The host controller supports 8 command protocols of the SMBus interface (see *System Management Bus (SMBus) Specification, Version 2.0*): Quick Command, Send Byte, Receive Byte, Write Byte/Word, Read Byte/Word, Process Call, Block Read/Write and Block Write-Block Read Process Call. Additionally, it supports 1 command protocol for I<sup>2</sup>C devices: I<sup>2</sup>C Read.

The SMBus host controller requires that the various data and command fields be setup for the type of command to be sent. When software sets the START bit, the SMBus Host controller performs the requested transaction, and interrupts the processor (or generates an SMI#) when the transaction is completed. Once a START command has been issued, the values of the “active registers” (Host Control (SMB\_Mem\_HCTL), Host Command (SMB\_Mem\_HCMD), Transmit Slave Address (SMB\_Mem\_TSA), Data 0 (SMB\_Mem\_HD0), Data 1 (SMB\_Mem\_HD1)) should not be changed or read until the interrupt status message (SMB\_Mem\_HSTS.INTR) has been set (indicating the completion of the command). Any register values needed for computation purposes should be saved prior to issuing of a new command, as the SMBus host controller updates all registers while completing the new command.

#### 33.2.1.1 Command Protocols

In all of the following commands, the Host Status (SMB\_Mem\_HSTS) register is used to determine the progress of the command. While the command is in operation, the SMB\_Mem\_HSTS.HBSY bit is set. If the command completes successfully, the SMB\_Mem\_HSTS.INTR bit will be set. If the device does not respond with an

acknowledge, and the transaction times out, the SMB\_Mem\_HSTS.DEVERR bit is set. If software sets the SMB\_Mem\_HCTL.KILL bit while the command is running, the transaction will stop and the SMB\_Mem\_HSTS.FAILED bit will be set.

### Quick Command

When programmed for a Quick Command, the Transmit Slave Address (SMB\_Mem\_TSA) register is sent. The PEC byte is never appended to the Quick Protocol. Software should force the SMB\_Config\_HCTL.PECEN bit to 0b when performing the Quick Command. Software must force the SMB\_Config\_HCFG.I2C\_EN bit to 0b when running this command. See section 5.5.1 of the *System Management Bus (SMBus) Specification*, Version 2.0 for the format of the protocol.

### Send Byte / Receive Byte

For the Send Byte command, the Transmit Slave Address (SMB\_Mem\_TSA) and Host Command (SMB\_Mem\_HCMTD) registers are sent. For the Receive Byte command, the Transmit Slave Address (SMB\_Mem\_TSA) register is sent. The data received is stored in the Data 0 (SMB\_Mem\_HD0) register. Software must force the SMB\_Config\_HCFG.I2C\_EN bit to 0b when running this command.

The Receive Byte is similar to a Send Byte, the only difference is the direction of data transfer. See sections 5.5.2 and 5.5.3 of the *System Management Bus (SMBus) Specification*, Version 2.0 for the format of the protocol.

### Write Byte/Word

The first byte of a Write Byte/Word access is the command code. The next 1 or 2 bytes are the data to be written. When programmed for a Write Byte/Word command, the Transmit Slave Address (SMB\_Mem\_TSA), Host Command (SMB\_Mem\_HCMTD), and Data 0 (SMB\_Mem\_HD0) registers are sent. In addition, the Data 1 (SMB\_Mem\_HD1) register is sent on a Write Word command. Software must force the SMB\_Config\_HCFG.I2C\_EN bit to 0 when running this command. See section 5.5.4 of the *System Management Bus (SMBus) Specification*, Version 2.0 for the format of the protocol.

### Read Byte/Word

Reading data is slightly more complicated than writing data. First the SoC must write a command to the slave device. Then it must follow that command with a repeated start condition to denote a read from that device's address. The slave then returns 1 or 2 bytes of data. Software must force the SMB\_Config\_HCFG.I2C\_EN bit to 0b when running this command.

When programmed for the read byte/word command, the Transmit Slave Address (SMB\_Mem\_TSA) and Host Command (SMB\_Mem\_HCMTD) registers are sent. Data is received into the Data 0 (SMB\_Mem\_HD0) on the read byte, and the Data 0

(SMB\_Mem\_HD0) and Data 1 (SMB\_Mem\_HD1) registers on the read word. See section 5.5.5 of the *System Management Bus (SMBus) Specification*, Version 2.0 for the format of the protocol.

### Process Call

The process call is so named because a command sends data and waits for the slave to return a value dependent on that data. The protocol is simply a Write Word followed by a Read Word, but without a second command or stop condition.

When programmed for the Process Call command, the SoC transmits the Transmit Slave Address (SMB\_Mem\_TSA), Host Command (SMB\_Mem\_HCMD), Data 0 (SMB\_Mem\_HD0) and Data 1 (SMB\_Mem\_HD1) registers. Data received from the device is stored in the Data 0 (SMB\_Mem\_HD0) and Data 1 (SMB\_Mem\_HD1) registers. The Process Call command with SMB\_Config\_HCFG.I2C\_EN set and the SMB\_Config\_HCTL.PECEN bit set produces undefined results. Software must force either SMB\_Config\_HCFG.I2C\_EN or SMB\_Config\_HCTL.PECEN & SMB\_Mem\_AUXC.AAC to 0b when running this command. See section 5.5.6 of the *System Management Bus (SMBus) Specification*, Version 2.0 for the format of the protocol.

**Note:** For process call command, the value written into SMB\_Mem\_TSA.RW needs to be 0b.

**Note:** If the SMB\_Config\_HCFG.I2C\_EN bit is set, the protocol sequence changes slightly: the Command Code (Bits 18:11 in the bit sequence) are not sent - as a result, the slave will not acknowledge (Bit 19 in the sequence).

### Block Read/Write

The SoC contains a 32-byte buffer for read and write data which can be enabled by setting SMB\_Mem\_AUXC.E32B, as opposed to a single byte of buffering. This 32-byte buffer is filled with write data before transmission, and filled with read data on reception. In the SoC, the interrupt is generated only after a transmission or reception of 32 bytes, or when the entire byte count has been transmitted/received.

**Note:** When operating in I<sup>2</sup>C mode (SMB\_Config\_HCFG.I2C\_EN bit is set), the SoC will never use the 32-byte buffer for any block commands.

The byte count field is transmitted but ignored by the SoC as software will end the transfer after all bytes it cares about have been sent or received.

For a Block Write, software must either force the SMB\_Config\_HCFG.I2C\_EN bit or both the SMB\_Config\_HCTL.PECEN and SMB\_Mem\_AUXC.AAC bits to 0b when running this command.

The block write begins with a slave address and a write condition. After the command code the SoC issues a byte count describing how many more bytes will follow in the message. If a slave had 20 bytes to send, the first byte would be the number 20 (14h), followed by 20 bytes of data. The byte count may not be 0. A Block Read or Write is allowed to transfer a maximum of 32 data bytes.

When programmed for a block write command, the Transmit Slave Address (SMB\_Mem\_TSA), Host Command (SMB\_Mem\_HCMD) and Data 0 (SMB\_Mem\_HD0) registers are sent. Data is then sent from the Host Block Data (SMB\_Mem\_HBD) register; the total data sent being the value stored in the Data 0 (SMB\_Mem\_HD0) register. On block read commands, the first byte received is stored in the Data 0 (SMB\_Mem\_HD0) register, and the remaining bytes are stored in the Host Block Data (SMB\_Mem\_HBD) register. See section 5.5.7 of the *System Management Bus (SMBus) Specification*, Version 2.0 for the format of the protocol.

**Note:** For Block Write, if the SMB\_Config\_HCFG.I2C\_EN bit is set, the format of the command changes slightly. The SoC will still send the number of bytes (on writes) or receive the number of bytes (on reads) indicated in the Data 0 (SMB\_Mem\_HD0) register. However, it will not send the contents of the Data 0 (SMB\_Mem\_HD0) register as part of the message. Also, the Block Write protocol sequence changes slightly: the Byte Count (bits 27:20 in the bit sequence) are not sent - as a result, the slave will not acknowledge (bit 28 in the sequence).

#### Block Write–Block Read Process Call

The block write-block read process call is a two-part message. The call begins with a slave address and a write condition. After the command code the host issues a write byte count (M) that describes how many more bytes will be written in the first part of the message. If a master has 6 bytes to send, the byte count field will have the value 6 (0000 0110b), followed by the 6 bytes of data. The write byte count (M) cannot be 0.

The second part of the message is a block of read data beginning with a repeated start condition followed by the slave address and a Read bit. The next byte is the read byte count (N), which may differ from the write byte count (M). The read byte count (N) cannot be 0.

The combined data payload must not exceed 32 bytes. The byte length restrictions of this process call are summarized as follows:

- $M \geq 1$  byte
- $N \geq 1$  byte
- $M + N \leq 32$  bytes

The read byte count does not include the PEC byte. The PEC is computed on the total message beginning with the first slave address and using the normal PEC computational rules. It is highly recommended that a PEC byte be used with the Block Write-Block Read Process Call. Software must do a read to the Host Command (SMB\_Mem\_HCMD) register to reset the 32 byte buffer pointer prior to reading the Host Block Data (SMB\_Mem\_HBD) register.

Note that there is no STOP condition before the repeated START condition, and that a NACK signifies the end of the read transfer.

**Note:** The SMB\_Mem\_AUXC.E32B bit in the Auxiliary Control register must be set when using this protocol.

See section 5.5.8 of the *System Management Bus (SMBus) Specification, Version 2.0* for the format of the protocol.

### I<sup>2</sup>C Read

This command allows the SoC to perform block reads to certain I<sup>2</sup>C devices, such as serial EEPROMs. The SMBus Block Read supports the 7-bit addressing mode only.

However, this does not allow access to devices using the I<sup>2</sup>C “Combined Format” that has data bytes after the address. Typically these data bytes correspond to an offset (address) within the serial memory chips.

**Note:** This command is supported independent of the setting of the SMB\_Config\_HCFG.I2C\_EN bit. The I<sup>2</sup>C Read command with the SMB\_Config\_HCTL.PECEN bit set produces undefined results. Software must force both the SMB\_Config\_HCTL.PECEN and SMB\_Mem\_AUXC.AAC bit to 0b when running this command.

For I<sup>2</sup>C Read command, the value written into SMB\_Mem\_TSA.RW needs to be 1b. The format that is used for the command is shown in below table.

**Table 311. I<sup>2</sup>C Block Read**

| Bit   | Description                         |
|-------|-------------------------------------|
| 1     | Start                               |
| 8:2   | Slave Address – 7 bits              |
| 9     | Write                               |
| 10    | Acknowledge from slave              |
| 18:11 | Send Data 1 (SMB_Mem_HD1) register  |
| 19    | Acknowledge from slave              |
| 20    | Repeated Start                      |
| 27:21 | Slave Address – 7 bits              |
| 28    | Read                                |
| 29    | Acknowledge from slave              |
| 37:30 | Data byte 1 from slave – 8 bits     |
| 38    | Acknowledge                         |
| 46:39 | Data byte 2 from slave – 8 bits     |
| 47    | Acknowledge                         |
| –     | Data bytes from slave / Acknowledge |
| –     | Data byte N from slave – 8 bits     |
| –     | NOT Acknowledge                     |
| –     | Stop                                |

The SoC will continue reading data from the peripheral until the NAK is received.

### 33.2.2 Bus Arbitration

Several masters may attempt to get on the bus at the same time by driving the PCU\_SMB\_DATA line low to signal a start condition. The SoC continuously monitors the PCU\_SMB\_DATA line. When the SoC is attempting to drive the bus to a 1 by letting go of the PCU\_SMB\_DATA line, and it samples PCU\_SMB\_DATA low, then some other master is driving the bus and the SoC will stop transferring data.

If the SoC sees that it has lost arbitration, the condition is called a collision. The SoC will set SMB\_Mem\_HSTS.BERR, and if enabled, generate an interrupt or SMI#. The processor is responsible for restarting the transaction.

The SoC, as a SMBus master, drives the clock. When the SoC is sending address or command or data bytes on writes, it drives data relative to the clock it is also driving. It will not start toggling the clock until the start or stop condition meets proper setup and hold time. The SoC will also ensure minimum time between SMBus transactions as a master.

### 33.2.3 Bus Timing

#### 33.2.3.1 Clock Stretching

Some devices may not be able to handle their clock toggling at the rate that the SoC as an SMBus master would like. They have the capability of stretching the low time of the clock. When the SoC attempts to release the clock (allowing the clock to go high), the clock will remain low for an extended period of time.

The SoC monitors the SMBus clock line after it releases the bus to determine whether to enable the counter for the high time of the clock. While the bus is still low, the high time counter must not be enabled. Similarly, the low period of the clock can be stretched by an SMBus master if it is not ready to send or receive data.

#### 33.2.3.2 Bus Time Out (SoC as SMBus Master)

If there is an error in the transaction, such that an SMBus device does not signal an acknowledge, or holds the clock lower than the allowed time-out time, the transaction will time out. The SoC will discard the cycle and set the SMB\_Mem\_HSTS.DEVERR bit. The time out minimum is 25 ms (800 RTC clocks). The time-out counter inside the SoC will start after the last bit of data is transferred by the SoC and it is waiting for a response.

The 25-ms time-out counter will not count under the following conditions:

1. The SMB\_Mem\_HSTS.BYTE\_DONE\_STS bit is set
2. The TCO\_STS.SECOND\_TO\_STS bit is not set (this indicates that the system has not locked up).

### 33.2.4 Interrupts / SMI#

The SoC SMBus controller uses INTB as its virtual interrupt wire. However, the system can alternatively be set up to generate SMI# instead of an interrupt, by setting the SMB\_Config\_HCFG.SMI\_EN bit.

Below tables specify how the various enable bits in the SMBus function control the generation of the interrupt and Host SMI internal signals. The rows in the tables are additive, which means that if more than one row is true for a particular scenario then the Results for all of the activated rows will occur.

**Table 312. Enable for PCU\_SMB\_ALERT#**

| Event                                                                  | SMB_Mem_HCTL.INTREN | SMB_Config_HCFG.SMI_EN | SMB_Mem_SCMD.SMBALTDIS | Result                               |
|------------------------------------------------------------------------|---------------------|------------------------|------------------------|--------------------------------------|
| PCU_SMB_ALERT# asserted low (always reported in SMB_Mem_HSTS.SMBALERT) | X                   | 1                      | 0                      | Slave SMI# generated (SMBUS_SMI_STS) |
|                                                                        | 1                   | 0                      | 0                      | Interrupt generated                  |

**Table 313. Enables for SMBus Host Events**

| Event                                                                                                      | SMB_Mem_HCTL.INTREN | SMB_Config_HCFG.SMI_EN | Event               |
|------------------------------------------------------------------------------------------------------------|---------------------|------------------------|---------------------|
| Any combination of SMB_Mem_HSTS.FAILED, SMB_Mem_HSTS.BERR, SMB_Mem_HSTS.DEVERR, SMB_Mem_HSTS.INTR asserted | 0                   | X                      | None                |
|                                                                                                            | 1                   | 0                      | Interrupt generated |
|                                                                                                            | 1                   | 1                      | Host SMI# generated |

**Table 314. Enables for the Host Notify Command**

| SMB_Mem_SCMD.HNINTREN | SMB_Config_HCFG.SMI_EN | SMB_Mem_SCMD.HNWAKEEN | Result                               |
|-----------------------|------------------------|-----------------------|--------------------------------------|
| 0                     | X                      | 0                     | None                                 |
| 1                     | 0                      | X                     | Interrupt generated                  |
| 1                     | 1                      | X                     | Slave SMI# generated (SMBUS_SMI_STS) |

### 33.2.5 PCU\_SMB\_ALERT#

PCU\_SMB\_ALERT# is multiplexed with GPIO\_S0\_SC[53]. When enabled and the signal is asserted, the SoC can generate an interrupt or an SMI#.

**Note:** Using this signal as a wake event from is not supported.

### 33.2.6 SMBus CRC Generation and Checking

If the SMB\_Mem\_AUXC.AAC is set, the SoC automatically calculates and drives CRC at the end of the transmitted packet for write cycles, and will check the CRC for read cycles. It will not transmit the contents of the Packet Error Check Data Register (SMB\_Mem\_PEC) PEC register for CRC. The SMB\_Mem\_HCTL.PECEN bit must not be set if this bit is set, or unspecified behavior will result.

If the read cycle results in a CRC error, the SMB\_Mem\_HSTS.DEVERR bit and the SMB\_Mem\_AUXS.CRCE bit will be set.

### 33.2.7 SMBus Slave Interface

The SoC does not implement a complete SMBus slave interface. Only the Host Notify Command is implemented to maintain specification compatibility.

#### 33.2.7.1 Format of Host Notify Command

The SoC tracks and responds to the standard Host Notify command as specified in the System Management Bus (SMBus) Specification, Version 2.0. The host address for this command is fixed to 0001000b. If the SoC already has data for a previously-received host notify command which has not been serviced yet by the host software (as indicated by the SMB\_Mem\_SSTS.HNST bit), then it will NACK following the host address byte of the protocol. This allows the host to communicate non-acceptance to the master and retain the host notify address and data values for the previous cycle until host software completely services the interrupt.

**Note:** Host software must always clear the SMB\_Mem\_SSTS.HNST bit after completing any necessary reads of the address and data registers.

Below table shows the Host Notify format.

**Table 315. Host Notify Format (Sheet 1 of 2)**

| Bit   | Description               | Driven By       | Comment                                                                                           |
|-------|---------------------------|-----------------|---------------------------------------------------------------------------------------------------|
| 1     | Start                     | External Master |                                                                                                   |
| 8:2   | SMB Host Address – 7 bits | External Master | Always 0001_000                                                                                   |
| 9     | Write                     | External Master | Always 0                                                                                          |
| 10    | ACK (or NACK)             | SoC             | SoC NACKs if SMB_Mem_SSTS.HNST is 1                                                               |
| 17:11 | Device Address – 7 bits   | External Master | Indicates the address of the master; loaded into the Notify Device Address Register (SMB_Mem_NDA) |
| 18    | Unused – Always 0         | External Master | 7-bit-only address; this bit is inserted to complete the byte                                     |
| 19    | ACK                       | SoC             |                                                                                                   |

Table 315. Host Notify Format (Sheet 2 of 2)

| Bit   | Description             | Driven By       | Comment                                                       |
|-------|-------------------------|-----------------|---------------------------------------------------------------|
| 27:20 | Data Byte Low – 8 bits  | External Master | Loaded into the Notify Data Low Byte Register (SMB_Mem_NDLB)  |
| 28    | ACK                     | SoC             |                                                               |
| 36:29 | Data Byte High – 8 bits | External Master | Loaded into the Notify Data High Byte Register (SMB_Mem_NDHB) |
| 37    | ACK                     | SoC             |                                                               |
| 38    | Stop                    | External Master |                                                               |

## 33.3 Use

### 33.3.1 Function Disable

The SMBus interface may be disabled by setting FUNC\_DIS\_2.SMB\_DIS to 1b.

### 33.3.2 SPD Write Disable

DRAM memory modules contain a 256-byte EEPROM, called SPD, accessible via SMBus used to store configuration information such as timing, physical size and more. A malicious user with administrative privileges can change and permanently lock invalid settings which could then lead to a permanent denial of service attack or a memory aliasing attack.

Write access to the SPI should be disabled by setting SMB\_Config\_HCFG.SPD\_WD to 1b.

| 7:0       | 00h<br>RO        | <b>Programming Interface (PRGIF):</b> Programming Interface |

### 33.6.7 D31\_F3\_Sub Class Code (SMB\_config\_SCC)—Offset Ah

A value of 05h indicates that this device is a SM Bus serial controller

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**SMB\_config\_SCC:** [B:0, D:31, F:3] + Ah

**Default:** 05h

|   |   |   |   |     |   |   |   |
|---|---|---|---|-----|---|---|---|
| 7 |   |   | 4 |     |   |   | 0 |
| 0 | 0 | 0 | 0 | 0   | 0 | 1 | 0 |
|   |   |   |   | SCC |   |   |   |

| Bit Range | Default & Access | Description                |
|-----------|------------------|----------------------------|
| 7:0       | 05h<br>RO        | <b>SCC:</b> Sub Class Code |

### 33.6.8 D31\_F3\_Base Class Code (SMB\_Config\_BCC)—Offset Bh

A value of 0Ch indicates that this device is a serial controller

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**SMB\_Config\_BCC:** [B:0, D:31, F:3] + Bh

**Default:** 0Ch

|   |   |   |   |     |   |   |   |
|---|---|---|---|-----|---|---|---|
| 7 |   |   | 4 |     |   |   | 0 |
| 0 | 0 | 0 | 0 | 0   | 1 | 1 | 0 |
|   |   |   |   | BCC |   |   |   |

| Bit Range | Default & Access | Description                 |
|-----------|------------------|-----------------------------|
| 7:0       | 0Ch<br>RO        | <b>BCC:</b> Base Class Code |

### 33.6.9 D31\_F3\_SMBus Memory Base Address (SMB\_Config\_MBARL)—Offset 10h

The memory bar

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**SMB\_Config\_MBARL:** [B:0, D:31, F:3] + 10h

**Default:** 00000000h

## Access Method

**SMB Config MBARH:** [B:0, D:31, F:3] + 14h

| Bit Range | Default & Access | Description          |
|-----------|------------------|----------------------|
| 31:0      | 00000000h<br>RO  | <b>BAR:</b> RESERVED |

### 33.6.11 D31\_F3\_SMB Base Addr (SMB\_Config\_IOBAR)—Offset 20h

The I/O memory bar

## Access Method

**SMB\_Config\_IOBAR:** [B:0, D:31, F:3] + 20h

|      |    |    |    |     |    |   |   |      |      |
|------|----|----|----|-----|----|---|---|------|------|
| 31   | 28 | 24 | 20 | 16  | 12 | 8 | 4 | 0    |      |
| 0    | 0  | 0  | 0  | 0   | 0  | 0 | 0 | 1    |      |
| RSV1 |    |    |    | BAR |    |   |   | RSV2 | TOST |

### 33.6.12 D31\_F3\_SVID (SMB\_Config\_SVID)—Offset 2Ch

| Bit Range | Default & Access | Description              |
|-----------|------------------|--------------------------|
| 15:0      | 0000h<br>RW/O    | <b>SID:</b> Subsystem ID |

### 33.6.14 D31\_F3\_CAP\_POINTER (SMB\_Config\_CAP\_POINTER)—Offset 34h

This optional register is used to point to a linked list of new capabilities implemented by this device. This register is only valid if the Capabilities List bit in the Status Register is set. If implemented, the bottom two bits are reserved and should be set to 00b. Software should mask these bits off before using this register as a pointer in Configuration Space to the first entry of a linked list of new capabilities.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**SMB\_Config\_CAP\_POINTER:** [B:0, D:31, F:3] + 34h

**Default:** 50h

|     |   |   |   |   |   |   |   |
|-----|---|---|---|---|---|---|---|
| 7   |   |   | 4 |   |   |   | 0 |
| 0   | 1 | 0 | 1 | 0 | 0 | 0 | 0 |
| CAP |   |   |   |   |   |   |   |

| Bit Range | Default & Access | Description                                                                        |
|-----------|------------------|------------------------------------------------------------------------------------|
| 7:0       | 50h<br>RO        | <b>Capability Pointer (CP):</b> Indicates the offset of the first Capability Item. |

### 33.6.15 D31\_F3\_Interrupt Line (SMB\_Config\_INTLN)—Offset 3Ch

This data is not used

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**SMB\_Config\_INTLN:** [B:0, D:31, F:3] + 3Ch

**Default:** 00h

|       |   |   |   |   |   |   |   |
|-------|---|---|---|---|---|---|---|
| 7     |   |   | 4 |   |   |   | 0 |
| 0     | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| INTLN |   |   |   |   |   |   |   |

| Bit Range | Default & Access | Description                  |
|-----------|------------------|------------------------------|
| 7:0       | 00h<br>RW        | <b>INTLN:</b> Interrupt Line |

### 33.6.16 D31\_F3\_Interrupt Pin (SMB\_Config\_INTPN)—Offset 3Dh

This register reflects the D31IP.SMIP in chipset configuration space

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**SMB\_Config\_INTPN:** [B:0, D:31, F:3] + 3Dh

**Default:** 02h

|       |   |   |
|-------|---|---|
| 7     | 4 | 0 |
| 0     | 0 | 0 |
| INTPN |   |   |

| Bit Range | Default & Access | Description                                                                                                                                  |
|-----------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 7:0       | 02h<br>RO        | <b>INTPN:</b> The 4 msb bits are hardwired to 0, and the 4 lsb bits are hardwired to 4'h2 indicates the INTB is used by the SMBus controller |

### 33.6.17 D31\_F3\_Host Configuration (SMB\_Config\_HCFG)—Offset 40h

Host Configuration Register

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**SMB\_Config\_HCFG:** [B:0, D:31, F:3] + 40h

**Default:** 00h

|      |        |        |
|------|--------|--------|
| 7    | 4      | 0      |

| 1:0       | 00b<br>RW        | <b>PowerState (PS):</b> This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the field values is given below. 00b - D0 01b - D1 10b - D2 11b - D3hot If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs. |

### 33.6.21 D31\_F3\_PMCSR\_BSE (SMB\_Config\_PMCSR\_BSE)—Offset 56h

PMCSR\_BSE supports PCI bridge specific functionality and is required for all PCI-to-PCI bridges.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**SMB\_Config\_PMCSR\_BSE:** [B:0, D:31, F:3] + 56h

**Default:** 00h

|       |     |      |   |

### 33.6.24 D31\_F3\_Manufacturer's ID (SMB\_Config\_MANID)—Offset F8h

Manufacturer's ID Register, The value reported in this register is coming from centralize unit by the SETIDVALUE message

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**SMB\_Config\_MANID:** [B:0, D:31, F:3] + F8h

**Default:** 00000000h

|      |       |     |     |      |    |   |   |   |

| 8h     | 1    | "Packet Error Check Data Register (SMB_Mem_PEC)—Offset 8h" on page 4472 | 00h           |
| Ch     | 1    | "Auxiliary Status (SMB_Mem_AUXS)—Offset Ch" on page 4473                | 00h           |
| Dh     | 1    | "Auxiliary Control (SMB_Mem_AUXC)—Offset Dh" on page 4473               | 00h           |
| Fh     | 1    | "SMBUS_PIN_CTL Register (SMB_Mem_SMBC)—Offset Fh" on page 4474          | 07h           |
| 10h    | 1    | "Slave Status Register (SMB_Mem_SSTS)—Offset 10h" on page 4474          | 00h           |
| 11h    | 1    | "Slave Command Register (SMB_Mem_SCMD)—Offset 11h" on page 4475         | 00h           |
| 14h    | 1    | "Notify Device Address Register (SMB_Mem_NDA)—Offset 14h" on page 4476  | 00h           |
| 16h    | 1    | "Notify Data Low Byte Register (SMB_Mem_NDLB)—Offset 16h" on page 4476  | 00h           |
| 17h    | 1    | "Notify Data High Byte Register (SMB_Mem_NDHB)—Offset 17h" on page 4477 | 00h           |

### 33.7.1 Host Status Register (SMB\_Mem\_HSTS)—Offset 0h

All status bits are set by hardware and cleared by the software writing a one to the particular bit position. Writing a zero to any bit position has no affect

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**SMB\_Mem\_HSTS:** [MBARL] + 0h

**MBARL Type:** PCI Configuration Register (Size: 32 bits)

**MBARL Reference:** [B:0, D:31, F:3] + 10h

**Default:** 00h

|     |     |            |        |      |        |      |      |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7         | 0b<br>RW         | <b>BDS:</b> BYTE_DONE_STS (BDS) - This bit will be set to 1 when the host controller has received a byte (for Block Read commands) or if it has completed transmission of a byte (for Block Write commands) when the 32-byte buffer is not being used. Note that this bit will be set, even on the last byte of the transfer. Software clears the bit by writing a 1 to the bit position. This bit has no meaning for block transfers when the 32-byte buffer is enabled. <b>Note: When the last byte of a block message is received, the host controller will set this bit. However, it will not immediately set the INTR bit (bit 1 in this register). When the interrupt handler clears the BYTE_DONE_STS bit, the message is considered complete, and the host controller will then set the INTR bit (and generate another interrupt). Thus, for a block message of n bytes, the SMBus host will generate n+1 interrupts. The interrupt handler needs to be implemented to handle these cases.</b> |
| 6         | 0b<br>RW         | <b>IUS:</b> In Use Status (IUS) - After a full PCI reset, a read to this bit returns a 0. After the first read, subsequent reads will return a 1. A write of a 1 to this bit will reset the next read value to 0. Writing a 0 to this bit has no effect. Software can poll this bit until it reads a 0, and will then own the usage of the host controller. This bit has no other effect on the hardware, and is only used as semaphore among various independent software threads that may need to use the SMBus host                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 5         | 0b<br>RW         | <b>SMB_ALERTB:</b> the SOC sets this bit to a '1' to indicates source of the interrupt or SMI# was the SMB_ALERTB signal. Software resets this bit by writing a 1 to this location.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 4         | 0b<br>RW         | <b>FAILED:</b> Failed (FAIL) - When set, this indicates that the source of the interrupt or SMI was a failed bus transaction. This is set in response to the KILL bit being set to terminate the host transaction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 0         | 0b<br>RW         | <b>HBSY:</b> Host Busy (HBSY) - A '1' indicates that the SMBus host is running a command from the host interface. No SMB registers should be accessed while this bit is set. Exception: The BLOCK DATA REGISTER can be accessed when this bit is set ONLY when the SMB_CMD bits (in Host control register) are programmed for Block command or I2C Read command. This is necessary in order to check the DONE_STS bit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### 33.7.2 Host Control Register (SMB\_Mem\_HCTL)—Offset 2h

Host Control Register

Note: A read to this register will clear the pointer in the 32-byte buffer.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**SMB\_Mem\_HCTL:** [MBARL] + 2h

**MBARL Type:** PCI Configuration Register (Size: 32 bits)

**MBARL Reference:** [B:0, D:31, F:3] + 10h

**Default:** 00h

| 7         | 0b<br>RW         | <b>PECEN:</b> PEC_EN: When set to '1', this bit causes the host controller to perform the SMBus transaction with the Packet Error Checking phase appended. For writes, the value of the PEC byte is transferred from the PEC Register. For reads, the PEC byte is loaded in to the PEC Register. When this bit is cleared to '0', the SMBus host controller does not perform the transaction with the PEC phase appended. This bit must be written prior to the write in which the START bit is set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 6         | 0b<br>WO         | <b>START (SATRT):</b> START: This write-only bit is used to initiate the command described in the SMB_CMD field. All registers should be setup prior to writing a '1' to this bit position. This bit always reads zero. The HOST_BUSY bit in the Host Status register (offset 00h) can be used to identify when the SMBus controller has finished the command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 5         | 0b<br>RW         | <b>LBYTE:</b> LAST_BYTE: Used for I2C Read commands as an indication that the next byte will be the last one to be received for that block. The algorithm and usage model for this bit will be as follows (assume a message of n bytes): A. When the software sees the BYTE_DONE_STS bit set (bit 7 in the SMBus Host Status Register) for each of bytes 1 through n-2 of the message, the software should then read the Block Data Byte Register to get the byte that was just received. B. After reading each of bytes 1 to n-2 of the message, the software will then clear the BYTE_DONE_STS bit. C. After receiving byte n-1 of the message, the software will then set the 'LAST BYTE' bit. The software will then clear the BYTE_DONE_STS bit. D. The Intel SOC will then receive the last byte of the message (byte n). However, the Intel SOC state machine will see the LAST_BYTE bit set, and instead of sending an ACK after receiving the last byte, it will instead send a NAK. E. After receiving the last byte (byte n), the software will still clear the BYTE_DONE_STS bit. However, the LAST_BYTE bit will be irrelevant at that point. Note: This bit may be set when the TCO timer causes the SECOND_TO_STS bit to be set. See the TCO_STS.SECOND_TO_STS register, for more details on that bit. The SMBus device driver should clear the LAST_BYTE bit (if it is set) before starting any new command. Note: In addition to I2C Read Commands, the LAST_BYTE bit will also cause Block Read/Write cycles to stop prematurely (at the end of the next byte). |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 4:2       | 000b<br>RW       | <p><b>SMBCMD: SMB_CMD</b> - As shown by the bit encoding below, indicates which command the SMBus host is to perform. If enabled, the SMBus host will generate an interrupt or SMI when the command has completed. If the value is for a non-supported or reserved command, the SMBus host will set the device error (DEV_ERR) status bit and generate an interrupt when the START bit is set. The SMBus controller will perform no command, and will not operate until DEV_ERR is cleared. <b>3'b000 - Quick</b></p> <p>The slave address and read/write value (bit 0) are stored in the tx slave address register</p> <p><b>3'b001 - Byte</b></p> <p>This command uses the transmit slave address and command registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 register will contain the read data.</p> <p><b>3'b010 - Byte Data</b></p> <p>This command uses the transmit slave address, command, and DATA0 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, the DATA0 register will contain the read data</p> <p><b>3'b011 - Word Data</b></p> <p>This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 and DATA1 registers will contain the read data.</p> <p><b>3'b100 - Process Call</b></p> <p>This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. After the command completes, the DATA0 and DATA1 registers will contain the read data.</p> <p><b>3'b101 - Block</b></p> <p>This command uses the transmit slave address, command, and DATA0 registers, and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block reads, the count is received and stored in the DATA0 register. Bit 0 of the slave address register selects if this is a read or write command. For writes, data is retrieved from the first n (where n is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register.</p> <p><b>3'b110 - I2C Read</b></p> <p>This command uses the transmit slave address, command, DATA0, DATA1 registers, and the Block Data Byte register. The read data is stored in the Block Data Byte register. The Intel SOC will continue reading data until the NAK is received.</p> <p><b>3'b111 - Block Process</b></p> <p>This command uses the transmit slave address, command, DATA0 and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block read, the count is received and stored in the DATA0 register. Bit 0 of the slave address register always indicate a write command. For writes, data is retrieved from the first m (where m is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. <b>Note: E32B bit in the Auxiliary Control Register must be set for this command to work.</b></p> |
| 1         | 0b<br>RW         | <p><b>KILL: KILL</b> - When set, kills the current host transaction taking place, sets the FAILED status bit, and asserts the interrupt (or SMI) selected by the SMB_Cfg_HCFG.SMI_EN field. This bit, once set, must be cleared to allow the SMB Host Controller to function normally</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### 33.7.3 Host Command Register (SMB\_Mem\_HCMD)—Offset 3h

This eight bit field is transmitted by the host controller in the command field of the SMB protocol during the execution of any command.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**SMB\_Mem\_HCMD:** [MBARL] + 3h

**MBARL Type:** PCI Configuration Register (Size: 32 bits)

**MBARL Reference:** [B:0, D:31, F:3] + 10h

**Default:** 00h

|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7:0       | 00h<br>RW        | <b>HD0:</b> DATA0/COUNT - This field contains the eight bit data sent in the DATA0 field of the SMB protocol. For block write commands, this register reflects the number of bytes to transfer. This register should be programmed to a value between 1 and 32 for block counts. A count of 0 or a count above 32 will result in unpredictable behavior. The host controller does not check or log illegal block counts. |

### 33.7.6 Data 1 Register (SMB\_Mem\_HD1)—Offset 6h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**SMB\_Mem\_HD1:** [MBARL] + 6h

**MBARL Type:** PCI Configuration Register (Size: 32 bits)

**MBARL Reference:** [B:0, D:31, F:3] + 10h

**Default:** 00h

| 7:0       | 00h<br>RW        | <b>HD1:</b> DATA1 - This eight bit register is transmitted in the DATA1 field of the SMB protocol during the execution of any command. |

### 33.7.7 Host Block Data (SMB\_Mem\_HBD)—Offset 7h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**SMB\_Mem\_HBD:** [MBARL] + 7h

**MBARL Type:** PCI Configuration Register (Size: 32 bits)

**MBARL Reference:** [B:0, D:31, F:3] + 10h

**Default:** 00h

| 7         | 4                | 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| 7:0       | 00h<br>RW        | <b>HBD:</b> Block Data (BDTA) - This is either a register, or a pointer into a 32-byte block array, depending upon whether the E32B bit is set in the Auxiliary Control register. When the E32B bit is cleared, this is a register containing a byte of data to be sent on a block write or read from on a block read, just as it behaved on the INTEL SOC. When the E32B bit is set, reads and writes to this register are used to access the 32-byte block data storage array. An internal index pointer is used to address the array, which is reset to 0 by reading the HCTL register (offset 02h). The index pointer then increments automatically upon each access to this register. The transfer of block data into (read) or out of (write) this storage array during an SMBus transaction always starts at index address 0. When the E32B bit is set, for writes, software will write up to 32-bytes to this register as part of the setup for the command. After the Host Controller has sent the Address, Command, and Byte Count fields, it will send the bytes in the SRAM pointed to by this register. When the E32B bit is cleared for writes, software will place a single byte in this register. After the host controller has sent the address, command, and byte count fields, it will send the byte in this register. If there is more data to send, software will write the next series of bytes to the FIFO pointed to by this register and clear the DONE_STS bit. The controller will then send the next byte. During the time between the last byte being transmitted to the next byte being transmitted, the controller will insert wait-states on the interface. When the E32B bit is set for reads, after receiving the byte count into the Data0 register, the first series of data bytes go into the FIFO pointed to by this register. If the byte count has been exhausted or the 32-byte FIFO has been filled, the controller will generate an SMI or interrupt (depending on configuration) and set the DONE_STS bit. Software will then read the data. During the time between when the last byte is read from the FIFO to when the DONE_STS bit is cleared, the controller will insert wait-states on the interface. |

### 33.7.8 Packet Error Check Data Register (SMB\_Mem\_PEC)—Offset 8h

This register contains the 8-bit CRC value that is used as the Packet Error Check on SMBus. For writes, this register is written by software prior to running the command. For reads, this register is read by software after the read command is completed on SMBus.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**SMB\_Mem\_PEC:** [MBARL] + 8h

**MBARL Type:** PCI Configuration Register (Size: 32 bits)

**MBARL Reference:** [B:0, D:31, F:3] + 10h

**Default:** 00h

| 0         | 0b<br>RW         | <b>HNST:</b> HOST_NOTIFY_STS: The SMBus controller sets this bit to a 1 when it has completely received a successful Host Notify Command on the SMBus pins. Software reads this bit to determine that the source of the interrupt or SMI# was the reception of the Host Notify Command. Software clears this bit after reading any information needed from the Notify address and data registers by writing a 1 to this bit. Note that the SMBus controller will allow the Notify Address and Data registers to be over-written once this bit has been cleared. When this bit is 1, the SMBus controller will NACK the first byte (host address) of any new 'Host Notify' commands on the SMBus. Writing a 0 to this bit has no effect. |

### 33.7.13 Slave Command Register (SMB\_Mem\_SCMD)—Offset 11h

All bits in this register are implemented in a slow (64khz) clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally. Also, software must confirm the prior written value before writing to the register again.

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**SMB\_Mem\_SCMD:** [MBARL] + 11h

**MBARL Type:** PCI Configuration Register (Size: 32 bits)

**MBARL Reference:** [B:0, D:31, F:3] + 10h

**Default:** 00h

| 2         | 0b<br>RW         | <b>SMBALTDIS:</b> Software sets this bit to 1 to block the generation of the interrupt or SMI# due to the SMB_ALERTB source. This bit is logically inverted and 'AND'ed with the SMB_ALERTB bit of HSTS register. The resulting signal is distributed to the SMI# and/or interrupt generation logic.                                                                                                                                                                                                                            |
| 1         | 0b<br>RW         | <b>HNWAKEEN:</b> Software sets this bit to 1 to enable the reception of a Host Notify command as a wake event.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 0         | 0b<br>RW         | <b>HNINTREN:</b> Software sets this bit to 1 to enable the generation of interrupt or SMI when HOST_NOTIFY_STS is 1. This enable does not affect the setting of the HOST_NOTIFY_STS bit. When the interrupt is generated, either INTRB or SMI is generated, depending on the value of the SMI_EN bit (D31, F3, Off40h, B1). If the HOST_NOTIFY_STS bit is set when this bit is written to a 1, then the interrupt (or SMI) will be generated. The interrupt (or SMI) is logically generated by AND'ing the STS and INTREN bits. |

### 33.7.14 Notify Device Address Register (SMB\_Mem\_NDA)—Offset 14h

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**SMB\_Mem\_NDA:** [MBARL] + 14h

**MBARL Type:** PCI Configuration Register (Size: 32 bits)

**MBARL Reference:** [B:0, D:31, F:3] + 10h

**Default:** 00h

|-----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7         | 0b<br>RW         | <b>BDS:</b> BYTE_DONE_STS (BDS) - This bit will be set to 1 when the host controller has received a byte (for Block Read commands) or if it has completed transmission of a byte (for Block Write commands) when the 32-byte buffer is not being used. Note that this bit will be set, even on the last byte of the transfer. Software clears the bit by writing a 1 to the bit position. This bit has no meaning for block transfers when the 32-byte buffer is enabled. <b>Note: When the last byte of a block message is received, the host controller will set this bit. However, it will not immediately set the INTR bit (bit 1 in this register). When the interrupt handler clears the BYTE_DONE_STS bit, the message is considered complete, and the host controller will then set the INTR bit (and generate another interrupt). Thus, for a block message of n bytes, the SMBus host will generate n+1 interrupts. The interrupt handler needs to be implemented to handle these cases.</b> |
| 6         | 0b<br>RW         | <b>IUS:</b> In Use Status (IUS) - After a full PCI reset, a read to this bit returns a 0. After the first read, subsequent reads will return a 1. A write of a 1 to this bit will reset the next read value to 0. Writing a 0 to this bit has no effect. Software can poll this bit until it reads a 0, and will then own the usage of the host controller. This bit has no other effect on the hardware, and is only used as semaphore among various independent software threads that may need to use the SMBus host                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 5         | 0b<br>RW         | <b>SMB_ALERTB:</b> the SOC sets this bit to a '1' to indicates source of the interrupt or SMI# was the SMB_ALERTB signal. Software resets this bit by writing a 1 to this location.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 0         | 0b<br>RW         | <b>HBSY:</b> Host Busy (HBSY) - A '1' indicates that the SMBus host is running a command from the host interface. No SMB registers should be accessed while this bit is set. Exception: The BLOCK DATA REGISTER can be accessed when this bit is set ONLY when the SMB_CMD bits (in Host control register) are programmed for Block command or I2C Read command. This is necessary in order to check the DONE_STS bit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### 33.8.2 Host Control Register (SMB\_Mem\_HCTL\_io)—Offset 2h

Host Control Register

Note: A read to this register will clear the pointer in the 32-byte buffer.

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**SMB\_Mem\_HCTL\_io:** [IOBAR] + 2h

**IOBAR Type:** PCI Configuration Register (Size: 32 bits)

**IOBAR Reference:** [B:0, D:31, F:3] + 20h

**Default:** 00h

| 7         | 0b<br>RW         | <b>PECEN:</b> PEC_EN: When set to '1', this bit causes the host controller to perform the SMBus transaction with the Packet Error Checking phase appended. For writes, the value of the PEC byte is transferred from the PEC Register. For reads, the PEC byte is loaded in to the PEC Register. When this bit is cleared to '0', the SMBus host controller does not perform the transaction with the PEC phase appended. This bit must be written prior to the write in which the START bit is set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 6         | 0b<br>WO         | <b>START (SATRT):</b> START: This write-only bit is used to initiate the command described in the SMB_CMD field. All registers should be setup prior to writing a '1' to this bit position. This bit always reads zero. The HOST_BUSY bit in the Host Status register (offset 00h) can be used to identify when the SMBus controller has finished the command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 5         | 0b<br>RW         | <b>LBYTE:</b> LAST_BYTE: Used for I2C Read commands as an indication that the next byte will be the last one to be received for that block. The algorithm and usage model for this bit will be as follows (assume a message of n bytes): A. When the software sees the BYTE_DONE_STS bit set (bit 7 in the SMBus Host Status Register) for each of bytes 1 through n-2 of the message, the software should then read the Block Data Byte Register to get the byte that was just received. B. After reading each of bytes 1 to n-2 of the message, the software will then clear the BYTE_DONE_STS bit. C. After receiving byte n-1 of the message, the software will then set the 'LAST BYTE' bit. The software will then clear the BYTE_DONE_STS bit. D. The Intel PCH will then receive the last byte of the message (byte n). However, the Intel PCH state machine will see the LAST_BYTE bit set, and instead of sending an ACK after receiving the last byte, it will instead send a NAK. E. After receiving the last byte (byte n), the software will still clear the BYTE_DONE_STS bit. However, the LAST_BYTE bit will be irrelevant at that point. Note: This bit may be set when the TCO timer causes the SECOND_TO_STS bit to be set. See the TCO2_STS Register in Volume 1, bit 1 for more details on that bit. The SMBus device driver should clear the LAST_BYTE bit (if it is set) before starting any new command. Note: In addition to I2C Read Commands, the LAST_BYTE bit will also cause Block Read/Write cycles to stop prematurely (at the end of the next byte). |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 4:2       | 000b<br>RW       | <p><b>SMBCMD:</b> SMB_CMD - As shown by the bit encoding below, indicates which command the SMBus host is to perform. If enabled, the SMBus host will generate an interrupt or SMI when the command has completed. If the value is for a non-supported or reserved command, the SMBus host will set the device error (DEV_ERR) status bit and generate an interrupt when the START bit is set. The SMBus controller will perform no command, and will not operate until DEV_ERR is cleared. <b>3'b000 - Quick</b></p> <p>The slave address and read/write value (bit 0) are stored in the tx slave address register</p> <p><b>3'b001 - Byte</b></p> <p>This command uses the transmit slave address and command registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 register will contain the read data.</p> <p><b>3'b010 - Byte Data</b></p> <p>This command uses the transmit slave address, command, and DATA0 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, the DATA0 register will contain the read data</p> <p><b>3'b011 - Word Data</b></p> <p>This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 and DATA1 registers will contain the read data.</p> <p><b>3'b100 - Process Call</b></p> <p>This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. After the command completes, the DATA0 and DATA1 registers will contain the read data.</p> <p><b>3'b101 - Block</b></p> <p>This command uses the transmit slave address, command, and DATA0 registers, and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block reads, the count is received and stored in the DATA0 register. Bit 0 of the slave address register selects if this is a read or write command. For writes, data is retrieved from the first n (where n is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register.</p> <p><b>3'b110 - I2C Read</b></p> <p>This command uses the transmit slave address, command, DATA0, DATA1 registers, and the Block Data Byte register. The read data is stored in the Block Data Byte register. The Intel PCH will continue reading data until the NAK is received.</p> <p><b>3'b111 - Block Process</b></p> <p>This command uses the transmit slave address, command, DATA0 and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block read, the count is received and stored in the DATA0 register. Bit 0 of the slave address register always indicate a write command. For writes, data is retrieved from the first m (where m is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. <b>Note: E32B bit in the Auxiliary Control Register must be set for this command to work.</b></p> |
| 1         | 0b<br>RW         | <p><b>KILL:</b> KILL - When set, kills the current host transaction taking place, sets the FAILED status bit, and asserts the interrupt (or SMI) selected by the SMB_INTRSEL field. This bit, once set, must be cleared to allow the SMB Host Controller to function normally</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### 33.8.3 Host Command Register (SMB\_Mem\_HCMD\_io)—Offset 3h

This eight bit field is transmitted by the host controller in the command field of the SMB protocol during the execution of any command.

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**SMB\_Mem\_HCMD\_io:** [IOBAR] + 3h

**IOBAR Type:** PCI Configuration Register (Size: 32 bits)

**IOBAR Reference:** [B:0, D:31, F:3] + 20h

**Default:** 00h

| 7:0       | 00h<br>RW        | <b>HD0:</b> DATA0/COUNT - This field contains the eight bit data sent in the DATA0 field of the SMB protocol. For block write commands, this register reflects the number of bytes to transfer. This register should be programmed to a value between 1 and 32 for block counts. A count of 0 or a count above 32 will result in unpredictable behavior. The host controller does not check or log illegal block counts. |

### 33.8.6 Data 1 Register (SMB\_Mem\_HD1\_io)—Offset 6h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**SMB\_Mem\_HD1\_io:** [IOBAR] + 6h

**IOBAR Type:** PCI Configuration Register (Size: 32 bits)

**IOBAR Reference:** [B:0, D:31, F:3] + 20h

**Default:** 00h

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |   |   |   |   |   |
| 7:0       | 00h<br>RW        | <b>HBD:</b> Block Data (BDTA) - This is either a register, or a pointer into a 32-byte block array, depending upon whether the E32B bit is set in the Auxiliary Control register. When the E32B bit is cleared, this is a register containing a byte of data to be sent on a block write or read from on a block read, just as it behaved on the INTEL SOC. When the E32B bit is set, reads and writes to this register are used to access the 32-byte block data storage array. An internal index pointer is used to address the array, which is reset to 0 by reading the HCTL register (offset 02h). The index pointer then increments automatically upon each access to this register. The transfer of block data into (read) or out of (write) this storage array during an SMBus transaction always starts at index address 0. When the E32B bit is set, for writes, software will write up to 32-bytes to this register as part of the setup for the command. After the Host Controller has sent the Address, Command, and Byte Count fields, it will send the bytes in the SRAM pointed to by this register. When the E32B bit is cleared for writes, software will place a single byte in this register. After the host controller has sent the address, command, and byte count fields, it will send the byte in this register. If there is more data to send, software will write the next series of bytes to the FIFO pointed to by this register and clear the DONE_STS bit. The controller will then send the next byte. During the time between the last byte being transmitted to the next byte being transmitted, the controller will insert wait-states on the interface. When the E32B bit is set for reads, after receiving the byte count into the Data0 register, the first series of data bytes go into the FIFO pointed to by this register. If the byte count has been exhausted or the 32-byte FIFO has been filled, the controller will generate an SMI or interrupt (depending on configuration) and set the DONE_STS bit. Software will then read the data. During the time between when the last byte is read from the FIFO to when the DONE_STS bit is cleared, the controller will insert wait-states on the interface. |   |   |   |   |   |

### 33.8.8 Packet Error Check Data Register (SMB\_Mem\_PEC\_io)—Offset 8h

This register contains the 8-bit CRC value that is used as the Packet Error Check on SMBus. For writes, this register is written by software prior to running the command. For reads, this register is read by software after the read command is completed on SMBus.

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**SMB\_Mem\_PEC\_io:** [IOBAR] + 8h

**IOBAR Type:** PCI Configuration Register (Size: 32 bits)

**IOBAR Reference:** [B:0, D:31, F:3] + 20h

**Default:** 00h

| 0         | 0b<br>RW         | <b>HNST:</b> HOST_NOTIFY_STS: The SMBus controller sets this bit to a 1 when it has completely received a successful Host Notify Command on the SMBus pins. Software reads this bit to determine that the source of the interrupt or SMI# was the reception of the Host Notify Command. Software clears this bit after reading any information needed from the Notify address and data registers by writing a 1 to this bit. Note that the SMBus controller will allow the Notify Address and Data registers to be over-written once this bit has been cleared. When this bit is 1, the SMBus controller will NACK the first byte (host address) of any new 'Host Notify' commands on the SMBus. Writing a 0 to this bit has no effect. |

### 33.8.13 Slave Command Register (SMB\_Mem\_SCMD\_io)—Offset 11h

All bits in this register are implemented in a slow (64khz) clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally. Also, software must confirm the prior written value before writing to the register again.

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**SMB\_Mem\_SCMD\_io:** [IOBAR] + 11h

**IOBAR Type:** PCI Configuration Register (Size: 32 bits)

**IOBAR Reference:** [B:0, D:31, F:3] + 20h

**Default:** 00h

| 2         | 0b<br>RW         | <b>SMBALTDIS:</b> Software sets this bit to 1 to block the generation of the interrupt or SMI# due to the SMB_ALERTB source. This bit is logically inverted and 'AND'ed with the SMB_ALERTB bit of HSTS register. The resulting signal is distributed to the SMI# and/or interrupt generation logic.                                                                                                                                                                                                                            |
| 1         | 0b<br>RW         | <b>HNWAKEEN:</b> Software sets this bit to 1 to enable the reception of a Host Notify command as a wake event.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 0         | 0b<br>RW         | <b>HNINTREN:</b> Software sets this bit to 1 to enable the generation of interrupt or SMI when HOST_NOTIFY_STS is 1. This enable does not affect the setting of the HOST_NOTIFY_STS bit. When the interrupt is generated, either INTRB or SMI is generated, depending on the value of the SMI_EN bit (D31, F3, Off40h, B1). If the HOST_NOTIFY_STS bit is set when this bit is written to a 1, then the interrupt (or SMI) will be generated. The interrupt (or SMI) is logically generated by AND'ing the STS and INTREN bits. |

### 33.8.14 Notify Device Address Register (SMB\_Mem\_NDA\_io)—Offset 14h

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**SMB\_Mem\_NDA\_io:** [IOBAR] + 14h

**IOBAR Type:** PCI Configuration Register (Size: 32 bits)

**IOBAR Reference:** [B:0, D:31, F:3] + 20h

**Default:** 00h

## 34 PCU – Intel® Legacy Block (iLB) Overview

The Intel Legacy Block (iLB) is a collection of disparate functional blocks that are critical for implementing the legacy PC platform features. These blocks include:

- PCU – iLB – Low Pin Count (LPC) Bridge
- PCU – iLB – Real Time Clock (RTC)
- PCU – iLB – 8254 Timers
- PCU – iLB – High Precision Event Timer (HPET)
- PCU – iLB – GPIO
- PCU – iLB – IO APIC
- PCU – iLB – 8259 Programmable Interrupt Controllers (PIC)

The iLB also implements a register range for configuration of some of those blocks along with support for Non-Maskable Interrupts (NMI).

### 34.1 Signal Descriptions

Please see [Chapter 2, "Physical Interfaces"](#) for additional details as well as the subsequent sections.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

Table 319. iLB Signals

| Signal Name    | Direction<br>Plat. Power | Description                                                                                                                              |
|----------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ILB_NMI</b> | I<br>V1P8S               | Non-Maskable Interrupt: This is an NMI event indication into the SoC.<br><i>This signal is muxed and may be used by other functions.</i> |

## 34.2 Features

### 34.2.1 Key Features

The key features of various blocks are as follows:

- Subtractive agent for the PCU
- LPC Interface
  - Supports Low Pin Count (LPC) 1.1 Specification
  - No support for DMA or bus mastering
  - Supports Trusted Platform Module (TPM) 1.2 and 2.0
  - Subtractive agent for the Intel Legacy Block
- General Purpose Input Output
  - Control interface for SoC GPIOs
  - I/O mapped registers
- 8259 Programmable Interrupt Controller
  - Legacy interrupt support
  - 15 total interrupts through two cascaded controllers
  - I/O and Memory mapped registers
- I/O Advanced Programmable Interrupt Controller
  - Legacy-free interrupt support
  - 87 total interrupts
  - Memory mapped registers
- 8254
  - Legacy timer support
  - Three timers with fixed uses: System Timer, Refresh Request Signal and Speaker Tone
  - I/O mapped registers
- HPET - High Performance Event Timers
  - Legacy-free timer support

- Three timers and one counter
- Memory mapped registers
- Real-Time Clock (RTC)
  - 242 byte RAM backed by battery (aka CMOS RAM)
  - Can generate wake/interrupt when time matches programmed value
  - I/O and indexed registers

### 34.2.2 Non-Maskable Interrupt

NMI support is enabled by setting the NMI Enable (NMI\_EN) bit, at IO Port 70h, Bit 7, to 0b.

Non-Maskable Interrupts (NMIs) can be generated by several sources, as described in [Table 320](#).

**Table 320. NMI Sources**

| NMI Source                                                                                                                                            | NMI Source Enabler/ Disabler | NMI Source Status | Alternate Configuration                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| SERR# goes active<br><b>NOTE:</b> A SERR# is only generated internally in the SoC)                                                                    | NSC.SNE                      | NSC.SNS           | All NMI sources may, alternatively, generate a SMI by setting GNMI.NMI2SMIEN=1b<br><br>The SoC uses GNMI.NMI2SMIST for observing SMI status |
| IOCHK# goes active<br><b>NOTE:</b> A IOCHK# is only generated as a SERIRQ# frame                                                                      | NSC.INE                      | NSC.INS           |                                                                                                                                             |
| ILB_NMI goes active<br><b>NOTE:</b> Active can be defined as being on the positive or negative edge of the signal using the GNMI.GNMIED register bit. | GNMI.GNMIED                  | GNMI.GNMIS        |                                                                                                                                             |
| Software sets the GNMI.NMIN register bit                                                                                                              | GNMI.NMIN                    | GNMI.NMINS        |                                                                                                                                             |

## 34.3 PCU iLB Interrupt Decode and Route

**Table 321. Summary of PCU iLB Interrupt Decode and Route Memory Mapped I/O Registers—ILB\_BASE\_ADDRESS**

| Offset | Size | Register ID—Description        | Default Value |

**Table 321. Summary of PCU iLB Interrupt Decode and Route Memory Mapped I/O Registers—ILB\_BASE\_ADDRESS (Continued)**

| Offset | Size | Register ID—Description                                   | Default Value |
|--------|------|-----------------------------------------------------------|---------------|
| 4Ah    | 2    | "IR21—Offset 4Ah" on page 4515                            | 0000h         |
| 4Ch    | 2    | "IR22—Offset 4Ch" on page 4516                            | 0000h         |
| 4Eh    | 2    | "IR23—Offset 4Eh" on page 4516                            | 0000h         |
| 50h    | 2    | "IR24—Offset 50h" on page 4517                            | 0000h         |
| 52h    | 2    | "IR25—Offset 52h" on page 4517                            | 0000h         |
| 54h    | 2    | "IR26—Offset 54h" on page 4518                            | 0000h         |
| 56h    | 2    | "IR27—Offset 56h" on page 4518                            | 0000h         |
| 58h    | 2    | "IR28—Offset 58h" on page 4519                            | 0000h         |
| 5Ah    | 2    | "IR29—Offset 5Ah" on page 4520                            | 0000h         |
| 5Ch    | 2    | "IR30—Offset 5Ch" on page 4520                            | 0000h         |
| 5Eh    | 2    | "IR31—Offset 5Eh" on page 4521                            | 0000h         |
| 60h    | 4    | "OIC—Offset 60h" on page 4522                             | 00001100h     |
| 64h    | 4    | "RC—Offset 64h" on page 4523                              | 00000000h     |
| 6Ch    | 4    | "BCS - BIOS Control Status (BCS)—Offset 6Ch" on page 4523 | 00000002h     |
| 70h    | 4    | "LE—Offset 70h" on page 4524                              | 00000003h     |
| 80h    | 4    | "NMI (GNMI)—Offset 80h" on page 4524                      | 00000004h     |
| 84h    | 4    | "LPCC—Offset 84h" on page 4525                            | 00000001h     |
| 88h    | 4    | "IRQEN (IRQE)—Offset 88h" on page 4526                    | 00000000h     |

### 34.3.1 ACTL—Offset 0h

ACPI Control

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**ACTL:** [ILB\_BASE\_ADDRESS] + 0h

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB BASE ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 00000003h

[illegible]

| Bit Range | Default & Access | Description            |
|-----------|------------------|------------------------|
| 31:3      | 0b<br>RO         | <b>RSVD0:</b> Reserved |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2:0       | 011b<br>RW       | <b>SCIS:</b> SCI IRQ Select (SCIS): Specifies on which IRQ SCI will rout to. If not using APIC, SCI must be routed to IRQ9-11 , and that interrupt is not sharable with SERIRQ, but is shareable with other interrupts. If using APIC, SCI can be mapped to IRQ20-23, and can be shared with other interrupts. When the interrupt is mapped to APIC interrupts 9, 10 or 11, APIC must be programmed for active-high reception. When the interrupt is mapped to APIC interrupts 20 through 23, APIC must be programmed for active-low reception. |

### 34.3.2 MC—Offset 4h

### Miscellaneous Control

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**MC:** [ILB BASE ADDRESS] + 4h

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB BASE ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 00000000h

|       |    |    |    |    |    |   |   |       |
|-------|----|----|----|----|----|---|---|-------|
| 31    | 28 | 24 | 20 | 16 | 12 | 8 | 4 | 0     |
| 0     | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0     |
| RSVD0 |    |    |    |    |    |   |   | DRTC  |
|       |    |    |    |    |    |   |   | D8259 |
|       |    |    |    |    |    |   |   | D8254 |
|       |    |    |    |    |    |   |   | AMF   |

| Bit Range | Default & Access | Description                                                                                                                                                                                                                                                                                             |
|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:4      | 0b RO            | <b>RSVD0</b> : Reserved                                                                                                                                                                                                                                                                                 |
| 3         | 0b RW            | <b>DRTC</b> : Disable RTC (DRTC): When set, decodes to the RTC will be disabled, and the accesses instead will be sent to LPC. This allows testing to determine whether these functions are needed for XP and Vista 'EDS Note: Do not include this field in the EDS.                                    |
| 2         | 0b RW            | <b>D8259</b> : Disable 8259 (D8259): When set, decodes to the 8259 will be disabled, and the accesses instead will be sent to LPC. This allows testing to determine whether these functions are needed for XP and Vista 'EDS Note: Do not include this field in the EDS.                                |
| 1         | 0b RW            | <b>D8254</b> : Disable 8254 (D8254): When set, decodes to the 8254 will be disabled, and the accesses instead will be sent to LPC. This allows testing to determine whether these functions are needed for XP and Vista 'EDS Note: Do not include this field in the EDS.                                |
| 0         | 0b RW            | <b>AME</b> : Alt Access Mode is a mode that enables host reading some WO registers . 1. Read 8254 (legacy timers) indirect WO registers 2. Read 8259 (legacy interrupt controller) indirect WO registers 3. Read port 0x70 - port 0x70 includes the RTC memory address [6:0] and the NMI enable bit [7] |

### 34.3.3 PIROA—Offset 8h

PIROA Routing Control

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**PIROA:** [ILB BASE ADDRESS] + 8h

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 80h

|     |   |       |   |   |    |   |   |

### 34.3.23 IR8—Offset 30h

IR8 - Interrupt Routing Device 8

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IR8:** [ILB\_BASE\_ADDRESS] + 30h

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 0000h

|     |    |     |   |     |
|-----|----|-----|---|-----|
| 15  | 12 | 8   | 4 | 0   |
| 0   | 0  | 0   | 0 | 0   |
| IRD |    | IRC |   | IRA |

| Bit Range | Default & Access | Description                         |
|-----------|------------------|-------------------------------------|
| 15:12     | 4'd3<br>RW       | <b>IRD:</b> INTD mapping to IRQ A-H |
| 11:8      | 4'd2<br>RW       | <b>IRC:</b> INTC mapping to IRQ A-H |
| 7:4       | 4'd1<br>RW       | <b>IRB:</b> INTB mapping to IRQ A-H |
| 3:0       | 4'd0<br>RW       | <b>IRA:</b> INTA mapping to IRQ A-H |

### 34.3.24 IR9—Offset 32h

IR9 - Interrupt Routing Device 9

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IR9:** [ILB\_BASE\_ADDRESS] + 32h

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 0000h

|     |    |     |   |     |
|-----|----|-----|---|-----|
| 15  | 12 | 8   | 4 | 0   |
| 0   | 0  | 0   | 0 | 0   |
| IRD |    | IRC |   | IRA |

| Bit Range | Default & Access | Description                         |
|-----------|------------------|-------------------------------------|
| 15:12     | 4'd3<br>RW       | <b>IRD:</b> INTD mapping to IRQ A-H |
| 11:8      | 4'd2<br>RW       | <b>IRC:</b> INTC mapping to IRQ A-H |

| Bit Range | Default & Access | Description                         |
|-----------|------------------|-------------------------------------|
| 7:4       | 4'd1<br>RW       | <b>IRB:</b> INTB mapping to IRQ A-H |
| 3:0       | 4'd0<br>RW       | <b>IRA:</b> INTA mapping to IRQ A-H |

### 34.3.25 IR10—Offset 34h

IR10 - Interrupt Routing Device 10

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IR10:** [ILB\_BASE\_ADDRESS] + 34h

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 0000h

|     |     |     |     |   |
|-----|-----|-----|-----|---|
| 15  | 12  | 8   | 4   | 0 |
| 0   | 0   | 0   | 0   | 0 |
| 0   | 0   | 0   | 0   | 0 |
| IRD | IRC | IRB | IRA |   |

| Bit Range | Default & Access | Description                         |
|-----------|------------------|-------------------------------------|
| 15:12     | 4'd3<br>RW       | <b>IRD:</b> INTD mapping to IRQ A-H |
| 11:8      | 4'd2<br>RW       | <b>IRC:</b> INTC mapping to IRQ A-H |
| 7:4       | 4'd1<br>RW       | <b>IRB:</b> INTB mapping to IRQ A-H |
| 3:0       | 4'd0<br>RW       | <b>IRA:</b> INTA mapping to IRQ A-H |

### 34.3.26 IR11—Offset 36h

IR11 - Interrupt Routing Device 11

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IR11:** [ILB\_BASE\_ADDRESS] + 36h

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 0000h

|     |     |     |     |   |
|-----|-----|-----|-----|---|
| 15  | 12  | 8   | 4   | 0 |
| 0   | 0   | 0   | 0   | 0 |
| 0   | 0   | 0   | 0   | 0 |
| IRD | IRC | IRB | IRA |   |

| Bit Range | Default & Access | Description                          |
|-----------|------------------|--------------------------------------|
| 15:12     | 4'd3<br>RW       | <b>IRD</b> : INTD mapping to IRQ A-H |
| 11:8      | 4'd2<br>RW       | <b>IRC</b> : INTC mapping to IRQ A-H |
| 7:4       | 4'd1<br>RW       | <b>IRB</b> : INTB mapping to IRQ A-H |
| 3:0       | 4'd0<br>RW       | <b>IRA</b> : INTA mapping to IRQ A-H |

### 34.3.27 IR12—Offset 38h

IR12 - Interrupt Routing Device 12

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IR12:** [ILB\_BASE\_ADDRESS] + 38h

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 0000h

|     |     |     |     |   |
|-----|-----|-----|-----|---|
| 15  | 12  | 8   | 4   | 0 |
| 0   | 0   | 0   | 0   | 0 |
| IRD | IRC | IRB | IRA |   |

| Bit Range | Default & Access | Description                          |
|-----------|------------------|--------------------------------------|
| 15:12     | 4'd3<br>RW       | <b>IRD</b> : INTD mapping to IRQ A-H |
| 11:8      | 4'd2<br>RW       | <b>IRC</b> : INTC mapping to IRQ A-H |
| 7:4       | 4'd1<br>RW       | <b>IRB</b> : INTB mapping to IRQ A-H |
| 3:0       | 4'd0<br>RW       | <b>IRA</b> : INTA mapping to IRQ A-H |

### 34.3.28 IR13—Offset 3Ah

IR13 - Interrupt Routing Device 13

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IR13:** [ILB\_BASE\_ADDRESS] + 3Ah

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 0000h

|     |   |   |   |     |   |   |   |     |   |   |   |     |   |   |   |   |
|-----|---|---|---|-----|---|---|---|-----|---|---|---|-----|---|---|---|---|
| 15  |   |   |   | 12  |   |   |   | 8   |   |   |   | 4   |   |   |   | 0 |
| 0   | 0 | 0 | 0 | 0   | 0 | 0 | 0 | 0   | 0 | 0 | 0 | 0   | 0 | 0 | 0 | 0 |
| IRD |   |   |   | IRC |   |   |   | IRB |   |   |   | IRA |   |   |   |   |

| Bit Range | Default & Access | Description                         |
|-----------|------------------|-------------------------------------|
| 15:12     | 4'd3<br>RW       | <b>IRD:</b> INTD mapping to IRQ A-H |
| 11:8      | 4'd2<br>RW       | <b>IRC:</b> INTC mapping to IRQ A-H |
| 7:4       | 4'd1<br>RW       | <b>IRB:</b> INTB mapping to IRQ A-H |
| 3:0       | 4'd0<br>RW       | <b>IRA:</b> INTA mapping to IRQ A-H |

### 34.3.29 IR14—Offset 3Ch

IR14 - Interrupt Routing Device 14

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IR14:** [ILB\_BASE\_ADDRESS] + 3Ch

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS** Reference: [B:0, D:31, F:0] + 50h

**Default:** 0000h

|     |   |   |    |     |   |   |     |   |   |     |   |   |
|-----|---|---|----|-----|---|---|-----|---|---|-----|---|---|
| 15  |   |   | 12 |     |   | 8 |     |   | 4 |     |   | 0 |
| 0   | 0 | 0 | 0  | 0   | 0 | 0 | 0   | 0 | 0 | 0   | 0 | 0 |
| IRD |   |   |    | IRC |   |   | IRB |   |   | IRA |   |   |

| Bit Range | Default & Access | Description                         |
|-----------|------------------|-------------------------------------|
| 15:12     | 4'd3<br>RW       | <b>IRD:</b> INTD mapping to IRQ A-H |
| 11:8      | 4'd2<br>RW       | <b>IRC:</b> INTC mapping to IRQ A-H |
| 7:4       | 4'd1<br>RW       | <b>IRB:</b> INTB mapping to IRQ A-H |
| 3:0       | 4'd0<br>RW       | <b>IRA:</b> INTA mapping to IRQ A-H |

### 34.3.30 IR15—Offset 3Eh

IR15 - Interrupt Routing Device 15

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IR15:** [ILB\_BASE\_ADDRESS] + 3Eh

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 0000h

|     |    |     |   |     |
|-----|----|-----|---|-----|
| 15  | 12 | 8   | 4 | 0   |
| 0   | 0  | 0   | 0 | 0   |
| IRD |    | IRC |   | IRA |

| Bit Range | Default & Access | Description                         |
|-----------|------------------|-------------------------------------|
| 15:12     | 4'd3<br>RW       | <b>IRD:</b> INTD mapping to IRQ A-H |
| 11:8      | 4'd2<br>RW       | <b>IRC:</b> INTC mapping to IRQ A-H |
| 7:4       | 4'd1<br>RW       | <b>IRB:</b> INTB mapping to IRQ A-H |
| 3:0       | 4'd0<br>RW       | <b>IRA:</b> INTA mapping to IRQ A-H |

### 34.3.31 IR16—Offset 40h

IR16 - Interrupt Routing Device 16

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IR16:** [ILB\_BASE\_ADDRESS] + 40h

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 0000h

|     |    |     |   |     |
|-----|----|-----|---|-----|
| 15  | 12 | 8   | 4 | 0   |
| 0   | 0  | 0   | 0 | 0   |
| IRD |    | IRC |   | IRA |

| Bit Range | Default & Access | Description                         |
|-----------|------------------|-------------------------------------|
| 15:12     | 4'd3<br>RW       | <b>IRD:</b> INTD mapping to IRQ A-H |
| 11:8      | 4'd2<br>RW       | <b>IRC:</b> INTC mapping to IRQ A-H |

| Bit Range | Default & Access | Description                         |
|-----------|------------------|-------------------------------------|
| 7:4       | 4'd1<br>RW       | <b>IRB:</b> INTB mapping to IRQ A-H |
| 3:0       | 4'd0<br>RW       | <b>IRA:</b> INTA mapping to IRQ A-H |

### 34.3.32 IR17—Offset 42h

IR17 - Interrupt Routing Device 17

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IR17:** [ILB\_BASE\_ADDRESS] + 42h

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 0000h

|     |     |     |     |   |
|-----|-----|-----|-----|---|
| 15  | 12  | 8   | 4   | 0 |
| 0   | 0   | 0   | 0   | 0 |
| 0   | 0   | 0   | 0   | 0 |
| IRD | IRC | IRB | IRA |   |

| Bit Range | Default & Access | Description                         |
|-----------|------------------|-------------------------------------|
| 15:12     | 4'd3<br>RW       | <b>IRD:</b> INTD mapping to IRQ A-H |
| 11:8      | 4'd2<br>RW       | <b>IRC:</b> INTC mapping to IRQ A-H |
| 7:4       | 4'd1<br>RW       | <b>IRB:</b> INTB mapping to IRQ A-H |
| 3:0       | 4'd0<br>RW       | <b>IRA:</b> INTA mapping to IRQ A-H |

### 34.3.33 IR18—Offset 44h

IR18 - Interrupt Routing Device 18

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IR18:** [ILB\_BASE\_ADDRESS] + 44h

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 0000h

|     |     |     |     |   |
|-----|-----|-----|-----|---|
| 15  | 12  | 8   | 4   | 0 |
| 0   | 0   | 0   | 0   | 0 |
| 0   | 0   | 0   | 0   | 0 |
| IRD | IRC | IRB | IRA |   |

| Bit Range | Default & Access | Description                          |
|-----------|------------------|--------------------------------------|
| 15:12     | 4'd3<br>RW       | <b>IRD</b> : INTD mapping to IRQ A-H |
| 11:8      | 4'd2<br>RW       | <b>IRC</b> : INTC mapping to IRQ A-H |
| 7:4       | 4'd1<br>RW       | <b>IRB</b> : INTB mapping to IRQ A-H |
| 3:0       | 4'd0<br>RW       | <b>IRA</b> : INTA mapping to IRQ A-H |

### 34.3.34 IR19—Offset 46h

IR19 - Interrupt Routing Device 19

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IR19:** [ILB\_BASE\_ADDRESS] + 46h

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 0000h

|     |     |     |     |   |
|-----|-----|-----|-----|---|
| 15  | 12  | 8   | 4   | 0 |
| 0   | 0   | 0   | 0   | 0 |
| IRD | IRC | IRB | IRA |   |

| Bit Range | Default & Access | Description                          |
|-----------|------------------|--------------------------------------|
| 15:12     | 4'd3<br>RW       | <b>IRD</b> : INTD mapping to IRQ A-H |
| 11:8      | 4'd2<br>RW       | <b>IRC</b> : INTC mapping to IRQ A-H |
| 7:4       | 4'd1<br>RW       | <b>IRB</b> : INTB mapping to IRQ A-H |
| 3:0       | 4'd0<br>RW       | <b>IRA</b> : INTA mapping to IRQ A-H |

### 34.3.35 IR20—Offset 48h

IR20 - Interrupt Routing Device 20

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IR20:** [ILB\_BASE\_ADDRESS] + 48h

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 0000h

|     |   |   |   |     |   |   |   |     |   |   |   |     |   |   |   |   |
|-----|---|---|---|-----|---|---|---|-----|---|---|---|-----|---|---|---|---|
| 15  |   |   |   | 12  |   |   |   | 8   |   |   |   | 4   |   |   |   | 0 |
| 0   | 0 | 0 | 0 | 0   | 0 | 0 | 0 | 0   | 0 | 0 | 0 | 0   | 0 | 0 | 0 | 0 |
| IRD |   |   |   | IRC |   |   |   | IRB |   |   |   | IRA |   |   |   |   |

| Bit Range | Default & Access | Description                         |
|-----------|------------------|-------------------------------------|
| 15:12     | 4'd3<br>RW       | <b>IRD:</b> INTD mapping to IRQ A-H |
| 11:8      | 4'd2<br>RW       | <b>IRC:</b> INTC mapping to IRQ A-H |
| 7:4       | 4'd1<br>RW       | <b>IRB:</b> INTB mapping to IRQ A-H |
| 3:0       | 4'd0<br>RW       | <b>IRA:</b> INTA mapping to IRQ A-H |

### 34.3.36 IR21—Offset 4Ah

IR21 - Interrupt Routing Device 21

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IR21:** [ILB\_BASE\_ADDRESS] + 4Ah

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS** Reference: [B:0, D:31, F:0] + 50h

**Default:** 0000h

|     |   |   |    |     |   |   |     |   |   |     |   |   |
|-----|---|---|----|-----|---|---|-----|---|---|-----|---|---|
| 15  |   |   | 12 |     |   | 8 |     |   | 4 |     |   | 0 |

| IRD |   |   |    | IRC |   |   | IRB |   |   | IRA |   |   |

| Bit Range | Default & Access | Description                         |
|-----------|------------------|-------------------------------------|
| 15:12     | 4'd3<br>RW       | <b>IRD:</b> INTD mapping to IRQ A-H |
| 11:8      | 4'd2<br>RW       | <b>IRC:</b> INTC mapping to IRQ A-H |
| 7:4       | 4'd1<br>RW       | <b>IRB:</b> INTB mapping to IRQ A-H |
| 3:0       | 4'd0<br>RW       | <b>IRA:</b> INTA mapping to IRQ A-H |

### 34.3.37 IR22—Offset 4Ch

IR22 - Interrupt Routing Device 22

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IR22:** [ILB\_BASE\_ADDRESS] + 4Ch

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 0000h

|     |    |     |   |     |
|-----|----|-----|---|-----|
| 15  | 12 | 8   | 4 | 0   |
| 0   | 0  | 0   | 0 | 0   |
| IRD |    | IRC |   | IRA |

| Bit Range | Default & Access | Description                         |
|-----------|------------------|-------------------------------------|
| 15:12     | 4'd3<br>RW       | <b>IRD:</b> INTD mapping to IRQ A-H |
| 11:8      | 4'd2<br>RW       | <b>IRC:</b> INTC mapping to IRQ A-H |
| 7:4       | 4'd1<br>RW       | <b>IRB:</b> INTB mapping to IRQ A-H |
| 3:0       | 4'd0<br>RW       | <b>IRA:</b> INTA mapping to IRQ A-H |

### 34.3.38 IR23—Offset 4Eh

IR23 - Interrupt Routing Device 23

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 16 bits)

**IR23:** [ILB\_BASE\_ADDRESS] + 4Eh

**ILB\_BASE\_ADDRESS Type:** PCI Configuration Register (Size: 32 bits)

**ILB\_BASE\_ADDRESS Reference:** [B:0, D:31, F:0] + 50h

**Default:** 0000h

|     |    |     |   |     |
|-----|----|-----|---|-----|
| 15  | 12 | 8   | 4 | 0   |
| 0   | 0  | 0   | 0 | 0   |
| IRD |    | IRC |   | IRA |

| Bit Range | Default & Access | Description                         |
|-----------|------------------|-------------------------------------|

## 35 PCU – iLB – Low Pin Count (LPC) Bridge

The SoC implements an LPC Interface as described in the LPC 1.1 Specification. The Low Pin Count (LPC) bridge function of the SoC resides in PCI Device 31, Function 0.

**Note:** In addition to the LPC bridge interface function, D31:F0 contains other functional units including interrupt controllers, timers, power management, system management, GPIO, and RTC.

### 35.1 Signal Descriptions

Please see [Chapter 2, "Physical Interfaces"](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal's function

**Note:** If the VGA interfaces is used, VLPC must have a nominal voltage of 3.3V.

Table 322. LPC Signals

## 35.2 Features

The LPC interface to the SoC is shown in [Figure 135](#). Note that the SoC implements all of the signals that are shown as optional, but peripherals are not required to do so.

**Note:** The LPC controller does not implement bus mastering cycles or DMA.

**Note:** The LPC controller is the subtractive agent of the Intel Legacy Block. All transactions not claimed elsewhere are sent to the LPC controller.

Figure 135. LPC Interface Diagram

**NOTES:**

1. The General Purpose Input (GPI) must use a SMI capable GPIO: GPIO\_S0\_SC[7:0].

### 35.2.1 Memory Cycle Notes

For cycles below 16M, the LPC Controller will perform standard LPC memory cycles. For cycles targeting firmware (BIOS/EFI code only), firmware memory cycles are used. Only 8-bit transfers are performed. If a larger transfer appears, the LPC controller will break it into multiple 8-bit transfers until the request is satisfied.

If the cycle is not claimed by any peripheral (and subsequently aborted), the LPC Controller will return a value of all 1's to the CPU.

### 35.2.2 Trusted Platform Module (TPM) 1.2 Support

The LPC interface supports accessing Trusted Platform Module (TPM) 1.2 and 2.0 devices via the LPC TPM START encoding. Memory addresses within the range FED40000h to FED40FFFh will be accepted by the LPC Bridge and sent on LPC as TPM special cycles. No additional checking of the memory cycle is performed.

**Note:** This is different to the FED00000h to FED4BFFFh range implemented on some other Intel components since no Intel® Trusted Execution Technology (Intel® TXT) transactions are supported.

### 35.2.3 FWH Cycle Notes

If the LPC controller receives any SYNC returned from the device other than short (0101), long wait (0110), or ready (0000) when running a FWH cycle, indeterminate results may occur. A FWH device is not allowed to assert an Error SYNC.

BIOS/EFI boot from LPC is not supported when Secure Boot is enabled.

### 35.2.4 Other Notes

All cycles that are not decoded internally, and are not targeted for LPC (i.e. configuration cycles and IO cycles above 64kb) will be sent to LPC with ILB\_LPC\_FRAME# not asserted. Memory cycles above 16 MB that are not decoded internally, and are not targeted for LPC will be sent to LPC with ILB\_LPC\_FRAME# asserted.

### 35.2.5 POST Code Redirection

Writes to addresses 80h - 8Fh in IO register space will also be passed to the LPC bus.

**Note:** Reads of these addresses do not result in any LPC transactions.

### 35.2.6 Power Management

#### 35.2.6.1 LPCPD# Protocol

Same timings as for PMC\_SUS\_STAT#. After driving PMC\_SUS\_STAT# active, the SoC drives ILB\_LPC\_FRAME# low, and tri-states (or drives low) ILB\_LPC\_AD[3:0].

**Note:** The Low Pin Count Interface Specification, Revision 1.1 defines the LPCPD# protocol where there is at least 30  $\mu$ s from LPCPD# assertion to LRST# assertion. This specification explicitly states that this protocol only applies to entry/exit of low power states which does not include asynchronous reset events. The SoC asserts both PMC\_SUS\_STAT# (connects to LPCPD#) and ILB\_PLTRST# (connects to LRST#) at the same time during a global reset. This is not inconsistent with the LPC LPCPD# protocol.

#### 35.2.6.2 Clock Run (CLKRUN)

When there are no pending LPC cycles, and SERIRQ is in quiet mode, the SoC can shut down the LPC clock. The SoC indicates that the LPC clock is going to shut down by de-asserting the ILB\_LPC\_CLKRUN# signal. LPC devices that require the clock to stay running should drive ILB\_LPC\_CLKRUN# low within 4 clocks of its de-assertion. If no device drives the signal low within 4 clocks, the LPC clock will stop. If a device asserts ILB\_LPC\_CLKRUN#, the SoC will start the LPC clock and assert ILB\_LPC\_CLKRUN#.

**Note:** The CLKRUN protocol is disabled by default. See [Section 35.3.2.2, "Clock Run Enable" on page 4534](#) for further details.

## 35.2.7 Serialized IRQ (SERIRQ)

### 35.2.7.1 Overview

The interrupt controller supports a serial IRQ scheme. The signal used to transmit this information is shared between the interrupt controller and all peripherals that support serial interrupts. The signal line, ILB\_LPC\_SERIRQ, is synchronous to LPC clock, and follows the sustained tri-state protocol that is used by LPC signals. The serial IRQ protocol defines this sustained tri-state signaling in the following fashion:

- **S - Sample Phase:** Signal driven low
- **R - Recovery Phase:** Signal driven high
- **T - Turn-around Phase:** Signal released

The interrupt controller supports 21 serial interrupts. These represent the 15 ISA interrupts (IRQ0- 1, 3-15), the four PCI interrupts, and the control signals SMI# and IOCHK#. Serial interrupt information is transferred using three types of frames:

- **Start Frame:** ILB\_LPC\_SERIRQ line driven low by the interrupt controller to indicate the start of IRQ transmission
- **Data Frames:** IRQ information transmitted by peripherals. The interrupt controller supports 21 data frames.
- **Stop Frame:** ILB\_LPC\_SERIRQ line driven low by the interrupt controller to indicate end of transmission and next mode of operation.

### 35.2.7.2 Start Frame

The serial IRQ protocol has two modes of operation which affect the start frame:

- **Continuous Mode:** The interrupt controller is solely responsible for generating the start frame
- **Quiet Mode:** Peripheral initiates the start frame, and the interrupt controller completes it.

These modes are entered via the length of the stop frame.

Continuous mode must be entered first, to start the first frame. This start frame width is 8 LPC clocks. This is a polling mode.

In Quiet mode, the ILB\_LPC\_SERIRQ line remains inactive and pulled up between the Stop and Start Frame until a peripheral drives ILB\_LPC\_SERIRQ low. The interrupt controller senses the line low and drives it low for the remainder of the Start Frame. Since the first LPC clock of the start frame was driven by the peripheral, the interrupt controller drives ILB\_LPC\_SERIRQ low for 1 LPC clock less than in continuous mode. This mode of operation allows for lower power operation.

### 35.2.7.3 Data Frames

Once the Start frame has been initiated, the ILB\_LPC\_SERIRQ peripherals start counting frames based on the rising edge of ILB\_LPC\_SERIRQ. Each of the IRQ/DATA frames has exactly 3 phases of 1 clock each:

- **Sample Phase:** During this phase, a device drives ILB\_LPC\_SERIRQ low if its corresponding interrupt signal is low. If its corresponding interrupt is high, then the ILB\_LPC\_SERIRQ devices tri-state ILB\_LPC\_SERIRQ. ILB\_LPC\_SERIRQ remains high due to pull-up resistors.
- **Recovery Phase:** During this phase, a device drives ILB\_LPC\_SERIRQ high if it was driven low during the Sample Phase. If it was not driven during the sample phase, it remains tri-stated in this phase.
- **Turn-around Phase:** The device tri-states ILB\_LPC\_SERIRQ.

### 35.2.7.4 Stop Frame

After the data frames, a Stop Frame will be driven by the interrupt controller. ILB\_LPC\_SERIRQ will be driven low for two or three LPC clocks. The number of clocks is determined by the SCNT.MD register bit. The number of clocks determines the next mode, as indicated in [Table 323](#).

**Table 323. SERIRQ, Stop Frame Width to Operation Mode Mapping**

| Stop Frame Width | Next Mode                                                                     |
|------------------|-------------------------------------------------------------------------------|
| Two LPC clocks   | <b>Quiet Mode:</b> Any SERIRQ device initiates a Start Frame                  |
| Three LPC clocks | <b>Continuous Mode:</b> Only the interrupt controller initiates a Start Frame |

### 35.2.7.5 Serial Interrupts Not Supported

There are four interrupts on the serial stream which are not supported by the interrupt controller. These interrupts are:

- IRQ0: Heartbeat interrupt generated off of the internal 8254 counter 0.
- IRQ8: RTC interrupt can only be generated internally.
- IRQ13: This interrupt (floating point error) is not supported.
- IRQ14: Interrupt can only be generated by the SATA controller in Legacy mode.

The interrupt controller will ignore the state of these interrupts in the stream.

### 35.2.7.6 Data Frame Format and Issues

Table below shows the format of the data frames. The decoded INT[A:D]# values are ANDed with the corresponding PCI-express input signals (PIRQ[A:D]#). This way, the interrupt can be shared.

The other interrupts decoded via SERIRQ are also ANDed with the corresponding internal interrupts. For example, if IRQ10 is set to be used as the SCI, then it is ANDed with the decoded value for IRQ10 from the SERIRQ stream.

**Table 324. SERIRQ Interrupt Mapping**

| Data Frame # | Interrupt | Clocks Past Start Frame | Comment                                                    |
|--------------|-----------|-------------------------|------------------------------------------------------------|
| 1            | IRQ0      | 2                       | Ignored. Can only be generated via the internal 8524       |
| 2            | IRQ1      | 5                       | Before port 60h latch                                      |
| 3            | SMI#      | 8                       | Causes SMI# if low. Sets SMI_STS.ILB_SMI_STS register bit. |
| 4            | IRQ3      | 11                      |                                                            |
| 5            | IRQ4      | 14                      |                                                            |
| 6            | IRQ5      | 17                      |                                                            |
| 7            | IRQ6      | 20                      |                                                            |
| 8            | IRQ7      | 23                      |                                                            |
| 9            | IRQ8      | 26                      | Ignored. IRQ8# can only be generated internally            |
| 10           | IRQ9      | 29                      |                                                            |
| 11           | IRQ10     | 32                      |                                                            |
| 12           | IRQ11     | 35                      |                                                            |
| 13           | IRQ12     | 38                      | Before port 60h latch                                      |
| 14           | IRQ13     | 41                      | Ignored                                                    |
| 15           | IRQ14     | 44                      | Ignored                                                    |
| 16           | IRQ15     | 47                      |                                                            |
| 17           | IOCHCK#   | 50                      | Same as ISA IOCHCK# going active.                          |
| 18           | PCI INTA# | 53                      |                                                            |
| 19           | PCI INTB# | 56                      |                                                            |
| 20           | PCI INTC# | 59                      |                                                            |
| 21           | PCI INTD# | 62                      |                                                            |

## 35.3 Use

### 35.3.1 LPC Clock Delay Compensation

In order to meet LPC interface AC timing requirements, a LPC clock loop back is required. The operation of this loop back can be configured in two ways:

1. On the SOC: In this configuration, ILB\_LPC\_CLK[0] is looped back on itself on the SOC pad.

a. Benefit:

ILB\_LPC\_CLK[0] and ILB\_LPC\_CLK[1] are both available for system clocking

b. Drawback:

Clock delay compensation is less effective at compensating for mainboard delay

c. Soft Strap & Register Requirements:

Soft Strap LPCCLK\_SLC = 0b

Configuration is reflected by register bit LPCC.LPCCLK\_SLC=0b

Soft Strap LPCCLK1\_ENB = 0b (ILB\_LPC\_CLK[1] disabled) or 1b (ILB\_LPC\_CLK[1] enabled)

2. Configuration is reflected by register bit LPCC.LPCCLK1EN=0b (ILB\_LPC\_CLK[1] disabled) or 1b (ILB\_LPC\_CLK[1] enabled)

3. On the main board: In this configuration, ILB\_LPC\_CLK[0] is looped back to ILB\_LPC\_CLK[1] on the main board.

a. Benefit:

Clock delay compensation is more effective at compensating for main board delay

b. Drawback:

Only ILB\_LPC\_CLK[0] is available for system clocking. ILB\_LPC\_CLK[1] must be disabled.

c. Soft Strap & Register Requirements:

Soft Strap LPCCLK\_SLC = 1b

Configuration is reflected by register bit LPCC.LPCCLK\_SLC=1b

Soft Strap LPCCLK1\_ENB = 0b (ILB\_LPC\_CLK[1] disabled)

Configuration is reflected by register bit LPCC.LPCCLK1EN=0b

## **35.3.2 LPC Power Management**

### **35.3.2.1 Clock Enabling**

The LPC clocks can be enabled or disabled by setting or clearing, respectively, the LPCC.LPCCLK[1:0]EN bits.

### **35.3.2.2 Clock Run Enable**

The Clock Run protocol is disabled by default and should only be enabled once all LPC devices have been initialized. The Clock Run protocol is enabled by setting the LPCC.CLKRUN\_EN register bit.

## **35.3.3 SERIRQ Disable**

Serialized IRQ support may be disabled by setting the OIC.SIRQEN bit to 0b.

|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7         | 0b<br>RO         | <b>Wait Cycle Control (WCC):</b> Reserved as '0' per PCI-Express spec                                                                                                                                                                                                                                                                                                                                       |
| 6         | 0b<br>RW         | <b>Parity Error Response Enable (PERE):</b> This bit controls the device's response to parity errors. When the bit is set, the device must take its normal action when a parity error is detected. When the bit is 0, the device sets its Detected Parity Error status bit (bit 15 in the Status register) when an error is detected, but does not assert PERR# and continues normal operation.             |
| 5         | 0b<br>RO         | <b>VGA Palette Snoop (VGA_PSE):</b> This bit controls how VGA compatible and graphics devices handle accesses to VGA palette registers. When this bit is 1, palette snooping is enabled (i.e., the device does not respond to palette register writes and snoops the data). When the bit is 0, the device should treat palette write accesses like all other accesses. Reserved as '0' per PCI-Express spec |
| 4         | 0b<br>RO         | <b>Memory Write and Invalidate Enable (MWIE):</b> This is an enable bit for using the Memory Write and Invalidate command. When this bit is 1, masters may generate the command. When it is 0, Memory Write must be used instead. Reserved as '0' per PCI-Express spec                                                                                                                                      |
| 3         | 0b<br>RO         | <b>Special Cycle Enable (SCE):</b> Controls a device's action on Special Cycle operations. A value of 0 causes the device to ignore all Special Cycle operations. A value of 1 allows the device to monitor Special Cycle operations. Reserved as '0' per PCI-Express spec                                                                                                                                  |
| 2         | 1b<br>RO         | <b>Bus Master Enable (BME):</b> Controls a device's ability to act as a master on the PCI bus. A value of 0 disables the device from generating PCI accesses. A value of 1 allows the device to behave as a bus master. Bus master cannot be disabled on LPC                                                                                                                                                |
| 1         | 1b<br>RO         | <b>Memory Space Enable (MSE):</b> Controls a device's response to Memory Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to Memory Space accesses. Memory space cannot be disable on LPC                                                                                                                                                               |
| 0         | 1b<br>RO         | <b>I/O Space Enable (IOSE):</b> Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. I/O space cannot be disable on LPC                                                                                                                                                                          |

### 35.6.3 Status (PCIE\_REG\_STATUS)—Offset 6h

The Status register is used to record status information for PCI bus related events. Reads to this register behave normally. Writes are slightly different in that bits can be reset, but not set. A one bit is reset (if it is not read-only) whenever the register is written, and the write data in the corresponding bit location is a 1. For instance, to clear bit 14 and not affect any other bits, write the value 0100\_0000\_0000\_0000b to the register.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**PCIE\_REG\_STATUS:** [B:0, D:31, F:0] + 6h

**Default:** 0210h

|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 14        | 0b<br>RW         | <b>Signaled System Error (SSE):</b> This bit must be set whenever the device asserts SERR#. Set when the LPC bridge signals a system error to the internal SERR# logic.                                                                                                                                                                                                                                                                       |
| 13        | 0b<br>RW         | <b>Received Master Abort (RMA):</b> This bit must be set by a master device whenever its transaction (except for Special Cycle) is terminated with Master-Abort. All master devices must implement this bit.                                                                                                                                                                                                                                  |
| 12        | 0b<br>RW         | <b>Received Target Abort (RTA):</b> This bit must be set by a master device whenever its transaction is terminated with Target-Abort. All master devices must implement this bit.                                                                                                                                                                                                                                                             |
| 11        | 0b<br>RW         | <b>Signaled Target Abort (STA):</b> This bit must be set by a target device whenever it terminates a transaction with Target-Abort. Devices that will never signal Target- Abort do not need to implement this bit.                                                                                                                                                                                                                           |
| 10:9      | 01b<br>RO        | <b>DEVSEL# Timing Status (DTS):</b> These bits encode the timing of DEVSEL#. These are encoded as 00b for fast, 01b for medium, and 10b for slow (11b is reserved). These bits Indicate medium timing, although this has no meaning on the backbone                                                                                                                                                                                           |
| 8         | 0b<br>RW         | <b>Data Parity Error Detected (DPD):</b> This bit is only implemented by bus masters. It is set when three conditions are met: 1) the bus agent asserted PERR# itself (on a read) or observed PERR# asserted (on a write); 2) the agent setting the bit acted as the bus master for the operation in which the error occurred; and 3) the Parity Error Response bit (Command register) is set.                                                |
| 7         | 0b<br>RO         | <b>Fast Back to Back Capable (FBC):</b> This optional read-only bit indicates whether or not the target is capable of accepting fast back-to-back transactions when the transactions are not to the same agent. This bit can be set to 1 if the device can accept these transactions and must be set to 0 otherwise. This bit has no meaning on internal backbone.                                                                            |
| 6         | 0b<br>RO         | <b>RSVD0:</b> Reserved                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 5         | 0b<br>RO         | <b>66 MHz Capable (C66):</b> This optional read-only bit indicates whether or not this device is capable of running at 66 MHz. A value of zero indicates 33 MHz. A value of 1 indicates that the device is 66 MHz capable. This bit has no meaning on internal backbone                                                                                                                                                                       |
| 4         | 1b<br>RO         | <b>Capabilities List (CLIST):</b> This optional read-only bit indicates whether or not this device implements the pointer for a New Capabilities linked list at offset 34h. A value of zero indicates that no New Capabilities linked list is available. A value of one indicates that the value read at offset 34h is a pointer in Configuration Space to a linked list of new capabilities. There is a capabilities list in the LPC bridge. |
| 3         | 0b<br>RO         | <b>Interrupt Status (IS):</b> This read-only bit reflects the state of the interrupt in the device/function. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. The LPC bridge does not generate interrupts                                     |
| 2:0       | 0b<br>RO         | <b>RSVD1:</b> Reserved                                                                                                                                                                                                                                                                                                                                                                                                                        |

### 35.6.4 Revision ID and Class Code (PCIE\_REG\_REVISION\_ID\_CLASS\_CODE)—Offset 8h

This register is a combination of two registers the Revision ID register and the Class Code register. The revision ID register specifies a device specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. The Class Code register is read-only and is used to identify the generic function of the device and, in some cases, a specific registerlevel programming interface.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**PCIE\_REG\_REVISION\_ID\_CLASS\_CODE:** [B:0, D:31, F:0] + 8h

**Default:** 06010000h

### 35.6.7 Subsystem ID and Vendor ID (PCIE\_REG\_SUBSYS\_VENDOR\_ID)—Offset 2Ch

This register is used to uniquely identify the add-in card or subsystem where the PCI device resides. It provides a mechanism for add-in card vendors to distinguish their add-in cards from one another even though the add-in cards may have the same PCI controller on them (and, therefore, the same Vendor ID and Device ID). Implementation of this register is required for all PCI devices except those that have a base class 6 with sub class 0-4 (0, 1, 2, 3, 4), or a base class 8 with sub class 0-3 (0, 1, 2, 3). Subsystem Vendor IDs can be obtained from the PCI SIG and are used to identify the vendor of the add-in card or subsystem. Values for the Subsystem ID are vendor specific. Values in these registers must be loaded and valid prior to the system firmware or any system software accessing the PCI Configuration Space. How these values are loaded is not specified but could be done during the manufacturing process or loaded from external logic (e.g., strapping options, serial ROMs, etc.). These values must not be loaded using expansion ROM software because expansion ROM software is not guaranteed to be run during POST in all systems. Devices are responsible for guaranteeing the data is valid before allowing reads to these registers to complete. This can be done by responding to any accesses with Retry until the data is valid. If a device is designed to be used exclusively on the system board, the system vendor may use system specific software to initialize these registers after each power-on. This register can be written only once after PMU\_PLTRST\_B de-assertion.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**PCIE\_REG\_SUBSYS\_VENDOR\_ID:** [B:0, D:31, F:0] + 2Ch

**Default:** 00000000h

|      |       |    |    |    |    |   |   |   |
|------|-------|----|----|----|----|---|---|---|
| 31   | 28    | 24 | 20 | 16 | 12 | 8 | 4 | 0 |
| 0    | 0     | 0  | 0  | 0  | 0  | 0 | 0 | 0 |
| SSID | SSVID |    |    |    |    |   |   |   |

| Bit Range | Default & Access | Description                                                                                                                                 |
|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------|

| 15:0      | 0000h<br>RW      | <b>Subsystem Vendor ID (SSVID):</b> This is written by BIOS. No hardware action taken on this value. This field could be written only once. |

### 35.6.8 Capability List Pointer (PCIE\_REG\_CAP\_POINTER)—Offset 34h

This optional register is used to point to a linked list of new capabilities implemented by this device. This register is only valid if the Capabilities List bit in the Status Register is set. If implemented, the bottom two bits are reserved and should be set to 00b. Software should mask these bits off before using this register as a pointer in Configuration Space to the first entry of a linked list of new capabilities.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**PCIE\_REG\_CAP\_POINTER:** [B:0, D:31, F:0] + 34h

**Default:** 000000E0h

|       |    |    |    |    |    |   |    |   |

| 7:0       | E0h<br>RO        | <b>Capability Pointer (CP):</b> Indicates the offset of the first Capability Item. |

### 35.6.9 ABASE (ACPI\_BASE\_ADDRESS)—Offset 40h

ACPI is mapped into I/O space. It is used by the PMC. Base Address registers that map into I/O Space are always 32 bits wide with bit 0 hardwired to a 1. Bit 1 is used to enable IO range pointed by this base address. Bits 31:16 are reserved and must return 0 on reads and the other bits could be used to map the device into I/O Space.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**ACPI\_BASE\_ADDRESS:** [B:0, D:31, F:0] + 40h

**Default:** 00000001h

|       |    |    |    |    |    |   |       |      |

### 35.6.10 PBASE (PMC\_BASE\_ADDRESS)—Offset 44h

PMC registers are mapped into memory space. It is used by the PMC. Base Address registers that map into Memory Space are always 32 bits wide bit 0 hardwired to a 0. Bit 1 is used to enable memory range pointed by this base address. For Memory Base Address registers, bit 2 indicates if base address could be on 64 bit space or only on 32 bit space. Bit 3 should be set to 1 if the data is prefetchable and reset to 0 otherwise

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**PMC\_BASE\_ADDRESS:** [B:0, D:31, F:0] + 44h

**Default:** 00000000h

|    |    |    |    |    |    |       |      |        |
|----|----|----|----|----|----|-------|------|--------|

### 35.6.15 MPBASE (MPHY\_BASE\_ADDRESS)—Offset 58h

M-phys registers are mapped into memory space. It is used by the Proxy agent (to M-phys). Base Address registers that map into Memory Space are always 32 bits wide bit 0 hardwired to a 0. Bit 1 is used to enable memory range pointed by this base address. For Memory Base Address registers, bit 2 indicates if base address could be on 64 bit space or only on 32 bit space. Bit 3 should be set to 1 if the data is prefetchable and reset to 0 otherwise

#### Access Method

**Type:** PCI Configuration Register  
(Size: 32 bits)

**MPHY\_BASE\_ADDRESS:** [B:0, D:31, F:0] + 58h

**Default:** 00000000h

### 35.6.18 BIOS Decode Enable (PCIE\_REG\_BIOS\_DECODE\_EN)—Offset D8h

This register enables ranges in the BIOS for decoding purposes. Note that this register affects the BIOS decode regardless of whether the BIOS is resident on LPC or SPI. The concept of Feature Space does not apply to SPI-based flash. PCU EP simply decodes these ranges as memory accesses when enabled for the SPI/LPC flash interface.

## Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**PCIE\_REG BIOS DECODE\_EN:** [B:0, D:31, F:0] + D8h

**Default:** FFCFh

### 35.6.19 FDCAP (Feature\_Detection\_Capability\_ID)—Offset E0h

Feature detection capability ID.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 16 bits)

**Feature\_Detection\_Capability\_ID:** [B:0, D:31, F:0] + E0h

**Default:** 0009h

|      |    |   |   |       |
|------|----|---|---|-------|
| 15   | 12 | 8 | 4 | 0     |
| 0    | 0  | 0 | 0 | 1     |
| 0    | 0  | 0 | 0 | 1     |
| NEXT |    |   |   | CAPID |

| Bit Range | Default & Access | Description                                                                                                                             |
|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 15:8      | 00h<br>RO        | <b>Next Item Pointer (NEXT):</b> Configuration offset of the next Capability Item. 0x00 indicates the last item in the Capability List. |
| 7:0       | 09h<br>RO        | <b>Capability ID (CAPID):</b> Value of 0x09 indicates a Vendor Specific Capability                                                      |

### 35.6.20 FDLEN (Feature\_Detection\_Capability\_Length)—Offset E2h

Feature detection capability length.

#### Access Method

**Type:** PCI Configuration Register  
(Size: 8 bits)

**Feature\_Detection\_Capability\_Length:** [B:0, D:31, F:0] + E2h

**Default:** 0Ch

|        |   |   |

| 9:2       | 0b<br>RO         | <b>RSVD2:</b> Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 1         | X<br>RW          | <b>Top Swap (TS):</b> When set, PCU EP will invert either A16, A17, or A18 for cycles going to the BIOS space (but not the feature space) in the FWH. When cleared, PCU EP will not invert A16. If booting from LPC (FWH), then the Boot Block size is 64KB and A16 is inverted if Top Swap is enabled. If booting from SPI, then the BOOT_BLOCK_SIZE soft strap determines if A16, A17, or A18 should be inverted if Top Swap is enabled. If Top-Swap pin-strap is active, then this bit cannot be cleared by software. This bit should be kept in RTC well and should be reset only by SRTCRST_b |
| 0         | 0h<br>RW         | <b>BIOS Interface Lock-Down (BILD):</b> When set, prevents GCS.TS and GCS.BBS from being changed. This bit can only be written from 0 to 1 once.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 36 PCU – iLB – Real Time Clock (RTC)

The SoC contains a Motorola MC146818B-compatible real-time clock with 242 bytes of battery-backed RAM. The real-time clock performs two key functions—keeping track of the time of day and storing system data, even when the system is powered down. The RTC operates on a 32.768 kHz crystal and a 3.3 V battery.

The RTC supports two lockable memory ranges. By setting bits in the configuration space, two 8-byte ranges can be locked to read and write accesses. This prevents unauthorized reading of passwords or other system security information.

The RTC supports a date alarm that allows for scheduling a wake up event up to 30 days in advance.

### 36.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

Table 327. RTC Signals

| Signal Name           | Direction<br>Plat. Power | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 36.2 Features

The Real Time Clock (RTC) module provides a battery backed-up date and time keeping device. Three interrupt features are available: time of day alarm with once a second to once a month range, periodic rates of 122 us to 500 ms, and end of update cycle notification. Seconds, minutes, hours, days, day of week, month, and year are counted.

The hour is represented in twelve or twenty-four hour format, and data can be represented in BCD or binary format. The design is meant to be functionally compatible with the Motorola MS146818B. The time keeping comes from a 32.768 kHz oscillating source, which is divided to achieve an update every second. The lower 14 bytes on the lower RAM block have very specific functions. The first ten are for time and date information. The next four (0Ah to 0Dh) are registers, which configure and report RTC functions. A host-initiated write takes precedence over a hardware update in the event of a collision.

### **36.2.1 Update Cycles**

An update cycle occurs once a second, if the B.SET bit is not asserted and the divide chain is properly configured. During this procedure, the stored time and date are incremented, overflow checked, a matching alarm condition is checked, and the time and date are rewritten to the RAM locations. The update cycle starts at least 488 us after A.UIP is asserted, and the entire cycle does not take more than 1984 us to complete. The time and date RAM locations (00h to 09h) are disconnected from the external bus during this time.

## **36.3 Interrupts**

The real-time clock interrupt is internally routed within the SoC both to the I/O APIC and the 8259. It is mapped to interrupt vector 8. This interrupt does not leave the SoC, nor is it shared with any other interrupt. IRQ8# from the ILB\_LPC\_SERIRQ stream is ignored. However, the High Performance Event Timers can also be mapped to IRQ8#; in this case, the RTC interrupt is blocked.

### **36.3.1 Lockable RAM Ranges**

The RTC battery-backed RAM supports two 8-byte ranges that can be locked: the RC.UL and RC.LL register bits. When the locking bits are set, the corresponding range in the RAM is not readable or writable. A write cycle to those locations will have no effect. A read cycle to those locations will not return the location's actual value (resultant value is undefined).

Once a range is locked, the range can be unlocked only by a hard reset, which will invoke the BIOS and allow it to re-lock the RAM range.

### **36.3.2 Clearing Battery-Backed RTC CMOS RAM**

Clearing CMOS RAM in an SoC-based platform can be done by using a jumper on ILB\_RTC\_TEST# or a GPI. Implementations should not attempt to clear CMOS by using a jumper to pull RTC\_VCC low.

**Note:** The entire Extended Bank and bytes 0Eh-7Fh of the Standard Bank will be cleared.

### 36.3.2.1 Using ILB\_RTC\_TEST# to Clear the RTC CMOS RAM

A jumper on ILB\_RTC\_TEST# can be used to clear CMOS values. When ILB\_RTC\_TEST# is low, the GEN\_PMC1.RPS register bit will be set. BIOS can monitor the state of this bit, and manually clear the RTC CMOS array once the system is booted. The normal position will cause ILB\_RTC\_TEST# to be pulled up through a weak pull-up resistor. This ILB\_RTC\_TEST# jumper technique allows the jumper to be moved and then replaced—all while the system is powered off. Then, once booted, the GEN\_PMC1.RPS bit can be detected in the set state.

### 36.3.3 Using a GPI to Clear CMOS

A jumper on a GPI can also be used to clear CMOS values. BIOS should detect the setting of this GPI on system boot-up, and manually clear the CMOS array.

**Note:** The GPI strap technique to clear CMOS requires multiple steps to implement. The system is booted with the jumper in new position, then powered back down. The jumper is replaced back to the normal position, then the system is rebooted again.

**Warning:** Do not implement a jumper on RTC\_VCC to clear CMOS.

### 36.3.4 Clearing Battery Backed RTC Registers

Clearing Battery Backed RTC Registers in an SoC based platform can be done by using a jumper on ILB\_RTC\_RST#. Implementations should not attempt to clear the registers by using a jumper to pull RTC\_VCC low. A jumper on ILB\_RTC\_RST# pulled to ground can be used to reset the state of those Battery Backed RTC Register configurations bit that reside in the RTC power well to their default state. [Table 328](#) shows which bits are set to their default state when ILB\_RTC\_RST# is asserted low.

**Table 328. Register Bits Reset by ILB\_RTC\_RST# Assertion (Sheet 1 of 2)**

| Register Bit                    | Bit(s) | Default State |
|---------------------------------|--------|---------------|
| RCRB_GENERAL_CONTROL.TS         | 1      | xb            |
| GEN_PMC1.PME_B0_S5_DIS          | 15     | 0b            |
| GEN_PMC1.WOL_EN_OVRD            | 13     | 0b            |
| GEN_PMC1.DIS_SLP_X_STRCH_SUS_UP | 12     | 0b            |
| GEN_PMC1.RTC Reserved           | 8      | 0b            |
| GEN_PMC1.SWSMI_RATESEL          | 7:6    | 00b           |
| GEN_PMC1.S4MAW                  | 5:4    | 00b           |
| GEN_PMC1.S4ASE                  | 3      | 0b            |
| GEN_PMC1.AG3E                   | 0      | 0b            |
| PM1_STS_EN.RTC_EN               | 26     | 0b            |
| PM1_STS_EN.PWRBTNOR_STS         | 11     | 0b            |

Table 328. Register Bits Reset by ILB\_RTC\_RST# Assertion (Sheet 2 of 2)

| Register Bit       | Bit(s) | Default State |
|--------------------|--------|---------------|
| PM1_CNT.SLP_TYP    | 12:10  | 0b            |
| GPE0a_EN.PME_B0_EN | 13     | 0b            |
| GPE0a_EN.BATLOW_EN | 10     | 0b            |

## 36.4 References

Accessing the Real Time Clock Registers and the NMI Enable Bit: <http://download.intel.com/design/intarch/PAPERS/321088.pdf>

## 36.5 Register Map

## 36.6 IO Mapped Registers

The RTC internal registers and RAM is organized as two banks of 128 bytes each, called the standard and extended banks.

**Note:** It is not possible to disable the extended bank.

The first 14 bytes of the standard bank contain the RTC time and date information along with four registers, A - D, that are used for configuration of the RTC. The extended bank contains a full 128 bytes of battery backed SRAM. All data movement between the host CPU and the RTC is done through registers mapped to the standard I/O space.

**Note:** Registers reg\_RTC\_IR\_type and reg\_RTC\_TR\_type are used for data movement to and from the standard bank. Registers reg\_RTC\_RIR\_type and reg\_RTC\_RTR\_type are used for data movement to and from the extended bank. All of these registers have alias I/O locations, as indicated in Table 329.

Table 329. I/O Registers Alias Locations

| Register         | Original I/O Location | Alias I/O Location |
|------------------|-----------------------|--------------------|
| reg_RTC_IR_type  | 70h                   | 74h                |
| reg_RTC_TR_type  | 71h                   | 75h                |
| reg_RTC_RIR_type | 72h                   | 76h                |
| reg_RTC_RTR_type | 73h                   | 77h                |

## 36.7 Indexed Registers

The RTC contains indexed registers that are accessed via the reg\_RTC\_IR\_type and reg\_RTC\_TR\_type registers.

**Table 330. RTC Indexed Registers**

| Start | End | Name                  |
|-------|-----|-----------------------|
| 00h   | 00h | Seconds               |
| 01h   | 01h | Seconds Alarm         |
| 02h   | 02h | Minutes               |
| 03h   | 03h | Minutes Alarm         |
| 04h   | 04h | Hours                 |
| 05h   | 05h | Hours Alarm           |
| 06h   | 06h | Day of Week           |
| 07h   | 07h | Day of Month          |
| 08h   | 08h | Month                 |
| 09h   | 09h | Year                  |
| 0Ah   | 0Ah | Register A            |

## 37 PCU – iLB – 8254 Timers

The 8254 contains three counters which have fixed uses including system timer and speaker tone. The reference clock for the counters (1.19318 MHz) is generated from a 14.318 MHz clock divided by 12.

### 37.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane.
- **Description:** A brief explanation of the signal’s function

**Table 332. 8254 Signals**

| Signal Name   | Direction<br>Plat. Power | Description                                                                                                                                                                                                               |
|---------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ILB_8254_SPKR | O<br>V1P8S               | <b>Speaker:</b> The signal drives an external speaker driver device, which in turn drives the system speaker. Upon PMC_PLTRST#, its output state is 0.<br><i>This signal is muxed and may be used by other functions.</i> |

## 37.2 Features

### 37.2.1 Counter 0, System Timer

This counter functions as the system timer by controlling the state of IRQ0 and is programmed for Mode 3 operation. The counter produces a square wave with a period equal to the product of the counter period (838 ns) and the initial count value. The counter loads the initial count value one counter period after software writes the count value to the counter I/O address. The counter initially asserts IRQ0 and decrements the count value by two each counter period. The counter negates IRQ0 when the count value reaches 0. It then reloads the initial count value and again decrements the initial count value by two each counter period. The counter then asserts IRQ0 when the count value reaches 0, reloads the initial count value, and repeats the cycle, alternately asserting and negating IRQ0.

### 37.2.2 Counter 1, Refresh Request Signal

This counter is programmed for Mode 2 operation and impacts the period of the NSC.RTS register bit. Programming the counter to anything other than Mode 2 results in undefined behavior.

### 37.2.3 Counter 2, Speaker Tone

This counter provides the speaker tone and is typically programmed for Mode 3 operation. The counter provides a speaker frequency equal to the counter clock frequency (1.193 MHz) divided by the initial count value. The speaker must be enabled by a write to the NSC.SDE register bit.

## 37.3 Use

### 37.3.1 Timer Programming

The counter/timers are programmed in the following fashion:

1. Write a control word to select a counter.
2. Write an initial count for that counter.
3. Load the least and/or most significant bytes (as required by Control Word Bits 5, 4) of the 16-bit counter.
4. Repeat with other counters.

Only two conventions need to be observed when programming the counters. First, for each counter, the control word must be written before the initial count is written. Second, the initial count must follow the count format specified in the control word (least significant byte only, most significant byte only, or least significant byte and then most significant byte).

A new initial count may be written to a counter at any time without affecting the counter's programmed mode. Counting is affected as described in the mode definitions. The new count must follow the programmed count format.

If a counter is programmed to read/write two-byte counts, the following precaution applies: A program must not transfer control between writing the first and second byte to another routine which also writes into that same counter. Otherwise, the counter will be loaded with an incorrect count.

The Control Word Register at port 43h controls the operation of all three counters. Several commands are available:

- **Control Word Command.** Specifies which counter to read or write, the operating mode, and the count format (binary or BCD).
- **Counter Latch Command.** Latches the current count so that it can be read by the system. The countdown process continues.
- **Read Back Command.** Reads the count value, programmed mode, the current state of the OUT pins, and the state of the Null Count Flag of the selected counter.

Table 333 lists the six operating modes for the interval counters.

**Table 333. Counter Operating Modes**

| Mode | Function                             | Description                                                                                                                                             |
|------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    | Out signal on end of count (=0)      | Output is 0. When count goes to 0, output goes to 1 and stays at 1 until counter is reprogrammed.                                                       |
| 1    | Hardware re-triggerable one-shot     | Output is 0. When count goes to 0, output goes to 1 for one clock time.                                                                                 |
| 2    | Rate generator (divide by n counter) | Output is 1. Output goes to 0 for one clock time, then back to 1 and counter is reloaded.                                                               |
| 3    | Square wave output                   | Output is 1. Output goes to 0 when counter rolls over, and counter is reloaded. Output goes to 1 when counter rolls over, and counter is reloaded, etc. |
| 4    | Software triggered strobe            | Output is 1. Output goes to 0 when count expires for one clock time.                                                                                    |
| 5    | Hardware triggered strobe            | Output is 1. Output goes to 0 when count expires for one clock time.                                                                                    |

### 37.3.2 Reading from the Interval Timer

It is often desirable to read the value of a counter without disturbing the count in progress. There are three methods for reading the counters: a simple read operation, counter Latch command, and the Read-Back command. Each is explained below.

With the simple read and counter latch command methods, the count must be read according to the programmed format; specifically, if the counter is programmed for two byte counts, two bytes must be read. The two bytes do not have to be read one right after the other. Read, write, or programming operations for other counters may be inserted between them.

### 37.3.2.1 Simple Read

The first method is to perform a simple read operation. The counter is selected through Port 40h (Counter 0), 41h (Counter 1), or 42h (Counter 2).

**Note:** Performing a direct read from the counter does not return a determinate value, because the counting process is asynchronous to read operations. However, in the case of Counter 2, the count can be stopped by writing 0b to the NSC.TC2E register bit.

### 37.3.2.2 Counter Latch Command

The Counter Latch command, written to Port 43h, latches the count of a specific counter at the time the command is received. This command is used to ensure that the count read from the counter is accurate, particularly when reading a two-byte count. The count value is then read from each counter's Count register as was programmed by the Control register.

The count is held in the latch until it is read or the counter is reprogrammed. The count is then unlatched. This allows reading the contents of the counters on the fly without affecting counting in progress. Multiple Counter Latch Commands may be used to latch more than one counter. Counter Latch commands do not affect the programmed mode of the counter in any way.

If a counter is latched and then, some time later, latched again before the count is read, the second Counter Latch command is ignored. The count read is the count at the time the first Counter Latch command was issued.

### 37.3.2.3 Read Back Command

The Read Back command, written to Port 43h, latches the count value, programmed mode, and current states of the OUT pin and Null Count flag of the selected counter or counters. The value of the counter and its status may then be read by I/O access to the counter address.

The Read Back command may be used to latch multiple counter outputs at one time. This single command is functionally equivalent to several counter latch commands, one for each counter latched. Each counter's latched count is held until it is read or reprogrammed. Once read, a counter is unlatched. The other counters remain latched until they are read. If multiple count Read Back commands are issued to the same counter without reading the count, all but the first are ignored.

The Read Back command may additionally be used to latch status information of selected counters. The status of a counter is accessed by a read from that counter's I/O port address. If multiple counter status latch operations are performed without reading the status, all but the first are ignored.

Both count and status of the selected counters may be latched simultaneously. This is functionally the same as issuing two consecutive, separate Read Back commands. If multiple count and/or status Read Back commands are issued to the same counters without any intervening reads, all but the first are ignored.

If both count and status of a counter are latched, the first read operation from that counter returns the latched status, regardless of which was latched first. The next one or two reads, depending on whether the counter is programmed for one or two type counts, returns the latched count. Subsequent reads return unlatched count.

## 37.4 Register Map

## 37.5 IO Mapped Registers

The IO ports listed in Table 334 have multiple register functions depending on the current programmed state of the 8254. The port numbers referenced in the register descriptions following Table 334 is one possible combination but not the only one.

**Table 334. Register Aliases**

| Port | Alias | Register Name                                     | Default Value | Access |
|------|-------|---------------------------------------------------|---------------|--------|
| 40h  | 50h   | Counter 0 Interval Time Status Byte Format (C0TS) | 0xxxxxxb      | RO     |
|      |       | Counter 0 Counter Access Port Register (C0AP)     | Undefined     | RW     |
| 41h  | 51h   | Counter 1 Interval Time Status Byte Format (C1TS) | 0xxxxxxb      | RO     |
|      |       | Counter 1 Counter Access Port Register (C1AP)     | Undefined     | RW     |
| 42h  | 52h   | Counter 2 Interval Time Status Byte Format (C2TS) | 0xxxxxxb      | RO     |
|      |       | Counter 2 Counter Access Port Register (C2AP)     | Undefined     | RW     |
| 43h  | -     | Timer Control Word Register (TCW)                 | Undefined     | WO     |
|      |       | Read Back Command (RBC)                           | xxxxxx0b      | WO     |
|      |       | Counter Latch Command (CLC)                       | xxxx0000b     | WO     |

## 37.6 PCU iLB 8254 Timers IO Registers

**Table 335. Summary of PCU iLB 8254 Timers I/O Registers—**

| Offset | Size | Register ID—Description        | Default Value |
|--------|------|--------------------------------|---------------|
| 40h    | 1    | "COTS—Offset 40h" on page 4569 | 00h           |
| 41h    | 1    | "C1TS—Offset 41h" on page 4570 | 00h           |
| 42h    | 1    | "C2TS—Offset 42h" on page 4570 | 00h           |

### 37.6.3 C2TS—Offset 42h

Counter 2 Interval Time Status Byte Format. Counter 2 Interval Time Status Byte Format. Status byte can be read following a Read Back Command. If latch status is chosen (bit 4=0, Read Back Command) as a read back option for counter 2, the next read from this register returns the status byte.

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**C2TS:** 42h

**Default:** 00h

## 38 PCU – iLB – High Precision Event Timer (HPET)

This function provides a set of timers that to be used by the operating system for timing events. One timer block is implemented, containing one counter and three timers.

### 38.1 Features

#### 38.1.1 Non-Periodic Mode - All Timers

This mode can be thought of as creating a one-shot. When a timer is set up for non-periodic mode, it generates an interrupt when the value in the main counter matches the value in the timer's comparator register. As timers 1 and 2 are 32-bit, they will generate another interrupt when the main counter wraps.

T0CV cannot be programmed reliably by a single 64-bit write in a 32-bit environment unless only the periodic rate is being changed. If T0CV needs to be re-initialized, the following algorithm is performed:

1. Set T0C.TVS
2. Set T0CV[31:0]
3. Set T0C.TVS
4. Set T0CV[63:32]

Every timer is required to support the non-periodic mode of operation.

### 38.1.2 Periodic Mode - Timer 0 only

When set up for periodic mode, when the main counter value matches the value in T0CV, an interrupt is generated (if enabled). Hardware then increases T0CV by the last value written to T0CV. During run-time, T0CV can be read to find out when the next periodic interrupt will be generated. Software is expected to remember the last value written to T0CV.

Example: if the value written to T0CV is 00000123h, then

- An interrupt will be generated when the main counter reaches 00000123h.
- T0CV will then be adjusted to 00000246h.
- Another interrupt will be generated when the main counter reaches 00000246h.
- T0CV will then be adjusted to 00000369h.

When the incremented value is greater than the maximum value possible for T0CV, the value will wrap around through 0. For example, if the current value in a 32-bit timer is FFFF0000h and the last value written to this register is 20000, then after the next interrupt the value will change to 00010000h.

If software wants to change the periodic rate, it writes a new value to T0CV. When the timer's comparator matches, the new value is added to derive the next matching point. If software resets the main counter, the value in the comparator's value register must also be reset by setting T0C.TVS. To avoid race conditions, this should be done with the main counter halted. The following usage model is expected:

1. Software clears GCFG.EN to prevent any interrupts.
2. Software clears the main counter by writing a value of 00h to it.
3. Software sets T0C.TVS.
4. Software writes the new value in T0CV.
5. Software sets GCFG.EN to enable interrupts.

#### 38.1.2.1 Interrupts

If each timer has a unique interrupt and the timer has been configured for edge-triggered mode, then there are no specific steps required. If configured to level-triggered mode, then its interrupt must be cleared by software by writing a '1' back to the bit position for the interrupt to be cleared.

Interrupts associated with the various timers have several interrupt mapping options. Software should mask GCFG.LRE when reprogramming HPET interrupt routing to avoid spurious interrupts.

#### 38.1.2.2 Mapping Option #1: Legacy Option (GCFG.LRE set)

This forces the following mapping:

**Table 336. 8254 Interrupt Mapping**

| Time<br>r | 8259<br>Mapping | APIC<br>Mapping | Comment                                      |
|-----------|-----------------|-----------------|----------------------------------------------|
| 0         | IRQ0            | IRQ2            | The 8254 timer will not cause any interrupts |
| 1         | IRQ8            | IRQ8            | RTC will not cause any interrupts.           |
| 2         | T2C.IR          | T2C.IRC         |                                              |

### 38.1.2.3 Mapping Option #2: Standard Option (GCFG.LRE cleared)

Each timer has its own routing control. The interrupts can be routed to various interrupts in the I/O APIC. T[2:0]C.IRC indicates which interrupts are valid options for routing. If a timer is set for edge-triggered mode, the timers should not be shared with any other interrupts.

## 39 PCU – iLB – GPIO

102 GPIOs are available for use during the S0 ACPI state, and 44 are available for use from S5 to S0 (SUS). Most of these GPIOs can be used as legacy GPIOs through IO registers.

### 39.1 Signal Descriptions

Please see [Chapter 2, “Physical Interfaces”](#) for additional details.

The signal description table has the following headings:

- **Signal Name:** The name of the signal/pin
- **Direction:** The buffer direction can be either input, output, or I/O (bidirectional)
- **Platform Power:** The reference power plane
- **Description:** A brief explanation of the signal’s function

**Table 338. GPIO Signals**

| Signal Name              | Direction<br>Plat. Power | Description                                                                                                                                                                  |
|--------------------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>GPIO_S0_SC[101:0]</b> | I/O<br>Varies            | These GPIO pins are powered and active in S0 only. Many of these are multiplexed with other functions and may have different default pin names.                              |
| <b>GPIO_S5[43:0]</b>     | I/O<br>Varies            | These GPIO pins are powered and active in S5-S0 (SUS). Many of these are multiplexed with other functions and may have different default pin names. Some are used as straps. |

### 39.2 Features

GPIOs can generate general purpose events (GPEs) on rising and/or falling edges.

## 39.3 Legacy Use

Each GPIO has six registers that control how it is used, or report its status:

- Use Select
- I/O Select
- GPIO Level
- Trigger Positive Edge
- Trigger Negative Edge
- Trigger Status

The Use Select register selects a GPIO pin as a GPIO, or leaves it as its programmed function. This register must be set for all other registers to affect the GPIO.

The I/O Select register determines the direction of the GPIO.

The Trigger Positive Edge and Trigger Negative Edge registers enable general purpose events on a rising and falling edge respectively. This only applies to GPIOs set as input.

The Trigger Status register is used by software to determine if the GPIO triggered a GPE. This only applies to GPIOs set as input and with one or both of the Trigger modes enabled.

Additionally, there is one additional register for each S5 GPIO:

- Wake Enable

This register allows S5 GPIOs to trigger a wake event based on the Trigger registers' settings.

## 39.4 Memory Mapped Use

Each GPIO has two registers that control how it is used, or report its status:

- Pad Configuration (PCONF0)
- Pad Value (PAD\_VAL)

**Note:** These registers are also implemented for the available Virtual GPIOs (vGPIOs).

The Pad Configuration register has the following functions:

- Configure the function of the pin as a GPIO or multiplexed native functions
- Configure pull resistors
- Configure electrical behavior
- Configure edge detection
- Configure interrupt handling

**Note:** The PCONF0 register is valid irrespective of whether or not the pin is configured as a GPIO

The Pad Value register has the following functions:

- Reads the GPIO value, when configured as a GPI
- Writes the GPIO value, when configured as a GPO
- Enables/disables input and output capabilities

**Note:** The Pad Value register is only valid when the pin is configured as a GPIO in the Pad Configuration register.

Additionally, there are a number of general configuration registers that control groups of GPIOs or report their status. These include:

- IRQ Status (IRQ\_TS)
- Direct IRQ Multiplexer (DIRECT\_IRQ)

The IRQ Status register indicates if an IRQ associated with a GPIO has been triggered.

The Direct IRQ Multiplexer register allows for a selection of GPIOs to be assigned a dedicated APIC interrupt.

The GPIO South CORE and GPIO South SUS families have 16 dedicated IRQ outputs for each. Each of these 16 has a mux with an 8 bit select that can pick which of the input pads are mapped to that direct IRQ (the pad would still need to be programmed). Refer to the Intel Bios Writers Guide. This programming is done with the Direct IRQ 0 - 3 registers for SCORE and SSUS domains listed in the GPIO Family Register section.

The 16 GPSCORE direct IRQs are mapped to IOAPIC\_IRQ [66:51].

The 16 GPSSUS direct IRQs are mapped to IOAPIC\_IRQ [82:67].

For example:

1. Programming GPSCORE Direct IRQ 0 [dirq0] = 4 will map GPIO\_S0\_SC[004]/pCIE\_CLKREQ[1#] to IRQ51.
2. Programming GPSCORE Direct IRQ 0 [dirq1] = 8 will map GPIO\_S0\_SC[008]/I2S0\_CLK to IRQ52.

## 39.5 Register Map

Figure 137.SIO - I<sup>2</sup>C Register Map

## 39.6 GPIO Registers

Registers are broken into two groups: memory mapped and legacy IO registers. Memory mapped registers are used by BIOS and firmware to select the configurable function of the GPIO and setup analog states needed for that function's operation. They

are named based on the pin/ball name. Legacy IO registers are the more traditional GPIO control/status type, and are used when the function selected is a traditional GPIO (direction, level, use registers). They are numbered based on the GPIO number.

Each group is further broken down into SCORE (internal partition naming) and SSUS. SCORE are for the GPIO's named GPIO\_S0\_SC[xxx], while SSUS are for the GPIO's named GPIO\_S5[xx].

**Note:** All GPIO registers must be accessed as double words. Unpredictable results will occur otherwise.

**Note:** All memory mapped GPIO \*\_PAD\_VAL's must set Ienenb = 0 in order to read the pad\_val of the GPIO. This applies to RO GPIO's as well.

**Note:** vGPIO's are virtual GPIO's for use by software to generate interrupts. They are not tied to physical pins.

**Note:** When a GPIO is selected via the IO USE\_SEL, Memory accesses are denied (pconf0, pconf1 and pad\_val).

## §

## 39.7 PCU iLB GPIO S0 IO Addressed Registers

### 39.7.1 South Core Use Select 1 (cfio\_ioreg\_SC\_USE\_SEL\_31\_0\_)—Offset 0h

Access via PCU proxy, the register is setting the corresponding GPIO to be selected and to be changed to IO access instead of the default Memory access. Bit 0 will set GPIO[0], and bit 1 will set GPIO[1] and so on. The default of IO GPIO pad is input so pull must be activated in the pad pconf0 register.

### 39.7.3 South Core Gpio Level 1 (cfio\_ioreg\_SC\_GP\_LVL\_31\_0\_)—Offset 8h

Access via PCU proxy, the registers are implemented as dual read/write with dedicated storage for write. Write value will be stored in the write register, while read is coming from the pad directly. If GPIO(n) is programmed to be an output (via the corresponding bit in the GP\_IO\_SEL register), then the corresponding GP\_LVL(n) write register value will drive a high or low value on the output pin. 1 = high, 0 = low. - Only the 8 lsb are used in VLV

#### Access Method

**Type:** I/O Register  
(Size: 32 bits)

**Offset:** [GBASE] + 8h

**GBASE Type:** PCI Configuration Register (Size: 32 bits)

**GBASE Reference:** [B:0, D:31, F:0] + 48h

### 39.7.6 South Core Trigger Status 1 (cfio\_ioreg\_SC\_TS\_31\_0)—Offset 14h

Access via PCU proxy, when set to a 1, the corresponding GPIO (if enabled in the GPIO\_USE\_SEL register) if enabled as input via IO\_SEL(n), triggered an GPE or SMI. This will be set if a 0 to 1 transition occurred and TPE(n) was set, or a 1 to 0 transition occurred and TNE(n) was set. If both TPE(n) and TNE(n) are set, then this bit will be set on both a 0 to 1 and a 1 to 0 transition. This bit will not be set if the GPIO is configured as an output. - Only the 8 lsb are used in VLV and it cannot be tested by the host

#### Access Method

### 39.7.7 South Core Use Select 2 (cfio\_ioreg\_SC\_USE\_SEL\_63\_32\_)—Offset 20h

Access via PCU proxy, the register is setting the corresponding GPIO to be selected and to be changed to IO access instead of the default Memory access. Bit 0 will set GPIO[32], and bit 1 will set GPIO[33] and so on. The default of IO GPIO pad is input so pull must be activated in the pad pconf0 register.

## Access Method

### 39.7.8 South Core Io Select 2 (cfio\_ioreg\_SC\_IO\_SEL\_63\_32\_)—Offset 24h

Access via PCU proxy, define the Input Output Select: When set to a 1, the corresponding GPIO signal (if enabled in the GPIO\_USE\_SEL register) is programmed as an input. When set to 0, the GPIO signal is programmed as an output - Only the 8 lsb are used in VLV. Default values will be read as 0 if IO is not used

#### Access Method

**Type:** I/O Register  
(Size: 32 bits)

**Offset:** [GBASE] + 24h

**GBASE Type:** PCI Configuration Register (Size: 32 bits)

**GBASE Reference:** [B:0, D:31, F:0] + 48h

**Default:** 00000000h

### 39.7.9 South Core Gpio Level 2 (cfio\_ioreg\_SC\_GP\_LVL\_63\_32\_)—Offset 28h

Access via PCU proxy, the registers are implemented as dual read/write with dedicated storage for write. Write value will be stored in the write register, while read is coming from the pad directly. If GPIO(n) is programmed to be an output (via the corresponding bit in the GP\_IO\_SEL register), then the corresponding GP\_LVL(n) write register value will drive a high or low value on the output pin. 1 = high, 0 = low. - Only the 8 lsb are used in VLV

#### Access Method

**Type:** I/O Register  
(Size: 32 bits)

**Offset:** [GBASE] + 28h

**GBASE Type:** PCI Configuration Register (Size: 32 bits)

**GBASE Reference:** [B:0, D:31, F:0] + 48h

**Default:** 00000000h

### 39.7.12 South Core Trigger Status 2 (cfio\_ioreg\_SC\_TS\_63\_32\_)—Offset 34h

When set to a 1, the corresponding GPIO (if enabled in the GPIO\_USE\_SEL register) if enabled as input via IO\_SEL(n), triggered an GPE or SMI. This will be set if a 0 to 1 transition occurred and TPE(n) was set, or a 1 to 0 transition occurred and TNE(n) was set. If both TPE(n) and TNE(n) are set, then this bit will be set on both a 0 to 1 and a 1 to 0 transition. This bit will not be set if the GPIO is configured as an output. - Only the 8 lsb are used in VLV

### 39.7.15 South Core Gpio Level 3 (cfio\_ioreg\_SC\_GP\_LVL\_95\_64\_)—Offset 48h

This registers are implemented as dual read/write with dedicated storage for write. Write value will be stored in the write register, while read is coming from the pad directly. If GPIO(n) is programmed to be an output (via the corresponding bit in the GP\_IO\_SEL register), then the corresponding GP\_LVL(n) write register value will drive a high or low value on the output pin. 1 = high, 0 = low. - Only the 8 lsb are used in VLV

### 39.7.24 South Core Trigger Status 4 (cfio\_ioreg\_SC\_TS\_127\_96\_)—Offset 74h

When set to a 1, the corresponding GPIO (if enabled in the GPIO\_USE\_SEL register) if enabled as input via IO\_SEL(n), triggered an GPE or SMI. This will be set if a 0 to 1 transition occurred and TPE(n) was set, or a 1 to 0 transition occurred and TNE(n) was set. If both TPE(n) and TNE(n) are set, then this bit will be set on both a 0 to 1 and a 1 to 0 transition. This bit will not be set if the GPIO is configured as an output. - Only the 8 lsb are used in VLV

## 39.8 PCU iLB GPIO S0 Memory Addressed Registers

**Table 340. Summary of iLB GPIO S0 Memory Mapped I/O Registers—I/OBASE**

| Offset | Size (Bytes) | Register Name (Register Symbol)                                                            | Default Value |

### 39.8.1 Uart1 Rts B Pad Configuration (cfio\_regs\_pad\_uart1\_rts\_b\_PCONF0)—Offset 0h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 0h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### PADs Memory space configuration register

Intel Atom® Processor E3800 Product Family  
Datasheet  
4639

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 40h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

### 39.8.11 I2c Nfc Sda Pad Configuration (cfio\_regs\_pad\_i2c\_nfc\_sda\_PCONF0)—Offset 50h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 50h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

### PADs Memory space Value register

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 98h**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

[illegible]

Intel Atom® Processor E3800 Product Family  
Datasheet  
4658

### 39.8.21 Pwm0 Pad Configuration (cfio\_regs\_pad\_pwm0\_PCONF0)—Offset A0h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + A0h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CD00h

### 39.8.23 Pwm1 Pad Configuration (cfio\_regs\_pad\_pwm1\_PCONF0)—Offset B0h

### PADs Memory space configuration register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + B0h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CD00h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pin_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.8.33 Spi1 Clk Pad Configuration (cfio\_regs\_pad\_spi1\_clk\_PCONF0)—Offset 100h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 100h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CD00h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pin_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### 39.8.35 Spi1 Cs0 B Pad Configuration (cfio\_regs\_pad\_spi1\_cs0\_b\_PCONF0)—Offset 110h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 110h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.8.37 Spi1 Miso Pad Configuration (cfio\_regs\_pad\_spi1\_miso\_PCONF0)—Offset 120h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 120h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pin_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### 39.8.45 I2c6 Scl Pad Configuration (cfio\_regs\_pad\_i2c6\_scl\_PCONF0)—Offset 160h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 160h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.8.47 I2c4 Scl Pad Configuration (cfio\_regs\_pad\_i2c4\_scl\_PCONF0)—Offset 170h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 170h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pin_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.8.59 I2c2 Sda Pad Configuration (cfio\_regs\_pad\_i2c2\_sda\_PCONF0)—Offset 1D0h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.8.63 I2c1 Sda Pad Configuration (cfio\_regs\_pad\_i2c1\_sda\_PCONF0)—Offset 1F0h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 1F0h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pin_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### 39.8.65 I2c0 Scl Pad Configuration (cfio\_regs\_pad\_i2c0\_scl\_PCONF0)—Offset 200h

PADs Memory space configuration register

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### 39.8.71 Hda Sdi1 Pad Configuration (cfio regs pad hda sdi1 PCONF0)—Offset 230h

### PADs Memory space configuration register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 230h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003ED00h

### 39.8.73 Hda Clk Pad Configuration (cfio\_regs\_pad\_hda\_clk\_PCONF0)—Offset 240h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 240h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003ED00h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.8.79 Hda Sdi0 Pad Configuration (cfio\_regs\_pad\_hda\_sdi0\_PCONF0)—Offset 270h

## Access Method

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.8.85 Sdmmc3 D3 Pad Configuration (cfio\_regs\_pad\_sdmmc3\_d3\_PCONF0)—Offset 2A0h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 2A0h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 20038C80h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.8.92 Sdmmc3 D2 Pad Configuration (cfio\_regs\_pad\_sdmmc3\_d2\_PCONF0)—Offset 2D0h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 2D0h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 20038C80h

### 39.8.95 Sdmmc3 D0 Pad Value (cfio\_regs\_pad\_sdmmc3\_d0\_PAD\_VAL)—Offset 2E8h

PADs Memory space Value register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 2E8h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 00000002h

Intel Atom® Processor E3800 Product Family  
Datasheet  
4775

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.8.100 Sdmmc2 D3 Cd B Pad Configuration (cfio regs pad\_sdmmc2\_d3\_cd\_b PCONF0)—Offset 310h

### PADs Memory space configuration register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 310h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003EC80h

### 39.8.102 Sdmmc2 Clk Pad Configuration (cfio\_regs\_pad\_sdmmc2\_clk\_PCONF0)—Offset 320h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 320h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003ED00h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.8.109 Sdmmc2 D0 Pad Configuration (cfio\_regs\_pad\_sdmmc2\_d0\_PCONF0)—Offset 350h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### 39.8.117 Sdmmc1 Cmd Pad Configuration (cfio\_regs\_pad\_sdmmc1\_cmd\_PCONF0)—Offset 390h

### PADs Memory space configuration register

### 39.8.119 Sdmmc3 Cd B Pad Configuration (cfio\_regs\_pad\_sdmmc3\_cd\_b\_PCONF0)—Offset 3A0h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 3A0h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.8.123 Mmc1 D5 Pad Configuration (cfio\_regs\_pad\_mmc1\_d5\_PCONF0)—Offset 3C0h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 3C0h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003EC80h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 3E0h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003ED00h

### 39.8.128 Sdmmc1 Clk Delay Line Multiplexer (cfio\_regs\_pad\_sdmmc1\_clk\_PCONF1)—Offset 3E4h

## DLL Multiplexer

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 3E4h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 00008000h

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 400h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003EC80h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### 39.8.134 Lpc Clkout1 Pad Configuration (cfio\_regs\_pad\_lpc\_clkout1\_PCONF0)—Offset 410h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 410h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 20038D00h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### PADs Memory space configuration register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 4D0h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CD00h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.8.162 Mhsi Acflag Pad Configuration (cfio\_regs\_pad\_mhsi\_acflag\_PCONF0)—Offset 4F0h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 4F0h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

### 39.8.167 Mhsi Cadata Pad Configuration (cfio\_regs\_pad\_mhsi\_cadata\_PCONF0)—Offset 510h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 510h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CD00h

### 39.8.174 Hda Dockenb Pad Configuration (cfio\_regs\_pad\_hda\_dockenb\_PCONF0)—Offset 540h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 540h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CD00h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pin_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### 39.8.186 Smb Data Pad Configuration (cfio\_regs\_pad\_smb\_data\_PCONF0)—Offset 5A0h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 5A0h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.8.196 Pmu Resetbutton B Pad Test (cfio\_regs\_pad\_pmu\_resetbutton\_b\_PAD\_DFT)—Offset 5ECh

## PADs Memory space Value register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 5ECh

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 00000400h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### 39.8.199 Pcie Clkreq0b Pad Configuration (cfio\_regs\_pad\_pcie\_clkreq0b\_PCONF0)—Offset 600h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 600h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

### 39.8.205 Pcie Clkreq1b Pad Configuration (cfio\_regs\_pad\_pcie\_clkreq1b\_PCONF0)—Offset 630h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 630h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### 39.8.209 Pcie Clkreq4b Pad Configuration (cfio\_regs\_pad\_pcie\_clkreq4b\_PCONF0)—Offset 650h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 650h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

### 39.8.215 Plt Clk3 Pad Configuration (cfio\_regs\_pad\_plt\_clk3\_PCONF0)—Offset 680h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 680h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CD00h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### 39.8.219 Plt Clk0 Pad Configuration (cfio\_regs\_pad\_plt\_clk0\_PCONF0)—Offset 6A0h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 6A0h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CD00h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.8.241 Vgpio 10 Pad Configuration (cfio\_regs\_pad\_vgpio\_10\_PCONF0)—Offset 750h

## Access Method

**Offset:** [IOBASE] + 750h**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 20038800h

### 39.8.252 Vgpios 15 Pad Value (cfio\_regs\_pad\_vgpios\_15\_PAD\_VAL)—Offset 7A8h

PADs Memory space Value register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 7A8h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 00000004h

### 39.8.254 Vgpio 16 Pad Value (cfio\_regs\_pad\_vgpio\_16\_PAD\_VAL)–Offset 7B8h

### PADs Memory space Value register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE] + 7B8h

**IOBASE Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 00000004h

[illegible]

## Access Method

**Offset:** [IOBASE] + 7C0h

**IOBASE Reference:** [B:0, D:31, F:0] + 4Ch

[illegible]

### 39.9.2 Sus Io Select 1 (cfio\_ioreg\_SUS\_IO\_SEL\_31\_0\_)—Offset 4h

Access via PCU Proxy, it defines Input Output Select: When set to a 1, the corresponding GPIO signal (if enabled in the GPIO\_USE\_SEL register) is programmed as an input. When set to 0, the GPIO signal is programmed as an output - Only the 8 lsb are used in VLV. Default values will be read as 0 if IO is not used

#### Access Method

**Type:** I/O Register  
(Size: 32 bits)

**Offset:** [GBASE + 80h] + 4h

**GBASE Type:** PCI Configuration Register (Size: 32 bits)

**GBASE Reference:** [B:0, D:31, F:0] + 48h

**Default:** 00000000h

### 39.9.3 Sus Gpio Level 1 (cfio\_ioreg\_SUS\_GP\_LVL\_31\_0\_)—Offset 8h

Access via PCU Proxy, the registers are implemented as dual read/write with dedicated storage for write. Write value will be stored in the write register, while read is coming from the pad directly. If GPIO(n) is programmed to be an output (via the corresponding bit in the GP\_IO\_SEL register), then the corresponding GP\_LVL(n) write register value will drive a high or low value on the output pin. 1 = high, 0 = low. - Only the 8 lsb are used in VLV

#### Access Method

Access via PCU Proxy, When set to a 1, the corresponding GPIO (if enabled in the GPIO\_USE\_SEL register) if enabled as input via IO\_SEL(n), triggered an GPE or SMI. This will be set if a 0 to 1 transition occurred and TPE(n) was set, or a 1 to 0 transition occurred and TNE(n) was set. If both TPE(n) and TNE(n) are set, then this bit will be set on both a 0 to 1 and a 1 to 0 transition. This bit will not be set if the GPIO is configured as an output. - Only the 8 lsb are used in VLV and it cannot be tested by the host

### 39.9.10 Sus Gpio Level 2 (cfio\_ioreg\_SUS\_GP\_LVL\_43\_32\_)—Offset 28h

This registers are implemented as dual read/write with dedicated storage for write. Write value will be stored in the write register, while read is coming from the pad directly. If GPIO(n) is programmed to be an output (via the corresponding bit in the GP\_IO\_SEL register), then the corresponding GP\_LVL(n) write register value will drive a high or low value on the output pin. 1 = high, 0 = low. - Only the 8 lsb are used in VLV

#### Access Method

**Type:** I/O Register  
(Size: 32 bits)

**Offset:** [GBASE + 80h] + 28h

**GBASE Type:** PCI Configuration Register (Size: 32 bits)

**GBASE Reference:** [B:0, D:31, F:0] + 48h

**Default:** 00000000h

|           |    |    |    |    |    |        |   |   |

### 39.9.13 Sus Trigger Status (cfio\_ioreg\_SUS\_TS\_43\_32\_)—Offset 34h

Access via PCU Proxy, When set to a 1, the corresponding GPIO (if enabled in the GPIO\_USE\_SEL register) if enabled as input via IO\_SEL(n), triggered an GPE or SMI. This will be set if a 0 to 1 transition occurred and TPE(n) was set, or a 1 to 0 transition occurred and TNE(n) was set. If both TPE(n) and TNE(n) are set, then this bit will be set on both a 0 to 1 and a 1 to 0 transition. This bit will not be set if the GPIO is configured as an output. - Only the 8 lsb are used in VLV

#### Access Method

**Type:** I/O Register  
(Size: 32 bits)

**Offset:** [GBASE + 80h] + 34h

**GBASE Type:** PCI Configuration Register (Size: 32 bits)

**GBASE Reference:** [B:0, D:31, F:0] + 48h

**Default:** 00000000h

### 39.10.1 Usb Oc1 B Pad Configuration (cfio\_regs\_pad\_usb\_oc1\_b\_PCONF0)—Offset 0h

### PADs Memory space configuration register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE + 0x2000] + 0h

**IOBASE + 0x2000 Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### 39.10.3 Pmu Wake B Pad Configuration (cfio\_regs\_pad\_pmu\_wake\_b\_PCONF0)—Offset 10h

### PADs Memory space configuration register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE + 0x2000] + 10h

**IOBASE + 0x2000 Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

### 39.10.7 Spi Cs1 B Pad Value (cfio\_regs\_pad\_spi\_cs1\_b\_PAD\_VAL)–Offset 28h

PADs Memory space Value register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE + 0x2000] + 28h

**IOBASE + 0x2000 Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 00000002h

[illegible]

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### 39.10.15 Spi Miso Pad Value (cfio\_regs\_pad\_spi\_miso\_PAD\_VAL)—Offset 68h

### PADs Memory space Value register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE + 0x2000] + 68h

**IOBASE + 0x2000 Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 00000006h

[illegible]

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.10.18 Suspwrdsnack Pad Test (cfio\_regs\_pad\_suspwrdsnack\_PAD\_DFT)—Offset 7Ch

## PADs Memory space Value register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE + 0x2000] + 7Ch

**IOBASE + 0x2000 Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 00000400h

[illegible]

### 39.10.20 Pmu Pwrbtn B Pad Value (cfio\_regs\_pad\_pmu\_pwrbtn\_b\_PAD\_VAL)—Offset 88h

### PADs Memory space Value register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE + 0x2000] + 88h

**IOBASE + 0x2000 Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 00000002h

[illegible]

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.10.29 Pmu Susclk Pad Test (cfio\_regs\_pad\_pmu\_susclk\_PAD\_DFT)—Offset BCh

### PADs Memory space Value register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE + 0x2000] + BCh

**IOBASE + 0x2000 Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 00000400h

[illegible]

### 39.10.35 Pmu Ac Present Pad Configuration (cfio regs pad pmu ac present PCONF0)—Offset E0h

### PADs Memory space configuration register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE + 0x2000] + E0h

**IOBASE + 0x2000 Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CD00h

### 39.10.37 Pmu Ac Present Pad Test (cfio\_regs\_pad\_pmu\_ac\_present\_PAD\_DFT)—Offset ECh

### 39.10.38 Pmu Slp S4 B Pad Configuration (cfio\_regs\_pad\_pmu\_slp\_s4\_b\_PCONF0)—Offset F0h

## PADs Memory space configuration register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE + 0x2000] + F0h

**IOBASE + 0x2000 Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003C800h

[illegible]

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.10.51 Sus Stat B Pad Test (cfio\_regs\_pad\_sus\_stat\_b\_PAD\_DFT)–Offset 13Ch

### PADs Memory space Value register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE + 0x2000] + 13Ch

**IOBASE + 0x2000 Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 00000400h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must to cleared to allow this register to reflect the output state. |

### 39.10.65 Gpio Dfx8 Pad Configuration (cfio\_regs\_pad\_gpio\_dfx8\_PCONF0)—Offset 1A0h

## Access Method

**Offset:** [IOBASE + 0x2000] + 1A0h

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

### 39.10.67 Gpio Dfx3 Pad Configuration (cfio\_regs\_pad\_gpio\_dfx3\_PCONF0)—Offset 1B0h

### PADs Memory space configuration register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE + 0x2000] + 1B0h

**IOBASE + 0x2000 Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CD00h

[illegible]

### 39.10.75 Gpio Sus3 Pad Configuration (cfio\_regs\_pad\_gpio\_sus3\_PCONF0)—Offset 1F0h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE + 0x2000] + 1F0h

**IOBASE + 0x2000 Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CC80h

### 39.10.81 Gpio Sus5 Pad Configuration (cfio\_regs\_pad\_gpio\_sus5\_PCONF0)—Offset 220h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE + 0x2000] + 220h

**IOBASE + 0x2000 Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CD00h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### 39.10.109 Usb Ulpi 0 Data4 Pad Configuration (cfio\_regs\_pad\_usb\_ulpi\_0\_data4\_PCONF0)—Offset 300h

PADs Memory space configuration register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE + 0x2000] + 300h

**IOBASE + 0x2000 Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CD00h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### 39.10.113 Usb Ulpi 0 Data6 Pad Configuration (cfio\_regs\_pad\_usb\_ulpi\_0\_data6\_PCONF0)—Offset 320h

### PADs Memory space configuration register

## Access Method

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pin_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### 39.10.120 Usb Ulpi 0 Nxt Pad Value (cfio\_regs\_pad\_usb\_ulpi\_0\_nxt\_PAD\_VAL)—Offset 358h

PADs Memory space Value register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE + 0x2000] + 358h

**IOBASE + 0x2000 Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 00000002h

[illegible]

## Access Method

**Offset:** [IOBASE + 0x2000] + 360h

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CD00h

| 0         | 0b<br>RW         | <b>Pad Val (pad_val):</b> Use this bit to set the output value or to read the pin state in memory mapped GPIO mode. Memory mapped GPIO mode is enabled when this configurable pad is set to the GPIO function via its respective func_pn_mux field and only accessed via memory mapped registers. When used as a memory mapped GPIO output, clear both ioutenb and iinenb bits. Even when used as output, the iinenb bit must be cleared to allow this register to reflect the output state. |

### 39.10.129 Usb Ulpi 0 Data7 Pad Configuration (cfio\_regs\_pad\_usb\_ulpi\_0\_data7\_PCONF0)—Offset 3A0h

### PADs Memory space configuration register

## Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**Offset:** [IOBASE + 0x2000] + 3A0h

**IOBASE + 0x2000 Type:** PCI Configuration Register (Size: 32 bits)

**IOBASE + 0x2000 Reference:** [B:0, D:31, F:0] + 4Ch

**Default:** 2003CD00h

## 40 *PCU – iLB – Interrupt Decoding and Routing*

---

The interrupt decoder is responsible for receiving interrupt messages from other devices in the SoC and decoding them for consumption by the interrupt router, the [PCU – iLB – 8259 Programmable Interrupt Controllers \(PIC\)](#) and/or the [PCU – iLB – IO APIC](#).

The interrupt router is responsible for mapping each incoming interrupt to the appropriate PIRQx, for consumption by the [PCU – iLB – 8259 Programmable Interrupt Controllers \(PIC\)](#) and/or [PCU – iLB – IO APIC](#).

### 40.1 Features

#### 40.1.1 Interrupt Decoder

The interrupt decoder receives interrupt messages from devices in the SoC. These interrupts can be split into two primary groups:

- For consumption by the interrupt router
- For consumption by the 8259 PIC

##### 40.1.1.1 For Consumption by the Interrupt Router

When a PCI-mapped device in the SoC asserts or de-asserts an INT[A:D] interrupt, an interrupt message is sent to the decoder. This message is decoded to indicate to the interrupt router which specific interrupt is asserted or de-asserted and which device the INT[A:D] interrupt originated from.

##### 40.1.1.2 For Consumption by the 8259 PIC

When a device in the SoC asserts or de-asserts a legacy interrupt (IRQ), an interrupt message is sent to the decoder. This message is decoded to indicate to the 8259 PIC, which specific interrupt (IRQ[3, 14 or 15]) was asserted or de-asserted.

#### 40.1.2 Interrupt Router

The interrupt router aggregates the INT[A:D] interrupts for each PCI-mapped device in the SoC, received from the interrupt decoder, and the INT[A:D] interrupts direct from the Serialized IRQ controller. It then maps these aggregated interrupts to 8 PCI based interrupts: PIRQ[A:H]. This mapping is configured using the IR[31:0] registers.

PCI based interrupts PIRQ[A:H] are then available for consumption by either the 8259 PICs or the IO-APIC, depending on the configuration of the 8 PIRQx Routing Control Registers: PIRQA, PIQRB, PIRQC, PIRQD, PIRQE, PIRQF, PIRQG, PIRQH.

#### 40.1.2.1 Routing PCI Based Interrupts to 8259 PIC

The interrupt router can be programmed to allow PIRQA-PIRQH to be routed internally to the 8259 as ISA compatible interrupts IRQ 3–7, 9–12 & 14–15. The assignment is programmable through the 8 PIRQx Routing Control Registers: PIRQA, PIQRB, PIRQC, PIRQD, PIRQE, PIRQF, PIRQG, PIRQH. One or more PIRQs can be routed to the same IRQ input. If ISA Compatible Interrupts are not required, the Route registers can be programmed to disable steering.

The PIRQx# lines are defined as active low, level sensitive. When a PIRQx# is routed to specified IRQ line, software must change the IRQ's corresponding ELCR bit to level sensitive mode. The SoC internally inverts the PIRQx# line to send an active high level to the PIC. When a PCI interrupt is routed onto the PIC, the selected IRQ can no longer be used by an active high device (through SERIRQ). However, active low interrupts can share their interrupt with PCI interrupts.

§

## 41 PCU – iLB – IO APIC

The IO Advanced Programmable Interrupt Controller (APIC) is used to support line interrupts more flexibly than the 8259 PIC. Line interrupts are routed to it from multiple sources, including legacy devices, via the interrupt decoder and serial IRQs, or they are routed to it from the interrupt router in the iLB. These line based interrupts are then used to generate interrupt messages targeting the local APIC in the processor.

### 41.1 Features

- 87 interrupt lines
  - IRQ0-86
- Edge or level trigger mode per interrupt
- Active low or high polarity per interrupt
- Works with local APIC in processor via MSIs
- MSIs can target specific processor core
- Established APIC programming model

**Figure 138. Detailed Block Diagram**

MSIs generated by the I/O APIC are sent as 32-bit memory writes to the Local APIC. The address and data of the write transaction are used as follows.

**Figure 139. MSI Address and Data**

Destination ID (DID) and Extended Destination ID (EDID) are used to target a specific processor core's local APIC.

## 41.2 Use

The I/O APIC contains indirectly accessed I/O APIC registers and normal memory mapped registers. There are three memory mapped registers:

- Index Register (IDX)
- Window Register (WDW)
- End Of Interrupt Register (EOI)

The Index register selects an indirect I/O APIC register (ID/VS/RTE[n]) to appear in the Window register.

The Window register is used to read or write the indirect register selected by the Index register.

The EOI register is written to by the Local APIC in the processor. The I/O APIC compares the lower eight bits written to the EOI register to the Vector set for each interrupt (RTE.VCT). All interrupts that match this vector will have their RTE.RIRR register cleared. All other EOI register bits are ignored.

## 41.3 Indirect I/O APIC Registers

These registers are selected with the IDX register, and read/written through the WDW register. Accessing these registers must be done as DW requests, otherwise unspecified behavior will result. Software should not attempt to write to reserved registers. Reserved registers may return non-zero values when read.

**Note:** There is one pair of redirection (RTE) registers per interrupt line. Each pair forms a 64-bit RTE register.

**Note:** Specified offsets should be placed in IDX, not added to IDX.

§

## 41.4 PCU iLB IO APIC Memory Mapped I/O Registers

**Table 343. Summary of PCU iLB I/O APIC Memory Mapped I/O Registers—**

| Offset    | Size | Register ID—Description                          | Default Value |
|-----------|------|--------------------------------------------------|---------------|
| FEC00000h | 1    | "IDX (IOAPIC_IDX)—Offset FEC00000h" on page 5302 | 00h           |
| FEC00010h | 4    | "WDW (IOAPIC_WDW)—Offset FEC00010h" on page 5302 | 00000000h     |
| FEC00040h | 4    | "EOI (IOAPIC_EOI)—Offset FEC00040h" on page 5303 | 00000000h     |

### 41.4.1 IDX (IOAPIC\_IDX)—Offset FEC00000h

Index Register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 8 bits)

**IOAPIC\_IDX:** FEC00000h

**Default:** 00h

|      |   |   |
|------|---|---|
| 7    | 4 | 0 |
| 0    | 0 | 0 |
| 1IDX |   |   |

| Bit Range | Default & Access | Description                                                                                                                                                                                                     |
|-----------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7:0       | 0h<br>RW         | <b>IDX:</b> This 8-bit register selects which indirect register appears in the window register to be manipulated by software. Software will program this register to select the desired APIC internal register. |

### 41.4.2 WDW (IOAPIC\_WDW)—Offset FEC00010h

Window Register

#### Access Method

**Type:** Memory Mapped I/O Register  
(Size: 32 bits)

**IOAPIC\_WDW:** FEC00010h

**Default:** 00000000h

|     |    |    |    |    |    |   |   |   |
|-----|----|----|----|----|----|---|---|---|
| 31  | 28 | 24 | 20 | 16 | 12 | 8 | 4 | 0 |
| 0   | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 |
| 0   | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 |
| 0   | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 |
| 0   | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 |
| 0   | 0  | 0  | 0  | 0  | 0  | 0 | 0 | 0 |

When a match is found, RTE.RIRR for that entry will be cleared. If multiple entries have the same vector, each of those entries will have RTE.RIRR cleared. |

## 42 PCU – iLB – 8259 Programmable Interrupt Controllers (PIC)

The SoC provides an ISA-compatible programmable interrupt controller (PIC) that incorporates the functionality of two, cascaded 8259 interrupt controllers.

### 42.1 Features

In addition to providing support for ISA compatible interrupts, this interrupt controller can also support PCI based interrupts (PIRQs) by mapping the PCI interrupt onto a compatible ISA interrupt line. Each 8259 controller supports eight interrupts, numbered 0–7. [Table 344](#) shows how the controllers are connected.

**Note:** The SoC does not implement any external PIRQ# signals. The PIRQs referred to in this chapter originate from the interrupt routing unit.

**Table 344. Interrupt Controller Connections**

| 8259   | 8259 Input | Connected Pin / Function                                                          |
|--------|------------|-----------------------------------------------------------------------------------|
| Master | 0          | Internal Timer / Counter 0 output or HPET #0; determined by GCFG.LRE register bit |
|        | 1          | IRQ1 using SERIRQ, Keyboard Emulation                                             |
|        | 2          | Slave controller INTR output                                                      |
|        | 3          | IRQ3 via SERIRQ or PIRQx                                                          |
|        | 4          | IRQ4 SERIRQ, PIRQx or PCU UART                                                    |
|        | 5          | IRQ5 via SERIRQ or PIRQx                                                          |
|        | 6          | IRQ6 via SERIRQ or PIRQx                                                          |
|        | 7          | IRQ7 via SERIRQ or PIRQx                                                          |
| Slave  | 0          | Inverted IRQ8# from internal RTC or HPET                                          |
|        | 1          | IRQ9 via SERIRQ, SCI or PIRQx                                                     |
|        | 2          | IRQ10 via SERIRQ, SCI or PIRQx                                                    |
|        | 3          | IRQ11 via SERIRQ, SCI, HPET or PIRQx                                              |
|        | 4          | IRQ12 via SERIRQ, PIRQx or mouse emulation                                        |
|        | 5          | None                                                                              |
|        | 6          | PIRQx or IRQ14 from SATA controller                                               |
|        | 7          | IRQ15 via SERIRQ or PIRQx or IRQ15 from SATA controller                           |

The SoC cascades the slave controller onto the master controller through master controller interrupt input 2. This means there are only 15 possible interrupts for the SoC PIC.

Interrupts can be programmed individually to be edge or level, except for IRQ0, IRQ2 and IRQ8#.

**Note:** Active-low interrupt sources (such as a PIRQ#) are inverted inside the SoC. In the following descriptions of the 8259s, the interrupt levels are in reference to the signals at the internal interface of the 8259s, after the required inversions have occurred. Therefore, the term “high” indicates “active,” which means “low” on an originating PIRQ#.

## 42.1.1 Interrupt Handling

### 42.1.1.1 Generating Interrupts

The PIC interrupt sequence involves three bits, from the IRR, ISR, and IMR, for each interrupt level. These bits are used to determine the interrupt vector returned, and status of any other pending interrupts. [Table 345](#) defines the IRR, ISR, and IMR.

Table 345. Interrupt Status Registers

| Bit | Description                                                                                                                                                                            |
|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IRR | <b>Interrupt Request Register.</b> This bit is set on a low to high transition of the interrupt line in edge mode, and by an active high level in level mode.                          |
| ISR | <b>Interrupt Service Register.</b> This bit is set, and the corresponding IRR bit cleared, when an interrupt acknowledge cycle is seen, and the vector returned is for that interrupt. |
| IMR | <b>Interrupt Mask Register.</b> This bit determines whether an interrupt is masked. Masked interrupts will not generate INTR.                                                          |

#### 42.1.1.2 Acknowledging Interrupts

The processor generates an interrupt acknowledge cycle that is translated into a Interrupt Acknowledge Cycle to the SoC. The PIC translates this command into two internal INTA# pulses expected by the 8259 controllers. The PIC uses the first internal INTA# pulse to freeze the state of the interrupts for priority resolution. On the second INTA# pulse, the master or slave sends the interrupt vector to the processor with the acknowledged interrupt code. This code is based upon the ICW2.IVBA bits, combined with the ICW2.IRL bits representing the interrupt within that controller.

**Note:** References to ICWx and OCWx registers are relevant to both the master and slave 8259 controllers.

Table 346. Content of Interrupt Vector Byte

| Master, Slave Interrupt | Bits [7:3] | Bits [2:0] |
|-------------------------|------------|------------|
| IRQ7,15                 | ICW2.IVBA  | 111        |
| IRQ6,14                 |            | 110        |
| IRQ5,13                 |            | 101        |
| IRQ4,12                 |            | 100        |
| IRQ3,11                 |            | 011        |
| IRQ2,10                 |            | 010        |
| IRQ1,9                  |            | 001        |
| IRQ0,8                  |            | 000        |

#### 42.1.1.3 Hardware/Software Interrupt Sequence

1. One or more of the Interrupt Request lines (IRQ) are raised high in edge mode, or seen high in level mode, setting the corresponding IRR bit.
2. The PIC sends INTR active to the processor if an asserted interrupt is not masked.
3. The processor acknowledges the INTR and responds with an interrupt acknowledge cycle.

4. Upon observing the special cycle, the SoC converts it into the two cycles that the internal 8259 pair can respond to. Each cycle appears as an interrupt acknowledge pulse on the internal INTA# pin of the cascaded interrupt controllers.
5. Upon receiving the first internally generated INTA# pulse, the highest priority ISR bit is set and the corresponding IRR bit is reset. On the trailing edge of the first pulse, a slave identification code is broadcast by the master to the slave on a private, internal three bit wide bus. The slave controller uses these bits to determine if it must respond with an interrupt vector during the second INTA# pulse.
6. Upon receiving the second internally generated INTA# pulse, the PIC returns the interrupt vector. If no interrupt request is present because the request was too short in duration, the PIC returns vector 7 from the master controller.
7. This completes the interrupt cycle. In AEOI mode the ISR bit is reset at the end of the second INTA# pulse. Otherwise, the ISR bit remains set until an appropriate EOI command is issued at the end of the interrupt subroutine.

### 42.1.2 Initialization Command Words (ICWx)

Before operation can begin, each 8259 must be initialized. In the SoC, this is a four byte sequence. The four initialization command words are referred to by their acronyms: ICW1, ICW2, ICW3, and ICW4.

The base address for each 8259 initialization command word is a fixed location in the I/O memory space: 20h for the master controller, and A0h for the slave controller.

#### 42.1.2.1 ICW1

A write to the master or slave controller base address with data bit 4 equal to 1 is interpreted as a write to ICW1. Upon sensing this write, the PIC expects three more byte writes to 21h for the master controller, or A1h for the slave controller, to complete the ICW sequence.

A write to ICW1 starts the initialization sequence during which the following automatically occur:

1. Following initialization, an interrupt request (IRQ) input must make a low-to-high transition to generate an interrupt.
2. The Interrupt Mask Register is cleared.
3. IRQ7 input is assigned priority 7.
4. The slave mode address is set to 7.
5. Special mask mode is cleared and Status Read is set to IRR.

#### 42.1.2.2 ICW2

The second write in the sequence (ICW2) is programmed to provide bits [7:3] of the interrupt vector that will be released during an interrupt acknowledge. A different base is selected for each interrupt controller.

#### 42.1.2.3 ICW3

The third write in the sequence (ICW3) has a different meaning for each controller.

- For the master controller, ICW3 is used to indicate which IRQ input line is used to cascade the slave controller. Within the SoC, IRQ2 is used. Therefore, MICW3.CCC is set to a 1, and the other bits are set to 0s.
- For the slave controller, ICW3 is the slave identification code used during an interrupt acknowledge cycle. On interrupt acknowledge cycles, the master controller broadcasts a code to the slave controller if the cascaded interrupt won arbitration on the master controller. The slave controller compares this identification code to the value stored in its ICW3, and if it matches, the slave controller assumes responsibility for broadcasting the interrupt vector.

#### 42.1.2.4 ICW4

The final write in the sequence (ICW4) must be programmed for both controllers. At the very least, ICW4.MM must be set to a 1 to indicate that the controllers are operating in an Intel Architecture-based system.

### 42.1.3 Operation Command Words (OCW)

These command words reprogram the Interrupt controller to operate in various interrupt modes.

- OCW1 masks and unmasks interrupt lines.
- OCW2 controls the rotation of interrupt priorities when in rotating priority mode, and controls the EOI function.
- OCW3 sets up ISR/IRR reads, enables/disables the special mask mode (SMM), and enables/disables polled interrupt mode.

### 42.1.4 Modes of Operation

#### 42.1.4.1 Fully Nested Mode

In this mode, interrupt requests are ordered in priority from 0 through 7, with 0 being the highest. When an interrupt is acknowledged, the highest priority request is determined and its vector placed on the bus. Additionally, the ISR for the interrupt is set. This ISR bit remains set until: the processor issues an EOI command immediately before returning from the service routine; or if in AEOI mode, on the trailing edge of the second INTA#. While the ISR bit is set, all further interrupts of the same or lower priority are inhibited, while higher levels generate another interrupt.

Interrupt priorities can be changed in the rotating priority mode.

#### 42.1.4.2 Special Fully-Nested Mode

This mode is used in the case of a system where cascading is used, and the priority has to be conserved within each slave. In this case, the special fully-nested mode is programmed to the master controller. This mode is similar to the fully-nested mode with the following exceptions:

- When an interrupt request from a certain slave is in service, this slave is not locked out from the master's priority logic and further interrupt requests from higher priority interrupts within the slave are recognized by the master and initiate interrupts to the processor. In the normal-nested mode, a slave is masked out when its request is in service.
- When exiting the Interrupt Service routine, software has to check whether the interrupt serviced was the only one from that slave. This is done by sending a Non-Specific EOI command to the slave and then reading its ISR. If it is 0, a non-specific EOI can also be sent to the master.

#### 42.1.4.3 Automatic Rotation Mode (Equal Priority Devices)

In some applications, there are a number of interrupting devices of equal priority. Automatic rotation mode provides for a sequential 8-way rotation. In this mode, a device receives the lowest priority after being serviced. In the worst case, a device requesting an interrupt has to wait until each of seven other devices are serviced at most once.

There are two ways to accomplish automatic rotation using OCW2.REOI; the Rotation on Non-Specific EOI Command (OCW2.REOI=101b) and the rotate in automatic EOI mode which is set by (OCW2.REOI=100b).

#### 42.1.4.4 Specific Rotation Mode (Specific Priority)

Software can change interrupt priorities by programming the bottom priority. For example, if IRQ5 is programmed as the bottom priority device, then IRQ6 is the highest priority device. The Set Priority Command is issued in OCW2 to accomplish this, where: OCW2.REOI=11xb, and OCW2.ILS is the binary priority level code of the bottom priority device.

In this mode, internal status is updated by software control during OCW2. However, it is independent of the EOI command. Priority changes can be executed during an EOI command by using the Rotate on Specific EOI Command in OCW2 (OCW2.REOI=111b) and OCW2.ILS=IRQ level to receive bottom priority.

#### 42.1.4.5 Poll Mode

Poll mode can be used to conserve space in the interrupt vector table. Multiple interrupts that can be serviced by one interrupt service routine do not need separate vectors if the service routine uses the poll command. Poll mode can also be used to expand the number of interrupts. The polling interrupt service routine can call the appropriate service routine, instead of providing the interrupt vectors in the vector

table. In this mode, the INTR output is not used and the microprocessor internal Interrupt Enable flip-flop is reset, disabling its interrupt input. Service to devices is achieved by software using a Poll command.

The Poll command is issued by setting OCW3.PMC. The PIC treats its next I/O read as an interrupt acknowledge, sets the appropriate ISR bit if there is a request, and reads the priority level. Interrupts are frozen from the OCW3 write to the I/O read. The byte returned during the I/O read contains a 1 in Bit 7 if there is an interrupt, and the binary code of the highest priority level in Bits 2:0.

#### **42.1.4.6 Edge and Level Triggered Mode**

In ISA systems this mode is programmed using ICW1.LTIM, which sets level or edge for the entire controller. In the SoC, this bit is disabled and a register for edge and level triggered mode selection, per interrupt input, is included. This is the Edge/Level control Registers ELCR1 and ELCR2.

If an ELCR bit is 0, an interrupt request will be recognized by a low-to-high transition on the corresponding IRQ input. The IRQ input can remain high without generating another interrupt. If an ELCR bit is 1, an interrupt request will be recognized by a high level on the corresponding IRQ input and there is no need for an edge detection. The interrupt request must be removed before the EOI command is issued to prevent a second interrupt from occurring.

In both the edge and level triggered modes, the IRQ inputs must remain active until after the falling edge of the first internal INTA#. If the IRQ input goes inactive before this time, a default IRQ7 vector is returned.

### **42.1.5 End of Interrupt (EOI) Operations**

An EOI can occur in one of two fashions: by a command word write issued to the PIC before returning from a service routine, the EOI command; or automatically when the ICW4.AEOI bit is set to 1.

#### **42.1.5.1 Normal End of Interrupt**

In normal EOI, software writes an EOI command before leaving the interrupt service routine to mark the interrupt as completed. There are two forms of EOI commands: Specific and Non-Specific. When a Non-Specific EOI command is issued, the PIC clears the highest ISR bit of those that are set to 1. Non-Specific EOI is the normal mode of operation of the PIC within the SoC, as the interrupt being serviced currently is the interrupt entered with the interrupt acknowledge. When the PIC is operated in modes that preserve the fully nested structure, software can determine which ISR bit to clear by issuing a Specific EOI.

An ISR bit that is masked is not cleared by a Non-Specific EOI if the PIC is in the special mask mode. An EOI command must be issued for both the master and slave controller.

#### 42.1.5.2 Automatic End of Interrupt Mode

In this mode, the PIC automatically performs a Non-Specific EOI operation at the trailing edge of the last interrupt acknowledge pulse. From a system standpoint, this mode should be used only when a nested multi-level interrupt structure is not required within a single PIC. The AEOI mode can only be used in the master controller and not the slave controller.

**Note:** Both the master and slave PICs have an AEOI bit: MICW4.AEOI and SICW4.AEOI respectively. Only the MICW4.AEOI bit should be set by software. The SICW4.AEOI bit should not be set by software.

### 42.1.6 Masking Interrupts

#### 42.1.6.1 Masking on an Individual Interrupt Request

Each interrupt request can be masked individually by the Interrupt Mask Register (IMR). This register is programmed through OCW1. Each bit in the IMR masks one interrupt channel. Masking IRQ2 on the master controller masks all requests for service from the slave controller.

#### 42.1.6.2 Special Mask Mode

Some applications may require an interrupt service routine to dynamically alter the system priority structure during its execution under software control. For example, the routine may wish to inhibit lower priority requests for a portion of its execution but enable some of them for another portion.

The special mask mode enables all interrupts not masked by a bit set in the Mask register. Normally, when an interrupt service routine acknowledges an interrupt without issuing an EOI to clear the ISR bit, the interrupt controller inhibits all lower priority requests. In the special mask mode, any interrupts may be selectively enabled by loading the Mask Register with the appropriate pattern.

The special mask mode is set by OCW3.ESMM=1b & OCW3.SMM=1b, and cleared where OCW3.ESMM=1b & OCW3.SMM=0b.

## 42.2 IO Mapped Registers

The interrupt controller registers are located at 20h and 21h for the master controller (IRQ0 - 7), and at A0h and A1h for the slave controller (IRQ8 - 13). These registers have multiple functions, depending upon the data written to them. [Table 347](#) is a description of the different register possibilities for each address.

**Note:** The register descriptions after [Table 347](#) represent one register possibility.

**Table 347. I/O Registers Alias Locations**

| Registers                        | Original I/O Location | Alias I/O Locations |
|----------------------------------|-----------------------|---------------------|
| MICW1<br>MOCW2<br>MOCW3          | 20h                   | 24h                 |
|                                  |                       | 28h                 |
|                                  |                       | 2Ch                 |
|                                  |                       | 30h                 |
|                                  |                       | 34h                 |
|                                  |                       | 38h                 |
|                                  |                       | 3Ch                 |
| MICW2<br>MICW3<br>MICW4<br>MOCW1 | 21h                   | 25h                 |
|                                  |                       | 29h                 |
|                                  |                       | 2Dh                 |
|                                  |                       | 31h                 |
|                                  |                       | 35h                 |
|                                  |                       | 39h                 |

### 42.3.1 MICW1—Offset 20h

Master Initialization Command Word 1.A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs: \* The Interrupt Mask register is cleared. \* IRQ7 input is assigned priority 7. \* The slave mode address is set to 7. \* Special Mask Mode is cleared and Status Read is set to IRR. Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**MICW1:** 20h

**Default:** 00h

| 0         | X<br>WO          | <b>IC4:</b> wICW4 Write Required (IC4): This bit must be programmed to a 1 to indicate that ICW4 needs to be programmed. |

### 42.3.2 MICW2—Offset 21h

Master ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**MICW2:** 21h

**Default:** 00h

| 7:0       | 00h<br>RW        | <b>IRM:</b> Interrupt Request Mask (IRM): When a 1 is written to any bit in this register, the corresponding IRQ line is masked. When a 0 is written to any bit in this register, the corresponding IRQ mask bit is cleared, and interrupt requests will again be accepted by the controller. Masking IRQ2 on the master controller will also mask the interrupt requests from the slave controller. |

### 42.3.8 SICW1—Offset A0h

Slave Initialization Command Word 1. A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs: \* The Interrupt Mask register is cleared. \* IRQ7 input is assigned priority 7. \* The slave mode address is set to 7. \* Special Mask Mode is cleared and Status Read is set to IRR. Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**SICW1:** A0h

### 42.3.9 SICW2—Offset A1h

Slave ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**SICW2:** A1h

**Default:** 00h

### 42.3.16 ELCR2—Offset 4D1h

Slave Edge/Level Control

#### Access Method

**Type:** I/O Register  
(Size: 8 bits)

**ELCR2:** 4D1h

**Default:** 00h

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,  
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
