Functional Description

The CY62147EV30 is a high performance CMOS static RAM (SRAM) organized as 256K words by 16 bits. This device features advanced circuit design to provide ultra low active current. It is ideal for providing More Battery Life™ (MoBL®) in

portable applications such as cellular telephones. The device also has an automatic power down feature that significantly reduces power consumption when addresses are not toggling. Placing the device into standby mode reduces power consumption by more than 99 percent when deselected (\overline{CE} HIGH or both \overline{BLE} and \overline{BHE} are HIGH). The input and output pins (I/O_0 through I/O_{15}) are placed in a high impedance state when:

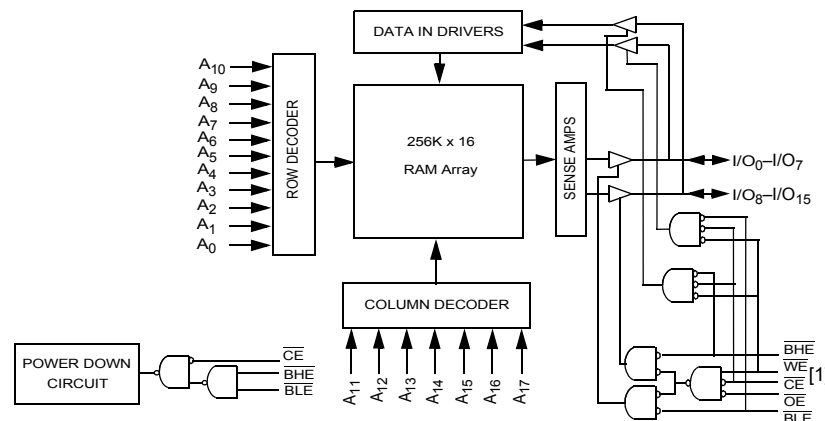

- Deselected (\overline{CE} HIGH)
- Outputs are disabled (\overline{OE} HIGH)
- Both Byte High Enable and Byte Low Enable are disabled (\overline{BHE} , \overline{BLE} HIGH)
- Write operation is active (\overline{CE} LOW and \overline{WE} LOW)

To write to the device, take Chip Enable (\overline{CE}) and Write Enable (\overline{WE}) inputs LOW. If Byte Low Enable (\overline{BLE}) is LOW, then data from I/O pins (I/O_0 through I/O_7) is written into the location specified on the address pins (A_0 through A_{17}). If Byte High Enable (\overline{BHE}) is LOW, then data from I/O pins (I/O_8 through I/O_{15}) is written into the location specified on the address pins (A_0 through A_{17}).

To read from the device, take Chip Enable (\overline{CE}) and Output Enable (\overline{OE}) LOW while forcing the Write Enable (\overline{WE}) HIGH. If Byte Low enable (\overline{BLE}) is LOW, then data from the memory location specified by the address pins appear on I/O_0 to I/O_7 . If Byte High enable (\overline{BHE}) is LOW, then data from memory appears on I/O_8 to I/O_{15} . See the Truth Table on page 11 for a complete description of read and write modes.

Note

1. BGA packaged device is offered in single CE and dual CE options. In this data sheet, for a dual CE device, \overline{CE} refers to the internal logical combination of \overline{CE}_1 and \overline{CE}_2 such that when \overline{CE}_1 is LOW and \overline{CE}_2 is HIGH, \overline{CE} is LOW. For all other cases \overline{CE} is HIGH.

Notes

- V_{IL(min)} = -2.0 V for pulse durations less than 20 ns.
- V_{IH(max)} = V_{CC} + 0.75 V for pulse durations less than 20 ns.
- Full device AC operation assumes a minimum of 100 μs ramp time from 0 to V_{CC(min)} and 200 μs wait time after V_{CC} stabilization.
- Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V_{CC} = V_{CC(typ)}, T_A = 25 °C.
- Chip enable (CE) and byte enables (BHE and BLE) need to be tied to CMOS levels to meet the I_{SB1} / I_{SB2} / I_{CCDR} spec. Other inputs can be left floating.

Notes

- Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at $V_{CC} = V_{CC(typ)}$, $T_A = 25\text{ }^\circ\text{C}$.
- Chip enable (\overline{CE}) and byte enables (\overline{BHE} and \overline{BLE}) need to be tied to CMOS levels to meet the I_{SB1} / I_{SB2} / I_{CCDR} spec. Other inputs can be left floating.
- Tested initially and after any design or process changes that may affect these parameters.
- Full device operation requires linear V_{CC} ramp from V_{DR} to $V_{CC(min)} \geq 100\text{ }\mu\text{s}$ or stable at $V_{CC(min)} \geq 100\text{ }\mu\text{s}$.
- BGA packaged device is offered in single CE and dual CE options. In this data sheet, for a dual CE device, \overline{CE} refers to the internal logical combination of \overline{CE}_1 and \overline{CE}_2 such that when \overline{CE}_1 is LOW and \overline{CE}_2 is HIGH, CE is LOW. For all other cases CE is HIGH.
- $\overline{BHE.BLE}$ is the AND of both \overline{BHE} and \overline{BLE} . Deselect the chip by either disabling the chip enable signals or by disabling both \overline{BHE} and \overline{BLE} .

Notes

17. Test conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns (1V/ns) or less, timing reference levels of $V_{CC(typ)}/2$, input pulse levels of 0 to $V_{CC(typ)}$, and output loading of the specified I_{OL}/I_{OH} as shown in the [Figure 4 on page 5](#).
18. In an earlier revision of this device, under a specific application condition, READ and WRITE operations were limited to switching of the byte enable and/or chip enable signals as described in the Application Notes [AN13842](#) and [AN66311](#). However, the issue has been fixed and in production now, and hence, these Application Notes are no longer applicable. They are available for download on our website as they contain information on the date code of the parts, beyond which the fix has been in production.
19. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZBE} is less than t_{LZBE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.
20. t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
21. If both byte enables are toggled together, this value is 10 ns.
22. The internal write time of the memory is defined by the overlap of \overline{WE} , $\overline{CE} = V_{IL}$, \overline{BHE} , \overline{BLE} , or both = V_{IL} . All signals must be active to initiate a write and any of these signals can terminate a write by going inactive. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.
23. The minimum write cycle pulse width for Write Cycle No. 3 (\overline{WE} Controlled, \overline{OE} LOW) should be equal to the sum of t_{SD} and t_{HZWE} .

Notes

24. The device is continuously selected. $\overline{\text{OE}}$, $\overline{\text{CE}} = V_{\text{IL}}$, $\overline{\text{BHE}}$, $\overline{\text{BLE}}$, or both = V_{IL} .

25. $\overline{\text{WE}}$ is HIGH for read cycle.

26. BGA packaged device is offered in single CE and dual CE options. In this data sheet, for a dual CE device, $\overline{\text{CE}}$ refers to the internal logical combination of $\overline{\text{CE}}_1$ and $\overline{\text{CE}}_2$ such that when $\overline{\text{CE}}_1$ is LOW and $\overline{\text{CE}}_2$ is HIGH, $\overline{\text{CE}}$ is LOW. For all other cases $\overline{\text{CE}}$ is HIGH.

27. Address valid before or similar to CE and BHE, BLE transition LOW.

The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.
- 30. Data I/O is high impedance if OE = V_{IH} .
- 31. If CE goes HIGH simultaneously with WE = V_{IH} , the output remains in a high impedance state.
- 32. During this period, the I/Os are in output state. Do not apply input signals.

34. If \overline{CE} goes HIGH simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high impedance state.
