2 DESCRIPTION

The L4971 is a step down monolithic power switching regulator delivering 1.5A at a voltage between 3.3V and 50V (selected by a simple external divider). Realized in BCD mixed technology, the device uses an internal power D-MOS transistor (with a typical R_{dson} of 0.25Ω) to obtain very high efficiency and high switching speed.

Figure 1. Package

Table 1. Order Codes

| Part Number | Package |
|-------------|---------------------|
| L4971 | DIP8 |
| L4971D | SO16W |
| L4971D013TR | SO16 in Tape & Reel |

A switching frequency up to 300KHz is achievable (the maximum power dissipation of the packages must be observed).

A wide input voltage range between 8V to 55V and output voltages regulated from 3.3V to 50V cover the majority of today's applications.

Features of this new generations of DC-DC converter include pulse-by-pulse current limit, hiccup mode for short circuit protection, voltage feedforward regulation, soft-start, protection against feedback loop disconnection, inhibit for zero current consumption and thermal shutdown.

The device is available in plastic dual in line, DIP8 for standard assembly, and SO16W for SMD assembly.

Table 2. Pin Description

| DIP | SO (*) | Name | Function |
|-----|--------|--------|---|
| 1 | 2 | GND | Ground |
| 2 | 3 | SS_INH | A logic signal (active low) disables the device (sleep mode operation). A capacitor connected between this pin and ground determines the soft start time. When this pin is grounded disabled the device (driven by open collector/drain). |
| 3 | 4 | OSC | An external resistor connected between the unregulated input voltage and this pin and a capacitor connected from this pin to ground fix the switching frequency. (Line feed forward is automatically obtained) |
| 4 | 5, 6 | OUT | Stepdown regulator output |
| 5 | 11 | Vcc | Unregulated DC input voltage |
| 6 | 12 | BOOT | A capacitor connected between this pin and OUT allows to drive the internal DMOS Transistor |
| 7 | 13 | COMP | E/A output to be used for frequency compensation |
| 8 | 14 | FB | Stepdown feedback input. Connecting directly to this pin results in an output voltage of 3.3V. An external resistive divider is required for higher output voltages. |

(*) Pins 1, 7, 8, 9, 10, 15 and 16 are not internally, electrically connected to the die.
