

## HDLx-3416 Series

Four Character 6.9 mm (0.27 inch)

Smart 5 x 7 Alphanumeric Displays

## Data Sheet

### Description

These are 5 x 7 dot matrix displays with four 0.27" tall characters, driven by an on-board CMOS IC. The IC stores and decodes 7-bit ASCII data and displays it with an easy-to-read 5x7 font. Multi-plexing circuitry and drivers are included in the IC to allow the display to interface simply with bus-based microprocessor systems.

The address and data inputs of the display can be directly connected to the microprocessor address and data buses.

These displays are related to the HDLX-2416 family, and thus share the same enhancements over the HPDL-2416 segmented displays. These features include support for the full 128 character US ASCII character set, 8 level dimming control, external hardware dimming capability, and digit blanking.

An extended function disable exists for those designers who desire compatibility with competitive displays. This function disables the dimming and digit blanking controls.

### Features

- Smart alphanumeric display  
Built-in RAM, ASCII decoder, and LED drive circuitry
- Software controlled dimming and blanking
- 128 ASCII character set
- End-stackable
- Categorized for luminous intensity
  - Yellow and Green categories for color
  - Use of like categories yields a uniform display
- Wide operating temperature range -40°C to +85°C
- Wave solderable
- Wide viewing angle (50° typical)

### Devices:

| High Efficiency Red | Orange    | Yellow    | Green     |
|---------------------|-----------|-----------|-----------|
| HDLO-3416           | HDLA-3416 | HDLY-3416 | HDLG-3416 |

**ESD WARNING:** Standard CMOS handling precautions should be observed to avoid static discharge.

## Package Dimensions

### Notes:

1. Unless otherwise specified, the tolerance on all dimensions is  $\pm 0.254$  mm (0.010).
2. All dimensions are in millimeters (inches).

| PIN NO. | FUNCTION         | PIN NO. | FUNCTION        |
|---------|------------------|---------|-----------------|

## Absolute Maximum Ratings

|                                                          |                                   |
|----------------------------------------------------------|-----------------------------------|
| Supply Voltage, V <sub>DD</sub> to Ground <sup>[1]</sup> | -0.5 V to 7.0 V                   |
| Input Voltage, Any Pin to Ground                         | -0.5 V to V <sub>DD</sub> + 0.5 V |
| Free Air Operating Temperature Range, T <sub>A</sub>     | -40°C to +85°C                    |
| Storage Temperature, T <sub>S</sub>                      | -40°C to +85°C                    |
| CMOS IC Junction Temperature, T <sub>J</sub> (IC)        | +150°C                            |
| Relative Humidity (non-condensing) at 65°C               | 85%                               |
| Soldering Temperature [1.59 mm (0.063 in.) Below Body]   |                                   |
| Solder Dipping                                           | 260°C for 5 secs                  |
| Wave Soldering                                           | 250°C for 3 secs                  |
| ESD Protection, R = 1.5 kΩ, C = 100 pF                   | V <sub>Z</sub> = 1 kV (each pin)  |

### Note:

1. Maximum Voltage is with no LEDs illuminated.

## Electrical Description

| Pin Function                                                          | Description                                                                                                                                                     |
|-----------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Chip Enable ( $\overline{CE}_1$ and $\overline{CE}_2$ , Pins 3 and 4) | $\overline{CE}_1$ and $\overline{CE}_2$ must be a logic 0 to write to the display.                                                                              |
| Clear ( $\overline{CLR}$ , Pin 5)                                     | When $\overline{CLR}$ is a logic 0 the ASCII RAM is reset to 20hex (space) and the Control Register/Attribute RAM is reset to 00hex.                            |
| Cursor Enable (CUE Pin 11)                                            | CUE determines whether the IC displays the ASCII or the Cursor memory. (1 = Cursor, 0 = ASCII.)                                                                 |
| Cursor Select ( $\overline{CU}$ , Pin 10)                             | $\overline{CU}$ determines whether data is stored in the ASCII RAM or the Attribute RAM/Control Register. (1 = ASCII, 0 = Attribute RAM/ Control Register.)     |
| Write ( $\overline{WR}$ , Pin 9)                                      | $\overline{WR}$ must be a logic 0 to store data in the display.                                                                                                 |
| Address Inputs ( $A_1$ and $A_0$ , Pins 7 and 8)                      | $A_0$ - $A_1$ selects a specific location in the display memory. Address 00 accesses the far right display location. Address 11 accesses the far left location. |
| Data Inputs ( $D_0$ - $D_6$ , Pins 16 – 22)                           | $D_0$ - $D_6$ are used to specify the input data for the display.                                                                                               |
| $V_{DD}$ (Pin 6)                                                      | $V_{DD}$ is the positive power supply input.                                                                                                                    |
| GND (Pin 12)                                                          | GND is the display ground.                                                                                                                                      |
| Blanking Input ( $\overline{BL}$ , Pin 14)                            | $\overline{BL}$ is used to flash the display, blank the display or to dim the display.                                                                          |

## Display Internal Block Diagram

Figure 1 shows the HDLX-3416 display internal block diagram. The CMOS IC consists of a 4 x 7 Character RAM, a 2 x 4 Attribute RAM, a 5 bit Control Register, a 128 character ASCII decoder and the refresh circuitry necessary to synchronize the decoding and driving of four 5 x 7 dot matrix displays.

Four 7 bit ASCII words are stored in the Character RAM. The IC reads the ASCII data and decodes it via the 128 character ASCII decoder. The ASCII decoder includes the 64 character set of the HPDL-2416, 32 lower case ASCII symbols, and 32 foreign language symbols.

A 5 bit word is stored in the Control Register. Three fields within the Control Register provide an 8 level brightness control, master blank, and extended functions disable.

For each display digit location, two bits are stored in the Attribute RAM. One bit is used to enable a cursor character at each digit location. A second bit is used to individually disable the blanking features at each digit location.

The display is blanked and dimmed through an internal blanking input on the row drivers. Logic within the IC allows the user to dim the display either through the  $\overline{BL}$  input or through the brightness control in the control register. Similarly the display can be blanked through the  $\overline{BL}$  input, the Master Blank in the Control Register, or the Digit Blank Disable in the Attribute RAM.

Figure 1. Internal block diagram.

## Display Clear

Data stored in the Character RAM, Control Register, and Attribute RAM will be cleared if the clear ( $\overline{\text{CLR}}$ ) is held low for a minimum of 10  $\mu\text{s}$ . Note that the display will be cleared regardless of the state of the chip enables ( $\overline{\text{CE}}_1$ ,  $\overline{\text{CE}}_2$ ). After the display is cleared, the ASCII code for a space (20hex) is loaded into all character RAM locations and 00hex is loaded into all Attribute RAM/Control Register memory locations.

## Data Entry

Figure 2 shows a truth table for the HDLX-3416 display. Setting the chip enables ( $\overline{\text{CE}}_1$ ,  $\overline{\text{CE}}_2$ ) to logic 0 and the cursor select ( $\overline{\text{CU}}$ ) to logic 1 will enable ASCII data loading. When cursor select ( $\overline{\text{CU}}$ ) is set to logic 0, data will be loaded into the Control Register and Attribute RAM. Address inputs  $A_0$ - $A_1$  are used to select the digit location in the display. Data inputs  $D_0$ - $D_6$  are used to load information into the display. Data will be latched into the display on the rising edge of the  $\overline{\text{WR}}$  signal.  $D_0$ - $D_6$ ,  $A_0$ - $A_1$ ,  $\overline{\text{CE}}_1$ ,  $\overline{\text{CE}}_2$ , and  $\overline{\text{CU}}$  must be held stable during the write cycle to ensure that correct data is stored into the display. Data can be loaded into the display in any order. Note that when  $A_0$  and  $A_1$  are logic 0, data is stored in the right most display location.

## Cursor

When cursor enable (CUE) is a logic 1, a cursor will be displayed in all digit locations where a logic 1 has been stored in the Digit Cursor memory in the Attribute RAM. The cursor consists of all 35 dots ON at half brightness. A flashing cursor can be displayed by pulsing CUE. When CUE is a logic 0, the ASCII data stored in the Character RAM will be displayed regardless of the Digit Cursor bits.

## Blanking

Blanking of the display is controlled through the  $\overline{\text{BL}}$  input, the Control Register, and Attribute RAM. The user can achieve a variety of functions by using these controls in different combinations, such as full hardware display blank, software blank, blanking of individual characters, and synchronized flashing of individual characters or entire display (by strobing the blank input). All of these blanking modes affect only the output drivers, maintaining the contents and write capability of the internal RAMs and Control Register, so that normal loading of RAMs and Control Register can take place even with the display blanked.

0 = Logic 0; 1 = Logic 1; X = Do Not Care

Figure 2. Display truth table.

Figure 3 shows how the Extended Function Disable (bit D<sub>6</sub> of the Control Register), Master Blank (bit D<sub>2</sub> of the Control Register), Digit Blank Disable (bit D<sub>1</sub> of the Attribute RAM), and BL input can be used to blank the display.

When the Extended Function Disable is a logic 1, the display can be blanked only with the  $\overline{\text{BL}}$  input. When the Extended Function Disable is a logic 0, the display can be blanked through the  $\overline{\text{BL}}$  input, the Master Blank, and the Digit Blank Disable. The entire display will be blanked if either the BL input is logic 0 or the Master Blank is logic 1, providing all Digit Blank Disable bits are logic 0. Those digits with Digit Blank Disable bits a logic 1 will ignore both blank signals and remain ON. The Digit Blank Disable bits allow individual characters to be blanked or flashed in synchronization with the  $\overline{\text{BL}}$  input.

## Dimming

Dimming of the display is controlled through either the  $\overline{\text{BL}}$  input or the Control Register. A pulse width modulated signal can be applied to the  $\overline{\text{BL}}$  input to dim the display. A three bit word in the Control Register generates an internal pulse width modulated signal to dim the display. The internal dimming feature is enabled only if the Extended Function Disable is a logic 0.

Bits 3–5 in the Control Register provide internal brightness control. These bits are interpreted as a three bit binary code, with code (000) corresponding to the maximum brightness and code (111) to the minimum brightness. In addition to varying the display brightness, bits 3–5 also vary the average value of I<sub>DD</sub>. I<sub>DD</sub> can be specified at any brightness level as shown in Table 1.

| EFD | MB | DBDn | $\overline{\text{BL}}$ |                                                                                             |

**Figure 4. Intensity modulation control using an astable multivibrator**  
(reprinted with permission from Electronics magazine, Sept. 19, 1974, V  
NU Business pub. Inc.).

Figure 4 shows a circuit designed to dim the display from 98% to 2% by pulse width modulating the  $\overline{BL}$  input. A logarithmic or a linear potentiometer may be used to adjust the display intensity. However, a logarithmic potentiometer matches the response of the human eye and therefore provides better resolution at low intensities. The circuit frequency should be designed to operate at 10 kHz or higher. Lower frequencies may cause the display to flicker.

### Extended Function Disable

Extended Function Disable (bit  $D_6$  of the Control Register) disables the extended blanking and dimming functions in the HDLX-3416. If the Extended Function Disable is a logic 1, the internal brightness control, Master Blank, and Digit Blank Disable bits are ignored. However, the  $\overline{BL}$  input and Cursor control are still active.

### Mechanical and Electrical Considerations

The HDLX-3416 is a 22 pin DIP package that can be stacked horizontally and vertically to create arrays of any size. The display is designed to operate continuously from  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  for all possible input conditions.

The HDLX-3416 is assembled by die attaching and wire bonding 140 LEDs and a CMOS IC to a high temperature printed circuit board. A polycarbonate lens is placed over the PC board creating an air gap environment for the LED wire bonds. Backfill epoxy environmentally seals the display package. This package construction makes the display highly tolerant to temperature cycling and allows wave soldering.

The inputs to the CMOS IC are protected against static discharge and input current latchup. However, for best results standard CMOS handling precautions should be used. Prior to use, the HDLX-3416 should be stored in anti-static tubes or conductive material. During assembly a grounded conductive work area should be used, and assembly personnel should wear conductive wrist straps. Lab coats made of synthetic material should be avoided since they are prone to static charge build-up.

Input current latchup is caused when the CMOS inputs are subjected either to a voltage below ground ( $V_{in} < \text{ground}$ ) or to a voltage higher than  $V_{DD}$  ( $V_{in} > V_{DD}$ ) and when a high current is forced into the input. To prevent input current latchup and ESD damage, unused inputs should be connected either to ground or to  $V_{DD}$ . Voltages should not be applied to the inputs until  $V_{DD}$  has been applied to the display. Transient input voltages should be eliminated.

### Soldering and Post Solder Cleaning Instructions for the HDLX-3416

The HDLX-3416 may be hand soldered or wave soldered with SN63 solder. When hand soldering it is recommended that an electronically temperature controlled and securely grounded soldering iron be used. For best results, the iron tip temperature should be set at  $315^{\circ}\text{C}$  ( $600^{\circ}\text{F}$ ). For wave soldering, a rosin-based RMA flux can be used. The solder wave temperature should be set at  $245^{\circ}\text{C} \pm 5^{\circ}\text{C}$  ( $473^{\circ}\text{F} \pm 9^{\circ}\text{F}$ ), and dwell in the wave should be set between 1½ to 3 seconds for optimum soldering. The preheat temperature should not exceed  $110^{\circ}\text{C}$  ( $230^{\circ}\text{F}$ ) as measured on the solder side of the PC board.

For further information on soldering and post solder cleaning, see Application Note 1027, Soldering LED Components.

### Contrast Enhancement

The objective of contrast enhancement is to provide good readability in the end user's ambient lighting conditions. The concept is to employ both luminance and chrominance contrast techniques. These enhance readability by having the OFF-dots blend into the display background and the ON-dots vividly stand out against the same background. For additional information on contrast enhancement, see Application Note 1015.

### Intensity Bin Limits

| Bin | Intensity Range (mcd) |       |
|-----|-----------------------|-------|
|     | Min.                  | Max.  |
| A   | 1.20                  | 1.77  |
| B   | 1.45                  | 2.47  |
| C   | 2.02                  | 3.46  |
| D   | 2.83                  | 4.85  |
| E   | 3.97                  | 6.79  |
| F   | 5.55                  | 9.50  |
| G   | 7.78                  | 13.30 |

Note:

Test conditions as specified in Optical Characteristic table.

### Color Bin Limits

| Color  | Bin | Color Range (nm) |       |
|--------|-----|------------------|-------|
|        |     | Min.             | Max.  |
| Green  | 1   | 576.0            | 580.0 |
|        | 2   | 573.0            | 577.0 |
|        | 3   | 570.0            | 574.0 |
|        | 4   | 567.0            | 571.5 |
| Yellow | 3   | 581.5            | 585.0 |
|        | 4   | 584.0            | 587.5 |
|        | 5   | 586.5            | 590.0 |
|        | 6   | 589.0            | 592.5 |

Note:

Test conditions as specified in Optical Characteristic table.

TECHNOLOGIES

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,  
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
