

80960CF-40, -33, -25

32-Bit High-Performance Superscalar Embedded Microprocessor

Datasheet

Product Features

- Socket and Object Code Compatible with 80960CA
 - Two Instructions/Clock Sustained Execution
 - Four 71 Mbytes/s DMA Channels with Data Chaining
 - Demultiplexed 32-Bit Burst Bus with Pipelining
-
- 32-Bit Parallel Architecture
 - Two Instructions/clock Execution
 - Load/Store Architecture
 - Sixteen 32-Bit Global Registers
 - Sixteen 32-Bit Local Registers
 - Manipulates 64-Bit Bit Fields
 - 11 Addressing Modes
 - Full Parallel Fault Model
 - Supervisor Protection Model
 - Fast Procedure Call/Return Model
 - Full Procedure Call in 4 Clocks
 - On-Chip Register Cache
 - Caches Registers on Call/Ret
 - Minimum of 6 Frames Provided
 - Up to 15 Programmable Frames
 - On-Chip Instruction Cache
 - 4 Kbyte Two-Way Set Associative
 - 128-Bit Path to Instruction Sequencer
 - Cache-Lock Modes
 - Cache-Off Mode
 - High Bandwidth On-Chip Data RAM
 - 1 Kbyte On-Chip Data RAM
 - Sustains 128 bits per Clock Access
 - Selectable Big or Little Endian Byte Ordering
-
- Four On-Chip DMA Channels
 - 71 Mbytes/s Fly-by Transfers
 - 40 Mbytes/s Two-Cycle Transfers
 - Data Chaining
 - Data Packing/Unpacking
 - Programmable Priority Method
 - 32-Bit Demultiplexed Burst Bus
 - 128-Bit Internal Data Paths to *and* from Registers
 - Burst Bus for DRAM Interfacing
 - Address Pipelining Option
 - Fully Programmable Wait States
 - Supports 8-, 16- or 32-Bit Bus Widths
 - Supports Unaligned Accesses
 - Supervisor Protection Pin
 - High-Speed Interrupt Controller
 - Up to 248 External Interrupts
 - 32 Fully Programmable Priorities
 - Multi-mode 8-Bit Interrupt Port
 - Four Internal DMA Interrupts
 - Separate, Non-maskable Interrupt Pin
 - Context Switch in 625 ns Typical
 - On-Chip Data Cache
 - 1 Kbyte Direct-Mapped, Write Through
 - 128 bits per Clock Access on Cache Hit

1.0 Purpose

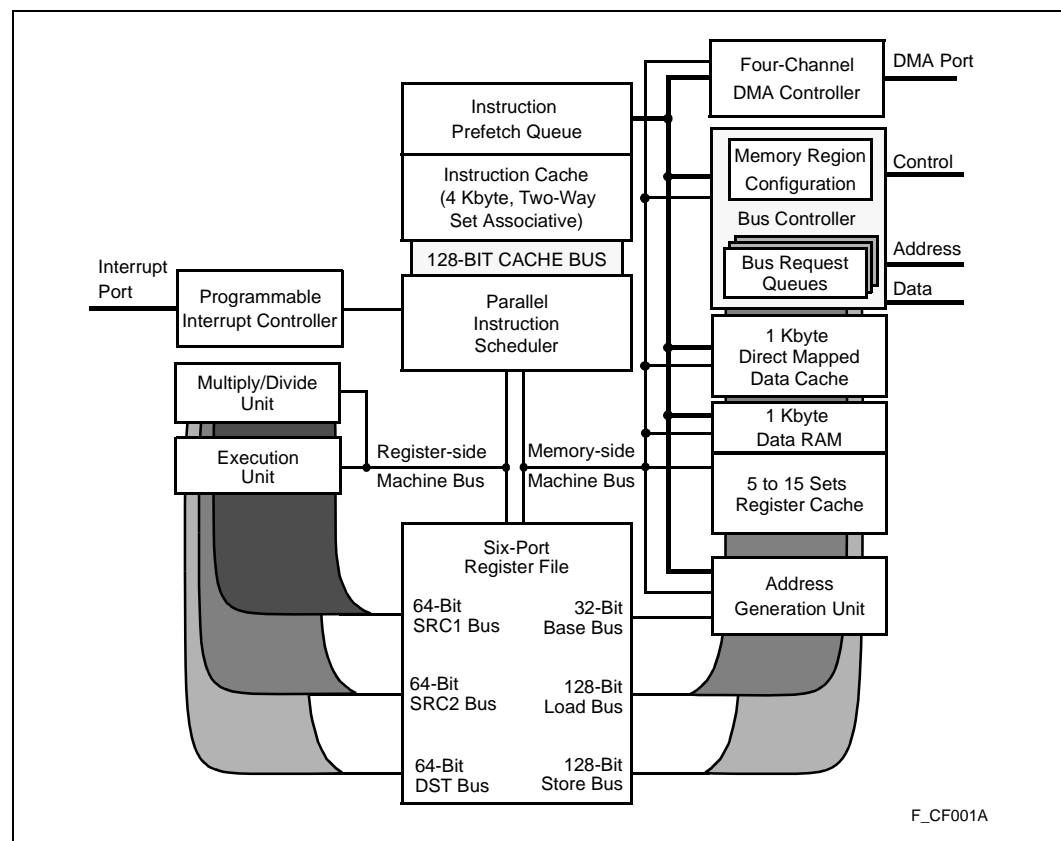

This document provides electrical characteristics of Intel's i960[®] CF embedded microprocessor. For functional descriptions consult the *i960[®] CA/CF Microprocessor User's Manual* (order number 270710). To obtain data sheet updates and errata, visit the Intel World Wide Web site at <http://www.intel.com> or contact your Intel field sales representative.

2.0 80960CF Processor Overview

Intel's 80960CF is the second processor in the series of superscalar i960 microprocessors that also includes the 80960CA and the 80960HA/HD/HT. Upgrading from the 80960CA to the 80960CF is straightforward because the two processors are socket- and object code-compatible.

As shown in Figure 1, the 80960CF's instruction cache is 4 Kbytes; data cache is 1 Kbyte (80960CA instruction cache is 1 Kbyte; it does not have a data cache.) This extra cache on the CF adds a significant performance boost over the CA.

Figure 1. 80960CF Processor-Block Diagram

The 80960CF, object code compatible with the 32-bit 80960 core Architecture, employs Special Function Register extensions to control on-chip peripherals and instruction set extensions to shift 64-bit operands and configure on-chip hardware. Multiple 128-bit internal buses, on-chip instruction caching and a sophisticated instruction scheduler allow the processor to sustain execution of two instructions per clock with peak execution of three instructions per clock.

A 32-bit demultiplexed and pipelined burst bus provides a 132 Mbyte/s bandwidth to a system's high-speed external memory subsystem. Also, the 80960CF's on-chip caching of instructions, procedure context and critical program data substantially decouples system performance from the wait states associated with accesses to the system's slower, cost sensitive, main memory subsystem.

The 80960CF bus controller integrates full wait state and bus width control for highest system performance with minimal system design complexity. Unaligned access and Big Endian byte order support reduces the cost of porting existing applications to the 80960CF.

The processor also integrates four complete data-chaining DMA channels and a high-speed interrupt controller on-chip. DMA channels perform single-cycle or two-cycle transfers, data packing and unpacking and data chaining. Block transfers — in addition to source or destination synchronized transfers — are supported.

The interrupt controller provides full programmability of 248 interrupt sources into 32 priority levels with a typical interrupt task switch (latency) time of 625 ns.

2.1 The 80960C-Series Core

The C-Series core is a very high performance microarchitectural implementation of the 80960 Core Architecture. This core may sustain execution of two instructions per clock (80 MIPS at 40 MHz). To achieve this level of performance, Intel has incorporated state-of-the-art silicon technology and innovative microarchitectural constructs into the C-Series core implementation. Factors that contribute to the core's performance include:

- Parallel instruction decoding allows issuance of up to three instructions per clock.
- Single-clock execution of most instructions
- Parallel instruction decode allows sustained, simultaneous execution of two single-clock instructions every clock cycle.
- Efficient instruction pipeline minimizes pipeline break losses.
- Register and resource scoreboarding allow simultaneous multi-clock instruction execution.
- Branch look-ahead and prediction allows many branches to execute with no pipeline break.
- Local Register Cache integrated on-chip caches Call/Return context.
- Two-way set associative, 4 Kbyte integrated instruction cache
- 1 Kbyte integrated Data RAM sustains a four-word (128-bit) access every clock cycle.
- Direct mapped, 1 Kbyte data cache, write through, write allocate

2.2 Pipelined, Burst Bus

A 32-bit high performance bus controller interfaces the 80960CF to external memory and peripherals. The Bus Control Unit features a maximum transfer rate of 160 Mbytes per second (at 40 MHz). Internally programmable wait states and 16 separately configurable memory regions allow the processor to interface with a variety of memory subsystems with a minimum of system complexity and a maximum of performance. The Bus Control Unit's main features include:

- Demultiplexed, burst bus to exploit most efficient DRAM access modes
- Address pipelining to reduce memory cost while maintaining performance
- 32-, 16- and 8-bit modes for I/O interfacing ease
- Full internal wait state generation to reduce system cost
- Little and Big Endian support to ease application development
- Unaligned access support for code portability
- Three-deep request queue to decouple the bus from the core

2.3 Instruction Set Summary

Table 1 summarizes the 80960CF instruction set by logical groupings. For a complete description of the instruction set, see the *i960® CA/CF Microprocessor User's Manual* (order number 270710).

2.4 Flexible DMA Controller

A four-channel DMA controller provides high speed DMA control for data transfers involving peripherals and memory. The DMA provides advanced features such as data chaining, byte assembly and disassembly and a high performance fly-by mode capable of transfer speeds of up to 71 Mbytes per second at 40 MHz. The DMA controller features a performance and flexibility which is only possible by integrating the DMA controller and the 80960CF core.

2.5 Priority Interrupt Controller

A programmable-priority interrupt controller manages up to 248 external sources through the 8-bit external interrupt port. The Interrupt Unit also handles the four internal sources from the DMA controller and a single non-maskable interrupt input. The 8-bit interrupt port may also be configured to provide individual interrupt sources that are level or edge triggered.

80960CF interrupts are prioritized and signaled within 225 ns of the request. When the interrupt is of higher priority than the processor priority, the context switch to the interrupt routine typically completes in another 400 ns. The interrupt unit provides the mechanism for the low latency and high throughput interrupt service which is essential for embedded applications.

Table 1 presents the 80960CF Instruction Set.

Table 1. 80960CF Instruction Set

3.0 Package Information

3.1 Package Introduction

This section describes the pins, pinouts and thermal characteristics for the 80960CF in the 168-pin Ceramic Pin Grid Array (PGA) package; the 80960CF-33 and -25 devices are also available in the 196-pin Plastic Quad Flat Package (PQFP). For complete package specifications and information, see the *Intel Packaging Databook*, available in individual chapters, at <http://www.intel.com>.

3.2 Pin Descriptions

This section defines the 80960CF pins. Table 2 presents the legend for interpreting the pin descriptions in Tables 3 through 5. Table 3 presents the external bus signals. Table 4 presents processor control signals. Table 5 presents the DMA and Interrupt Unit control signals.

Note: All pins float while the processor is in the ONCE mode.

Table 2. Symbol Legend

Symbol	Description
I	Input only pin
O	Output only pin
I/O	Pin may be either an input or output
–	Pins “must be” connected as described
S(...)	Synchronous. Inputs must meet setup and hold times relative to PCLK2:1 for proper operation. Outputs are synchronous to PCLK2:1. S(E) Edge sensitive input S(L) Level sensitive input
A(...)	Asynchronous. Inputs may be asynchronous to PCLK2:1. A(E) Edge sensitive input A(L) Level sensitive input
H(...)	While the bus is in the Hold Acknowledge or Bus Backoff state, the pin: H(1) is driven to V_{CC} H(0) is driven to V_{SS} H(Z) floats H(Q) continues to be a valid input
R(...)	While the processor's $\overline{\text{RESET}}$ pin is low, the pin: R(1) is driven to V_{CC} R(0) is driven to V_{SS} R(Z) floats R(Q) continues to be a valid output

Table 3. 80960CF Pin Description—External Bus Signals (Sheet 1 of 2)

Name	Type	Description																																				
A31:2	O S H(Z) R(Z)	ADDRESS BUS carries the physical address' upper 30 bits. A31 is the most significant bit; A2 is least significant. During a bus access, A31:2 identify all external addresses to word (4-byte) boundaries. Byte enable signals indicate the selected byte in each word. During burst accesses, A3:2 increment to indicate successive data cycles.																																				
D31:0	I/O S(L) H(Z) R(Z)	DATA BUS carries 32-, 16- or 8-bit data quantities depending on bus width configuration. The least significant bit is carried on D0 and the most significant on D31. When the bus is configured for 8-bit data, the lower 8 data lines, D7:0 are used. For 16-bit data bus widths, D15:0 are used. For 32-bit bus widths the full data bus is used.																																				
$\overline{\text{BE}}3:0$	O S H(Z) R(1)	<p>BYTE ENABLES select which of the four bytes addressed by A31:2 are active during an access to a memory region configured for a 32-bit data-bus width. BE3 applies to D31:24; BE2 applies to D23:16; BE1 applies to D15:8 BE0 applies to D7:0.</p> <p>32-bit bus:</p> <table> <tr> <td>$\overline{\text{BE}}3$</td> <td>Byte Enable 3</td> <td>enable D31:24</td> </tr> <tr> <td>$\overline{\text{BE}}2$</td> <td>Byte Enable 2</td> <td>enable D23:16</td> </tr> <tr> <td>$\overline{\text{BE}}1$</td> <td>Byte Enable 1</td> <td>enable D15:8</td> </tr> <tr> <td>BE0</td> <td>Byte Enable 0</td> <td>enable D7:0</td> </tr> </table> <p>For accesses to a memory region configured for a 16-bit data-bus width, the processor uses the BE3, BE1 and BE0 pins as BHE, A1 and BLE respectively.</p> <p>16-bit bus:</p> <table> <tr> <td>$\overline{\text{BE}}3$</td> <td>Byte High Enable (BHE)</td> <td>enable D15:8</td> </tr> <tr> <td>$\overline{\text{BE}}2$</td> <td>Not used (driven high or low)</td> <td></td> </tr> <tr> <td>$\overline{\text{BE}}1$</td> <td>Address Bit 1 (A1)</td> <td></td> </tr> <tr> <td>BE0</td> <td>Byte Low Enable (BLE)</td> <td>enable D7:0</td> </tr> </table> <p>For accesses to a memory region configured for an 8-bit data-bus width, the processor uses the BE1 and BE0 pins as A1 and A0 respectively.</p> <p>8-bit bus:</p> <table> <tr> <td>$\overline{\text{BE}}3$</td> <td>Not used (driven high or low)</td> <td></td> </tr> <tr> <td>$\overline{\text{BE}}2$</td> <td>Not used (driven high or low)</td> <td></td> </tr> <tr> <td>$\overline{\text{BE}}1$</td> <td>Address Bit 1 (A1)</td> <td></td> </tr> <tr> <td>BE0</td> <td>Address Bit 0 (A0)</td> <td></td> </tr> </table>	$\overline{\text{BE}}3$	Byte Enable 3	enable D31:24	$\overline{\text{BE}}2$	Byte Enable 2	enable D23:16	$\overline{\text{BE}}1$	Byte Enable 1	enable D15:8	BE0	Byte Enable 0	enable D7:0	$\overline{\text{BE}}3$	Byte High Enable (BHE)	enable D15:8	$\overline{\text{BE}}2$	Not used (driven high or low)		$\overline{\text{BE}}1$	Address Bit 1 (A1)		BE0	Byte Low Enable (BLE)	enable D7:0	$\overline{\text{BE}}3$	Not used (driven high or low)		$\overline{\text{BE}}2$	Not used (driven high or low)		$\overline{\text{BE}}1$	Address Bit 1 (A1)		BE0	Address Bit 0 (A0)	
$\overline{\text{BE}}3$	Byte Enable 3	enable D31:24																																				
$\overline{\text{BE}}2$	Byte Enable 2	enable D23:16																																				
$\overline{\text{BE}}1$	Byte Enable 1	enable D15:8																																				
BE0	Byte Enable 0	enable D7:0																																				
$\overline{\text{BE}}3$	Byte High Enable (BHE)	enable D15:8																																				
$\overline{\text{BE}}2$	Not used (driven high or low)																																					
$\overline{\text{BE}}1$	Address Bit 1 (A1)																																					
BE0	Byte Low Enable (BLE)	enable D7:0																																				
$\overline{\text{BE}}3$	Not used (driven high or low)																																					
$\overline{\text{BE}}2$	Not used (driven high or low)																																					
$\overline{\text{BE}}1$	Address Bit 1 (A1)																																					
BE0	Address Bit 0 (A0)																																					
W/R	O S H(Z) R(0)	WRITE/READ is asserted for read requests and deasserted for write requests. The W/R signal changes in the same clock cycle as ADS. It remains valid for the entire access in non-pipelined regions. In pipelined regions, W/R is not ensured to be valid in the last cycle of a read access.																																				
$\overline{\text{ADS}}$	O S H(Z) R(1)	ADDRESS STROBE indicates a valid address and the start of a new bus access. $\overline{\text{ADS}}$ is asserted for the first clock of a bus access.																																				
$\overline{\text{READY}}$	I S(L) H(Z) R(Z)	READY is an input which signals the termination of a data transfer. $\overline{\text{READY}}$ is used to indicate that read data on the bus is valid or that a write-data transfer has completed. The READY signal works in conjunction with the internally programmed wait-state generator. When READY is enabled in a region, the pin is sampled after the programmed number of wait-states has expired. When the READY pin is deasserted, wait states continue to be inserted until READY becomes asserted. This is true for the N_{RAD} , N_{RDD} , N_{WAD} and N_{WDD} wait states. The N_{XDA} wait states cannot be extended.																																				
$\overline{\text{BTERM}}$	I S(L) H(Z) R(Z)	BURST TERMINATE is an input which breaks up a burst access and causes another address cycle to occur. The BTERM signal works in conjunction with the internally programmed wait-state generator. When READY and BTERM are enabled in a region, the BTERM pin is sampled after the programmed number of wait states has expired. When BTERM is asserted, a new ADS signal is generated and the access is completed. The READY input is ignored when BTERM is asserted. BTERM must be externally synchronized to satisfy BTERM setup and hold times.																																				
$\overline{\text{WAIT}}$	O S H(Z) R(1)	WAIT indicates internal wait state generator status. $\overline{\text{WAIT}}$ is asserted when wait states are being caused by the internal wait state generator and not by the READY or BTERM inputs. WAIT may be used to derive a write-data strobe. WAIT may also be thought of as a READY output that the processor provides when it is inserting wait states.																																				

Table 3. 80960CF Pin Description—External Bus Signals (Sheet 2 of 2)

Name	Type	Description
$\overline{\text{BLAST}}$	O S H(Z) R(0)	BURST LAST indicates the last transfer in a bus access. $\overline{\text{BLAST}}$ is asserted in the last data transfer of burst and non-burst accesses after the wait state counter reaches zero. $\overline{\text{BLAST}}$ remains asserted until the clock following the last cycle of the last data transfer of a bus access. When the $\overline{\text{READY}}$ or $\overline{\text{BTERM}}$ input is used to extend wait states, the $\overline{\text{BLAST}}$ signal remains asserted until $\overline{\text{READY}}$ or $\overline{\text{BTERM}}$ terminates the access.
$\overline{\text{DT/R}}$	O S H(Z) R(0)	DATA TRANSMIT/RECEIVE indicates direction for data transceivers. $\overline{\text{DT/R}}$ is used in conjunction with $\overline{\text{DEN}}$ to provide control for data transceivers attached to the external bus. When $\overline{\text{DT/R}}$ is asserted, the signal indicates that the processor receives data. Conversely, when deasserted, the processor sends data. $\overline{\text{DT/R}}$ changes only while $\overline{\text{DEN}}$ is high.
$\overline{\text{DEN}}$	O S H(Z) R(1)	DATA ENABLE indicates data cycles in a bus request. $\overline{\text{DEN}}$ is asserted at the start of the bus request first data cycle and is deasserted at the end of the last data cycle. $\overline{\text{DEN}}$ is used in conjunction with $\overline{\text{DT/R}}$ to provide control for data transceivers attached to the external bus. $\overline{\text{DEN}}$ remains asserted for sequential reads from pipelined memory regions. $\overline{\text{DEN}}$ is deasserted when $\overline{\text{DT/R}}$ changes.
$\overline{\text{LOCK}}$	O S H(Z) R(1)	BUS LOCK indicates that an atomic read-modify-write operation is in progress. $\overline{\text{LOCK}}$ may be used to prevent external agents from accessing memory which is currently involved in an atomic operation. $\overline{\text{LOCK}}$ is asserted in the first clock of an atomic operation and deasserted in the clock cycle following the last bus access for the atomic operation. To allow the most flexibility for memory system enforcement of locked accesses, the processor acknowledges a bus hold request when $\overline{\text{LOCK}}$ is asserted. The processor performs DMA transfers while $\overline{\text{LOCK}}$ is active.
HOLD	I S(L) H(Z) R(Z)	HOLD REQUEST signals that an external agent requests access to the external bus. The processor asserts $\overline{\text{HOLDA}}$ after completing the current bus request. $\overline{\text{HOLD}}$, $\overline{\text{HOLDA}}$ and $\overline{\text{BREQ}}$ are used together to arbitrate access to the processor's external bus by external bus agents.
$\overline{\text{BOFF}}$	I S(L) H(Z) R(Z)	BUS BACKOFF , when asserted, suspends the current access and causes the bus pins to float. When $\overline{\text{BOFF}}$ is deasserted, the $\overline{\text{ADS}}$ signal is asserted on the next clock cycle and the access is resumed.
HOLDA	O S H(1) R(Q)	HOLD ACKNOWLEDGE indicates to a bus requestor that the processor has relinquished control of the external bus. When $\overline{\text{HOLDA}}$ is asserted, the external address bus, data bus and bus control signals are floated. $\overline{\text{HOLD}}$, $\overline{\text{BOFF}}$, $\overline{\text{HOLDA}}$ and $\overline{\text{BREQ}}$ are used together to arbitrate access to the processor's external bus by external bus agents. Since the processor grants $\overline{\text{HOLD}}$ requests and enters the Hold Acknowledge state even while $\overline{\text{RESET}}$ is asserted, the state of the $\overline{\text{HOLDA}}$ pin is independent of the $\overline{\text{RESET}}$ pin.
BREQ	O S H(Q) R(0)	BUS REQUEST is asserted when the bus controller has a request pending. $\overline{\text{BREQ}}$ may be used by external bus arbitration logic in conjunction with $\overline{\text{HOLD}}$ and $\overline{\text{HOLDA}}$ to determine when to return mastership of the external bus to the processor.
$\overline{\text{D/C}}$	O S H(Z) R(Z)	DATA OR CODE is asserted for a data request and deasserted for instruction requests. $\overline{\text{D/C}}$ has the same timing as $\overline{\text{W/R}}$.
$\overline{\text{DMA}}$	O S H(Z) R(Z)	DMA ACCESS indicates whether the bus request was initiated by the DMA controller. $\overline{\text{DMA}}$ is asserted for any DMA request. $\overline{\text{DMA}}$ is deasserted for all other requests.
$\overline{\text{SUP}}$	O S H(Z) R(Z)	SUPERVISOR ACCESS indicates whether the bus request is issued while in supervisor mode. $\overline{\text{SUP}}$ is asserted when the request has supervisor privileges and is deasserted otherwise. $\overline{\text{SUP}}$ may be used to isolate supervisor code and data structures from non-supervisor requests.

Table 4. 80960CF Pin Description—Processor Control Signals (Sheet 1 of 2)

Name	Type	Description
$\overline{\text{RESET}}$	I A(L) H(Z) R(Z)	RESET causes the chip to <u>reset</u> . When $\overline{\text{RESET}}$ is asserted, all external signals return to the reset state. When $\overline{\text{RESET}}$ is deasserted, initialization begins. When the 2-x clock mode is selected, $\overline{\text{RESET}}$ must remain asserted for 32 CLKIN cycles before being deasserted to ensure correct processor initialization. When the 1-x clock mode is selected, $\overline{\text{RESET}}$ must remain asserted for 10,000 CLKIN cycles before being deasserted to ensure correct processor initialization. The CLKMODE pin selects 1-x or 2-x input clock division of the CLKIN pin. The Hold Acknowledge bus state <u>functions</u> while the chip is reset. When the bus is in the Hold Acknowledge state when $\overline{\text{RESET}}$ is asserted, the processor internally resets, but maintains the Hold Acknowledge state on external pins until the Hold request is removed. When a Hold request is made while the processor is in the reset state, the processor bus grants HOLDA and enters the Hold Acknowledge state.
$\overline{\text{FAIL}}$	O S H(Q) R(0)	FAIL indicates failure of the self-test performed at initialization. When $\overline{\text{RESET}}$ is deasserted and initialization begins, the $\overline{\text{FAIL}}$ pin is asserted. An internal self-test is performed as part of the initialization process. When this self-test passes, the $\overline{\text{FAIL}}$ pin is deasserted; otherwise it remains asserted. The $\overline{\text{FAIL}}$ pin is reasserted while the processor performs an external bus self-confidence test. When this self-test passes, the processor <u>deasserts</u> the $\overline{\text{FAIL}}$ pin and branches to the user's initialization <u>routine</u> ; otherwise the $\overline{\text{FAIL}}$ pin remains asserted. Internal self-test and the use of the $\overline{\text{FAIL}}$ pin may be disabled with the STEST pin.
STEST	I S(L) H(Z) R(Z)	SELF TEST enables or disables the internal self-test feature at initialization. STEST is read on the rising edge of $\overline{\text{RESET}}$. When asserted, internal self-test and external bus confidence tests are performed during processor initialization. When deasserted, only the bus confidence tests are performed during initialization.
$\overline{\text{ONCE}}$	I A(L) H(Z) R(Z)	ON CIRCUIT EMULATION , when asserted, causes all outputs to be floated. $\overline{\text{ONCE}}$ is continuously sampled while $\overline{\text{RESET}}$ is low and is latched on the rising edge of $\overline{\text{RESET}}$. To place the processor in the ONCE state: <ol style="list-style-type: none"> (1) Assert $\overline{\text{RESET}}$ and $\overline{\text{ONCE}}$ (order does not matter) (2) Wait for at least 16 CLKIN periods in 2-x mode—or 10,000 CLKIN periods in 1-x mode—after V_{CC} and CLKIN are within operating specifications (3) Deassert $\overline{\text{RESET}}$ (4) Wait at least 32 CLKIN periods (The processor may now be latched in the ONCE state while $\overline{\text{RESET}}$ is high.) To exit the ONCE state, bring V_{CC} and CLKIN to operating conditions, then assert $\overline{\text{RESET}}$ and bring $\overline{\text{ONCE}}$ high prior to deasserting $\overline{\text{RESET}}$. CLKIN must operate within the specified operating conditions until Step 4 completes. CLKIN may then be changed to DC to achieve the lowest possible ONCE mode leakage current. $\overline{\text{ONCE}}$ may be used by emulator products or board testers to effectively make an installed processor transparent in the board.
CLKIN	I A(E) H(Z) R(Z)	CLOCK INPUT is an input for the external clock needed to run the processor. The external clock is internally divided as prescribed by the CLKMODE pin to produce PCLK2:1.
CLKMODE	I A(L) H(Z) R(Z)	CLOCK MODE selects the division factor applied to the external clock input (CLKIN). When CLKMODE is high, CLKIN is divided by one to create PCLK2:1 and the processor's internal clock. When CLKMODE is low, CLKIN is divided by two to create PCLK2:1 and the processor's internal clock. CLKMODE should be tied high or low in a system as the clock mode is not latched by the processor. When left unconnected, the processor internally pulls the CLKMODE pin low, enabling the 2-x clock mode.

Table 4. 80960CF Pin Description—Processor Control Signals (Sheet 2 of 2)

Name	Type	Description
PCLK2:1	O S H(Q) R(Q)	PROCESSOR OUTPUT CLOCKS provide a timing reference for all inputs and outputs. All input and output timings are specified in relation to PCLK2 and PCLK1. PCLK2 and PCLK1 are identical signals. Two output pins are provided to allow flexibility in the system's allocation of capacitive loading on the clock. PCLK2:1 may also be connected at the processor to form a single clock signal.
V _{SS}	–	GROUND connections must be connected externally to a V _{SS} board plane.
V _{CC}	–	POWER connections must be connected externally to a V _{CC} board plane.
V _{CCPLL}	–	V _{CCPLL} is a separate V _{CC} supply pin for the phase lock loop used in 1-x clock mode. Connecting a simple lowpass filter to V _{CCPLL} may help reduce clock jitter (T _{CP}) in noisy environments. Otherwise, V _{CCPLL} should be connected to V _{CC} .
NC	–	NO CONNECT pins must not be connected in a system.

Table 5. 80960CF Pin Description—DMA and Interrupt Unit Control Signals

Name	Type	Description
$\overline{\text{DREQ}}3:0$	I A(L) H(Z) R(Z)	DMA REQUEST is used to request a DMA transfer. Each of the four signals requests a transfer on a single channel. $\overline{\text{DREQ}}0$ requests channel 0, $\overline{\text{DREQ}}1$ requests channel 1, etc. When two or more channels are requested simultaneously, the channel with the highest priority is serviced first. Channel priority mode is programmable.
$\overline{\text{DACK}}3:0$	O S H(1) R(1)	DMA ACKNOWLEDGE indicates that a DMA transfer is being executed. Each of the four signals acknowledges a transfer for a single channel. $\overline{\text{DACK}}0$ acknowledges channel 0, $\overline{\text{DACK}}1$ acknowledges channel 1, etc. $\overline{\text{DACK}}3:0$ are asserted when the requesting device of a DMA is accessed.
$\overline{\text{EOP}}/\overline{\text{TC}}3:0$	I/O A(L) H(Z/Q) R(Z)	END OF PROCESS/TERMINAL COUNT may be programmed as either an input ($\overline{\text{EOP}}3:0$) or output ($\overline{\text{TC}}3:0$), but <u>not both</u> . Each pin is individually programmable. When programmed as an input, $\overline{\text{EOP}}x$ causes termination of a current DMA transfer for the channel that corresponds to the $\overline{\text{EOP}}x$ pin. $\overline{\text{EOP}}0$ corresponds to channel 0, $\overline{\text{EOP}}1$ corresponds to channel 1, etc. When a channel is configured for source <i>and</i> destination chaining, the $\overline{\text{EOP}}$ pin for that channel causes termination of <u>only the</u> current buffer transferred and causes the next buffer to be transferred. $\overline{\text{EOP}}3:0$ are asynchronous inputs. When programmed as an output, the channel's $\overline{\text{TC}}x$ pin indicates that the channel byte count has reached 0 and a DMA has terminated. $\overline{\text{TC}}x$ is driven with the same timing as $\overline{\text{DACK}}x$ during the last DMA transfer for a buffer. When the last bus request is executed as multiple bus accesses, $\overline{\text{TC}}x$ stays asserted for the entire bus request.
$\overline{\text{XINT}}7:0$	I A(E/L) H(Z) R(Z)	EXTERNAL INTERRUPT PINS cause interrupts to be requested. These pins may be configured in three modes: Dedicated Mode: Each pin is a dedicated external interrupt source. Dedicated inputs may be individually programmed to be level (low) or edge (falling) activated. Expanded Mode: The eight pins act together as an 8-bit vectored interrupt source. The interrupt pins in this mode are level activated. Since the interrupt pins are active low, the vector number requested is the 1's complement of the positive logic value place on the port. This eliminates glue logic to interface to combinational priority encoders which output negative logic. Mixed Mode: $\overline{\text{XINT}}7:5$ are dedicated sources and $\overline{\text{XINT}}4:0$ act as the five most significant bits of an expanded mode vector. The least significant bits are set to 010 internally.
$\overline{\text{NMI}}$	I A(E) H(Z) R(Z)	NON-MASKABLE INTERRUPT causes a non-maskable interrupt event to occur. $\overline{\text{NMI}}$ is the highest priority interrupt recognized. $\overline{\text{NMI}}$ is an edge (falling) activated source.

3.3 80960CF Mechanical Data

3.3.1 80960CF PGA Pinout

Figure 2 shows the complete 80960CF PGA pinout as viewed from the top side of the component (i.e., pins facing down). Figure 3 shows the complete 80960CF PGA pinout as viewed from the pin-side of the package (i.e., pins facing up).

Table 6 presents the 80960CF pin names and package location in signal order. Table 7 presents the pin names and package location in pin order. See Section 4.0, “Electrical Specifications” on page 26 for specifications and recommended connections.

Figure 4. 80960CF PQFP Pinout—Top View (80960CF-33 and -25 Only)

3.4 Package Thermal Specifications

The 80960CF is specified for operation when case temperature (T_C) is within the range of 0 °C–100 °C for 33 and 25 MHz, and 0 °C–85 °C for 40 MHz. T_C may be measured in any environment to determine whether the 80960CF is within specified operating range. Case temperature should be measured at the center of the top surface, opposite the pins. Refer to [Figure 5](#) for more information.

Ambient temperature (T_A) is calculated from thermal resistance from case to ambient (θ_{CA}) using [Equation 1](#):

Equation 1. Calculation of Ambient Temperature (T_A)

$$T_A = T_C - (P \cdot \theta_{CA})$$

[Table 10](#) shows the maximum T_A allowable (without exceeding T_C) at various airflows and operating frequencies (f_{PCLK}).

Note that T_A is greatly improved by attaching fins or a heatsink to the package. Maximum power consumption (P) is calculated by using the typical I_{CC} as tabulated in [Section 4.4, “D.C. Specifications”](#) on [page 27](#) and V_{CC} of 5 V.

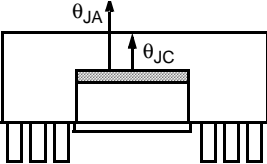

Figure 5. Measuring 80960CF PGA and PQFP Case Temperature

Table 10. Maximum T_A at Various Airflows in $^{\circ}\text{C}$ (PGA Package Only)

		Airflow-ft/min (m/sec)					
		f_{PCLK} (MHz)	0 (0)	200 (1.01)	400 (2.03)	600 (3.04)	800 (4.06)
T_A with Heatsink (†)	40	20	40	58	60	66	68
	33	38	57	74	76	81	84
	25	50	65	79	81	85	87
	16	63	74	84	86	89	90
T_A without Heatsink (†)	40	0	15	30	40	50	52
	33	18	33	47	57	66	67
	25	34	46	57	65	72	74
	16	51	60	68	74	80	81

† 0.285" high unidirectional heatsink (Al alloy 6061, 50 mil fin width, 150 mil center-to-center fin spacing).

Table 11. 80960CF PGA Package Thermal Characteristics

Thermal Resistance — °C/Watt						
Parameter	Airflow — ft./min (m/sec)					
	0 (0)	200 (1.01)	400 (2.03)	600 (3.07)	800 (4.06)	1000 (5.07)
θ Junction-to-Case (Case measured as shown in Figure 5.)	1.5	1.5	1.5	1.5	1.5	1.5
θ Case-to-Ambient (No Heatsink)	17	14	11	9	7.1	6.6
θ Case-to-Ambient (With Heatsink) (See Note 3.)	13	9	5.5	5	3.9	3.4

NOTES:

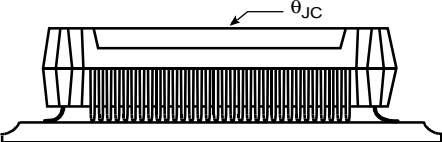

1. This table applies to 80960CF PGA plugged into socket or soldered directly to board.
2. $\theta_{JA} = \theta_{JC} + \theta_{CA}$
3. 0.285" high unidirectional heatsink (Al alloy 6061, 50 mil fin width, 150 mil center-to-center fin spacing).

Table 12. 80960CF PQFP Package Thermal Characteristics

Thermal Resistance — °C/Watt							
Parameter	Airflow — ft./min (m/sec)						
	0 (0)	50 (0.25)	100 (0.50)	200 (1.01)	400 (2.03)	600 (3.04)	800 (4.06)
θ Junction-to-Case (Case Measured as shown in Figure 5.)	5	5	5	5	5	5	5
θ Case-to-Ambient (No Heatsink)	19	18	17	15	12	10	9

NOTES:

1. This table applies to 80960CF PQFP soldered directly to board.
2. $\theta_{JA} = \theta_{JC} + \theta_{CA}$

3.5 Stepping Register Information

Upon reset, register g0 contains die stepping information (see Figure 6). The most significant byte contains ASCII 0; the upper middle byte contains an ASCII C; the lower middle byte contains an ASCII F. The least significant byte contains the stepping number in ASCII, and g0 retains this information until it is overwritten by the user program. Table 13 contains a cross reference of the number in the least significant byte of register g0 to the die stepping number.

Figure 6. Register g0

ASCII	00	43	46	Stepping Number
DECIMAL	0	C	F	Stepping Number
	MSB		LSB	

Table 13. Die Stepping Cross Reference

g0 Least Significant Byte	Die Stepping
01	A
02	B
03	C
04	D
05	E

3.6 Sources for Accessories

The following is a list of suggested sources for 80960CF accessories. This is neither an endorsement nor a warranty of the performance of any of the listed products and/or companies.

Sockets

- 3M Textool Test and Interconnection Products
6801 River Place Blvd. Mail Stop 130-3N-29
Austin, TX 78726-9000
(800) 328-0411
- Augat, Inc. Interconnection Products Group
452 John Dietsch Blvd.
Attleboro Falls, MA 02763
(508) 699-7646
- Concept Mfg., Inc. (Decoupling Sockets)
400 Walnut St. Suite 609
Redwood City, CA 94063
(415) 365-1162 FAX: (415)265-1164

Heatsinks/Fins

- Thermalloy, Inc.
2021 West Valley View Lane
Dallas, TX 75234
(214) 243-4321
FAX: (214) 241-4656
- Wakefield Engineering
60 Audubon Road
Wakefield, MA 01880
(617) 245-5900

4.0 Electrical Specifications

4.1 Absolute Maximum Ratings

Table 14 presents the absolute maximum ratings for the 80960CF.

Table 14. Absolute Maximum Ratings

Parameter	Maximum Rating
Storage Temperature	-65 °C to +150 °C
Case Temperature Under Bias	-65 °C to +110 °C
Supply Voltage wrt. V_{SS}	-0.5 V to + 6.5 V
Voltage on Other Pins wrt. V_{SS}	-0.5 V to $V_{CC} + 0.5$ V

Note: The specifications are subject to change without notice. Verify with your local Intel sales office that you have the latest datasheet before finalizing a design.

Warning: Stressing the device beyond the “Absolute Maximum Ratings” may cause permanent damage. These are stress ratings only. Operation beyond the “Operating Conditions” is not recommended and extended exposure beyond the “Operating Conditions” may affect device reliability.

4.2 Operating Conditions

Table 15 presents the operating conditions for the 80960CF.

Table 15. Operating Conditions

Symbol	Parameter	Min	Max	Units	Notes
V_{CC}	Supply Voltage				
	80960CF-40	4.75	5.25	V	
	80960CF-33	4.50	5.50		
	80960CF-25	4.50	5.50		
f_{CLK2x}	Input Clock Frequency (2-x Mode)				
	80960CF-40	0	80	MHz	
	80960CF-33	0	66		
	80960CF-25	0	50		
f_{CLK1x}	Input Clock Frequency (1-x Mode)				
	80960CF-40	8	40	MHz	(†)
	80960CF-33	8	33		
	80960CF-25	8	25		
T_C	Case Temp Under Bias				
	PGA Pkg. (80960CF-40)	0	85	°C	
	PGA Pkg. (80960CF-33, -25 Only)	0	100		
	196-Pin PQFP (80960CF-33, -25 Only)	0	100		

† When in the 1-x input clock mode, CLKIN is an input to an internal phase-locked loop and must maintain a minimum frequency of 8 MHz for proper processor operation. However, in the 1-x mode, CLKIN may still be stopped when the processor is in a reset condition. When CLKIN is stopped, the specified RESET low time must be provided once CLKIN restarts and has stabilized.

4.3 Recommended Connections

Power and ground connections must be made to multiple V_{CC} and V_{SS} (GND) pins. Every 80960CF-based circuit board should include power (V_{CC}) and ground (V_{SS}) planes for power distribution. Every V_{CC} pin must be connected to the power plane, and every V_{SS} pin must be connected to the ground plane. Pins identified as 'NC' **must not** be connected in the system.

Liberal decoupling capacitance should be placed near the 80960CF. The processor may cause transient power surges when its numerous output buffers transition, particularly when connected to large capacitive loads.

Low inductance capacitors and interconnects are recommended for best high frequency electrical performance. Inductance may be reduced by shortening the board traces between the processor and decoupling capacitors as much as possible. Capacitors specifically designed for PGA packages may offer the lowest possible inductance.

For reliable operation, always connect unused inputs to an appropriate signal level. In particular, any unused interrupt (\overline{XINT} , \overline{NMI}), DMA (\overline{DREQ}), or \overline{BTERM} input should be connected to V_{CC} through a pull-up resistor. Pull-up resistors should be in the range of 20 KW for each pin tied high. When \overline{READY} or \overline{HOLD} are not used, the unused input should be connected to ground. **N.C. pins must always remain unconnected.** For additional information refer to the *i960[®] CA/CF Microprocessor User's Manual* (order number 270710).

4.4 D.C. Specifications

Table 16 presents the D.C. specifications of the 80960CF.

Table 16. D.C. Specifications

Symbol	Parameter (1)	Min	Max	Units	Notes
V_{IL}	Input Low Voltage for all pins except \overline{RESET}	-0.3	+0.8	V	
V_{IH}	Input High Voltage for all pins except \overline{RESET}	2.0	$V_{CC} + 0.3$	V	
V_{OL}	Output Low Voltage		0.45	V	$I_{OL} = 5 \text{ mA}$
V_{OH}	Output High Voltage $I_{OH} = -1 \text{ mA}$ $I_{OH} = -200 \mu\text{A}$	2.4 $V_{CC} - 0.5$		V V	
V_{ILR}	Input Low Voltage for \overline{RESET}	-0.3	1.5	V	
V_{IHR}	Input High Voltage for \overline{RESET}	3.5	$V_{CC} + 0.3$	V	
I_{LI1}	Input Leakage Current for each pin <i>except</i> : \overline{BTERM} , \overline{ONCE} , $\overline{DREQ3:0}$, \overline{STEST} , $\overline{EOP3:0/TC3:0}$, \overline{NMI} , $\overline{XINT7:0}$, \overline{BOFF} , \overline{READY} , \overline{HOLD} , $\overline{CLKMODE}$		± 15	μA	$0 \leq V_{IN} \leq V_{CC}$ (2)
I_{LI2}	Input Leakage Current for: \overline{BTERM} , \overline{ONCE} , $\overline{DREQ3:0}$, \overline{STEST} , $\overline{EOP3:0/TC3:0}$, \overline{NMI} , $\overline{XINT7:0}$, \overline{BOFF}	0	-300	μA	$V_{IN} = 0.45 \text{ V}$ (3)
I_{LI3}	Input Leakage Current for: \overline{READY} , \overline{HOLD} , $\overline{CLKMODE}$	0	500	μA	$V_{IN} = 2.4 \text{ V}$ (4, 8)
I_{LO}	Output Leakage Current		± 15	μA	$0.45 \leq V_{OUT} \leq V_{CC}$
I_{CC}	Supply Current (80960CF-40, 33): $I_{CC \text{ Max}}$ $I_{CC \text{ Typ}}$		1150 1000	mA mA	(5) (6)
I_{CC}	Supply Current (80960CF-25): $I_{CC \text{ Max}}$ $I_{CC \text{ Typ}}$		950 775	mA mA	(5) (6)
I_{CC}	Supply Current (80960CF-16): $I_{CC \text{ Max}}$ $I_{CC \text{ Typ}}$		750 575	mA	(5) (6)
I_{ONCE}	ONCE-mode Supply Current 80960CF-40 80960CF-33, -25, -16		225 150	mA	
C_{IN}	Input Capacitance for: \overline{CLKIN} , \overline{RESET} , \overline{ONCE} , \overline{READY} , \overline{HOLD} , $\overline{DREQ3:0}$, \overline{BOFF} , $\overline{XINT7:0}$, \overline{NMI} , \overline{BTERM} , $\overline{CLKMODE}$	0	12	pF	$F_C = 1 \text{ MHz}$
C_{OUT}	Output Capacitance of each output pin		12	pF	$F_C = 1 \text{ MHz}$ (7)
$C_{I/O}$	I/O Pin Capacitance		12	pF	$F_C = 1 \text{ MHz}$

NOTES:

- 80960CF-33 and -25 under the conditions described in Section 4.2, "Operating Conditions" on page 26.
- No pullup or pulldown.
- These pins have internal pullup resistors.
- These pins have internal pulldown resistors.
- Measured at worst case frequency, V_{CC} and temperature, with device operating and outputs loaded to the test conditions described in Section 4.5.1, "A.C. Test Conditions" on page 35.
- I_{CC} Typical is not tested.
- Output Capacitance is the capacitive load of a floating output.
- $\overline{CLKMODE}$ pin has a pulldown resistor only when \overline{ONCE} pin is deasserted.

Table 19. 80960CF AC Characteristics (25 MHz) (Sheet 3 of 3)

Symbol	Parameter (1)	Min	Max	Unit	Notes
--------	---------------	-----	-----	------	-------

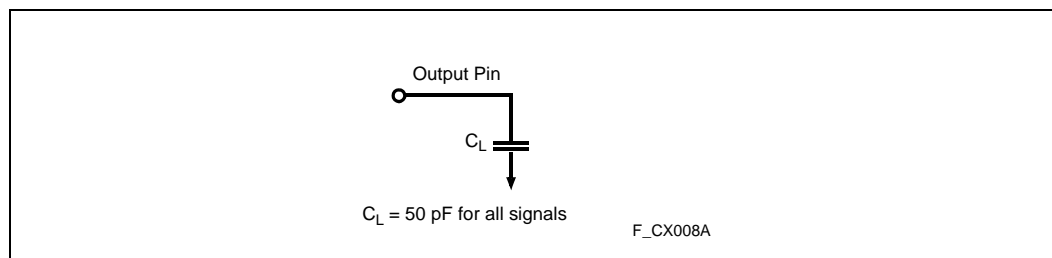

NOTES:

- 80960CF-25 only, per the conditions in [Section 4.2, Operating Conditions](#) and [Section 4.5.1, A.C. Test Conditions](#).
- See [Section 4.5.2, A.C. Timing Waveforms](#) for waveforms and definitions.
- See [Figure 16](#) for capacitive derating information for output delays and hold times.
- See [Figure 17](#) for capacitive derating information for rise and fall times.
- Where N is the number of NRAD, NRDD, NWAD or NWDD wait states that are programmed in the Bus Controller Region Table. WAIT never goes active when there are no wait states in an access.
- N = Number of wait states inserted with READY.
- Output Data and/or DT/R may be driven indefinitely following a cycle when there is no subsequent bus activity.
- Since asynchronous inputs are synchronized internally by the 80960CF, they have no required setup or hold times to be recognized and for proper operation. However, to ensure recognition of the input at a particular edge of PCLK2:1, the setup times shown must be met. Asynchronous inputs must be active for at least two consecutive PCLK2:1 rising edges to be seen by the processor.
- These specifications are ensured by the processor.
- These specifications must be met by the system for proper operation of the processor.
- This timing is dependent upon the loading of PCLK2:1. Use the derating curves of [Section 4.5.3, Derating Curves](#) to adjust the timing for PCLK2:1 loading.
- In the 1-x input clock mode, the maximum input clock period is limited to 125 ns while the processor is operating. When the processor is in reset, the input clock may stop even in 1-x mode.
- When in the 1-x input clock mode, these specifications assume a stable input clock with a period variation of less than $\pm 0.1\%$ between adjacent cycles.
- In 2-x clock mode, RESET is an asynchronous input which has no required setup and hold time for proper operation. However, to ensure the device exits reset synchronized to a particular clock edge, the RESET pin must meet setup and hold times to the falling edge of the CLKIN. (See [Figure 23](#).)
- In 1-x clock mode, RESET is an asynchronous input which has no required setup and hold time for proper operation. However, to ensure the device exits reset synchronized to a particular clock edge, the RESET pin must meet setup and hold times to the rising edge of the CLKIN. (See [Figure 24](#).)
- The interrupt pins are synchronized internally by the 80960CF. They have no required setup or hold times for proper operation. These pins are sampled by the interrupt controller every other clock and must be active for at least three consecutive PCLK2:1 rising edges when asserting them asynchronously. To ensure recognition at a particular clock edge, the setup and hold times shown must be met for two consecutive PCLK2:1 rising edges.

4.5.1 A.C. Test Conditions

The AC Specifications in [Section 4.5, “A.C. Specifications” on page 29](#) are tested with the 50 pF load shown in [Figure 7](#). [Figure 16](#) shows how timings vary with load capacitance.

Specifications are measured at the 1.5 V crossing point, unless otherwise indicated. Input waveforms are assumed to have a rise and fall time of ≤ 2 ns from 0.8 V to 2.0 V. See [Section 4.5.2, “A.C. Timing Waveforms” on page 36](#) for AC specification definitions, test points and illustrations.

5.0 Reset, Backoff and Hold Acknowledge

Table 20 lists the condition of each processor output pin while $\overline{\text{RESET}}$ is asserted (low). Table 21 lists the condition of each processor output pin while HOLDA is asserted (high).

In Table 21, with regard to bus output pin state only, the Hold Acknowledge state takes precedence over the reset state. Although asserting the $\overline{\text{RESET}}$ pin internally resets the processor, the processor's bus output pins do not enter the reset state when Hold Acknowledge has been granted to a previous HOLD request (HOLDA is active). Furthermore, the processor grants new HOLD requests and enters the Hold Acknowledge state even while in reset.

For example, when HOLD is asserted while HOLDA is inactive and the processor is in the reset state, the processor's bus pins enter the Hold Acknowledge state and HOLDA is granted. The processor is not able to perform memory accesses until the HOLD request is removed, even when the $\overline{\text{RESET}}$ pin is brought high. This operation is provided to simplify boot-up synchronization among multiple processors sharing the same bus.

Table 20. Reset Conditions

Pins	State During Reset (HOLDA inactive)
A31:2	Floating
D31:0	Floating
$\overline{\text{BE}}3:0$	Driven high (Inactive)
$\overline{\text{W}}/\overline{\text{R}}$	Driven low (Read)
$\overline{\text{ADS}}$	Driven high (Inactive)
$\overline{\text{WAIT}}$	Driven high (Inactive)
$\overline{\text{BLAST}}$	Driven low (Active)
$\overline{\text{DT}}/\overline{\text{R}}$	Driven low (Receive)
$\overline{\text{DEN}}$	Driven high (Inactive)
$\overline{\text{LOCK}}$	Driven high (Inactive)
BREQ	Driven low (Inactive)
$\overline{\text{D}}/\overline{\text{C}}$	Floating
$\overline{\text{DMA}}$	Floating
$\overline{\text{SUP}}$	Floating
$\overline{\text{FAIL}}$	Driven low (Active)
$\overline{\text{DACK}}3:0$	Driven high (Inactive)
$\overline{\text{EOP}}3:0/\overline{\text{TC}}3:0$	Floating (Set to input mode)

Table 21. Hold Acknowledge and Backoff Conditions

Pins	State During HOLDA
A31:2	Floating
D31:0	Floating
$\overline{\text{BE}}3:0$	Floating
$\overline{\text{W}}/\overline{\text{R}}$	Floating
$\overline{\text{ADS}}$	Floating
$\overline{\text{WAIT}}$	Floating
$\overline{\text{BLAST}}$	Floating
$\overline{\text{DT}}/\overline{\text{R}}$	Floating
$\overline{\text{DEN}}$	Floating
$\overline{\text{LOCK}}$	Floating
BREQ	Driven (High or low)
$\overline{\text{D}}/\overline{\text{C}}$	Floating
$\overline{\text{DMA}}$	Floating
$\overline{\text{SUP}}$	Floating
$\overline{\text{FAIL}}$	Driven high (Inactive)
$\overline{\text{DACK}}3:0$	Driven high (Inactive)
$\overline{\text{EOP}}3:0/\overline{\text{TC}}3:0$	Driven (When output)

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
