Overview

LC75805PE is the 1/1 to 1/4 duty general-purpose LCD display driver with the LED driver to use for the instrument panel display by control with the controller. In addition, LC75805PE is able to drive up to 48 LED and LCD of up to 140 segments directly, and has a built-in 7ch PWM function for brightness adjustment of LED. Furthermore, because of built-in the oscillator circuit, it is possible to reduce external resistor and capacitor for oscillation.

Features

(1) When CL is stopped at the low level

(Note 1) The input of serial data is taken in at the rising edge of CL, and latched at the falling edge of CE. In addition, this IC has the function that counts the number of CL clock to receive the correct serial data. That is to say, because it isn't latched at the falling edge of CE when the number of the count of CL in each serial data is wrong, receiving wrong serial data can be prevented.

For example, if (L1A, L1B, L1C) = (1, 0, 0), (L11A, L11B, L11C) = (1, 1, 0) and (L21A, L21B, L21C) = (0, 1, 1) is set, LED driver output pin LD1 select PWM circuit (Ch1) and LED driver output pin LD11 select PWM circuit (Ch3) and LED driver output pin LD21 select PWM circuit (Ch6).

(7) PF0 to PF3 ... Control data for setting of the frame frequency of LED driver output waveform

These control data bits set the frame frequency of LED driver output waveform of LED output pin setting PWM circuit (Ch1 to Ch7).

PF0	PF1	PF2	PF3	Frame frequency of LED driver output waveform f_p [Hz]	
				Internal oscillator operating mode (Control data OC = "0", $f_{osc} = 300$ [kHz] typ)	External clock operating mode (Control data OC = "1", $f_{CK} = 300$ [kHz] typ)
0	0	0	0	$f_{osc}/1664$	$f_{CK}/1664$
1	0	0	0	$f_{osc}/1536$	$f_{CK}/1536$
0	1	0	0	$f_{osc}/1408$	$f_{CK}/1408$
1	1	0	0	$f_{osc}/1280$	$f_{CK}/1280$
0	0	1	0	$f_{osc}/1152$	$f_{CK}/1152$
1	0	1	0	$f_{osc}/1024$	$f_{CK}/1024$
0	1	1	0	$f_{osc}/896$	$f_{CK}/896$
1	1	1	0	$f_{osc}/768$	$f_{CK}/768$
0	0	0	1	$f_{osc}/640$	$f_{CK}/640$
1	0	0	1	$f_{osc}/512$	$f_{CK}/512$

Note) If (PF0, PF1, PF2, PF3) = (X, 1, 0, 1), (X, X, 1, 1) are set, the frame frequency ($f_{osc}/1408$, $f_{CK}/1408$) of setting (PF0, PF1, PF2, PF3) = (0, 1, 0, 0) is selected.

Display Control and the $\overline{\text{INH}}$ Pin

Since the LSI internal data (1/4 Duty Drive: LCD display data D1 to D140 + LED display data LT1 to LT48 + control data, 1/3 Duty Drive: LCD display data D1 to D108 + LED display data LT1 to LT48 + control data, 1/2 Duty Drive: LCD display data D1 to D74 + LED display data LT1 to LT48 + control data, Static Drive: LCD display data D1 to D38 + LED display data LT1 to LT48 + control data) is undefined when power is first applied, applications should set the $\overline{\text{INH}}$ pin low at the same time as power is applied to turn off the display of LCD and LED (LD1 to LD48 ••• High impedance, COM1 and COM2/S38 to COM4/S36 and S35 to S1 ••• VSS level). The serial data is transferred from the controller during this period, and then input $\overline{\text{INH}} = \text{“H”}$ after the serial data is transferred. This procedure prevents meaningless display at power on.
