

KAI-43140

8040 (X) x 5360 (V) Interline CCD Image Sensor

Description

The KAI-43140 image sensor is a 43 megapixel Interline Transfer CCD in a 35 mm optical format. Leveraging a 4.5 μm pixel design that provides a 50% resolution increase compared to the KAI-29050 and KAI-29052 devices, the KAI-43140 provides excellent image uniformity and broad dynamic range. A flexible output architecture supports 1, 2, or 4 outputs for full resolution readout of up to 4 frames per second, and a true electronic shutter enables image capture without motion artifacts across a broad range of exposure times.

In addition to standard monochrome and Bayer Color configurations, the sensor is available in a Sparse CFA configuration which provides a 2x improvement in light sensitivity compared to the standard Bayer Color part. The sensor shares the same package as the KAI-29050 and KAI-29052 image sensors, simplifying camera design.

Table 1. GENERAL SPECIFICATIONS

| Parameter | Typical Value |
|--|---|
| Architecture | Interline CCD; Progressive Scan |
| Total Number of Pixels | 8160 (H) x 5480 (V) |
| Number of Effective Pixels | 8080 (H) x 5400 (V) |
| Number of Active Pixels | 8040 (H) x 5360 (V) |
| Pixel Size | 4.5 μm (H) x 4.5 μm (V) |
| Active Image Size | 36.18 mm (H) x 24.12 mm (V) 43.48 mm (Diag.), 35 mm Optical Format |
| Aspect Ratio | 3:2 |
| Number of Outputs | 1, 2, or 4 |
| Charge Capacity | 13,000 electrons |
| Output Sensitivity | 42 $\mu\text{V}/\text{e}^-$ |
| Quantum Efficiency Pan (-AXA, -QXA) R, G, B (-FXA, -QXA) | 45 % 27%, 34%, 37% |
| Read Noise (f = 60 MHz) | 13 electrons rms |
| Dark Current Photodiode VCCD | 7 electrons/s 50 electrons/s |
| Dynamic Range | 60 dB |
| Charge Transfer Efficiency | 0.999999 |
| Blooming Suppression | > 300 X |
| Smear | -98 dB |
| Image Lag | < 10 electrons |
| Maximum Pixel Clock Speed | 60 MHz |
| Maximum Frame Rates Quad Output Dual Output Single Output | 4 fps 2 fps 1 fps |
| Package | 72 pin PGA |
| Cover Glass | AR Coated, 2 Sides |

NOTE: All parameters are specified at T = 40°C unless otherwise noted.

Figure 1. KAI-43140 CCD Image Sensor

Features

- High Resolution Image Capture in 35 mm Optical Format
- True Electronic Shutter with Broad Exposure Latitude
- Low Noise Architecture
- Excellent Smear Performance
- Monochrome, Bayer Color, and Sparse CFA Configurations

Applications

- Industrial Imaging and Inspection
- Security and Surveillance

ORDERING INFORMATION

See detailed ordering, marking and shipping information on page 2 of this data sheet.

See the ON Semiconductor *Device Nomenclature* document (TND310/D) for a full description of the naming convention used for image sensors. For reference documentation, including information on evaluation kits, please visit our web site at www.onsemi.com.

DEVICE DESCRIPTION

Architecture

Figure 2. Block Diagram

Dark Reference Pixels

There are 40 dark reference rows at the top and 40 dark rows at the bottom of the image sensor. The dark rows are not entirely dark and so should not be used for a dark reference level. Use the 40 dark columns on the left or right side of the image sensor as a dark reference. Under normal circumstances use only the center 38 columns of the 40 column dark reference due to potential light leakage.

Dummy Pixels

Within each horizontal shift register there are 12 leading additional shift phases. These pixels are designated as dummy pixels and should not be used to determine a dark reference level. In addition, there is one dummy row of pixels at the top and bottom of the image.

Active Buffer Pixels

20 unshielded pixels adjacent to any leading or trailing dark reference regions are classified as active buffer pixels. These pixels are light sensitive but are not tested for defects and non-uniformities. The 8 outer buffer pixels are less

sensitive than the inner buffer pixels. The inner buffer pixels have the same sensitivity as the 8040 by 5360 active pixels.

Image Acquisition

An electronic representation of an image is formed when incident photons falling on the sensor plane create electron-hole pairs within the individual silicon photodiodes. These photoelectrons are collected locally by the formation of potential wells at each photo-site. Below photodiode saturation, the number of photoelectrons collected at each pixel is linearly dependent upon light level and exposure time and non-linearly dependent on wavelength. When the photodiodes charge capacity is reached, excess electrons are discharged into the substrate to prevent blooming.

ESD Protection

Adherence to the power-up and power-down sequence is critical. Failure to follow the proper power-up and power-down sequences may cause damage to the sensor. See Power-Up and Power-Down Sequence section.

DEFECT DEFINITIONS

Table 7. OPERATING CONDITIONS

| Description | Condition | Notes |
|--------------|---|---|
| Light Source | Continuous Red, Green, and/or Blue LED Illumination | For the monochrome sensor, only the green LED is used |
| Operation | Nominal Operating Voltages and Timing | |

Table 8. OPERATING PARAMETERS

| Description | 1 Output | 4 Outputs |
|----------------------|---------------|---------------|
| HCCD Clock Frequency | 20 MHz | 20 MHz |
| Pixels per Line | 8160 | 4080 |
| Lines per Frame | 5480 | 5480 |
| Line Time | 429.6 μ s | 225.6 μ s |
| Frame Time | 2354.3 ms | 618.2 ms |

Table 9. TIMING MODES

| Timing Mode | Conditions |
|-------------|---|
| Mode A | 1 Output, no electronic shutter used. Photodiode integration time is equal to the Frame Time |
| Mode B | 4 Outputs, no electronic shutter used. Photodiode integration time is equal to the Frame time |

Table 10. DEFECT DEFINITIONS

| Description | Definition | Grade 1 | Grade 2 (mono) | Grade 2 (color) |
|--------------------|--|-------------------|-------------------|-------------------|
| Column Defect | A group of more than 10 contiguous pixels along a single column that deviate from the neighboring columns by: <ul style="list-style-type: none"> more than 94 mV in the dark field using Timing Mode A at 40°C more than 94 mV in the dark field using Timing Mode A at 27°C more than -2% or +50% in the bright field using timing mode A at 27°C or 40°C | 0 | 7 | 27 |
| Cluster Defect | A group of 2 to N contiguous defective pixels, but no more than W adjacent defects horizontally, that deviate from the neighboring pixels by: <ul style="list-style-type: none"> more than 440 mV in the dark field using Timing Mode A at 40°C more than 236 mV in the dark field using Timing Mode A at 27°C more than -12% or +12% in the bright field using timing mode A at 27°C or 40°C | 30 W=4 N=19 | 70 W=5 N=38 | 70 W=5 N=38 |
| Major Point Defect | A single defective pixel that deviates from the neighboring pixels by: <ul style="list-style-type: none"> more than 440 mV in the dark field using Timing Mode A at 40°C more than 236 mV in the dark field using Timing Mode A at 27°C more than -12% or +50% in the bright field using timing mode A at 27°C or 40°C | 400 | 800 | 800 |
| Minor Point Defect | A single defective pixel that deviates from the neighboring pixels by: <ul style="list-style-type: none"> more than 220 mV in the dark field using Timing Mode A at 40°C | 4000 | 8000 | 8000 |

10. Bright field is define as where the average signal level of the sensor is 382 mV, with the substrate voltage set to the recommend VAB setting such that the capacity of the photodiodes is 546 mV (13,000 electrons)

11. For the color devices (KAI-43140-FXA or KAI-43140-QXA), a bright field defective pixel is with respect to pixels of the same color

12. Column and cluster defects are separated by no less than two (2) non-defective pixels in any direction (excluding single pixel defects).

DEFECT MAP

The defect map supplied with each sensor is based upon testing at an ambient (27°C) temperature. Minor point

defects are not included in the defect map. All defective pixels are reference to pixel 1, 1 in the defect maps.

Figure 13. Pixel 1, 1 Location

OPERATION

Table 11. ABSOLUTE MAXIMUM RATINGS

| Description | Symbol | Minimum | Maximum | Units | Notes |
|-----------------------|--------|---------|---------|-------|--------|
| Operating Temperature | Top | -50 | +70 | °C | 13, 15 |
| Humidity | RH | 5 | 90 | % | 14, 15 |
| Output Bias Current | Iout | - | 60 | mA | 16 |
| Off-Chip Load | CL | - | 10 | pF | |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

13. Noise performance will degrade at higher temperatures.

14. T = 25 °C. Excessive humidity will degrade MTTF.

15. The KAI-43140 image sensors have epoxy sealed cover glass. The seal formed is non-hermetic, and may allow moisture ingress over time, depending on the storage environment. As a result, care must be taken to avoid cooling the device below the dew point inside the package cavity, since this may result in condensation on the sensor. For all KAI-43140 configurations, no warranty, expressed or implied, covers condensation.

16. Total for all outputs. Maximum current is -15 mA for each output. Avoid shorting output pins to ground or any low impedance source during operation. Amplifier bandwidth increases at higher current and lower load capacitance at the expense of reduced gain (sensitivity).

Table 12. ABSOLUTE MAXIMUM VOLTAGE RATINGS BETWEEN PINS AND GROUND

| Description | Minimum | Maximum | Units | Notes |
|--|-----------|------------|-------|-------|
| VDD α , VOUT α | -0.4 | +17.5 | V | 17 |
| RD α | -0.4 | +15.5 | V | 17 |
| V1TB | ESD - 0.4 | ESD + 24.0 | V | |
| V2B, V2T, V3B, V3T, V3B, V3T | ESD - 0.4 | ESD + 14.0 | V | |
| FDG α b, FDG α d | ESD - 0.4 | ESD + 15.0 | V | |
| H1 α , H2 α , H2L α | ESD - 0.4 | ESD + 14.0 | V | 17 |
| R α | ESD - 0.4 | ESD + 18.0 | V | 17 |
| ESD | -10 | 0.0 | V | |
| SUB | -0.4 | 40.0 | V | 18 |

17. α refers to a, b, c, or d.

18. Refer to Application Note Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions

Power-Up and Power-Down Sequence

Adherence to the power-up and power-down sequence is critical. Failure to follow the proper power-up and power-down sequences may cause damage to the sensor.

NOTES:

- 19. Activate all other biases when ESD is stable and SUB is above 3 V.
- 20. Do not pulse the electronic shutter until ESD is stable.
- 21. The VCCD clock waveform must not have a negative overshoot more than 0.4 V below the ESD voltage. See Figure 15.
- 22. The image sensor can be protected from an accidental improper ESD voltage by current limiting the SUB current to less than 10 mA. SUB and VDD must always be greater than GND. ESD must always be less than GND. Placing diodes between SUB, VDD, ESD and ground will protect the sensor from accidental overshoots of SUB, VDD and ESD during power on and power off. See Figure 16.

Figure 14. Power-Up and Power-Down Sequence

Figure 15. VCCD Clock Overshoots

Figure 16. External Diode Protection

Table 13. DC BIAS OPERATING CONDITIONS

| Description | Pins | Symbol | Minimum | Nominal | Maximum | Units | Max. DC Current | Notes |
|-------------------------|--------------|--------|---------|---------|---------|-------|-----------------|------------|
| Reset Drain | RD α | RD | +12.3 | +12.5 | +12.7 | V | 10 μ A | 23 |
| Output Gate | OG α | OG | +1.5 | +1.7 | +2.4 | V | 10 μ A | 23 |
| Output Amplifier Supply | VDD α | VDD | +14.5 | +15.0 | +15.5 | V | 11.0 mA | 23, 24 |
| Ground | GND | GND | +0.0 | +0.0 | +0.0 | V | -1.0 mA | |
| Substrate | SUB | VSUB | +5.0 | VAB | VDD | V | 50 μ A | 25, 30 |
| ESD Protection Disable | ESD | ESD | -9.2 | -9.0 | -8.8 | V | 50 μ A | 28, 29 |
| Output Bias Current | VOU α | Iout | -3.0 | -5.0 | -10.0 | mA | | 23, 26, 27 |

23. α denotes a, b, c or d

24. The maximum DC current is for one output. $I_{dd} = I_{out} + I_{ss}$. See Figure 17.

25. The operating value of the substrate voltage, VAB, will be marked on the shipping container for each device. The value of VAB is set such that the photodiode charge capacity is the nominal PNe (see Specifications).

26. An output load sink must be applied to each VOUT pin to activate each output amplifier.

27. Nominal value required for 60 MHz operation per output. May be reduced for slower data rates and lower noise.

28. Adherence to the power-up and power-down sequence is critical. See Power-Up and Power-Down Sequence section.

29. ESD maximum value must be less than or equal to V1_L - 0.4 V and V2_L - 0.4 V.

30. Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*.

| Electronic Shutter (Notes 35, 38) | SUB | VES | High | - | - | +40 | V | 12 nF |
| | | VES_Offset | Offset | VAB + 24 | VAB + 25 | - | | |
| Fast Line Dump Gate | FDG α , FDG α d | FDG_L | Low | -8.2 | -8.0 | -7.8 | V | 200 pF |
| | | FDG_H | High | +4.5 | +5.0 | +5.5 | | |

31. α denotes a, b, c or d.

32. Capacitance is total for all like named pins.

33. Use separate clock driver for improved speed performance.

34. Reset low should be set to +2.0 V for signal levels greater than 26,000 electrons.

35. Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*.

36. Capacitance values are estimated.

37. If the minimum horizontal clock low level is used (-0.2 V), then a 4 V clock amplitude should be used to create a -0.2 V to +3.8 V clock. For the maximum horizontal charge transfer efficiency performance a 5 volt clock amplitude may be used.

38. Figure 18 shows the DC bias (VSUB) and AC clock (VES) applied to the SUB pin. Both the DC bias and AC clock are referenced to ground. The VES_Offset is referenced to VSUB.

Figure 18. VSUB and VES Reference

Device Identification

The device identification pin (DevID) may be used to determine which ON Semiconductor 5.5 micron pixel interline CCD sensor is being used.

Table 15. DEVICE IDENTIFICATION

| Description | Pins | Symbol | Minimum | Nominal | Maximum | Unit | Max. DC Current | Notes |
|-----------------------|-------|--------|---------|---------|---------|------|-----------------|------------|
| Device Identification | DevID | DevID | 230,000 | 260,000 | 300,00 | Ω | 50 μA | 39, 40, 41 |

39. Nominal value subject to verification and/or change during release of preliminary specifications.

40. If the Device Identification is not used, it may be left disconnected.

41. After Device Identification resistance has been read during camera initialization, it is recommended that the circuit be disabled to prevent localized heating of the sensor due to current flow through the R_DeviceID resistor.

Recommended Circuit

Note that V1 must be a different value than V2.

Figure 19. Device Identification Recommended Circuit

Timing Diagrams

The timing sequence for the clocked device pins may be represented as one of seven patterns (P1–P7) as shown in the

table below. The patterns are defined in Figure 20 and Figure 21. Contact ON Semiconductor Application Engineering for other readout modes.

Table 17. TIMING SEQUENCE

| Device Pin | Quad Readout | Dual Readout VOUTa, VOUTb | Dual Readout VOUTa, VOUTc | Single Readout VOUTa |
|-------------------------|--------------|---------------------------------------|---------------------------------------|---------------------------------------|
| V1BT | P1BT | P1BT | P1BT | P1BT |
| V2T | P2T | P4B | P2T | P4B |

| H1Sc | P5 | P5 ⁴⁴ or Off ⁴⁶ | P5 | P5 ⁴⁴ or Off ⁴⁶ |
| H1Bc | | | | |
| H2Sc (Note 45) | P6 | P6 ⁴⁴ or Off ⁴⁶ | P6 | P6 ⁴⁴ or Off ⁴⁶ |
| H2Bc | | | | |
| Rc | P7 | P7 ⁴⁴ or Off ⁴⁶ | P7 | P7 ⁴⁴ or Off ⁴⁶ |
| H1Sd | P5 | P5 ⁴⁴ or Off ⁴⁶ | P5 | P5 ⁴⁴ or Off ⁴⁶ |
| H1Bd | | | P6 | |
| H2Sd (Note 45) | P6 | P6 ⁴⁴ or Off ⁴⁶ | P6 | P6 ⁴⁴ or Off ⁴⁶ |
| H2Bd | | | P5 | |
| Rd | P7 | P7 ⁴⁴ or Off ⁴⁶ | P7 ⁴⁴ or Off ⁴⁶ | P7 ⁴⁴ or Off ⁴⁶ |
| | | | | |
| # Lines/Frame (Minimum) | 2740 | 5480 | 2740 | 5480 |
| # Pixels/Line (Minimum) | 4092 | | 8172 | |

44. For optimal performance of the sensor. May be clocked at a lower frequency. If clocked at a lower frequency, the frequency selected should be a multiple of the frequency used on the a and b register.

45. H2SLx follows the same pattern as H2Sx For optimal speed performance, use a separate clock driver.

46. Off = R_H for the Reset Gate and H_H for the Horizontal CCD gates. Note that there may be operating conditions (high temperature and/or very bright light sources) that will cause blooming from the unused c/d register into the image area.

Photodiode Transfer Timing

A row of charge is transferred to the HCCD on the falling edge of V1 as indicated in the P1 pattern below. Using this timing sequence, the leading dummy row or line is combined with the first dark row in the HCCD. The “Last Line” is dependent on readout mode – either 2740 or 5480 minimum counts required. It is important to note that, in

general, the rising edge of a vertical clock (patterns P1–P4) should be coincident or slightly leading a falling edge at the same time interval. This is particularly true at the point where P1 returns from the high (3rd level) state to the mid-state when P4 transitions from the low state to the high state.

Figure 20. Photodiode Transfer Timing

Line and Pixel Timing

Each row of charge is transferred to the output, as illustrated below, on the falling edge of H2SL (indicated as

P6 pattern). The number of pixels in a row is dependent on readout mode – either 4092 or 8172 minimum counts required.

Figure 21. Line and Pixel Timing

Pixel Timing Detail

Figure 22. Pixel Timing Detail

Frame/Electronic Shutter Timing

The SUB pin may be optionally clocked to provide electronic shuttering capability as shown below. The

resulting photodiode integration time is defined from the falling edge of SUB to the falling edge of V1 (P1 pattern).

Figure 23. Electronic Shutter Timing

VCCD Clock Edge Alignment

Figure 24. VCCD Clock Rise Time, Fall Time, and Edge Alignment

Line and Pixel Timing – Vertical Binning by 2

Figure 25. Line and Pixel Timing – Vertical Binning by 2

Fast Line Dump Timing

The FDG pins may be optionally clocked to efficiently remove unwanted lines in the image resulting for increased

frame rates at the expense of resolution. Below is an example of a 2 line dump sequence followed by a normal readout line.

Figure 26. Fast Line Dump Timing

STORAGE AND HANDLING

Table 18. STORAGE CONDITIONS

| Description | Symbol | Minimum | Maximum | Units | Notes |
|---------------------|-----------------|---------|---------|-------|-------|
| Storage Temperature | T _{AT} | -55 | +88 | °C | 47 |
| Humidity | RH | 5 | 90 | % | 48 |

47. Long term storage toward the maximum temperature will accelerate color filter degradation.

48. T = 25 °C. Excessive humidity will degrade MTF.

For information on ESD and cover glass care and cleanliness, please download the *Image Sensor Handling and Best Practices* Application Note (AN52561/D) from www.onsemi.com.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
