

## General Description

The MAX3736 evaluation kit (EV kit) is an assembled demonstration board that provides complete optical evaluation of the MAX3736 3.3V multirate laser driver.

The EV kit is composed of an optical test circuit. The output of the optical evaluation section is configured for attachment to a laser/monitor diode that is configured in the standard four-lead laser connection on BOSA packages.

## Features

- Single +3.3V Power-Supply Operation
- AC-Coupling Provided On-Board
- Allows Optical Evaluation
- Proven PCB Layout
- Fully Assembled and Tested

Ordering Information appears at end of data sheet.

## Optical Evaluation Component List

| DESIGNATION            | QTY | DESCRIPTION                                     |
|------------------------|-----|-------------------------------------------------|
| C1, C11, C15, C16, C20 | 5   | 0.1 $\mu$ F $\pm$ 10% ceramic capacitors (0402) |
| C2–C4                  | 0   | Not installed, ceramic capacitors (0402)        |
| C5, C6                 | 2   | 220pF $\pm$ 10% ceramic capacitors (0402)*      |
| C7                     | 1   | 1 $\mu$ F $\pm$ 10% ceramic capacitor (0805)    |
| C17, C23               | 2   | 0.01 $\mu$ F $\pm$ 5% ceramic capacitors (0402) |
| D1                     | 0   | Not installed, user-supplied laser              |
| J1, J2                 | 2   | SMA connectors, tab contact                     |
| J8, J10, TP1–TP10      | 12  | Test points                                     |

\*EP = Exposed pad.

\*These components are part of the compensation network, which can reduce overshoot and ringing. Ringing due to parasitic series inductance of the laser can be eliminated with R22/R3 and C6/C5. Starting values for most coaxial lasers is R3 = 75 $\Omega$  in series with C5 = 220pF and R22 = 24 $\Omega$  in series with C6 = 220pF. These values should be experimentally adjusted until the optical eye diagram is optimized.

## Component Supplier

| SUPPLIER                               | PHONE        | WEBSITE                     |

**Note:** Indicate that you are using the MAX3736 when contacting this component supplier.

## QuickStart

### Procedure

For optical evaluation of the device, configure the EV kit as follows:

- 1) To enable the outputs, connect DIS to GND by placing a shunt across jumper JU13.
- 2) The EV kit is designed to allow connection to a typical BOSA-packaged laser. Connect the laser with monitor diode (Figure 1) as follows:

Keeping its leads as short as possible, connect the laser diode to the appropriate pads in the cut-out portion on the top (component) side of the PCB.

**Note:** When performing the following resistance checks, manually set the ohmmeter to a high range to avoid forward biasing the on-chip ESD protection diodes.

- 3) Adjust R17, the R<sub>MODSET</sub> potentiometer, for maximum resistance ( $\approx 20\text{k}\Omega$ ) between TP7 and ground. This sets the modulation current to a low value ( $< 10\text{mA}$ ). Refer to the *Design Procedure* section in the MAX3736 IC data sheet.
- 4) Apply a differential input signal ( $200\text{mV}_{\text{P-P}}$  to  $2400\text{mV}_{\text{P-P}}$ ) between SMA connectors J1 and J2 (IN+ and IN-).
- 5) Attach the laser diode fiber connector to an optical-to-electrical converter.

- 6) Connect a 3.3V supply between J8 (V<sub>CC</sub>) and J10 (GND). Set the current limit to 200mA and power on the device.
- 7) Adjust R15 (R<sub>BIASSET</sub>) until the desired average optical power is achieved.
- 8) The BIAS current can be monitored at TP8 (V<sub>BC\_MON</sub>) using the following equation:

$$I_{\text{BIAS}} = \frac{V_{\text{BC\_MON}}}{1000\Omega} \times 85$$

**Note:** If the voltage at TP8 exceeds 1.39V, the BC\_MON pin goes out of regulation.

- 9) Adjust R17 (R<sub>MODSET</sub>) until the desired optical amplitude is achieved. Optical amplitude can be observed on an oscilloscope connected to an optical-to-electrical converter. Laser overshoot and ringing can be improved by appropriate selection of R3, R21–R23, C5, and C6, as described in the *Design Procedure* section in the MAX3736 IC data sheet.

**Note:** External DACs can be used to control the bias and modulation current. To do this, remove shunts from jumpers JU1 and JU2 to disconnect potentiometers R15 (R<sub>BIASSET</sub>) and R17 (R<sub>MODSET</sub>). Connect the DAC outputs to TP6 (BIASSET) and TP7 (MODSET).

**Table 1. Adjustment and Control Descriptions (see the Quick Start section first)**

| DESIGNATION | NAME                 | DESCRIPTION                                                                                                                                                                                          |
|-------------|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JU13        | DIS                  | Enables/disables the output currents. Active low (shunt across JU13 to enable output currents).                                                                                                      |
| R15         | R <sub>BIASSET</sub> | Adjusts the bias current.                                                                                                                                                                            |
| R17         | R <sub>MODSET</sub>  | Adjusts the laser modulation current.                                                                                                                                                                |
| TP8         | BC_MON               | TP8 offers a connection to probe the BC_MON current through a 1kΩ resistor to ground. This allows the bias current to be determined as $I_{\text{BIAS}} = V_{\text{BC\_MON}}/1000\Omega \times 85$ . |
| TP9         | BIAS                 | TP9 allows the voltage at the BIAS pin to be monitored.                                                                                                                                              |
| TP10        | MD                   | TP10 offers a connection to probe the monitor diode current through a 1kΩ resistor to ground. The current can be determined as $I_{\text{MD}} = V_{\text{MD}}/1000\Omega$ .                          |

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,  
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
