### Description

The TSV358, TSV358A, TSV324, and TSV324A (dual and quad) devices are low voltage versions of the LM358 and LM324 commodity operational amplifiers. The TSV321 and TSV321A are the single version. All devices operate with voltages as low as  $2.5\text{ V}$  and feature both I/O rail-to-rail.

The common mode input voltage extends  $200\text{ mV}$  beyond the supply voltages at  $25\text{ }^\circ\text{C}$  while the output voltage swing is within  $100\text{ mV}$  of each rail with a  $600\ \Omega$  load resistor. At  $V_{CC} = 3\text{ V}$ , these devices offer  $1.3\text{ MHz}$  of gain bandwidth product and provide high output current capability with a typical value of  $80\text{ mA}$ .

These features make the TSV3xx and TSV3xxA family ideal for active filters, general purpose low voltage applications, and general purpose portable devices.

	Output short-circuit duration	See <sup>(7)</sup>		

**Notes:**

- <sup>(1)</sup>All voltage values, except the differential voltage are with respect to the network terminal.
- <sup>(2)</sup>The differential voltage is the non-inverting input terminal with respect to the inverting input terminal. If  $V_{id} > \pm 1$  V, the maximum input current must not exceed  $\pm 1$  mA. When  $V_{id} > \pm 1$  V, an input series resistor must be added to limit input current.
- <sup>(3)</sup>Short-circuits can cause excessive heating and destructive dissipation.  $R_{th}$  are typical values.
- <sup>(4)</sup>Human body model: 100 pF discharged through a 1.5 kΩ resistor between two pins of the device, done for all couples of pin combinations with other pins floating.
- <sup>(5)</sup>Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω), done for all couples of pin combinations with other pins floating.
- <sup>(6)</sup>Charged device model: all pins plus package are charged together to the specified voltage and then discharged directly to ground.
- <sup>(7)</sup>Short-circuits from the output to  $V_{CC}$  can cause excessive heating. The maximum output current is approximately 80 mA, independent of the magnitude of  $V_{CC}$ . Destructive dissipation can result from simultaneous short-circuits on all amplifiers.
