Single, Dual, Quad Low Voltage, Rail-to-Rail Operational Amplifiers

The LMV821, LMV822, and LMV824 are operational amplifiers with low input voltage offset and drift vs. temperature. In spite of low quiescent current requirements these devices have 5 MHz bandwidth and 1.4 V/ μ s slew rate. In addition they provide rail-to-rail output swing into 600 Ω loads. The input common-mode voltage range includes ground, and the maximum input offset voltage is only 3.5 mV. Substantially large capacitive loads can be driven by simply adding a pullup resistor or isolation resistor.

The LMV821 (single) is available in a space-saving SC70-5 while the dual and quad also come in ultra small SOIC and TSSOP packages.

Features

- Low Offset Voltage: 3.5 mV
- Very low Offset Drift: 1.0 μ V/ $^{\circ}$ C
- High Bandwidth: 5 MHz
- Rail-to-Rail Output Swing into a 600 Ω load
- Capable of driving highly capacitive loads
- Small Packages:
 - LMV821 in SC-70
 - LMV822 in Micro8* and SOIC-8*
 - (*Contact Sales for Package Availability)
 - LMV824 in SOIC-14 and TSSOP-14
- These Devices are Pb-Free and are RoHS Compliant

Typical Applications

- Notebook Computers
- PDAs
- Modem Transmitter/ Receivers

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. Continuous short-circuit operation to ground at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C. Output currents in excess of 45 mA over long term may adversely affect reliability. Shorting output to either V+ or V- will adversely affect reliability.

APPLICATIONS INFORMATION

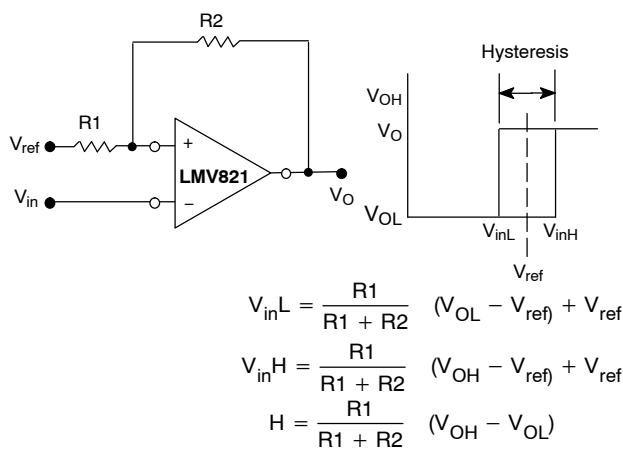

Figure 16. Comparator with Hysteresis

Given: f_0 = center frequency
 $A(f_0)$ = gain at center frequency

Choose value f_0, C

$$\text{Then : } R3 = \frac{Q}{\pi f_0 C}$$

$$R1 = \frac{R3}{2 A(f_0)}$$

$$R2 = \frac{R1 R3}{4Q^2 R1 - R3}$$

For less than 10% error from operational amplifier,
 $((Q_0 f_0)/BW) < 0.1$ where f_0 and BW are expressed in Hz.
 If source impedance varies, filter may be preceded with
 voltage follower buffer to stabilize filter parameters.
