◆ Termination sequence

① Strip the cable.

② Cut the shield and expose the wire.

③ Cut back the shield above the sheath and wrap with conductive tape.

④ Strip the wire and form it.

Jig used: Cable-forming strip jig
(Refer to Page 85 for detail.)

⑤ Crimp the wire to the internal terminal.

Jig used: Automatic crimping machine.
(Refer to Page 85 for detail.)

⑥ Insert the internal terminals into the Outer terminals.

⑦ Crimp the Outer terminal.

Jig used: Outside tube caulking jig.
(Refer to Page 91 for detail.)

⑧ Insert the terminal into the housing. (Please insert until the terminal is stopped by the lance.)

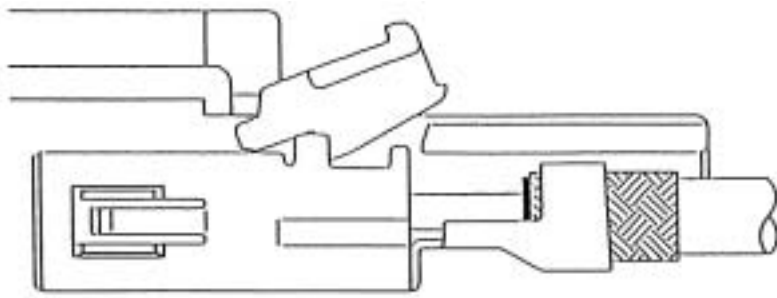

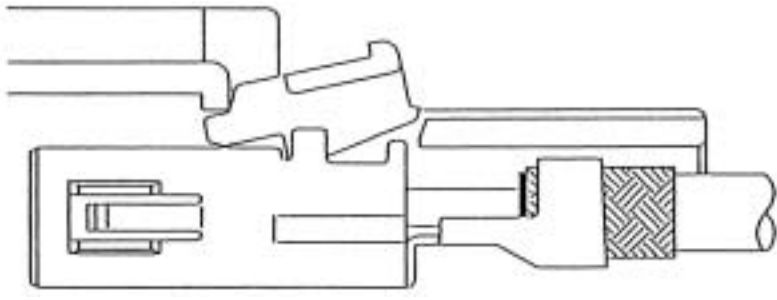

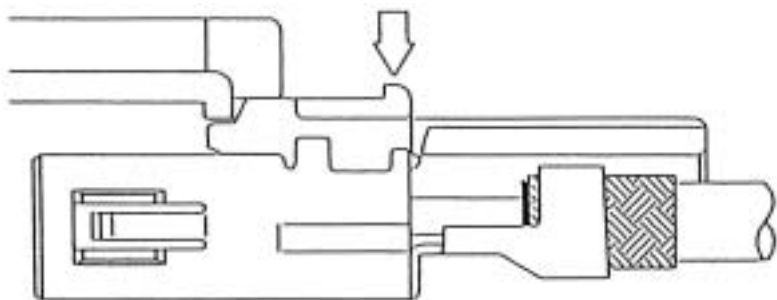

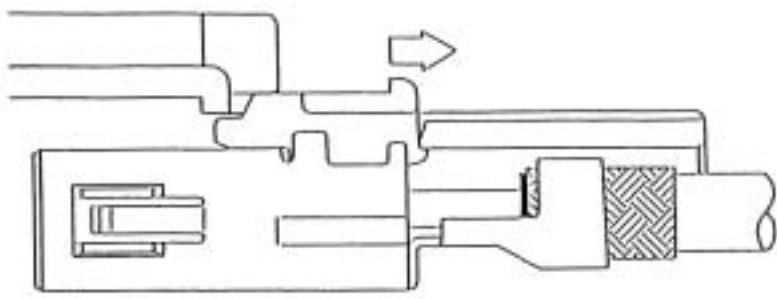

⑨ Mount the retainer to complete the task.

Refer to Page 84 for information
about the retainer mounting
method.

◆ Retainer Mounting Method

<p>a. Insert so that the terminal locking tab is inserted between the top surface of the terminal and the housing.</p>	 A cross-sectional diagram of a terminal assembly. A locking tab is being inserted from the top into a slot between the terminal and the housing. The terminal has a textured cylindrical section.
<p>b. Push in while changing the angle of the retainer until the front surface comes to a stop.</p>	 A cross-sectional diagram similar to the first one, but the locking tab is now pushed further into the slot and is angled downwards. The front surface of the tab is in contact with the housing.
<p>c. Press the rear portion of the retainer and snap it into the locked position.</p>	 A cross-sectional diagram showing a downward-pointing arrow above the rear portion of the locking tab, indicating it is being pressed down into the housing.
<p>d. If locking is not complete, press the rear portion of the retainer again while pulling it backward.</p>	 A cross-sectional diagram showing a downward arrow above the rear portion of the tab and a rightward arrow pointing from the rear of the tab, indicating it is being pulled back while being pressed down.

* Check that all locations are locked.

* Check that the bands are housed in all of the receiving areas.
