

Nanopower μ P Supervisory Circuits with Manual Reset and Watchdog Timer

General Description

The MAX6854/MAX6855/MAX6856/MAX6858/MAX6860–MAX6869 ultra-low-current (170nA, typ) microprocessor (μ P) supervisory circuits combine voltage monitoring, watchdog timer, and manual reset input functions in a 5-pin SOT23 package. These devices assert a reset signal whenever the monitored voltage drops below the factory-trimmed reset threshold voltage, manual reset is asserted, or the watchdog timer expires. The reset output remains asserted for a minimum timeout period after V_{CC} rises above the reset threshold and manual reset is deasserted. Factory-trimmed reset threshold voltages are offered from +1.575V to +4.625V in approximately 100mV increments (see the *Threshold Suffix Guide*). Each device is offered with six minimum reset timeout options, ranging from 10ms to 1200ms.

The MAX6854/MAX6855/MAX6856/MAX6858/MAX6860–MAX6869 are offered in a variety of configurations (see the *Selector Guide*). The MAX6854/MAX6855/MAX6856/MAX6861–MAX6869 provide a manual reset input, MR. The MAX6864–MAX6869 offer a watchdog timer that monitors activity at the WDI input to prevent code execution errors. The MAX6864–MAX6869 offer watchdog timeout options of 3.3s or 209s (typ). The MAX6861/MAX6862/MAX6863 feature a pin-selectable reset delay period of 10ms or 150ms (min). Push-pull active-low, push-pull active-high, and open-drain active-low reset outputs are available.

Applications

Portable/Battery-Powered Equipment
PDA's/Cell Phones
MP3 Players/Pagers
Glucose Monitors/Patient Monitors

Typical Operating Circuit

Features

- ◆ Ultra-Low 170nA (typ) Supply Current
- ◆ Reset Thresholds from +1.575V to +4.625V in Approximately 100mV Increments
- ◆ Six Minimum Reset Timeout Period Options from 10ms to 1200ms
- ◆ Manual Reset Option
- ◆ Watchdog Timer Option
- ◆ Pin-Selectable 10ms/150ms (min) Reset Timeout Period (MAX6861/MAX6862/MAX6863)
- ◆ Immune to Short V_{CC} Transients
- ◆ Guaranteed Reset Valid to $V_{CC} = +1.1V$
- ◆ Three Reset Output Options:
Push-Pull RESET
Push-Pull RESET
Open-Drain RESET
- ◆ No External Components
- ◆ Small 5-Pin SOT23 Package
- ◆ Pin Compatible to the TPS3836/TPS3837/TPS3838 (MAX6861/MAX6862/MAX6863)

Ordering Information

PART [†]	TEMP RANGE	PIN-PACKAGE
MAX6854UK_ _D_-T	-40°C to +85°C	5 SOT23-5
MAX6855UK_ _D_-T	-40°C to +85°C	5 SOT23-5

[†]Insert reset threshold suffix (see Table 2, *Threshold Suffix Guide*) after UK. Insert the number corresponding to the desired reset timeout period (see Table 4, *Reset Timeout Period*) after D.

Note: Sample stock is generally held on standard versions only (see Table 5, *Standard Versions Table*). Standard versions have an order increment of 2500 pieces. Nonstandard versions have an order increment of 10,000 pieces. Contact factory for availability of nonstandard versions.

Devices are available in both leaded and lead-free packaging. Specify lead-free by replacing “-T” with “+T” when ordering.

Pin Configurations and Selector Guide appear at end of data sheet.

Ordering Information continued at end of data sheet.

MAX6854/MAX6855/MAX6856 Pin Description

PIN		NAME	FUNCTION
MAX6854/ MAX6856	MAX6855		
1	—	$\overline{\text{RESET}}$	Active-Low Open-Drain or Push-Pull Reset Output. $\overline{\text{RESET}}$ transitions from high to low when V_{CC} drops below the selected reset threshold or $\overline{\text{MR}}$ is pulled low. $\overline{\text{RESET}}$ remains low for the reset timeout period after V_{CC} exceeds the device reset threshold and $\overline{\text{MR}}$ deasserts. Push-pull $\overline{\text{RESET}}$ outputs are referenced to V_{CC} . Open-drain $\overline{\text{RESET}}$ outputs require an external pullup resistor.
2, 4	2, 4	GND	Ground. Connect all GND inputs to the same potential.
3	3	$\overline{\text{MR}}$	Active-Low Manual Reset Input. Drive $\overline{\text{MR}}$ low to initiate a reset. The reset output remains asserted while $\overline{\text{MR}}$ is held low and for the reset timeout period after $\overline{\text{MR}}$ transitions high. Leave $\overline{\text{MR}}$ unconnected or connect to V_{CC} if unused. $\overline{\text{MR}}$ is internally pulled up to V_{CC} through 10k Ω .
5	5	V_{CC}	Supply Voltage. Input for V_{CC} reset monitor. For noisy systems, bypass V_{CC} with a 0.1 μ F capacitor to GND.
—	1	RESET	Active-High Push-Pull Reset Output. RESET transitions from low to high when V_{CC} drops below the selected reset threshold or $\overline{\text{MR}}$ is pulled low. RESET remains high for the reset timeout period after V_{CC} exceeds the device reset threshold and $\overline{\text{MR}}$ deasserts. RESET is referenced to V_{CC} .

Detailed Description

RESET/RESET Output

A μ P's reset input starts the μ P in a known state. The MAX6854/MAX6855/MAX6856/MAX6858/MAX6860-MAX6869 μ P supervisory circuits assert a reset to prevent code-execution errors during power-up, power-down, and brownout conditions. The MAX6854/MAX6855/MAX6856/MAX6858/MAX6860-MAX6869 reset output is guaranteed to be valid for V_{CC} down to 1.1V.

Whenever V_{CC} falls below the reset threshold, the reset output asserts low for $\overline{\text{RESET}}$ and high for RESET . Once V_{CC} exceeds the reset threshold, an internal timer keeps the reset output asserted for the specified reset timeout period, then after this interval the reset output deasserts (see Figure 2).

Manual Reset Input

Many μ P-based products require manual reset capability, allowing the operator, a test technician, or external logic circuitry to initiate a reset. The MAX6854/MAX6855/MAX6856/MAX6861-MAX6869 feature an $\overline{\text{MR}}$ input. A logic low on $\overline{\text{MR}}$ asserts a reset. Reset remains asserted while $\overline{\text{MR}}$ is low and for the timeout period, t_{RP} , after $\overline{\text{MR}}$ returns high. The devices provide an internal $10\text{k}\Omega$ pullup from $\overline{\text{MR}}$ to V_{CC} . Leave $\overline{\text{MR}}$ unconnected or connect to V_{CC} if unused. $\overline{\text{MR}}$ can be driven with CMOS logic levels or with open-drain/collector outputs. Connect a normally open momentary switch from $\overline{\text{MR}}$ to GND to implement a manual reset function; external debounce circuitry is not required. If $\overline{\text{MR}}$ is driven by long cables or the device is used in a noisy environment, connect a $0.1\mu\text{F}$ capacitor from $\overline{\text{MR}}$ to GND to provide additional noise immunity.

Watchdog Input

The MAX6864-MAX6869's watchdog timer circuitry monitors the μ P's activity. If the μ P does not toggle (low-to-high or high-to-low) the watchdog input (WDI) within the watchdog timeout period (t_{WDI}), reset asserts for the reset timeout period (t_{RP}). The internal timer is cleared when reset asserts, when manual reset is asserted, or by a rising or falling edge on WDI. The watchdog input detects pulses as short as 150ns. While reset is asserted the watchdog timer does not count. As soon as reset deasserts, the watchdog timer resumes counting (Figure 3).

Applications Information

Selecting the Reset Timeout Period

The reset timeout period for the MAX6854/MAX6855/MAX6856/MAX6858/MAX6860/MAX6864-MAX6869 is fixed (see Table 4). The MAX6861/MAX6862/MAX6863 feature a reset timeout select input, CT. Connect CT according to Table 1 to select between the available 10ms and 150ms (min) reset timeout periods. The timeout period can be changed while a reset timeout period is in progress, but will not update until the reset timeout period has expired.

Table 1. MAX6861/MAX6862/MAX6863 Reset Timeout Period Selection

CT CONNECTION	MIN	TYP	MAX	UNITS
LOW	10	15	25	ms
HIGH	150	225	300	

Nanopower μ P Supervisory Circuits with Manual Reset and Watchdog Timer

Transient Immunity

In addition to issuing a reset to the μ P during power-up, power-down, and brownout conditions, the MAX6854/MAX6855/MAX6856/MAX6858/MAX6860–MAX6869 are relatively immune to short-duration supply transients, or glitches. The Maximum V_{CC} Transient Duration vs. Reset Threshold Overdrive graph in the *Typical Operating Characteristics* shows this relationship.

The area below the curve of the graph is the region in which these devices typically do not generate a reset pulse. This graph was generated using a falling pulse applied to V_{CC} , starting 100mV above the actual reset threshold, V_{TH} , and ending below this threshold (reset-threshold overdrive). As the magnitude of the transient increases, the maximum allowable pulse width decreases. Typically, a 100mV V_{CC} transient duration of 40 μ s or less does not cause a reset.

Interfacing to Other Voltages for Logic Compatibility

The open-drain \overline{RESET} output can be used to interface to a μ P with other logic levels. As shown in Figure 4, the open-drain output can be connected to voltages from 0 to 5.5V.

Generally, the pullup resistor connected to \overline{RESET} connects to the supply voltage that is being monitored at the IC's V_{CC} input. However, some systems use the

open-drain output to level-shift from the monitored supply to reset circuitry powered by another supply voltage. Keep in mind that as the supervisor's V_{CC} decreases, so does the IC's ability to sink current at \overline{RESET} .

Ensuring a Valid \overline{RESET} Down to $V_{CC} = 0V$ (Push-Pull \overline{RESET})

When V_{CC} falls below 1.1V, \overline{RESET} 's current-sinking capability declines drastically. The high-impedance CMOS logic inputs connected to \overline{RESET} can drift to undetermined voltages. This presents no problems in most applications, since most μ Ps and other circuitry do not operate with V_{CC} below 1.1V.

In those applications where \overline{RESET} must be valid down to 0, add a pulldown resistor between \overline{RESET} and GND for the MAX6854/MAX6858/MAX6861/MAX6864/MAX6867 push-pull outputs. The resistor sinks any stray leakage currents, holding \overline{RESET} low (Figure 5). Choose a pulldown resistor that accommodates leakages, such that \overline{RESET} is not significantly loaded and is capable of pulling to GND. The external pulldown cannot be used with the open-drain reset outputs.

Watchdog Software Considerations

One way to help the watchdog timer monitor software execution more closely is to set and reset the watchdog

Figure 4. Interfacing with Other Voltage Levels

Figure 5. Ensuring \overline{RESET} Valid to $V_{CC} = \text{Ground}$

Nanopower μ P Supervisory Circuits with Manual Reset and Watchdog Timer

input at different points in the program, rather than pulsing the watchdog input high-low-high or low-high-low. This technique avoids a stuck loop, in which the watchdog timer would continue to be reset inside the loop, keeping the watchdog from timing out.

Figure 6 shows an example of a flow diagram where the I/O driving the watchdog input is set high at the beginning of the program, set low at the beginning of every subroutine or loop, then set high again when the program returns to the beginning. If the program should hang in any subroutine, the problem would quickly be corrected, since the I/O is continually set low and the watchdog timer is allowed to time out, causing a reset or interrupt to be issued.

Figure 6. Watchdog Flow Diagram

Table 2. Threshold Suffix Guide

SUFFIX	V _{CC} THRESHOLD FALLING			UNITS
	MIN	TYP	MAX	
46	4.509	4.625	4.741	V

MAX6869UK__D__-T	-40°C to +85°C	5 SOT23-5

[†] Insert reset threshold suffix (see Table 2, Threshold Suffix Guide) after UK. Insert the number corresponding to the desired reset timeout period (see Table 4, Reset Timeout Period) after D. Insert the letter corresponding to the desired watchdog timeout period (S or L, see Table 3) into the blank following the reset timeout period suffix for the MAX6864–MAX6869.

Note: Sample stock is generally held on standard versions only (see Table 5, Standard Versions Table). Standard versions have an order increment of 2500 pieces. Nonstandard versions have an order increment of 10,000 pieces. Contact factory for availability of nonstandard versions.

Devices are available in both leaded and lead-free packaging. Specify lead-free by replacing “-T” with “+T” when ordering.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
