## NB3N1200K/NB3W1200L Evaluation Board User's Manual

### EVAL BOARD USER'S MANUAL

#### Introduction

The NB3N1200KMNGEVB and the NB3W1200LMNGEVB evaluation boards were developed with a common PCB layout design to accommodate the NB3N1200K (standard HCSL outputs) and the NB3W1200L (HCSL Push-Pull outputs) devices. Each board comes fully assembled and tested and is ready to evaluate in the lab. This evaluation board was designed to provide a flexible and convenient platform to quickly evaluate, characterize and verify the operation of the NB3N1200K or NB3W1200L devices. To minimize the board size, six differential outputs are accessed with SMA connectors. The other six differential outputs are loaded, terminated and can be monitored with a high impedance probe as explained later in the manual.

The NB3N1200K Evaluation Board schematic is the same as the NB3W1200L schematic except the “1200L” has some components depopulated (DNI) per the “1200L” BOM.

- The NB3W1200LMNGEVB does not have RP resistors installed on its differential Push-Pull outputs.
- The NB3W1200LMNGEVB does not have FB\_OUT/FB\_OUT# resistors installed.
- The NB3W1200LMNGEVB does not have R<sub>REF</sub> resistor R107 installed.

This manual should be used in conjunction with the device datasheet which contains full technical details on the device specifications and operation.

This evaluation board manual contains:

- Information on the NB3N1200K/NB3W1200L Evaluation Board
- Assembly Instructions
- Test and Measurement Setup Procedures
- Board Schematic and Bill of Materials

## QUICK START LAB SET-UP USER'S GUIDE

### Pre-Power-Up

1. The NB3N1200K and NB3W1200L have positive power supply pins VDD and VDDIO. Connect power supply cables to VDD, VDDIO and GND banana jacks; (do not turn power on, yet)
2. Connect a signal generator to the SMA connectors for the CLK\_IN & CLK\_IN# inputs.
3. 50-ohm termination resistors are installed for a signal generator on the board. Set appropriate input signal levels; (HCSL input,  $V_{IL} = 0\text{ V}$ ,  $V_{IH} = 700\text{ mV}$ , Frequency 100 or 133.33 MHz)
4. Ensure the PWRGD/PWRDN# pin is in the Low state before power up (PWRDN#). There is a jumper on pin 6 to easily select between High and Low. See Figure 8.
5. The 100M\_133M# and HBW\_BYPASS\_LBW pins need to be hardware selected with jumpers. See Figures 4 and 7.
6. To monitor the DIF\_n/DIF\_n# outputs, connect the DIF\_n/DIF\_n# outputs to the appropriate oscilloscope.

Table 1. POWER SUPPLY CONNECTIONS

Device Pin Power Supply Connector	Power Supply
VDD	3.3 V
VDDIO	1.05 V to 3.3 V
GND	0 V

Figure 2. Power Supply Connections

Figure 3. Typical Lab Test Set-Up

### Power -Up Sequence

1. Turn on power supply, 3.3 V (VDD & VDDIO).
2. Move PWRGD/PWRDN# jumper from Low to logic High, PWRGD position.
3. Turn on the Differential Clock Signal for the CLK\_IN inputs. The differential Clock signal for the CLK\_IN inputs can be ON or active before or after PWRGD is set HIGH.
4. Monitor DIF\_n/DIF\_n# outputs on oscilloscope.

### Optional

#### Graphical User Interface (see page 7)

There is a stand-alone Graphical User Interface software package and user's manual that will interface with the DUT via the USB connector.

1. Connect the USB port on the evaluation board to a USB port on the PC via cable.
2. See the stand-alone GUI instructions document.
3. Allow Windows to install the necessary drivers for the eval board USB interface hardware.
4. Start the GUI program.

# NB3N1200KMNGEVB, NB3W1200LMNGEVB

## Power Supplies

Each VDD, VDDIO and GND power supply has a separate side-launch banana jack located on bottom side. This board is capable of measuring device IDD & IDDIO separately.

Board Layer #2 = SMA Ground = Device GND = 0 V.

GND Banana Jack = negative power supply for DUTGND and SMAGND.

**Exposed Pad (EP):** The exposed pad footprint on the board is soldered to the exposed pad of the QFN-64 package, and is electrically connected to GND power supply.

Board Layer #3 = VDD and VDDIO Power Supplies

VDD = positive power supply for core and inputs; VDD/VDDA/VDDR (pins #1, 8, 24, 40, 57)

VDDIO = positive power supply for outputs; VDDIO (pins #25, 32, 49, 56)

VDD & VDDIO have the power supply filtering per datasheet by the banana jacks.

All VDD/VDDA/VDDR/VDDIO device pins have a 0.1  $\mu$ F bypass capacitor installed on top side next to package pins.

## Control Pins

Each control pin can be managed manually with a H/L jumper header; H = VDD, L = GND.

*Tri-Level Input Pins - HBW\_BYPASS\_LBW#, SA0 and SA1*

The three tri-level input pins, HBW\_BYPASS\_LBW#, SA0 and SA1, have selectable (with jumper) 4.7 k-ohm pull-up to VDD and 4.7 k-ohm pull-down to GND resistors; No jumper defaults to open/float.

- For a HIGH Level – Put Jumper to High
- For a LOW Level – Put Jumper to Low
- For a MID Level – Put Jumper to both High and Low; this will Enable both Pull-up and Pull-down Resistors

*HBW\_BYPASS\_LBW#*

At J65 and J66 headers, there is a 4.7 k $\Omega$  pull-up to VDD and a 4.7 k $\Omega$  pull-down resistor to GND for manual control. See Figure 4.

*SA0 & SA1*

At J67 and J69 headers, there are 4.7 k $\Omega$  pull-ups to VDD and at J68 and J70, there are 4.7 k $\Omega$  pull-down resistors to GND for manual control. See Figure 5.

Figure 4. HBW\_BYPASS\_LBW# Schematic/PCB Configuration

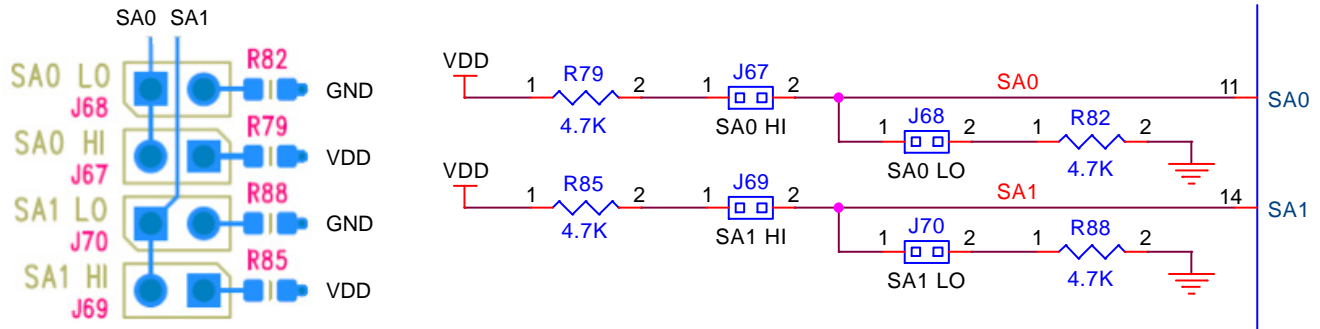

Figure 5. SA0 & SA1 Schematic/PCB Configuration

# NB3N1200KMNGEVB, NB3W1200LMNGEVB

## Control Pins (Continued)

### OE\_n# Pins (Output Enable/Disable Function)

Six of the twelve differential outputs that have metal traces going to SMA connectors have OE\_n# pins on the left side of the board that can be controlled manually using the convenient High/Low OE\_n# jumpers. See Figure 6.

All twelve of the OE\_n#s can be controlled individually/ automatically by using the software GUI. GUI control is accomplished via the USB when the OE\_n# jumper is installed on the middle header position. See Figure 6.

Figure 6. OE\_n# Pins Schematic/PCB Configuration

### 100M\_133M# - Frequency Selection (J55)

The 100M\_133M# frequency selection pin can be controlled manually with the High/Low header jumper J55, H = 100 MHz, L = 133 MHz.

Figure 7. 100M\_133M# Pin Schematic/PCB Configuration

### PWRGD/PWRDN# (J56)

The PWRGD/PWRDN# pin can be controlled manually with the High/Low header jumper J56; H = PWRGD, L = PWRDN#.

Figure 8. PWRGD/PWRDN# Pin Schematic/PCB Configuration

# NB3N1200KMNGEVB, NB3W1200LMNGEVB

## Differential Clock Inputs and Outputs

### CLK\_IN & CLK\_IN# - Differential Clock Inputs

The differential Clock input traces, CLK\_IN/CLK\_IN#, are equal length routed straight from the SMA connectors on the left side directly to the DUT; there are no vias on metal traces.

CLK\_IN & CLK\_IN# have resistor pads (R51 & R52) to GND to terminate a signal generator, if used. 50-ohm resistors are installed. **Remove these resistors** if CLK\_IN & CLK\_IN# are driven by another IC device.

### DIF\_n and DIF\_n# - Differential Outputs

NB3N1200KMNGEVB and NB3W1200LMNGEVB were designed with a flexible PCB layout configuration to measure the differential HCSL (1200K) or Push-Pull (1200L) outputs with a 50-ohm scope head or high-impedance FET probe. (See Output Layout in Figures 8 and 9)

Six of the twelve differential outputs are designed to have equal length metal traces from the device pins to the SMA connectors.

The other six differential outputs have shortened metal traces, do not have SMA connectors and can be observed with a high-impedance probe on the metal pads provided.

Each DIF\_n/DIF\_n# output has a provision for C<sub>Load</sub>; **2 pF capacitors are installed on all outputs.**

Rs & Rp pads are located close to the DUT. Rs = 33-Ω is installed for both the NB3N1200K and NB3W1200L.

### NB3N1200K (HCSL Outputs)

RP is not installed on the six output pair with long metal traces to SMA connectors; Use 50-Ω to GND of the oscilloscope head for RP.

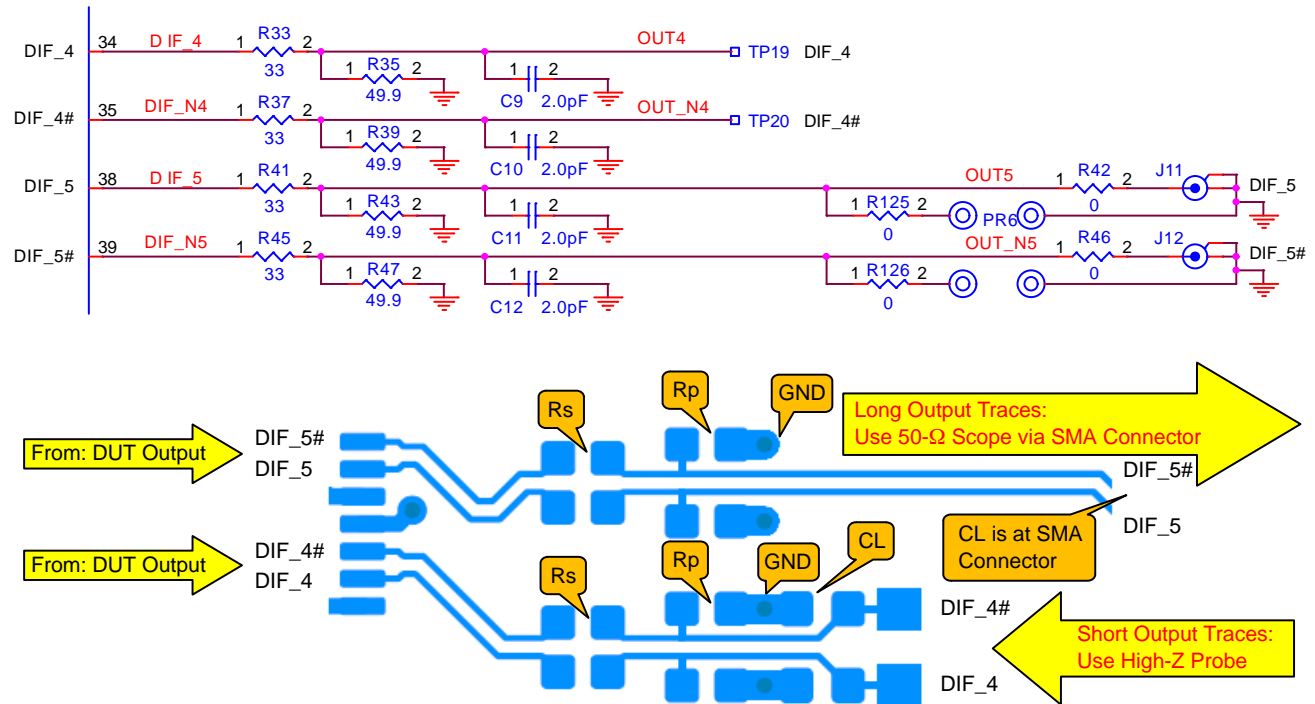

Rp is installed (50-Ω to GND) on the short metal traces without SMA connectors and will use Hi-Z probes.

### NB3W1200L (Push-Pull Outputs)

Rp is not installed

**Table 2. NB3N1200KMNGEVB AND NB3W1200LMNGEVB OUTPUT LOAD AND TERMINATION VS. OSCILLOSCOPE MEASUREMENT**

Device	Output Traces	Rs	Rp	C <sub>Load</sub>	Scope
1200K	Long	33-Ω	Open (DNI)	2 pF	50-Ω
1200K	Short	33-Ω	50-Ω	2 pF	Hi-Z
1200L	Long or Short	33-Ω	Open (DNI)	2 pF	Hi-Z

**Figure 9. Differential Outputs Schematic/PCB Configuration: Long vs. Short Metal Traces**

## NB3N1200KMNGEVB, NB3W1200LMNGEVB

### HCSL Output Measurement

HCSL outputs are typically terminated with 50-Ω to ground. Measuring HCSL outputs can be easily accomplished by:

#### NB3N1200K (HCSL Outputs) – 50-Ω Oscilloscope Head

With  $R_P$  removed from board, connect the HCSL outputs through the SMA connectors to the 50-Ω internal impedance of the oscilloscope sampling head.

#### NB3N1200K (HCSL Outputs) – Use Hi-Z Probe

With  $R_P$  installed, use a high-impedance probe on the output's metal trace. Holes for headers to connect to Hi-Z probes are available, but the header pins are not installed.

- Single-ended Hi-Z probes or,
- Differential Hi-Z probe; (see layout below)

#### NB3W1200L (Push-Pull Outputs) – Use Hi-Z Probe

$R_P$  is not installed

- A 0-Ω series resistor is installed between the end of the transmission line and the SMA connector. This resistor can be removed, if needed, to eliminate any SMA impedance/stub when using Hi-Z probes.
- As a feature, an optional component can be installed on each output, ie. additional capacitance loading etc.

The following figures describe the boards' output features:

Figure 10. Differential Outputs Schematic/PCB Configuration: Use Hi-Z Probe Scope for NB3W1200L

### Misc. Pins

#### FB\_OUT & FB\_OUT# – External Termination of Feedback Pins

FB\_OUT & FB\_OUT# have convenient “test point anvils” to monitor these pins with Hi-Z probe.

##### NB3N1200K (HCSL):

Since the FB\_OUT & FB\_OUT# pins do not drive transmission lines (no SMAs), the board layout has these pins loaded/terminated at the DUT per datasheet; 83-Ω to GND is installed for the 100-Ω board.

##### NB3W1200L (Push-Pull):

FB\_OUT & FB\_OUT# resistors are not installed.

### IREF Pin

#### NB3N1200K (HCSL):

The  $R_{REF}$  resistor (R107) to GND for the HCSL output part device.

$R_{REF} = 475\text{-}\Omega$  is installed for the 100-Ω board.

#### NB3W1200L (Push-Pull)

$R_{REF}$  is not installed for the NB3W1200L device.

# NB3N1200KMNGEVB, NB3W1200LMNGEVB

## Graphical User Interface (GUI)

### USB & I<sup>2</sup>C/SMBus Interface

The NB3N1200K EVB has an on-board I<sup>2</sup>C/SMBus interface circuitry located in the upper left section of the board.

This circuitry will interface with the software program and the device via the SDA and SCL input pins, and can control all twelve of the OE\_n# pins, PLL Mode and Frequency Select directly from the GUI.

### SCL & SDA

The SMBus Clock (SCL) and Data (SDA) pins are exercised through the on-board I<sup>2</sup>C interface.

In order to enable the I<sup>2</sup>C control of the DUT, **header jumpers J63 & J64 must be shorted.**

The I<sup>2</sup>C/SMBus interface circuitry is powered separately from the USB type-B connection and is isolated from device VDD and VDDIO.

The SDA and SCL pins can also be externally accessed by an off-board programmer, allowing other SMBus emulators to be used to program the DUT. If used, remove both jumpers J63 & J64. “Test-point anvils” TP5 & TP6 are available for external control of the device with the use with mini-grabber cables.

## BOARD FEATURES

### Single Board Design/Layout for NB3N1200K or NB3W1200L:

- The single board design and layout accommodates the electrical characterization of either the NB3N1200K (standard HCSL outputs) or the NB3W1200L (HCSL Push-Pull outputs).
- Incorporates on-board I<sup>2</sup>C/SMBus interface circuitry powered from a USB connection, minimizing cabling.
- Convenient and compact board layout.
- 3.3 V power supply device operation.
- Differential inputs/outputs signals are accessed via SMA connectors or high impedance probes.

### Other Board Features

There are no vias on the high-speed differential I/O metal traces so as to eliminate via impedance and stub affects.

Board stand-offs are installed.

### Board Layout

The NB3N1200K QFN-64 Evaluation Board provides a high bandwidth, 50-Ω controlled trace impedance

environment (100-Ω line-to-line differential) and is implemented in four layers.

- All layers are constructed with FR4 dielectric material.
- The first layer is the primary signal layer, including all of the differential inputs and outputs.
- The second layer is the ground plane. It is dedicated for the DUT ground/SMA ground plane.
- The third layer is dedicated as the power plane. A portion of this 3<sup>rd</sup> layer is designated for the device VDD and VDDIO power planes.
- The fourth layer contains control lines, power supply banana jacks and device power pin bypass capacitors.

### Layer Stack

- L1 (Top) Signal
- L2 Device Ground and SMA Ground
- L3 VDD, VDDIO (Separate Device Power Supplies)
- L4 (Bottom), Power Supply By-pass Capacitors, Control Pin Traces and Banana Jacks

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
