

### FEATURES

- Current sink: 120 mA
- 2-wire, (I<sup>2</sup>C-compatible) 1.8 V serial interface
- 10-bit resolution
- Integrated current sense resistor
- Power supply: 2.7 V to 5.5 V
- Guaranteed monotonic over all codes
- Power down to: 0.5  $\mu$ A typical
- Internal reference
- Ultralow noise preamplifier
- Power-down function
- Power-on reset
- Available in 3  $\times$  3 array WLCSP package

### APPLICATIONS

#### Consumer

- Lens autofocus
- Image stabilization
- Optical zoom
- Shutters
- Iris/exposure
- Neutral density (ND) filters
- Lens covers
- Camera phones
- Digital still cameras
- Camera modules
- Digital video cameras/camcorders
- Camera-enabled devices
- Security cameras
- Web/PC cameras

#### Industrial

- Heater control
- Fan control
- Cooler (Peltier) control
- Solenoid control
- Valve control
- Linear actuator control
- Light control
- Current loop control

### GENERAL DESCRIPTION

The AD5398A is a single, 10-bit digital-to-analog converter (DAC) with a current sink output capability of 120 mA. This device features an internal reference and operates from a single 2.7 V to 5.5 V supply. The DAC is controlled via a 2-wire (1.8 V, I<sup>2</sup>C\*-compatible) serial interface that operates at clock rates up to 400 kHz.

The AD5398A incorporates a power-on reset circuit, which ensures the DAC output powers up to 0 V and remains there until a valid write takes place. It has a power-down feature that reduces the current consumption of the device to 0.5  $\mu$ A typically.

The AD5398A is designed for autofocus, image stabilization, and optical zoom applications in camera phones, digital still cameras, and camcorders. The AD5398A is also suitable for many industrial applications, such as controlling temperature, light, and movement without derating, over temperatures ranging from  $-30^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ . The I<sup>2</sup>C address range for the AD5398A is 0x18 to 0x1F inclusive.

## SPECIFICATIONS

$V_{DD} = 2.7\text{ V to }5.5\text{ V}$ ,  $AGND = DGND = 0\text{ V}$ , load resistance ( $R_L$ ) =  $25\ \Omega$  connected to  $V_{DD}$ ; all specifications  $T_{MIN}$  to  $T_{MAX}$ , unless otherwise noted.

Table 1.

Parameter	Min	B Version <sup>1</sup> Typ	Max	Unit	Test Conditions/Comments
DC PERFORMANCE					$V_{DD} = 3.6\text{ V to }4.5\text{ V}$ ; device operates over $2.7\text{ V to }5.5\text{ V}$ with reduced performance
Resolution		10		Bits	117 $\mu\text{A/LSB}$
Relative Accuracy <sup>2</sup>		$\pm 1.5$	$\pm 4$	LSB	
Differential Nonlinearity <sup>2, 3</sup>			$\pm 1$	LSB	Guaranteed monotonic over all codes
Zero Code Error <sup>2, 4</sup>	0	0.5	1	mA	All 0s loaded to DAC
Offset Error @ Code 16 <sup>2</sup>		0.5		mA	
Gain Error <sup>2</sup>			$\pm 0.6$	% of FSR	at $25^\circ\text{C}$
Offset Error Drift <sup>2, 4, 5</sup>		10		$\mu\text{A}/^\circ\text{C}$	
Gain Error Drift <sup>2, 5</sup>		$\pm 0.2$	$\pm 0.5$	LSB/ $^\circ\text{C}$	
OUTPUT CHARACTERISTICS					
Minimum Sink Current <sup>4</sup>		3		mA	
Maximum Sink Current		120		mA	$V_{DD} = 3.6\text{ V to }4.5\text{ V}$ ; device operates over $2.7\text{ V to }5.5\text{ V}$ ; specified maximum sink current may not be achieved
Output Current During PD <sup>5</sup>		80		nA	PD = 1
Output Compliance <sup>5</sup>	0.6		$V_{DD}$	V	Output voltage range over which maximum 120 mA sink current is available
Output Compliance <sup>5</sup>	0.48		$V_{DD}$	V	Output voltage range over which 90 mA sink current is available
Power-Up Time <sup>5</sup>		20		$\mu\text{s}$	To 10% of FS, coming out of power-down mode; $V_{DD} = 5\text{ V}$
LOGIC INPUT (PD) <sup>5</sup>					
Input Current			$\pm 1$	$\mu\text{A}$	
Input Low Voltage, $V_{INL}$			0.54	V	$V_{DD} = 2.7\text{ V to }5.5\text{ V}$
Input High Voltage, $V_{INH}$	1.26			V	$V_{DD} = 2.7\text{ V to }5.5\text{ V}$
Pin Capacitance		3		pF	
LOGIC INPUTS (SCL, SDA) <sup>5</sup>					
Input Low Voltage, $V_{INL}$	-0.3		+0.54	V	$V_{DD} = 2.7\text{ V to }3.6\text{ V}$
Input High Voltage, $V_{INH}$	1.26		$V_{DD} + 0.3$	V	$V_{DD} = 2.7\text{ V to }3.6\text{ V}$
Input Low Voltage, $V_{INL}$	-0.3		+0.54	V	$V_{DD} = 3.6\text{ V to }5.5\text{ V}$
Input High Voltage, $V_{INH}$	1.4		$V_{DD} + 0.3$	V	$V_{DD} = 3.6\text{ V to }5.5\text{ V}$
Input Leakage Current, $I_{IN}$			$\pm 1$	$\mu\text{A}$	$V_{IN} = 0\text{ V to }V_{DD}$
Input Hysteresis, $V_{HYST}$	0.05 $V_{DD}$			V	
Digital Input Capacitance, $C_{IN}$		6		pF	
Glitch Rejection <sup>6</sup>			50	ns	Pulse width of spike suppressed
POWER REQUIREMENTS					
$V_{DD}$	2.7		5.5	V	
$I_{DD}$ (Normal Mode)		0.5	1	mA	$I_{DD}$ specification is valid for all DAC codes; $V_{IH} = V_{DD}$ , $V_{IL} = \text{GND}$ , $V_{DD} = 5.5\text{ V}$
$I_{DD}$ (Power-Down Mode) <sup>7</sup>		0.5		$\mu\text{A}$	$V_{IH} = V_{DD}$ , $V_{IL} = \text{GND}$ , $V_{DD} = 3\text{ V}$

<sup>1</sup> Temperature range for the B version is  $-30^\circ\text{C}$  to  $+85^\circ\text{C}$ .

<sup>2</sup> See the Terminology section.

<sup>3</sup> Linearity is tested using a reduced code range: Code 32 to Code 1023.

<sup>4</sup> To achieve near zero output current, use the power-down feature.

<sup>5</sup> Guaranteed by design and characterization; not production tested. PD is active high. SDA and SCL pull-up resistors are tied to 1.8 V.

<sup>6</sup> Input filtering on both the SCL and SDA inputs suppresses noise spikes that are less than 50 ns.

<sup>7</sup> PD is active high. When PD is taken high, the AD5389A enters power-down mode.

# AD5398A

## AC SPECIFICATIONS

$V_{DD} = 2.7 \text{ V}$  to  $5.5 \text{ V}$ ,  $AGND = DGND = 0 \text{ V}$ ,  $R_L = 25 \Omega$  connected to  $V_{DD}$ , unless otherwise noted.

Table 2.

Parameter	B Version <sup>1,2</sup>			Unit	Test Conditions/Comments
	Min	Typ	Max		
Output Current Settling Time		250		$\mu\text{s}$	$V_{DD} = 5 \text{ V}$ , $R_L = 25 \Omega$ , $L_L = 680 \mu\text{H}$ ¼ scale to ¾ scale change (0x100 to 0x300)
Slew Rate		0.3		$\text{mA}/\mu\text{s}$	
Major Code Change Glitch Impulse		0.15		$\text{nA}\cdot\text{sec}$	1 LSB change around major carry
Digital Feedthrough <sup>3</sup>		0.06		$\text{nA}\cdot\text{sec}$	

<sup>1</sup> Temperature range for the B version is  $-30^\circ\text{C}$  to  $+85^\circ\text{C}$ .

<sup>2</sup> Guaranteed by design and characterization; not production tested.

<sup>3</sup> See the Terminology section.

## TIMING SPECIFICATIONS

$V_{DD} = 2.7 \text{ V}$  to  $5.5 \text{ V}$ . All specifications  $T_{MIN}$  to  $T_{MAX}$ , unless otherwise noted.

Table 3.

Parameter <sup>1</sup>	B Version Limit at $T_{MIN}$ , $T_{MAX}$	Unit	Description
$f_{SCL}$	400	$\text{kHz max}$	SCL clock frequency
$t_1$	2.5	$\mu\text{s min}$	SCL cycle time
$t_2$	0.6	$\mu\text{s min}$	$t_{HIGH}$ , SCL high time
$t_3$	1.3	$\mu\text{s min}$	$t_{LOW}$ , SCL low time
$t_4$	0.6	$\mu\text{s min}$	$t_{HD, STA}$ , start/repeated start condition hold time
$t_5$	100	$\text{ns min}$	$t_{SU, DAT}$ , data setup time
$t_6^2$	0.9	$\mu\text{s max}$	$t_{HD, DAT}$ , data hold time
	0	$\mu\text{s min}$	
$t_7$	0.6	$\mu\text{s min}$	$t_{SU, STA}$ , setup time for repeated start
$t_8$	0.6	$\mu\text{s min}$	$t_{SU, STO}$ , stop condition setup time
$t_9$	1.3	$\mu\text{s min}$	$t_{BUF}$ , bus free time between a stop condition and a start condition
$t_{10}$	300	$\text{ns max}$	$t_R$ , rise time of both SCL and SDA when receiving
	0	$\text{ns min}$	Can be CMOS driven
$t_{11}$	250	$\text{ns max}$	$t_F$ , fall time of SDA when receiving
	300	$\text{ns max}$	$t_F$ , fall time of both SCL and SDA when transmitting
	$20 + 0.1 C_b^3$	$\text{ns min}$	
$C_b$	400	$\text{pF max}$	Capacitive load for each bus line

<sup>1</sup> Guaranteed by design and characterization; not production tested.

<sup>2</sup> A master device must provide a hold time of at least 300 ns for the SDA signal (referred to the  $V_{IH, MIN}$  of the SCL signal) to bridge the undefined region of the SCL falling edge.

<sup>3</sup>  $C_b$  is the total capacitance of one bus line in pF.  $t_R$  and  $t_F$  are measured between  $0.3 V_{DD}$  and  $0.7 V_{DD}$ .

## Timing Diagram

## ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$ , unless otherwise noted.<sup>1</sup>

**Table 4.**

Parameter	Rating
$V_{DD}$ to AGND	−0.3 V to +7 V
$V_{DD}$ to DGND	−0.3 V to $V_{DD} + 0.3$ V
AGND to DGND	−0.3 V to +0.3 V
SCL, SDA to DGND	−0.3 V to $V_{DD} + 0.3$ V
PD to DGND	−0.3 V to $V_{DD} + 0.3$ V
$I_{SINK}$ to AGND	−0.3 V to $V_{DD} + 0.3$ V
Operating Temperature Range	
Industrial (B Version)	−40°C to +85°C
Storage Temperature Range	−65°C to +150°C
Junction Temperature ( $T_J$ max)	150°C
$\theta_{JA}$ Thermal Impedance <sup>2</sup>	
Mounted on 2-Layer Board	84°C/W
Mounted on 4-Layer Board	48°C/W
Lead Temperature, Soldering	
Maximum Peak Reflow Temperature <sup>3</sup>	260°C ( $\pm 5^\circ\text{C}$ )

<sup>1</sup>Transient currents of up to 100 mA do not cause SCR latch-up.

<sup>2</sup>To achieve the optimum  $\theta_{JA}$ , it is recommended that the AD5398A be soldered onto a 4-layer board.

<sup>3</sup>As per JEDEC J-STD-020C.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Only one absolute maximum rating may be applied at any one time.

### ESD CAUTION

#### **ESD (electrostatic discharge) sensitive device.**

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Table 5. 9-Ball WLCSP Pin Function Description

Pin Number	Mnemonic	Description
A1	ISINK	Output Current Sink.
A2	NC	No Connection.
A3	PD	Power-Down. Asynchronous power-down signal.
B1	AGND	Analog Ground Pin.
B2	DGND	Digital Ground Pin.
B3	SDA	I <sup>2</sup> C Interface Signal.
C1	DGND	Digital Ground Pin.
C2	V <sub>DD</sub>	Digital Supply Voltage.
C3	SCL	I <sup>2</sup> C Interface Signal.

## TERMINOLOGY

### Relative Accuracy

For the DAC, relative accuracy or integral nonlinearity is a measurement of the maximum deviation, in LSB, from a straight line passing through the endpoints of the DAC transfer function. A typical INL vs. code plot is shown in Figure 5.

### Differential Nonlinearity (DNL)

Differential nonlinearity is the difference between the measured change and the ideal 1 LSB change between any two adjacent codes. A specified differential nonlinearity of  $\pm 1$  LSB maximum ensures monotonicity. This DAC is guaranteed monotonic by design. A typical DNL vs. code plot is shown in Figure 6.

### Zero-Code Error

Zero-code error is a measurement of the output error when zero code (0x0000) is loaded to the DAC register. Ideally, the output is 0 mA. The zero-code error is always positive in the AD5398A because the output of the DAC cannot go below 0 mA. This is due to a combination of the offset errors in the DAC and output amplifier. Zero-code error is expressed in mA.

### Gain Error

This is a measurement of the span error of the DAC. It is the deviation in slope of the DAC transfer characteristic from the ideal, expressed as a percent of the full-scale range.

### Gain Error Drift

This is a measurement of the change in gain error with changes in temperature. It is expressed in LSB/°C.

### Digital-to-Analog Glitch Impulse

Digital-to-analog glitch impulse is the impulse injected into the analog output when the input code in the DAC register changes state. It is normally specified as the area of the glitch in nA-sec and is measured when the digital input code is changed by 1 LSB at the major carry transition.

### Digital Feedthrough

Digital feedthrough is a measurement of the impulse injected into the analog output of the DAC from the digital inputs of the DAC, however is measured when the DAC output is not updated. It is specified in nA-sec and measured with a full-scale code change on the data bus, that is, from all 0s to all 1s and vice versa.

### Offset Error

Offset error is a measurement of the difference between  $I_{\text{SINK}}$  (actual) and  $I_{\text{OUT}}$  (ideal) in the linear region of the transfer function, expressed in mA. Offset error is measured on the AD5398A with Code 16 loaded into the DAC register.

### Offset Error Drift

This is a measurement of the change in offset error with a change in temperature. It is expressed in  $\mu\text{V}/^\circ\text{C}$ .

## THEORY OF OPERATION

The AD5398A is a fully integrated 10-bit DAC with 120 mA output current sink capability and is intended for driving voice coil actuators in applications such as lens autofocus, image stabilization, and optical zoom. The circuit diagram is shown in Figure 16. A 10-bit current output DAC coupled with Resistor R generates the voltage that drives the noninverting input of the operational amplifier. This voltage also appears across the  $R_{SENSE}$  resistor and generates the sink current required to drive the voice coil.

The R and  $R_{SENSE}$  resistors are interleaved and matched. Therefore, the temperature coefficient and any nonlinearities over temperature are matched and the output drift over temperature is minimized. Diode D1 is an output protection diode.

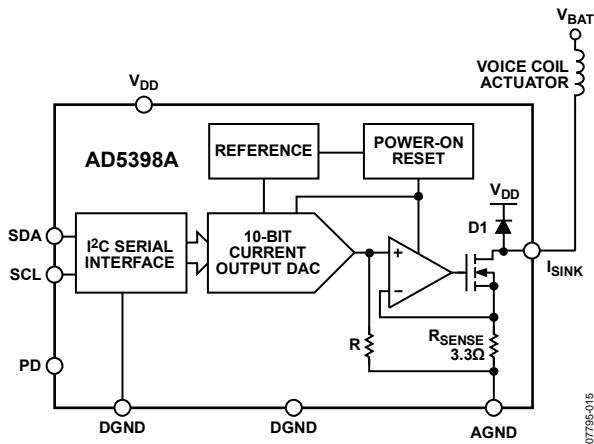

Figure 16. Circuit Diagram Showing Connection to Voice Coil

### SERIAL INTERFACE

The AD5398A is controlled using the industry-standard I<sup>2</sup>C 2-wire serial protocol. Data can be written to or read from the DAC at data rates up to 400 kHz. After a read operation, the contents of the input register are reset to all zeros.

### I<sup>2</sup>C BUS OPERATION

An I<sup>2</sup>C bus operates with one or more master devices that generate the serial clock (SCL), and read/write data on the serial data line (SDA) to/from slave devices such as the AD5398A. On all devices on an I<sup>2</sup>C bus, the SCL pin is connected to the SCL line and the SDA pin is connected to the SDA line. I<sup>2</sup>C devices can only pull the bus lines low; pulling high is achieved by the pull-up resistors,  $R_P$ . The value of  $R_P$  depends on the data rate, bus capacitance, and the maximum load current that the I<sup>2</sup>C device can sink (3 mA for a standard device).

Figure 17. Typical I<sup>2</sup>C Bus

When the bus is idle, SCL and SDA are both high. The master device initiates a serial bus operation by generating a start condition, which is defined as a high-to-low transition on the SDA line while SCL is high. The slave device connected to the bus responds to the start condition and shifts in the next eight data bits under the control of the serial clock. These eight data bits consist of a 7-bit address, plus a read/write bit, which is 0 if data is to be written to a device, and 1 if data is to be read from a device. Each slave device on an I<sup>2</sup>C bus must have a unique address. The address of the AD5398A is 0001100; however, 0001101, 0001110, and 0001111 address the part because the last two bits are unused/don't care (see Figure 18 and Figure 19). Because the address plus R/W bit always equals eight bits of data, another way of looking at it is that the write address of the AD5398A is 0001 1000 (0x18) and the read address is 0001 1001 (0x19). Again, Bit 6 and Bit 7 of the address are unused, and, therefore, the write addresses can also be 0x1A, 0x1C, and 0x1E, and the read address can be 0x1B, 0x1D, and 0x1F (see Figure 18 and Figure 19).

At the end of the address data, after the R/W bit, the slave device that recognizes its own address responds by generating an acknowledge (ACK) condition. This is defined as the slave device pulling SDA low while SCL is low before the ninth clock pulse, and keeping it low during the ninth clock pulse. Upon receiving an ACK, the master device can clock data into the AD5398A in a write operation, or it can clock it out in a read operation. Data must change either during the low period of the clock, because SDA transitions during the high period define a start condition as described previously, or during a stop condition as described in the Data Format section.

I<sup>2</sup>C data is divided into blocks of eight bits, and the slave generates an ACK at the end of each block. The AD5398A requires 10 bits of data; two data-words must be written to it when a write operation occurs, or read from it when a read operation occurs. At the end of a read or write operation, the AD5398A acknowledges the second data byte. The master generates a stop condition, defined as a low-to-high transition on SDA while SCL is high, to end the transaction.

## DATA FORMAT

Data is written to the AD5398A high byte first, MSB first, and is shifted into the 16-bit input register. After all data is shifted in, data from the input register is transferred to the DAC register.

Because the DAC requires only 10 bits of data, not all bits of the input register data are used. The MSB is reserved for an active-high, software-controlled, power-down function.

The data format is shown in Table 6. When referring to this table, note that Bit 14 is unused; Bit 13 to Bit 4 correspond to the DAC data bits, D9 to D0; and Bit 3 to Bit 0 are unused.

During a read operation, data is read in the same bit order.

Figure 18. Write Operation

Figure 19. Read Operation

Table 6. Data Format

Serial Data- Words	High Byte								Low Byte							
	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Serial Data Bits	SD7	SD6	SD5	SD4	SD3	SD2	SD1	SD0	SD7	SD6	SD5	SD4	SD3	SD2	SD1	SD0
Input Register	R15	R14	R13	R12	R11	R10	R9	R8	R7	R6	R5	R4	R3	R2	R1	R0
Function <sup>1</sup>	PD	X	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	X	X	X	X

<sup>1</sup> PD = soft power-down; X = unused/don't care; and D7 to D0 = DAC data.

## POWER SUPPLY BYPASSING AND GROUNDING

When accuracy is important in an application, it is beneficial to consider power supply and ground return layout on the PCB. The PCB for the AD5398A should have separate analog and digital power supply sections. Where shared AGND and DGND is necessary, the connection of grounds should be made at only one point, as close as possible to the AD5398A.

Pay special attention to the layout of the AGND return path and track it between the voice coil motor and  $I_{SINK}$  to minimize any series resistance. Figure 20 shows the output current sink of the AD5398A and illustrates the importance of reducing the effective series impedance of AGND, and the track resistance between the motor and  $I_{SINK}$ . The voice coil is modelled as Inductor  $L_C$  and Resistor  $R_C$ . The current through the voice coil is effectively a dc current that results in a voltage drop,  $V_C$ , when the AD5398A is sinking current; the effect of any series inductance is minimal. The maximum voltage drop allowed across  $R_{SENSE}$  is 400 mV, and the minimum drain to source voltage of Q1 is 200 mV. This means that the AD5398A output has a compliance voltage of 600 mV. If  $V_{DROP}$  falls below 600 mV, the output transistor, Q1, can no longer operate properly and  $I_{SINK}$  might not be maintained as a constant.

Figure 20. Effect of PCB Trace Resistance and Inductance

As the current increases through the voice coil,  $V_C$  increases and  $V_{DROP}$  decreases and eventually approaches the minimum specified compliance voltage of 600 mV. The ground return path is modelled by the  $R_G$  and  $L_G$  components. The track resistance between the voice coil and the AD5398A is modelled as  $R_T$ . The inductive effects of  $L_G$  influence  $R_{SENSE}$  and  $R_C$  equally, and because the current is maintained as a constant, it is not as critical as the purely resistive component of the ground return path.

When the maximum sink current is flowing through the motor, the resistive elements,  $R_T$  and  $R_G$ , may have an impact on the voltage headroom of Q1 and may, in turn, limit the maximum value of  $R_C$  because of voltage compliance.

For example, if

$$V_{BAT} = 3.6 \text{ V}$$

$$R_G = 0.5 \Omega$$

$$R_T = 0.5 \Omega$$

$$I_{SINK} = 120 \text{ mA}$$

$$V_{DROP} = 600 \text{ mV (the compliance voltage)}$$

then the largest value of resistance of the voice coil,  $R_C$ , is

$$R_C = \frac{V_{BAT} - [V_{DROP} + (I_{SINK} \times R_T) + (I_{SINK} \times R_G)]}{I_{SINK}} = \frac{3.6 \text{ V} - [600 \text{ mV} + 2 \times (120 \text{ mA} \times 0.5 \Omega)]}{120 \text{ mA}} = 24 \Omega$$

For this reason, it is important to minimize any series impedance on both the ground return path and interconnect between the AD5398A and the motor.

The power supply of the AD5398A should be decoupled with 0.1  $\mu\text{F}$  and 10  $\mu\text{F}$  capacitors. These capacitors should be kept as physically close as possible, with the 0.1  $\mu\text{F}$  capacitor serving as a local bypass capacitor, and therefore should be located as close as possible to the  $V_{DD}$  pin. The 10  $\mu\text{F}$  capacitor should be a tantalum bead-type; the 0.1  $\mu\text{F}$  capacitor should be a ceramic type with a low effective series resistance and effective series inductance. The 0.1  $\mu\text{F}$  capacitor provides a low impedance path to ground for high transient currents.

The power supply line should have as large a trace as possible to provide a low impedance path and reduce glitch effects on the supply line. Clocks and other fast switching digital signals should be shielded from other parts of the board by digital ground. Avoid crossover of digital and analog signals if possible.

When traces cross on opposite sides of the board, ensure that they run at right angles to each other to reduce feedthrough effects through the board. The best board layout technique is to use a multilayer board with ground and power planes, where the component side of the board is dedicated to the ground plane only and the signal traces are placed on the solder side. However, this is not always possible with a 2-layer board.

## APPLICATIONS INFORMATION

The AD5398A is designed to drive both spring preloaded and nonspring linear motors used in applications such as lens autofocus, image stabilization, or optical zoom. The operating principle of the spring-preloaded motor is that the lens position is controlled by the balancing of a voice coil and a spring. Figure 21 shows the transfer curve of a typical spring preloaded linear motor for autofocus. The key points of this transfer function are displacement or stroke, which is the actual distance the lens moves in millimeters (mm), and the current through the motor in milliamperes (mA).

A start current is associated with spring-preloaded linear motors, which is effectively a threshold current that must be exceeded for any displacement in the lens to occur. The start current is usually 20 mA or greater; the rated stroke or displacement is usually 0.25 mm to 0.4 mm; and the slope of the transfer curve is approximately 10  $\mu\text{m}/\text{mA}$  or less.

The AD5398A is designed to sink up to 120 mA, which is more than adequate for available commercial linear motors or voice coils. Another factor that makes the AD5398A the ideal solution for these applications is the monotonicity of the device, which ensures that lens positioning is repeatable for the application of a given digital word.

Figure 22 shows a typical application circuit for the AD5398A.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,  
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
