## GENERAL DESCRIPTION

The **ADG613-EP** is a monolithic CMOS device containing four independently selectable switches. This switch offers ultralow charge injection of 1 pC over the full input signal range and typical leakage currents of 0.01 nA at 25°C.

The device is fully specified for  $\pm 5$  V, 5 V, and 3 V supplies. It contains four independent single-pole, single-throw (SPST) switches. The **ADG613-EP** contains two switches with digital control logic that turns on with logic low and two switches in which the logic is inverted.

Each switch conducts equally well in both directions when on and has an input signal range that extends to the supplies. The

Operation beyond the maximum operating conditions for extended periods may affect product reliability.

Only one absolute maximum rating can be applied at any one time.

### ESD CAUTION

#### ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.
