring the link to active and then initiate the transition to the desired low power state (with the exception of DEVSLP). The transition to DEVSLP may occur from any other state if CAP2.DESO is cleared to '0'. If CAP2.DESO is set to '1', then DEVSLP may only be transitioned to if the link is in Slumber. |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 27        | 0h<br>RW         | <b>Aggressive Slumber Partial (ASP):</b> When set to 1, and the ALPE bit is set, the HBA shall aggressively enter Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter Partial state when it clears a bit in the PxCI or PxSACT register and the register values are both 0h. If CAP.SALP is cleared to 0, software shall treat this bit as reserved.      |
| 26        | 0h<br>RW         | <b>Aggressive Link Power Management Enable (ALPE):</b> When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit.                                                                                                                                                                                                                                                                                          |
| 25        | 0h<br>RW         | <b>Drive LED on ATAPI Enable (DLAE):</b> When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software                                                                                                                                                                                                    |
| 24        | 0h<br>RW         | <b>Device is ATAPI (ATAPI):</b> When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.                                                                                                                                                                                                                                                                                 |
| 23        | 0h<br>RW         | <b>Automatic Partial to Slumber Transitions Enabled (APSTE):</b> When set to 1, the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0 - the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1 - if CAP2.APST is set to 1; if CAP2.APST is cleared to 0 - software shall treat this bit as reserved.                                                                                             |
| 22        | 0h<br>RO         | <b>FIS-based Switching Capable Port (FBSCP):</b> The SATA controller does not support FIS-Based Switching.                                                                                                                                                                                                                                                                                                                                                                     |
| 21        | 0h<br>RW/O       | <b>External SATA Port (ESP):</b> When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to 1, then the port may experience hot plug events.                                                                                                      |
| 20        | 0h<br>RO         | <b>Cold Presence Detection (CPD):</b> The SATA controller does not support cold presence detect.                                                                                                                                                                                                                                                                                                                                                                               |
| 19        | 0h<br>RW/O       | <b>Mechanical Presence Switch Attached to Port (MPSP):</b> If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.                                                                                                                                                                                                                           |
| 18        | 0h<br>RW/O       | <b>Hot Plug Capable Port (HPCP):</b> This indicates whether this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.                                                                                   |

| 12:8      | 00h<br>RO        | <b>Current Command Slot (CCS):</b> Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1. |
| 7         | 0b<br>RO         | <b>RSVD1:</b> Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 6         | 0h<br>RO         | <b>PHYSLP Present (PSP):</b> If set to 1, the platform supports PHYSLP on this port. If cleared to 0, the platform does not support PHYSLP on this port. This bit may only be set to 1 if CAP2.SPS is set to 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 5         | 0h<br>RW         | <b>Aggressive PHYSLP Enable (APSE):</b> This bit is read/write for HBAs that support aggressive PHYSLP management (CAP2.SAPM == 1). This bit is read-only for HBAs that do not support aggressive PHYSLP management (CAP2.SPS == 0). When this bit is set to 1, the HBA shall assert the PHYSLP signal after the port has been idle (PxCI == 0h and PxSACT == 0h) for the amount of time specified by the GHC.PITO register. When this bit is cleared to 0, the HBA does not enter PHYSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxCMD.PSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the PHYSLP signal if asserted.                                                                                     |
| 4         | 0h<br>RW         | <b>FIS Receive Enable (FRE):</b> When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 3         | 0h<br>RW/1S      | <b>Command List Override (CLO):</b> Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.                                                                                                                                                                                                                                                                                                                                                                        |
| 2         | 1h<br>RO         | <b>Power On Device (POD):</b> The SATA controller does not support cold presence detect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 1         | 0h<br>RW         | <b>Spin-Up Device (SUD):</b> This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1 for HBAs that do not support staggered spin-up. On an edge detect from 0 to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to 0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0 and PxSCTL.DET = 0h, the HBA will enter listen mode.                                                                                                                                                                                                                                                                                       |
| 0         | 0h<br>RW         | <b>Start (ST):</b> When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.                                                                                                                                                                                                                                                                                                                                                                                 |

### 17.8.34 Port-Task File Data (PxTFD1)—Offset 1A0h

## Access Method

If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. 0h No interface restrictions 1h Transitions to the PARTIAL state disabled 2h Transitions to the SLUMBER state disabled 3h Transitions to both PARTIAL and SLUMBER states disabled 4h Transitions to the DEVSLP power management state are disabled 5h Transitions to the Partial and DEVSLP power management states are disabled 6h Transitions to the Slumber and DEVSLP power management states are disabled 7h Transitions to the Partial, Slumber and DEVSLP power management states are disabled All other values reserved                                                                                                                                                                       |
| 7:4       | 0h RW            | <b>Speed Allowed (SPD):</b> Indicates the highest allowable speed of the interface. 0h No speed negotiation restrictions. 1h Limit speed negotiation to Generation 1 communication rate. 2h Limit speed negotiation to a rate not greater than Generation 2 communication rate. 3h Limit speed negotiation to a rate not greater than Generation 3 communication rate. All other values reserved. Note: If software changes SPD after port has been enabled, software is required to perform a port reset via DET=1h.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 3:0       | 0h RW            | <b>Device Detection Initialization (DET):</b> Controls HBA's device detection and interface initialization. 0h No device detection or initialization action requested. 1h Perform interface communication initialization sequence to establish communication. This is functionally equivalent to a hard reset and results in the interface being reset and communications reinitialized. While this field is 1h, COMRESET is continuously transmitted on the interface. Software should leave the DET field set to 1h for a minimum of 1 millisecond to ensure that a COMRESET is sent on the interface. 4h Disable the Serial ATA interface and put Phy in offline mode. All other values reserved. This field may only be changed when PxCMD.ST is '0'. Changing this field while the HBA is running results in undefined behavior. When PxCMD.ST is set to '1', this field should have a value of 0h. It is permissible to implement any of the Serial ATA defined behaviors for transmission of COMRESET when PxSCTL.DET = 1h |

### 17.8.38 Port-Serial ATA Error (PxSERR1)—Offset 1B0h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**PxSERR1:** [ABAR] + 1B0h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

**ABAR Reference:** [B:0, D:19, F:0] + 24h

**Default:** 00000000h

| 31:16     | 0000h<br>RW/1C   | <b>Diagnostics (DIAG):</b> Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. Bit Field 31:27 Reserved 26 Exchanged (X): When set to one this bit indicates that a change in device presence has been detected since the last time this bit was cleared. The means by which the implementation determines that the device presence has changed is vendor specific. This bit shall always be set to one anytime a COMINIT signal is received. This bit is reflected in the POIS.PCS bit. 25 Unrecognized FIS Type (F): Indicates that one or more FISs were received by the Transport layer with good CRC, but had a type field that was not recognized. 24 Transport state transition error (T): Indicates that an error has occurred in the transition from one state to another within the Transport layer since the last time this bit was cleared. 23 Link Sequence Error (S): Indicates that one or more Link state machine error conditions were encountered. The Link Layer state machine defines the conditions under which the link layer detects an erroneous transition. 22 Handshake Error (H): Indicates that one or more R_ERR handshake response was received in response to frame transmission. Such errors may be the result of a CRC error detected by the recipient, a disparity or 8b/10b decoding error, or other error condition leading to a negative handshake on a transmitted frame. 21 CRC Error (C): Indicates that one or more CRC errors occurred with the Link Layer. 20 Disparity Error (D): This field is not used by AHCI. 19 10B to 8B Decode Error (B): Indicates that one or more 10B to 8B decoding errors occurred. 18 Comm Wake (W): Indicates that a Comm Wake signal was detected by the Phy. 17 Phy Internal Error (I): Indicates that the Phy detected some internal error. 16 PhyRdy Change (N): When set to 1 this bit indicates that the internal PhyRdy signal changed state since the last time this bit was cleared. The state of this bit is reflected in the PxIS.PRCs interrupt status bit and an interrupt will be generated if enabled. |
| 15:0      | 0000h<br>RW/1C   | <b>Error (ERR):</b> The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. 15:12 Reserved 11 Internal Error (E): The SATA controller failed due to a master or target abort when attempting to access system memory. 10 Protocol Error (P): A violation of the Serial ATA protocol was detected. 9 Persistent Communication or Data Integrity Error (C): A communication error that was not recovered occurred that is expected to be persistent. Persistent communications errors may arise from faulty interconnect with the device, from a device that has been removed or has failed, or a number of other causes. 8 Transient Data Integrity Error (T): A data integrity error occurred that was not recovered by the interface. 7:2 Reserved 1 Recovered Communications Error (M): Communications between the device and host was temporarily lost but was re-established. This can arise from a device temporarily being removed, from a temporary loss of Phy synchronization, or from other causes and may be derived from the PhyNRdy signal between the Phy and Link layers. 0 Recovered Data Integrity Error (I): A data integrity error occurred that was recovered by the interface through a retry operation or other recovery action.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:29     | 0b<br>RO         | <b>RSVD0:</b> Reserved                                                                                                                                                                                                                                                                                                                                                                   |
| 28:25     | Fh<br>RW/O       | <b>DITO Multiplier (DM):</b> 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied. The HBA computes the total idle timeout as a product of DM and DITO (i.e. DITO actual = DITO * DM). |
| 24:15     | 004h<br>RW       | <b>DEVSLP Idle Timeout (DITO):</b> This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal.                                                                                                                                                                                                                |
| 14:10     | 0Ah<br>RW        | <b>DEVSLP Minimum Assertion Time (MDAT):</b> This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The nominal value is 10ms and the minimum is 1ms depending on device identification information.                                                                                              |
| 9:2       | 14h<br>RW        | <b>DEVSLP Exit Timeout (DETO):</b> This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The nominal value is 20ms while the max value is 255ms depending on device identification information.                                                                                                   |
| 1         | 1h<br>RW/O       | <b>DEVSLP Present (DSP):</b> If set to 1, the platform supports DEVSLP on this port. If cleared to 0, the platform does not support DEVSLP on this port.                                                                                                                                                                                                                                 |
| 0         | 0h<br>RW         | <b>Aggressive DEVSLP Enable (ADSE):</b> When this bit is cleared to 0, the HBA does not enter DEVSLP unless software directed via PxCMD.ICC. This bit shall only be set to 1 if PxDEVSLP.DSP is set to 1. If this bit is set to 1 and software clears the bit to 0, then the HBA shall de-assert the DEVSLP signal if asserted.                                                          |

## 17.8.42 Enclosure Management Message Format (EM\_MF)—Offset 580h

This register is not implemented in VLV.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**EM\_MF:** [ABAR] + 580h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)

| 6h     | 1    | "Primary Channel Device register (P_DRIVE_HEAD)—Offset 6h" on page 2009           | 00h           |
| 7h     | 1    | "Primary Channel Status register (P_STATUS)—Offset 7h" on page 2009               | 00h           |

### 17.9.1 Primary Channel Error register (P\_ERROR)—Offset 1h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_ERROR:** [PCMDIDEBA] + 1h

**PCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCMDIDEBA Reference:** [B:0, D:19, F:0] + FCh

**Default:** 00h

| 7         | 4                | 0                         |
|-----------|------------------|---------------------------|
| 0         | 0                | 0                         |
| P_ERROR_1 |                  |                           |
| Bit Range | Default & Access | Description               |
| 7:0       | 00h<br>RW        | Error (P_ERROR_1): Error. |

### 17.9.2 Primary Channel Sector Count register (P\_SECTOR\_COUNT)—Offset 2h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_SECTOR\_COUNT:** [PCMDIDEBA] + 2h

**PCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCMDIDEBA Reference:** [B:0, D:19, F:0] + FCh

**Default:** 00h

| Bit Range | Default & Access | Description                                             |
|-----------|------------------|---------------------------------------------------------|
| 7:0       | 00h<br>RW        | Sector Count ( <b>P_SECTOR_COUNT_1</b> ): Sector Count. |

### 17.9.3 Primary Channel Sector Number register (**P\_SECTOR\_NUMBER**)—Offset 3h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_SECTOR\_NUMBER:** [PCMDIDEBA] + 3h

**PCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCMDIDEBA Reference:** [B:0, D:19, F:0] + FCh

**Default:** 00h

| Bit Range | Default & Access | Description                                                |
|-----------|------------------|------------------------------------------------------------|
| 7:0       | 00h<br>RW        | Sector Number ( <b>P_SECTOR_NUMBER_1</b> ): Sector Number. |

## 17.9.4 Primary Channel Cylinder Low register (P\_CYL\_LOW)—Offset 4h

### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_CYL\_LOW:** [PCMDIDEBA] + 4h

**PCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCMDIDEBA Reference:** [B:0, D:19, F:0] + FCh

**Default:** 00h

| Bit Range | Default & Access | Description                               |
|-----------|------------------|-------------------------------------------|
| 7:0       | 00h<br>RW        | Cylinder Low (P_CYL_LOW_1): Cylinder Low. |

## 17.9.5 Primary Channel Cylinder High register (P\_CYL\_HIGH)—Offset 5h

### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_CYL\_HIGH:** [PCMDIDEBA] + 5h

**PCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCMDIDEBA Reference:** [B:0, D:19, F:0] + FCh

**Default:** 00h

| Bit Range | Default & Access | Description                                  |
|-----------|------------------|----------------------------------------------|
| 7:0       | 00h<br>RW        | Cylinder High (P_CYL_HIGH_1): Cylinder High. |

## 17.9.6 Primary Channel Device register (P\_DRIVE\_HEAD)—Offset 6h

### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_DRIVE\_HEAD:** [PCMDIDEBA] + 6h

**PCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCMDIDEBA Reference:** [B:0, D:19, F:0] + FCh

**Default:** 00h

|       |   |   |                |       |   |   |   |
|-------|---|---|----------------|-------|---|---|---|
| 7     |   |   | 4              |       |   |   | 0 |
| 0     | 0 | 0 | 0              | 0     | 0 | 0 | 0 |
| RSVD0 |   |   | P_DRIVE_HEAD_1 | RSVD1 |   |   |   |

| Bit Range | Default & Access | Description                             |
|-----------|------------------|-----------------------------------------|
| 7:5       | 0b<br>RO         | <b>RSVD0:</b> Reserved                  |
| 4         | 0h<br>RW         | <b>Device (P_DRIVE_HEAD_1):</b> Device. |
| 3:0       | 0b<br>RO         | <b>RSVD1:</b> Reserved                  |

## 17.9.7 Primary Channel Status register (P\_STATUS)—Offset 7h

### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_STATUS:** [PCMDIDEBA] + 7h

**PCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCMDIDEBA Reference:** [B:0, D:19, F:0] + FCh

**Default:** 00h

|              |               |             |       |              |       |                  |   |
|--------------|---------------|-------------|-------|--------------|-------|------------------|---|
| 7            |               |             | 4     |              |       |                  | 0 |
| 0            | 0             | 0           | 0     | 0            | 0     | 0                | 0 |
| P_STATUS_BSY | P_STATUS_DRDY | P_STATUS_DF | RSVD0 | P_STATUS_DRQ | RSVD1 | P_STATUS_ERR_CHK |   |

| Bit Range | Default & Access | Description                       |
|-----------|------------------|-----------------------------------|
| 7         | 0h<br>RW         | <b>BUSY (P_STATUS_BSY):</b> BUSY. |

| Bit Range | Default & Access | Description                                                                |
|-----------|------------------|----------------------------------------------------------------------------|
| 6         | 0h<br>RW         | <b>Device Ready (P_STATUS_DRDY):</b> Device Ready.                         |
| 5         | 0h<br>RW         | <b>Device Fault/Stream Error (P_STATUS_DF):</b> Device Fault/Stream Error. |
| 4         | 0b<br>RO         | <b>RSVD0:</b> Reserved                                                     |
| 3         | 0h<br>RW         | <b>Data Request (P_STATUS_DRQ):</b> Data Request.                          |
| 2:1       | 0b<br>RO         | <b>RSVD1:</b> Reserved                                                     |
| 0         | 0h<br>RW         | <b>ERR/CHK (P_STATUS_ERR_CHK):</b> ERR/CHK.                                |

## 17.10 SATA Primary Write Control IO Registers

**Table 198. Summary of SATA Primary Write Control I/O Registers—PCTLIDEBA**

| Offset | Size | Register ID—Description                                                          | Default Value |
|--------|------|----------------------------------------------------------------------------------|---------------|
| 2h     | 1    | "Primary Channel Device Control register (P_DEVICE_CTRL)—Offset 2h" on page 2011 | 00h           |

### 17.10.1 Primary Channel Device Control register (P\_DEVICE\_CTRL)—Offset 2h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**P\_DEVICE\_CTRL:** [PCTLIDEBA] + 2h

**PCTLIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**PCTLIDEBA Reference:** [B:0, D:19, F:0] + 104h

|------------------|---|---|---|---|---|---|---|---|---|
| 7                |   |   |   | 4 |   |   |   |   | 0 |
| 0                | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| S_SECTOR_COUNT_1 |   |   |   |   |   |   |   |   |   |

| Bit Range | Default & Access | Description                                             |
|-----------|------------------|---------------------------------------------------------|
| 7:0       | 00h<br>RW        | Sector Count ( <b>S_SECTOR_COUNT_1</b> ): Sector Count. |

### 17.13.3 Secondary Channel Sector Number register (S\_SECTOR\_NUMBER)—Offset 3h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**S\_SECTOR\_NUMBER:** [SCMDIDEBA] + 3h

**SCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**SCMDIDEBA Reference:** [B:0, D:19, F:0] + 100h

**Default:** 00h

|                   |   |   |   |   |   |   |   |   |   |
|-------------------|---|---|---|---|---|---|---|---|---|
| 7                 |   |   |   | 4 |   |   |   |   | 0 |

| S_SECTOR_NUMBER_1 |   |   |   |   |   |   |   |   |   |

| Bit Range | Default & Access | Description                                                |
|-----------|------------------|------------------------------------------------------------|
| 7:0       | 00h<br>RW        | Sector Number ( <b>S_SECTOR_NUMBER_1</b> ): Sector Number. |

### 17.13.4 Secondary Channel Cylinder Low register (S\_CYL\_LOW)—Offset 4h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**S\_CYL\_LOW:** [SCMDIDEBA] + 4h

**SCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**SCMDIDEBA Reference:** [B:0, D:19, F:0] + 100h

**Default:** 00h

| Bit Range | Default & Access | Description                               |
|-----------|------------------|-------------------------------------------|
| 7:0       | 00h<br>RW        | Cylinder Low (S_CYL_LOW_1): Cylinder Low. |

### 17.13.5 Secondary Channel Cylinder High register (S\_CYL\_HIGH)—Offset 5h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**S\_CYL\_HIGH:** [SCMDIDEBA] + 5h

**SCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**SCMDIDEBA Reference:** [B:0, D:19, F:0] + 100h

**Default:** 00h

| Bit Range | Default & Access | Description                                  |
|-----------|------------------|----------------------------------------------|
| 7:0       | 00h<br>RW        | Cylinder High (S_CYL_HIGH_1): Cylinder High. |

## 17.13.6 Secondary Channel Device register (S\_DRIVE\_HEAD)—Offset 6h

### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**S\_DRIVE\_HEAD:** [SCMDIDEBA] + 6h

**SCMDIDEBA Type:** PCI Configuration Register (Size: 32 bits)

**SCMDIDEBA Reference:** [B:0, D:19, F:0] + 100h

**Default:** 00h

|       |   |   |                |       |   |   |   |

### 17.17.3 PCS\_DWORD2 (pcs\_dword2)—Offset 8h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**pcs\_dword2:** [Port: 0xA3] + (2200h + 8h)

#### Op Codes:

0h - Read, 1h - Write

**Default:** 00000000h

|                                  |                                |                                 |                      |                                  |                                |                                |                     |                           |

### 17.17.11 PCS\_DWORD10 (pcs\_dword10)—Offset 28h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**pcs\_dword10:** [Port: 0xA3] + (2200h + 28h)

#### Op Codes:

0h - Read, 1h - Write

**Default:** 00000000h
