

MIC7111

1.8V to 11V, 15 μ A, 25kHz GBW, Rail-to-Rail
Input and Output Operational Amplifier

General Description

The MIC7111 is a low-power operational amplifier with rail-to-rail inputs and outputs. The device operates from a 1.8V to 11V single supply or an $\pm 0.9V$ to $\pm 5.5V$ dual supply. The device consumes a low 15 μ A of current from a 1.8V supply and 25 μ A from a 10V supply. The device features a unity gain bandwidth of 25kHz and swings within 1mV of either the supply rail with a 100k Ω load. The device is capable of sinking and sourcing 25mA of current from a 1.8V supply and up to 200mA from a 10V supply. The device is available in the cost effective SOT23-5 package.

Datasheets and support documentation are available on Micrel's web site at: www.micrel.com.

Features

- 1.8V to 11V single supply operation
- $\pm 0.9V$ to $\pm 5.5V$ dual supply operation
- Low 15 μ A supply current at 1.8V
- 25kHz gain bandwidth
- 1mV input offset voltage (typical)
- 1pA input bias current (typical)
- 0.01pA input offset current (typical)
- Input-referred noise is 110nv/ $\sqrt{\text{Hz}}$ at 1kHz
- Output swing to within 1mV of rails with 1.8V supply and 100k Ω load
- Suitable for driving capacitive loads
- Cost effective SOT23-5 package

Applications

- Wireless and cellular communications
- GaAs RF bias amplifier
- Current sensing for battery chargers
- Transducer linearization and interface
- Portable computing

Functional Configuration

Ordering Information

Part Number	Junction Temperature Range	Package⁽¹⁾
Pb-Free

					34	
		Output LOW, $R_L = 2k$		6.8	23	
					34	

Notes:

- Absolute maximum ratings indicate limits beyond which damage to the component may occur. Electrical specifications do not apply when operating the device outside its recommended operating ratings.
- The device is not guaranteed to function outside its operating ratings.
- I/O pin voltage is any external voltage to which an input or output is referenced.
- The maximum allowable power dissipation is a function of the maximum junction temperature, $T_{J(MAX)}$; the junction-to-ambient thermal resistance, θ_{JA} ; and the ambient temperature, T_A . The maximum allowable power dissipation at any ambient temperature is calculated using $P_D = (T_{J(MAX)} - T_A) \div \theta_{JA}$. Exceeding the maximum allowable power dissipation will result in excessive die temperature.
- Thermal resistance, θ_{JA} , applies to a part soldered on a printed-circuit board.
- Devices are ESD protected, however, handling precautions are recommended. All limits guaranteed by testing on statistical analysis. Human body model, 1.5k Ω in series with 100pF.

DC Electrical Characteristics (Continued)

Application Information

Input Common Mode Voltage

The MIC7111 tolerates input overdrive by at least 300mV beyond either rail without producing phase inversion.

If the absolute maximum input voltage is exceeded, the input current should be limited to $\pm 5\text{mA}$ maximum to prevent reducing reliability. A $10\text{k}\Omega$ series input resistor, used as a current limiter, will protect the input structure from voltages as large as 50V above the supply or below ground. See [Figure 1](#).

Figure 1. Input Current-Limit Protection

Output Voltage Swing

Sink and source output resistances of the MIC7111 are equal. Maximum output voltage swing is determined by the load and the approximate output resistance. The output resistance is presented in Equation 1:

$$R_{\text{OUT}} = \frac{V_{\text{DROP}}}{I_{\text{LOAD}}} \quad \text{Eq. 1}$$

V_{DROP} is the voltage dropped within the amplifier output stage. V_{DROP} and I_{LOAD} can be determined from the V_{O} (output swing) portion of the appropriate electrical characteristics table. I_{LOAD} is equal to the typical output high voltage minus $V+/2$ and divided by R_{LOAD} . For example, using the *DC Electrical Characteristics (5V)* table, the typical output voltage drop using a $2\text{k}\Omega$ load (connected to $V+/2$) is 0.015V, which produces an I_{LOAD} of:

$$\frac{2.5\text{V} - 0.015\text{V}}{2\text{k}\Omega} = 1.243\text{mA} \quad \text{Eq. 2}$$

Then,

$$R_{\text{OUT}} = \frac{15\text{mV}}{1.243\text{mA}} = 12.1 = 12\Omega \quad \text{Eq. 3}$$

Driving Capacitive Loads

Driving a capacitive load introduces phase-lag into the output signal, and this in turn reduces op-amp system phase margin. The application that is least forgiving of reduced phase margin is a unity gain amplifier. The MIC7111 can typically drive a 500pF capacitive load connected directly to the output when configured as a unity-gain amplifier.

Using Large-Value Feedback Resistors

A large-value feedback resistor ($> 500\text{k}\Omega$) can reduce the phase margin of a system. This occurs when the feedback resistor acts in conjunction with input capacitance to create phase lag in the feedback signal. Input capacitance is usually a combination of input circuit components and other parasitic capacitance, such as amplifier input capacitance and stray printed circuit board capacitance.

[Figure 2](#) illustrates a method of compensating phase lag caused by using a large-value feedback resistor. Feedback capacitor C_{FB} introduces sufficient phase lead to overcome the phase lag caused by feedback resistor R_{FB} and input capacitance C_{IN} . The value of C_{FB} is determined by first estimating C_{IN} and then applying the following formula:

$$R_{\text{IN}} \times C_{\text{IN}} \leq R_{\text{FB}} \times C_{\text{FB}} \quad \text{Eq. 4}$$

Figure 2. Cancelling Feedback Phase Lag

Since a significant percentage of C_{IN} may be caused by board layout, it is important to note that the correct value of C_{FB} may change when changing from a breadboard to the final circuit layout.

Typical Circuits

Some single-supply, rail-to-rail applications – for which the MIC7111 is well suited – are shown in the circuit diagrams of Figures 3 through 8.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
