| 19:16     | X<br>RW          | <b>SEC_CURR_OPER_MODE:</b> The field indicates the firmware mode of operation during this boot cycle. The host must look at this field only after DRAM_INIT_DONE (DID) register based message unless the firmware is in ERR before sending the DID. The Operation Mode doesn't change at runtime. Possible values: 0: Normal. SeC is running in normal mode. 1: Reserved. 2: Debug mode. SeC firmware enters this operation mode when SeC firmware FLASH variable TBD is configured in FLASH to 1. Firmware stays in this mode until the SeC firmware FLASH variable TBD is set to 0. 3: Soft temporary disable. SeC firmware enters this operation mode when BIOS sends the Temporary Disable message to firmware. Firmware stays in this mode until BIOS sends a follow-up message to get SeC out of this mode. Entering this mode is not supported when the system is provisioned with Intel AT firmware. 4: SECOVR_JMPR: SeC firmware enters this operation mode when HDA_SDO asserts high. Asserting the HDA_SDO high on the rising edge of PWROK will also disable SeC and SeC applications. 5: SECOVR_HECI_MSG: SeC firmware enters this operation mode during the firmware image re-flash in the factory environments. BIOS sends the flash protection override message (HMRFPD ENABLE HECI command) and causes a global reset then SeC firmware stays in this state similar to 'Soft Temporary Disable'. Before sending End of Post message (at late POST timeframe), BIOS needs to send a HMRFPD DISABLE command if SECOVR_HECI_MSG is set. In the same boot, the user can flash an image and reset (global reset or G3- exit) the system that will cause firmware to boot with a normal mode. |
| 15:12     | X<br>RW          | <b>ERR_CODE:</b> Set to a nonzero value if the firmware has encountered a fatal error. The firmware has stopped normal operation. Encoding as follows: 0: No error. Firmware is operational in current state. 1: Uncategorized Failure. SeC firmware has experienced an uncategorized error and has disabled itself. Further details of the failure can be found in field FW_STS1.EXT_STAT_DAT. This state can only be exited by powering down or resetting the machine. 2: Reserved. 3: Image Failure. SeC firmware stored in the system flash is not valid. If supported by the platform, the host should program a full firmware image into SeC flash region through the SPI controller. After completion of the SeC flash region update, the host should generate a full system reset the platform (global reset). 4: Debug Failure. Set when more data is available to the firmware on the cause of the failure. Please refer to field FW_STS1.EXT_STAT_DAT_CURR_STATE for more details. 5: Internal ROM Error. 6: Invalid fuse configuration. 7: Failure to access SPI FLASH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

When this bit set, it may or may not have the error code shown in field ERR_CODE. The system can get this bit clear by flashing the proper firmware image again.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 4         | X<br>RW          | <b>MANUF_MODE:</b> When this bit is set, the platform is still in Manufacturing mode. Host can use this bit to inform user that the platform is NOT ready for production yet. This bit is set as long as SeC Manufacturing Mode Done bit is set to 0 or SPI flash descriptor region is not locked. For shipping machine, this bit has to be to 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 3:0       | X<br>RW          | <b>SEC_CURR_WRK_STATE:</b> This field describes the current working state of the SeC firmware. Further information about the progress within the Current Working State can be found in field SEC_FW_STS1.EXT_STS_DAT. In spoken language, the 'Current Working State' indicates what firmware is doing at this moment. Encoding is as follows: 0: Reset. SeC firmware is in a reset state. 1: Initializing. SeC firmware is initializing, the final functional state is NOT known at this time. 2: Recovery: SeC firmware is recovering from an image update failure. Upon completion of this state, SeC firmware will enter the Initializing State. The firmware will stay in recovery state until a new firmware update is run. 3: Reserved. 4: Reserved. 5: Normal. SeC firmware is operating in normal state. 6: Platform Disable Wait. SeC firmware enters this state when it pauses itself with AT fuses set to halt platform after 30 minutes wait. 7: OP State Transition. SeC firmware sets this state before starting a transition to a new operation state. 8: Reserved. |

### 22.3.15 PCI\_CONF\_SEC\_TO\_HOST\_3\_7[0-4] (PCI\_CONF\_SEC\_TO\_HOST\_3\_7\_REGS[0-4])—Offset 4Ch, Count 5, Stride 4h

PCI Configuration register - SeC to Host 3-7. The functionality of this register is currently reserved. Register access control: FW=RW PMC=RO Host=RO

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset[0-4]:** [B:0, D:26, F:0] + 4Ch + [0-4]\*4h

**Default:** 00000000h

DRAM Init Done Message. BIOS uses this register in order to pass a message to SeC about the memory that it has reserved for SEC. Register acces control: FW=RO PMC=RW Host=RW

## Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**Offset:** [B:0, D:26, F:0] + 60h

**Default:** 00000000h

## 23 PCI Express\* 2.0

There are four lanes and up to four PCI Express root ports, each supporting the *PCI Express\* Base Specification*, Rev. 2.0 at a maximum 5 GT/s signaling rate. The root ports can be configured to support a diverse set of lane assignments.

### 23.1 Signal Descriptions

Please see [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

**Note:** PMC\_WAKE\_PCIE[3:0]# are not listed, but can be used by PCI Express\* devices. Please see [Section 30, "PCU – Power Management Controller \(PMC\)"](#) on page 4344 for details.

**Table 240. Signals**

| Signal Name                              | Direction<br>Plat. Power | Description                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PCIE_TXP[3:0]<br/>PCIE_TXN[3:0]</b>   | O<br>PCIESATA            | <b>PCI Express* Transmit</b><br>PCI Express* Ports 3:0 transmit pair (P and N) signals. Each pair makes up the transmit half of a lane.                                                                                                                                                                                                                                                        |
| <b>PCIE_RXP[3:0]<br/>PCIE_RXN[3:0]</b>   | I<br>PCIESATA            | <b>PCI Express* Receive:</b><br>PCI Express* Ports 3:0 receive pair (P and N) signals. Each pair makes up the receive half of lane.                                                                                                                                                                                                                                                            |
| <b>PCIE_CLKP[3:0]<br/>PCIE_CLKN[3:0]</b> | O<br>V1P0S               | <b>PCI Express* Output Clock</b><br>100-MHz differential clock signals. These are not owned by the PCI Express* controller, but are platform clocks found in the Integrated Clock.                                                                                                                                                                                                             |
| <b>PCIE_CLKREQ[3:0]#</b>                 | I<br>V1P8S               | <b>PCI Express* Clock Request</b><br>Used for devices that need to request one of the four output clocks. Each clock request maps to the matching clock output (e.g., PCIE_CLKREQ[0] maps to PCIE_CLKP/N[0]). These are not owned by the PCI Express* controller, but are platform clocks found in the Integrated Clock.<br><i>These signals are muxed and may be used by other functions.</i> |
| <b>PCIE_RCOMP_P<br/>PCIE_RCOMP_N</b>     | I/O                      | These pins are used to connect the external resistors used for Rcomp. Please contact your Intel representative for details.                                                                                                                                                                                                                                                                    |

**Figure 112. PCIe\* 2.0 Lane 0 Signal Example**

## 23.2 Features

- Conforms to *PCI Express\* Base Specification, Rev. 2.0*
- 5.0 or 2.5 GT/s operation per root port
- Virtual Channel support for VC0
- x1, x2 and x4 link widths (auto negotiated)
- Flexible Root Port (1-4) configuration options
  - (4) x1's

- (2) x2's
- (1) x2 plus (2) x1's
- (1) x4
- Interrupts and Events
  - Legacy (INTx) and MSI Interrupts
  - General Purpose Events
  - Express Card Hot Plug Events
  - System Error Events
- Power Management
  - Link State support for L0s, L1 and L2
  - Powered down in ACPI S3 state - L3

### 23.2.1 Root Port Configurations

Depending on SKU, there are up to four possible lane assignments for root ports 1-4.

**Figure 113. Root Port Configuration Options**

Root port configurations are set by SoftStraps stored in SPI flash, and the default option is "(4) x1". Links for each root port will train automatically to the maximum possible for each port.

**Note:** x2 link widths are not common. Most devices will only train to x1 or x4.

**Note:** PCI functions in PCI configuration space are disabled for root ports not available.

## 23.2.2 Interrupts and Events

A root port is capable of handling interrupts and events from an end point device. A root port can also generate its own interrupts for some events, including power management and hot plug events, but also including error events.

There are two interrupt types a root port will receive from an end point device: INTx (legacy), and MSI. MSI's are automatically passed upstream by the root port, just as other memory writes would be. INTx messages are delivered to the Legacy block's interrupt router/controller by the root port.

Events and interrupts that are handled by the root port are shown with the possible interrupts they can deliver to the interrupt decoder/router.

**Table 241. Possible Interrupts Generated From Events/Packets**

| Packet/Event          | Type   | INTx | MSI | SERR | SCI | SMI | GPE |
|-----------------------|--------|------|-----|------|-----|-----|-----|
| INTx                  | Packet | X    | X   |      |     |     |     |
| PM_PME                | Packet | X    | X   |      |     |     |     |
| Power Management (PM) | Event  | X    | X   |      | X   | X   |     |
| Hot Plug (HP)         | Event  | X    | X   |      | X   | X   |     |
| ERR_CORR              | Packet |      |     | X    |     |     |     |
| ERR_NONFATAL          | Packet |      |     | X    |     |     |     |
| ERR_FATAL             | Packet |      |     | X    |     |     |     |
| Internal Error        | Event  |      |     | X    |     |     |     |
| VDM                   | Packet |      |     |      |     |     | X   |

**Note:** Table 241 lists the possible interrupts and events generated based on Packets received, or events generated in the root port. Configuration needed by software to enable the different interrupts as applicable.

When INTx interrupts are received by an end point, they are mapped to the following interrupts and sent to the interrupt decoder/router in the iLB:

**Table 242. Interrupt Generated for INT[A-D] Interrupts**

|             | INTA  | INTB  | INTC  | INTD  |
|-------------|-------|-------|-------|-------|
| Root Port 1 | INTA# | INTB# | INTC# | INTD# |
| Root Port 2 | INTD# | INTA# | INTB# | INTC# |
| Root Port 3 | INTC# | INTD# | INTA# | INTB# |
| Root Port 4 | INTB# | INTC# | INTD# | INTA# |

**Note:** Interrupts generated from events within the root port are not swizzled.

### 23.2.2.1 Express Card Hot Plug Events

Express Card Hot Plug is available based on Presence Detection for each root port.

**Note:** A full Hot Plug Controller is not implemented.

Presence detection occurs when a PCI Express\* device is plugged in and power is supplied. The physical layer will detect the presence of the device, and the root port will set the SLSTS.PDS and SLSTS.PDC bits.

When a device is removed and detected by the physical layer, the root port will clear the SLSTS.PDS bit, and set the SLSTS.PDC bit.

Interrupts can be generated by the root port when a hot plug event occurs. A hot plug event is defined as the transition of the SLSTS.PDC bit from 0 to 1. Software can set the SLCTL.PDE and SLTCTL.HPE bits to allow hot plug events to generate an interrupt.

If SLCTL.PDE and SLTCTL.HPE are both set, and SLSTS.PDC transitions from 0 to 1, an interrupt will be generated.

#### 23.2.2.2 System Error (SERR)

System Error events are support by both internal and external sources. See the PCI Express\* Base Specification, Rev. 2.0 for details.

#### 23.2.3 Power Management

Each root port's link supports L0s, L1, and L2/3 link states per PCI Express\* Base Specification, Rev. 2.0. L2/3 is entered on entry to S3.

### 23.3 References

*PCI Express\* Base Specification, Rev. 2.0*

### 23.4 Register Map

Each root port supports its own extended PCI bridge header in PCI configuration space. These headers are located on PCI bus 0, device 28, functions 0-3 as shown below. There are no other registers implemented by the root ports or their controller.

See Chapters [Chapter 3, "Register Access Methods"](#) and [Chapter 4, "Mapping Address Spaces"](#) for additional information.

**Figure 114. PCI Express Register Map**

## 23.5 PCI Configuration Registers

Registers listed are for function 0 (root port 1). All other root ports contain the same registers. Differences for other root ports (functions 1-3) will be noted in individual registers.

## 23.6 PCI Express\* PCI Configuration Registers

**Table 243. Summary of PCI Express\* PCI Configuration Registers—0/28/0**

| Offset | Size | Register ID—Description                                                                                               | Default Value |
|--------|------|-----------------------------------------------------------------------------------------------------------------------|---------------|

| 10        | 0b<br>RW/V       | <b>Interrupt Disable (ID):</b> This disables pin-based INTx# interrupts on enabled hot plug and power management events. This bit has no effect on MSI operation. When set, internal INTx# messages will not be generated. When cleared, internal INTx# messages are generated if there is an interrupt for hot plug or power management and MSI is not enabled. This bit does not affect interrupt forwarding from devices connected to the root port. Assert_INTx and Deassert_INTx messages will still be forwarded to the internal interrupt controllers if this bit is set. For PCI Bus Emulation Mode compatibility, if the PCIBEM register is set, this register is RO and returns a value of 0 when read, else it is RW with the functionality described above. |

This register is not dependent on CMD.SEE being set.                   |
| 1         | 0b<br>RW         | <b>System Error on Non-Fatal Error Enable (SNE):</b> When set, an SERR# will be generated if a non-fatal error is reported by any of the devices in the hierarchy of this root port, including non-fatal errors in this root port. This register is not dependent on CMD.SEE being set.       |
| 0         | 0b<br>RW         | <b>System Error on Correctable Error Enable (SCE):</b> When set, an SERR# will be generated if a correctable error is reported by any of the devices in the hierarchy of this root port, including correctable errors in this root port. This register is not dependent on CMD.SEE being set. |

### 23.6.21 Root Status (RSTS)—Offset 60h

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                               |
|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:18     | 0000h<br>RO      | <b>Reserved (RSVD):</b> Reserved                                                                                                                                                                                                                                                                          |
| 17        | 0b<br>RO/V       | <b>PME Pending (PP):</b> Indicates another PME is pending when the PME status bit is set. When the original PME is cleared by software, it will be set again, the requestor ID will be updated, and this bit will be cleared. Root ports have a one deep PME pending queue.                               |
| 16        | 0b<br>RW/C       | <b>PME Status (PS):</b> Indicates that PME was asserted by the requestor ID in RID. Subsequent PMEs are kept pending until this bit is cleared.                                                                                                                                                           |
| 15:0      | 0000h<br>RO/V    | <b>PME Requestor ID (RID):</b> Indicates the PCI requestor ID of the last PME requestor. Valid only when PS is set. Root ports are capable of storing the requester ID for two PM_PME messages, with one active (this register) and a one deep pending queue. Subsequent PM_PME messages will be dropped. |

### 23.6.22 Device Capabilities 2 (DCAP2)—Offset 64h

## Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**DCAP2:** [B:0, D:28, F:0] + 64h

**Power Well:** Core

**Default:** 00080816h

| 3:0       | 6h<br>RO         | <b>Completion Timeout Ranges Supported (CTRS):</b> This field indicates device support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. Four time value ranges are defined: Range A: 50us to 10ms Range B: 10ms to 250ms Range C: 250ms to 4s Range D: 4s to 64s Bits are set according to the table below to show timeout value ranges supported. 0000b Completion Timeout programming not supported. 0001b Range A 0010b Range B 0011b Ranges A [amp] B 0110b Ranges B [amp] C [It]-- This is supported 0111b Ranges A, B [amp] C 1110b Ranges B, C [amp] D 1111b Ranges A, B, C [amp] D All other values are reserved. |

### 23.6.23 Device Control 2; Device Status 2 (DCTL2\_DSTS2)—Offset 68h

## Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**DCTL2 DSTS2:** [B:0, D:28, F:0] + 68h

### Power Well: Core

**Default:** 00000000h

| 4         | 0b<br>RW         | <b>Completion Timeout Disable (CTD):</b> When set to 1b, this bit disables the Completion Timeout mechanism. This field is required for all devices that support the Completion Timeout Disable Capability. Software is permitted to set or clear this bit at any time. When set, the Completion Timeout detection mechanism is disabled. If there are outstanding requests when the bit is cleared, it is permitted but not required for hardware to apply the completion timeout mechanism to the outstanding requests. If this is done, it is permitted to base the start time for each request on either the time this bit was cleared or the time each request was issued.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 3:0       | 0h<br>RW         | <b>Completion Timeout Value (CTV):</b> In Devices that support Completion Timeout programmability, this field allows system software to modify the Completion Timeout value. This field is applicable to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. A Device that does not support this optional capability must hardwire this field to 0000b and is required to implement a timeout value in the range 50us to 50ms. Devices that support Completion Timeout programmability must support the values given below corresponding to the programmability ranges indicated in the Completion Timeout Values Supported field. The root port targeted configurable ranges are listed below, along with the range allowed by the PCI Express 2.0 specification. Defined encodings: 0000b Default range: 40-50ms (spec range 50us to 50ms) Values available if Range B (10ms to 250ms) programmability range is supported: 0101b 40-50ms (spec range is 16ms to 55ms) 0110b 160-170ms (spec range is 65ms to 210ms) Values available if Range C (250ms to 4s) programmability range is supported: 1001b 400-500ms (spec range is 260ms to 900ms) 1010b 1.6-1.7s (spec range is 1s to 3.5s) Values not defined above are Reserved. Software is permitted to change the value in this field at any time. For requests already pending when the Completion Timeout Value is changed, hardware is permitted to use either the new or the old value for the outstanding requests, and is permitted to base the start time for each request either when this value was changed or when each request was issued. |

## 23.6.34 PCI Power Management Control And Status (PMCS)—Offset A4h

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**PMCS:** [B:0, D:28, F:0] + A4h

**Power Well:** Core

**Default:** 00000000h

| 3         | 0b<br>RO         | <b>No Soft Reset (NSR):</b> When set to 1 this bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset. Configuration context is preserved. Upon transition from D3hot to D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits. When clear, devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the Power State bits. Configuration Context is lost when performing the soft reset. Upon transition from D3hot to D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled. |

| 1:0       | 00b<br>RW        | <b>Power State (PS):</b> This field is used both to determine the current power state of the root port and to set a new power state. The values are: 00 D0 state 11 D3HOT state When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Type 1 configuration cycles are also not accepted. Interrupts are not required to be blocked as software will disable interrupts prior to placing the port into D3HOT. If software attempts to write a '10' or '01' to these bits, the write will be ignored.                                                                                                                                                                                                                                                                                                                                                                                |

### 23.6.35 Manufacturer's ID (MANID)—Offset F8h

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**MANID:** [B:0, D:28, F:0] + F8h

**Power Well:** Core

**Default:** 00000F00h

### 23.6.39 Uncorrectable Error Severity (UEV)—Offset 10Ch

This register gives the option to make an uncorrectable error fatal or non-fatal. An error is fatal if the bit is set. An error is non-fatal if the bit is cleared. This register is only reset by a loss of core power.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**UEV:** [B:0, D:28, F:0] + 10Ch

**Power Well:** Core

**Default:** 00060011h

## 23.6.49 Error Source Identification (ESID)—Offset 134h

Size:32 bits Identifies the source (Requester ID) of the first correctable and uncorrectable (Non-Fatal / Fatal) errors reported in the Root Error Status register. This register is only reset by a loss of core power.

### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**ESID:** [B:0, D:28, F:0] + 134h

**Power Well:** Core

**Default:** 00000000h

|         |    |    |    |       |    |   |   |   |
|---------|----|----|----|-------|----|---|---|---|
| 31      | 28 | 24 | 20 | 16    | 12 | 8 | 4 | 0 |

| 25        | 0h<br>RW         | <b>i_rxsq_asyncmode_h:</b> Squelch Async Startup Mode This squelch startup mode is power state independent. When enabled, the squelchen signal sent to Modphy will asynchronously enable the squelch detector circuit. Once enabled, the squelch detector circuit will asynchronously send an unfiltered/unqualified squelch indication signal out of Modphy. The squelch indication signal will initially be unstable, so it is up to the consumer of this signal to filter/qualify it accordingly. The asynchronous squelch startup mode is beneficial because it significantly reduces the squelch startup latency. This decrease in latency does come at the cost of slightly higher power when squelch is not enabled as the IREF and Squelch Keeper circuits must remain enabled. When disabled, the squelch startup sequence is synchronous in nature and the squelch indication signal sent out of Modphy is stable/filtered. |

The susclk enable must be continuously de-asserted for the duration of this delay in order for the de-asserted state to be captured by the clock gating controller. 5'b00000 - 0 Cycle Delay 5'b00001 - 1 Cycle Delay 5'b00010 - 2 Cycle Delay ..... 5'b11110 - 30 Cycle Delay 5'b11111 - 31 Cycle Delay                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 9:8       | 0h<br>RW         | <b>cri_data_dynclkgate_mode_1_0:</b> Controls the dynamic clock gating behavior in the data lane. 00 - susclk gating and laneclkreq disabled (Forced to configured value). In this mode the susclk will not be gated under any circumstances and the laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 01 - susclk gating disabled, laneclkreq enabled . In this mode the susclk will not be gated under any circumstances. The laneclkreq sent out of the data lane will toggle based on whether the lane power state, susclk need and the previous lane's laneclkreq signal. 10 - susclk gating enabled, laneclkreq disabled (forced to configured value) - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 11 - susclk gating and laneclkreq enabled - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the data lane will toggle based on the lane power state, susclk need and the previous lane's laneclkreq signal. |

## 23.8.6 TX\_DWORD5 (tx\_dword5)—Offset 14h

### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**tx\_dword5:** [Port: 0xA6] + (280h + 14h)

### Op Codes:

0h - Read, 1h - Write

**Default:** 00000000h

### 23.8.13 TX\_DWORD12 (tx\_dword12)—Offset 30h

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**tx\_dword12:** [Port: 0xA6] + (280h + 30h)

#### Op Codes:

0h - Read, 1h - Write

**Default:** 00000000h

October 2018  
Document Number: 538136, Rev. 4.3

| Bit Range | Default & Access | Description                                                                                                                                                                                                                |
|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11:8      | 0h<br>RW         | <b>ovisa1_lanesel_3_0</b> : VISA Lane Select for Lane1. Selects the byte of data to be sent out on lane1.                                                                                                                  |
| 7         | 0h<br>RW         | <b>ovisa_bypass</b> : VISA Bypass. Allows for signals to be passed asynchronously through VISA block. Applies to both lane0 and lane1. 0 : Flop signals in local VISA block (default) 1 : Bypass flops in local VISA block |
| 6:4       | 0h<br>RW         | <b>ovisa0_clkssel_2_0</b> : VISA Clock Select for Lane0. Selects the source synchronous clock to be used for data being sent on lane0.                                                                                     |
| 3:0       | 0h<br>RW         | <b>ovisa0_lanesel_3_0</b> : VISA Lane Select for Lane0. Selects data byte to be driven out of VISA-0 byte. Can be either clocked or unclocked data                                                                         |

### 23.8.16 TX\_DWORD15 (tx\_dword15)—Offset 3Ch

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**tx\_dword15:** [Port: 0xA6] + (280h + 3Ch)

#### Op Codes:

0h - Read, 1h - Write

**Default:** 00000000h

The susclk enable must be continuously de-asserted for the duration of this delay in order for the de-asserted state to be captured by the clock gating controller. 5'b00000 - 0 Cycle Delay 5'b00001 - 1 Cycle Delay 5'b00010 - 2 Cycle Delay ..... 5'b11110 - 30 Cycle Delay 5'b11111 - 31 Cycle Delay                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 9:8       | 0h<br>RW         | <b>cri_data_dynclkgate_mode_1_0:</b> Controls the dynamic clock gating behavior in the data lane. 00 - susclk gating and laneclkreq disabled (Forced to configured value). In this mode the susclk will not be gated under any circumstances and the laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 01 - susclk gating disabled, laneclkreq enabled . In this mode the susclk will not be gated under any circumstances. The laneclkreq sent out of the data lane will toggle based on whether the lane power state, susclk need and the previous lane's laneclkreq signal. 10 - susclk gating enabled, laneclkreq disabled (forced to configured value) - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the lane will be forced to a programmed value (can be forced high or low) 11 - susclk gating and laneclkreq enabled - In this mode the susclk will be gated during P2/Slumber when there are no requests to change the TX common mode. The laneclkreq sent out of the data lane will toggle based on the lane power state, susclk need and the previous lane's laneclkreq signal. |

## 23.10.10 TX\_DWORD9 (tx\_dword9)—Offset 24h

### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**tx\_dword9:** [Port: 0xA6] + (480h + 24h)

### Op Codes:

0h - Read, 1h - Write

**Default:** 00430C06h

### 23.10.11 TX\_DWORD10 (tx\_dword10)—Offset 28h

**Type:** Message Bus Register  
(Size: 32 bits)

**Op Codes:**

Intel Atom® Processor E3800 Product Family  
Datasheet  
3327

### 23.10.12 TX\_DWORD11 (tx\_dword11)—Offset 2Ch

| 25        | 0h<br>RW         | <b>i_rxsq_asyncmode_h:</b> Squelch Async Startup Mode This squelch startup mode is power state independent. When enabled, the squelchen signal sent to Modphy will asynchronously enable the squelch detector circuit. Once enabled, the squelch detector circuit will asynchronously send an unfiltered/unqualified squelch indication signal out of Modphy. The squelch indication signal will initially be unstable, so it is up to the consumer of this signal to filter/qualify it accordingly. The asynchronous squelch startup mode is beneficial because it significantly reduces the squelch startup latency. This decrease in latency does come at the cost of slightly higher power when squelch is not enabled as the IREF and Squelch Keeper circuits must remain enabled. When disabled, the squelch startup sequence is synchronous in nature and the squelch indication signal sent out of Modphy is stable/filtered. |

This register is applicable to synchronous squelch startup mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 25        | 0h<br>RW         | <b>i_rxsq_asyncmode_h:</b> Squelch Async Startup Mode This squelch startup mode is power state independent. When enabled, the squelchen signal sent to Modphy will asynchronously enable the squelch detector circuit. Once enabled, the squelch detector circuit will asynchronously send an unfiltered/unqualified squelch indication signal out of Modphy. The squelch indication signal will initially be unstable, so it is up to the consumer of this signal to filter/qualify it accordingly. The asynchronous squelch startup mode is beneficial because it significantly reduces the squelch startup latency. This decrease in latency does come at the cost of slightly higher power when squelch is not enabled as the IREF and Squelch Keeper circuits must remain enabled. When disabled, the squelch startup sequence is synchronous in nature and the squelch indication signal sent out of Modphy is stable/filtered. |

### 23.14.4 TX\_DWORD3 (tx\_dword3)—Offset Ch

#### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**tx\_dword3:** [Port: 0xA6] + (880h + Ch)

#### Op Codes:

0h - Read, 1h - Write

**Default:** 0C782040h

October 2018  
Document Number: 538136, Rev. 4.3

## 23.14.5 TX\_DWORD4 (tx\_dword4)—Offset 10h

### Access Method

**Type:** Message Bus Register  
(Size: 32 bits)

**tx\_dword4:** [Port: 0xA6] + (880h + 10h)

### Op Codes:

0h - Read, 1h - Write

**Default:** 2B40D55h

## 24 Serial IO (SIO) Overview

The Serial I/O (SIO) is a collection of hardware blocks that implement simple but key serial I/O interfaces for platform usage. These hardware blocks include:

- SIO - I<sup>2</sup>C Interface
- SIO - High Speed UART
- SIO - Serial Peripheral Interface (SPI)
- SIO - Pulse Width Modulation (PWM)

### 24.1 Serial I/O (SIO) Register Map

Refer to [Chapter 3, "Register Access Methods"](#) and [Chapter 4, "Mapping Address Spaces"](#) for additional information.

|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:8      | 000000h<br>RO    | <b>Class Code (CLASS_CODES):</b> The Class Code register is read-only and used to identify the generic function of the device and, in some cases, a specific register level programming interface. The register is broken into three byte size fields. The upper byte (at offset 0Bh) is a base class code which broadly classifies the type of function the device performs. The middle byte (at offset 0Ah) is a sub-class code which identifies more specifically the function of the device. The lower byte (at offset 09h) identifies a specific register-level programming interface (if any) so that device independent software can interact with the device. This register is tied to a strap at the top level. |
| 7:0       | 00h<br>RO        | <b>Revision ID (RID):</b> Revision ID identifies the revision of particular AHB device. This is tied to a strap at the top level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### 24.3.1 Source Address Register for Channel 0 - Low (SAR0\_LO)—Offset 0h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current AHB transfer.

#### Access Method

**Offset:** [BAR] + 0h

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

### 24.3.3 Destination Address Register for Channel 0 - Low (DAR0\_LO)—Offset 8h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current AHB transfer.

## Access Method

| 12        | 0h<br>RW         | <b>Done Bit (DONE)</b> : If status write-back is enabled, the upper word of the control register, CTLx[63:32], is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTLx.DONE bit to see when a block transfer is complete. The LLI CTLx.DONE bit should be cleared when the linked lists are set up in memory, prior to enabling the channel.<br>LLI accesses are always 32-bit accesses (Hsize = 2) aligned to 32-bit boundaries and cannot be changed or programmed to anything other than 32-bit. |
| 11:0      | 2h<br>RW         | <b>Block Transfer Size (BLOCK_TS)</b> : When the DW_ahb_dmac is the flow controller, the user writes this field before the channel is enabled in order to indicate the block size.                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### 24.3.11 Dest Status Register for Channel 0 - Low (DSTAT0\_LO)—Offset 28h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI before the start of the next block. For conditions under which the destination status information is fetched, refer to the abovementioned spec.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 28h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

### 24.3.19 Source Gather Register for Channel 0 - Low (SGR0\_LO)—Offset 48h

The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

## Access Method

| 31:0      | 0h<br>RW         | <b>SAR:</b> Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every source transfer throughout the block transfer. |

### 24.3.46 Source Address Register for Channel 2 - High (SAR2\_HI)—Offset B4h

Refer to the description for register Source Address Register for Channel 0 - Low.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + B4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

  #### 24.3.54 Source Status Register for Channel 2 - High (SSTAT2\_HI)—Offset D4h

Refer to the register description for Source Status Register for Channel 0 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + D4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

### 24.3.57 Source Status Address Register for Channel 2 - Low (SSTATAR2\_LO)—Offset E0h

## Access Method

**BAR Reference:** [B:0, D:30, F:0] + 10h

Diagram illustrating the SSTATAR architecture. The input is a 32-bit vector divided into eight 4-bit segments, labeled 0, 4, 8, 12, 16, 20, 24, and 28. The output is a 32-bit vector labeled SSTATAR.

| 31:0      | 0h<br>RW         | <b>Current Source Address of DMA Transfer (SAR):</b> Updated after each source transfer. The SINC field in the CTLx register determines whether the address increments, decrements, or is left unchanged on every source transfer throughout the block transfer. |

### 24.3.68 Source Address Register for Channel 3 - High (SAR3\_HI)—Offset 10Ch

Refer to the description for register Source Address Register for Channel 0 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 10Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

[illegible]

| Bit Range | Default & Access | Field Name (ID): Description |

### 24.3.69 Destination Address Register for Channel 3 - Low (DAR3\_LO)–Offset 110h

Refer to the description for register Destination Address Register for Channel 0 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 110h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

## Access Method

**BAR Reference:** [B:0, D:30, F:0] + 10h

The diagram illustrates the SSTATAR architecture. A 32-bit input vector, labeled with bit positions 0 through 31, is fed into a block labeled SSTATAR. The output of the block is a 32-bit vector. The first 16 bits (0 to 15) of the output are zero, and the remaining 16 bits (16 to 31) contain the input data, effectively shifting the input data to the higher-order bits of the output vector.

| Bit Range | Default & Access | Field Name (ID): Description                                                                                      |

### 24.3.129 Source Gather Register for Channel 5 - Low (SGR5\_LO)—Offset 200h

Refer to the register description for Source Gather Register for Channel 0 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 200h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

### 24.3.130 Source Gather Register for Channel 5 - High (SGR5\_HI)—Offset 204h

Refer to the register description for Source Gather Register for Channel 0 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 204h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

## Access Method

**Offset:** [BAR] + 208h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

| 19:0      | 0h<br>RW         | <b>Dest Scatter Interval (DSI):</b> Refer to the description for DSR0_LO.DSI.                                 |

### 24.3.132 Dest Scatter Register for Channel 5 - High (DSR5\_HI)—Offset 20Ch

## Access Method

**Offset:** [BAR] + 20Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

## Access Method

**Offset:** [BAR] + 210h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

### 24.3.134 Source Address Register for Channel 6 - High (SAR6\_HI)—Offset 214h

## Access Method

**Offset:** [BAR] + 214h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

## Access Method

**Offset:** [BAR] + 218h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |  |  |  |  |  |  |  |  |  |  |  | ### 24.3.136 Destination Address Register for Channel 6 - High (DAR6\_HI)—Offset 21Ch

Refer to the description for register Destination Address Register for Channel 0 - Low.

## Access Method

**Offset:** [BAR] + 21Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

## Access Method

**Offset:** [BAR] + 220h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                               |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 31:2      | 0h<br>RW         | <b>LOC:</b> Starting Address In Memory of next LLI if block chaining is enabled.                                                           |
| 1:0       | 0h<br>RW         | <b>List Master Select (LMS):</b> Identifies the AHB layer/interface where the memory device that stores the next linked list item resides. |

### 24.3.138 Linked List Pointer Register for Channel 6 - High (LLP6\_HI)—Offset 224h

## Access Method

**Offset:** [BAR] + 224h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                                     |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 24.3.143 Dest Status Register for Channel 6 - Low (DSTAT6\_LO)—Offset 238h

Refer to the register description for Dest Status Register for Channel 0 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 238h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

Diagram of the 32-bit DSTAT register. The register is divided into eight 4-bit fields. The top row shows bit positions 31, 28, 24, 20, 16, 12, 8, and 4. The bottom row shows bit positions 0, 4, 8, 12, 16, 20, 24, and 28. The label 'DSTAT' is centered below the register.

| Bit Range | Default & Access | Field Name (ID): Description                                                                         |

### 24.3.173 Source Gather Register for Channel 7 - Low (SGR7\_LO)—Offset 2B0h

Refer to the register description for Source Gather Register for Channel 0 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 2B0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

[illegible]

| Bit Range | Default & Access | Field Name (ID): Description                                                                             |
|-----------|------------------|----------------------------------------------------------------------------------------------------------|
| 31:20     | 0h<br>RW         | <b>Source Gather Count (SGC):</b> Source contiguous transfer count between successive gather boundaries. |
| 19:0      | 0h<br>RW         | <b>Source Gather Interval (SGI):</b> Refer to the description for SGR0_LO.SGI.                           |

### 24.3.174 Source Gather Register for Channel 7 - High (SGR7\_HI)—Offset 2B4h

Refer to the register description for Source Gather Register for Channel 0 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 2B4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

[illegible]

### 24.3.176 Dest Scatter Register for Channel 7 - High (DSR7\_HI)—Offset 2BCh

Refer to the register description for Destination Scatter Register for Channel 0 - Low.

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 2BCh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

### 24.3.177 Interrupt Raw Status Registers - Low (RawTfr\_LO)—Offset 2C0h

## Access Method

**Offset:** [BAR] + 2C4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|-----------|------------------|------------------------------|

### 24.3.188 Interrupt Status Registers - High (StatusTfr\_HI)—Offset 2ECh

All interrupt events from all channels are stored in these Interrupt Status registers after masking: StatusBlock, StatusDstTran, StatusErr, StatusSrcTran, and StatusTfr. Each Interrupt Status register has a bit allocated per channel; for example, StatusTfr[2] is the Channel 2 status transfer complete interrupt. The contents of these registers are used to generate the interrupt signals (int or int\_n bus, depending on interrupt polarity) leaving the DW\_ahb\_dmac.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 2ECh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

### 24.3.190 Interrupt Status Registers - High (StatusBlock\_HI)—Offset 2F4h

Refer to the description for register StatusTfr\_HI.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 2F4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

|           |    |    |    |    |    |   |   |   |

### 24.3.199 Interrupt Mask Registers - Low (MaskBlock\_LO)—Offset 318h

The contents of the Raw Status registers are masked with the contents of the Mask registers: MaskBlock, MaskDstTran, MaskErr, MaskSrcTran, and MaskTfr. Each Interrupt Mask register has a bit allocated per channel; for example, MaskTfr[2] is the mask bit for the Channel 2 transfer complete interrupt.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 318h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

| 15:8      | 0h<br>WO         | <b>Interrupt Mask Write Enable (INT_MASK_WE):</b> <ul style="list-style-type: none"> <li>0 = write disabled</li> <li>1 = write enabled</li> </ul> |

## Access Method

**Offset:** [BAR] + 324h

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

Diagram illustrating the bit positions (0 to 31) of a 32-bit register. The register is divided into four 8-bit segments. The first segment (bits 0-7) contains the value 0. The second segment (bits 8-15) contains the value 0. The third segment (bits 16-23) contains the value 0. The fourth segment (bits 24-31) contains the value 0. The label "Undefined" is placed below the first three segments, indicating they are not defined.

| Bit Range | Default & Access | Field Name (ID): Description |
|-----------|------------------|------------------------------|
| 31:0      | 0h<br>RW         | <b>Undefined:</b> Reserved.  |

### 24.3.207 Interrupt Clear Registers - Low (ClearTfr\_LO)—Offset 338h

Each bit in the Raw Status and Status registers is cleared on the same cycle by writing a 1 to the corresponding location in the Clear registers: ClearBlock, ClearDstTran, ClearErr, ClearSrcTran, and ClearTfr. Each Interrupt Clear register has a bit allocated per channel; for example, ClearTfr[2] is the clear bit for the Channel 2 transfer complete interrupt. Writing a 0 has no effect. These registers are not readable.

#### Access Method

### 24.3.209 Interrupt Clear Registers - Low (ClearBlock\_LO)—Offset 340h

Refer to the description for register ClearTfr\_HI.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 340h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

|           |    |    |    |    |    |   |       |   |

### 24.3.218 Combined Interrupt Status Register - High (StatusInt\_HI)— Offset 364h

Refer to the description for register StatusInt\_LO.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 364h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                             |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15:8      | 0h<br>WO         | <b>Destination Request Write Enable (DST_REQ_WE):</b> <ul style="list-style-type: none"><li>0 = write disabled</li><li>1 = write enabled</li></ul>                                       |
| 7:0       | 0h<br>RW         | <b>Destination Request (DST_REQ):</b> A bit is assigned for each channel in this register. ReqDstReg[n] is ignored when software handshaking is not enabled for the source of channel n. |

### 24.3.222 Destination Software Transaction Request Register - High (ReqDstReg\_HI)—Offset 374h

A bit is assigned for each channel in this register. ReqDstReg[n] is ignored when software handshaking is not enabled for the source of channel n.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 374h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

| 31:0      | 0h<br>RW         | <b>Undefined:</b> Reserved.  |

### 24.3.237 DW\_ahb\_dmac Test Register - Low (DmaTestReg\_LO)—Offset 3B0h

This register is used to put the AHB slave interface into test mode, during which the readback value of the writable registers match the value written, assuming the DW\_ahb\_dmac configuration has not optimized the same registers. In normal operation, the readback value of some registers is a function of the DW\_ahb\_dmac state, and does not match the value written.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 3B0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

### 24.3.248 DW\_ahb\_dmac Component Parameters Register 2 - High (DMA\_COMP\_PARAMS\_2\_HI)—Offset 3ECh

This is a constant read-only register that contains encoded information about the component parameter settings. The reset value depends on coreConsultant parameter(s).

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 3ECh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 00000000h

### 24.3.250 DW\_ahb\_dmac Component Parameters Register 1 - High (DMA\_COMP\_PARAMS\_1\_HI)—Offset 3F4h

Refer to the description for DW\_ahb\_dmac Component Parameters Register 1 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 3F4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 37000F04h

### 24.3.251 DMA Component ID RegisterDma - Low (DmaCompsID\_LO)— Offset 3F8h

This is the DW\_ahb\_dmac Component Version register, which is a read-only register that specifies the version of the packaged component in the upper 32 bits and the component type in the lower 32 bits.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 3F8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:30, F:0] + 10h

**Default:** 44571110h

## 24.5.1 Source Address Register for Channel 0 - Low (SAR0\_LO)—Offset 0h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current AHB transfer.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

|     |    |    |    |    |    |   |   |   |
|-----|----|----|----|----|----|---|---|---|
| 31  | 28 | 24 | 20 | 16 | 12 | 8 | 4 | 0 |

#### 24.5.4 Destination Address Register for Channel 0 - High (DAR0\_HI)—Offset Ch

## Access Method

**Offset:** [BAR] + Ch

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|-----------|------------------|------------------------------|
| 31:0      | 0h<br>RW         | <b>Undefined:</b> Reserved.  |

### 24.5.6 Linked List Pointer Register for Channel 0 - High (LLP0\_HI)—Offset 14h

## 24.5.7 Control Register for Channel 0 - Low (CTL0\_LO)—Offset 18h

This register contains fields that control the DMA transfer. **Note:** You need to program this register prior to enabling the channel.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 18h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00304801h

| 12        | 0h<br>RW         | <p><b>Done Bit (DONE):</b> If status write-back is enabled, the upper word of the control register, CTLx[63:32], is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTLx.DONE bit to see when a block transfer is complete. The LLI CTLx.DONE bit should be cleared when the linked lists are set up in memory, prior to enabling the channel.</p> <p>LLI accesses are always 32-bit accesses (Hsize = 2) aligned to 32-bit boundaries and cannot be changed or programmed to anything other than 32-bit.</p> |

| Bit Range | Default & Access | Field Name (ID): Description |
|-----------|------------------|------------------------------|
| 31:0      | 0h<br>RW         | <b>Undefined:</b> RESERVED   |

#### 24.5.11 Dest Status Register for Channel 0 - Low (DSTAT0\_LO)—Offset 28h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI before the start of the next block. For conditions under which the destination status information is fetched, refer to the abovementioned spec.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 28h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

Diagram illustrating the IEEE 754 single-precision floating-point format (32 bits):

- Sign (S): 1 bit (bit 31)
- Exponent (E): 8 bits (bits 30-23)
- Mantissa (M): 23 bits (bits 22-0)

The mantissa field is further divided into four groups of 4 bits each, with the last group being 3 bits.

#### 24.5.16 Dest Status Address Register for Channel 0 - High (DSTATAR0\_HI)—Offset 3Ch

Refer to the description for register Dest Status Address Register for Channel 0 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 3Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

Diagram illustrating the bit positions (0 to 31) of a 32-bit register. The register is divided into four 8-bit segments. The first segment (bits 0-7) contains the value 0. The second segment (bits 8-15) contains the value 0. The third segment (bits 16-23) contains the value 0. The fourth segment (bits 24-31) contains the value 0. The label "Undefined" is placed below the first three segments, indicating they are not defined.

## 24.5.22 Dest Scatter Register for Channel 0 - High (DSR0\_HI)—Offset 54h

Refer to the register description for Destination Scatter Register for Channel 0 - Low.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 54h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

## 24.5.23 Source Address Register for Channel 1 - Low (SAR1\_LO)—Offset 58h

Refer to the description for register Source Address Register for Channel 0 - Low.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 58h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

| 11:0      | 2h<br>RW         | <b>Block Transfer Size (BLOCK_TS)</b> : When the DW_ahb_dmac is the flow controller, the user writes this field before the channel is enabled, to indicate the block size. |

### 24.5.31 Source Status Register for Channel 1 - Low (SSTAT1\_LO)—Offset 78h

Refer to the register description for Source Status Register for Channel 0 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 78h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

[illegible]

#### 24.5.34 Dest Status Register for Channel 1 - High (DSTAT1\_HI)—Offset 84h

## Access Method

**Offset:** [BAR] + 84h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

## Access Method

**Offset:** [BAR] + 90h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |  |  |  |  |  |  |  |  |  |  |  |  | ### 24.5.38 Dest Status Address Register for Channel 1 - High (DSTATAR1\_HI)—Offset 94h

## Access Method

**Offset:** [BAR] + 94h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

## Access Method

**Offset:** [BAR] + 98h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**Default:** 00000E20h

| Bit Range | Default & Access | Field Name (ID): Description                                                                                                                                                                                                                  |
|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31        | 0h<br>RW         | <b>Automatic Destination Reload (RELOAD_DST):</b> The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.                                                                 |
| 30        | 0h<br>RW         | <b>Automatic Source Reload (RELOAD_SRC):</b> The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers.                                                                      |
| 29:20     | 0h<br>RW         | <b>Maximum AMBA Burst Length (MAX_ABRST):</b> Maximum AMBA burst length that is used for DMA transfers on this channel. A value of 0 indicates that software is not limiting the maximum AMBA burst length for DMA transfers on this channel. |

#### 24.5.56 Dest Status Register for Channel 2 - High (DSTAT2\_HI)—Offset DCh

Refer to the register description for Dest Status Register for Channel 0 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + DCh

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

### 24.5.57 Source Status Address Register for Channel 2 - Low (SSTATAR2\_LO)—Offset E0h

Refer to the description for register Source Status Address Register for Channel 0 - Low.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + E0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

 ## 24.5.96 Control Register for Channel 4 - High (CTL4\_HI)—Offset 17Ch

Refer to the register description for Control Register for Channel 0 - Low.

### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 17Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000002h

## Access Method

**BAR Reference:** [B:0, D:24, F:0] + 10h

|       |    |   |    |   |    |   |    |   |    |   |    |   |   |   |   |   |   |

 #### 24.5.104 Dest Status Address Register for Channel 4 - High (DSTATAR4\_HI)—Offset 19Ch

Refer to the description for register Dest Status Address Register for Channel 0 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 19Ch

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

| 31        | 28               | 24                           | 20 | 16 | 12 | 8 | 4 | 0 |

### 24.5.105 Configuration Register for Channel 4 - Low (CFG4\_LO)—Offset 1A0h

Refer to the register description for Configuration Register for Channel 0 - Low.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 1A0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000E80h

### 24.5.118 Control Register for Channel 5 - High (CTL5\_HI)—Offset 1D4h

Refer to the register description for Control Register for Channel 0 - Low.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 1D4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000002h

[illegible]

Intel Atom® Processor E3800 Product Family  
Datasheet  
3705

## Access Method

**Offset:** [BAR] + 1E0h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

#### 24.5.122 Dest Status Register for Channel 5 - High (DSTAT5\_HI)—Offset 1E4h

## Access Method

**Offset:** [BAR] + 1E4h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

### 24.5.123 Source Status Address Register for Channel 5 - Low (SSTATAR5\_LO)—Offset 1E8h

Refer to the description for register Source Status Address Register for Channel 0 - Low.

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [BAR] + 1E8h

**BAR Type:** PCI Configuration Register (Size: 32 bits)

**BAR Reference:** [B:0, D:24, F:0] + 10h

**Default:** 00000000h

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |  |  |  |  |  |  |  |
