S6AP413A

4ch DC/DC Converter with I²C Interface and Internal SW FETs

S6AP413A contains 3ch buck DC/DC converter and 1ch buck-boost DC/DC converter. S6AP413A can supply the main power line in several systems by using only its chip. The current mode control is adopted for the DC/DC converter, and it is possible to use the small chip inductor with the high switching frequency operation which contains internal switching FETs. S6AP413A contains the output setting resistor and the phase compensation circuit, and contributes to reduce the number of external components and its mount area. Also it contains the CTL input pin which can control the ON/OFF for each DC/DC converter, the Power Good signal output pin and I²C communication interface, therefore it is easy to design the power supply sequence. It is possible to tune in the output voltage exactly using the I²C communication.

Features

- Operating input voltage range: 2.5V to 5.5V (Maximum rating: 6.5V)
- Output voltage setting range: DD1*:0.7V to 1.32V (20mV/step)
  DD2*:1.2V to 1.95V (50mV/step)
  DD3*:2.8Vto 3.5V (100mV/step)
  DD4*:0.7V to 1.32V (20mV/step)
- Maximum output current: DD1:2A, DD2:1.2A, DD3:0.6A, DD4:2A
- Internal switching FETs, output voltage setting resistor, phase compensation circuit and output discharge resistor (all DC/DC converters)
- Buck-boost DC/DC converter is seamless to change operation mode
- Soft start time setting range: 1 ms to 16 ms (approximately 1ms/step)
- Switching frequency for the DC/DC converter: 3 MHz
- Communication interface: I²C (ON/OFF, Output voltage, Soft start time)
- Internal PFM/PWM auto switching mode
- Each DC/DC converter Power Good function (open drain)
- Several protection functions: Under voltage lockout (UVLO), Over current protection (OCP), Thermal shut down (TSD)
- Small package: QFN32 (5mm × 5mm × 0.71mm, 0.5mm pitch)

*: DD1, DD2, DD3, and DD4: DC/DC converter blocks 1,2,3,4

Applications

Network equipment, Factory automation, Security system, Surveillance camera, Electrical music instrument, Multi-function printer, Scanner, Printer, Copy machine, Home appliances, Data storage (HDD, SSD), Mobile equipment for Li+ battery (1 cell)

6. Absolute Maximum Ratings

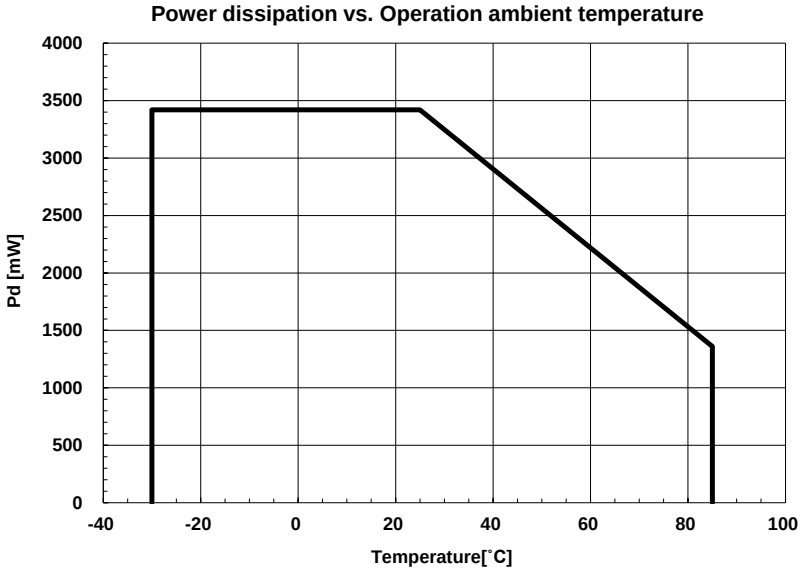
Parameter	Symbol	Condition	Rating		Unit
			Min	Max	
Power supply voltage	V_{VCC1}	AVCC,PVCC input voltage	-0.3	6.5	V
	V_{VCC2}	DVCC input voltage	-0.3	6.5	V
Terminal voltage	V_{CTL1}	CTL1, CTL2, CTL3 input voltage	-0.3	6.5	V
	V_{CTL2}	CTLMAIN input voltage	-0.3	6.5	V
	V_{LOGIC}	SDA,SCL input voltage	-0.3	6.5	V
	V_{PG}	PG1, PG2, PG3, PG4 drain voltage	-0.3	6.5	V
	V_{OUT}	IN1, IN2, IN3, IN4 input voltage	-0.3	6.5	V
LX voltage	V_{LX}	LX1, LX2, LX3, LX4 voltage	-1.0	6.5	V
Permission loss	P_D	Ta≤+25°C Thermal resistance(θja):(29.2°C /W(*1))	0	3420	mW
Maximum junction temperature	T_{jmax}	-	-	+125	°C
Storage temperature	T_{STG}	-	-55	+125	°C

*1: When the IC is mounted on 74mm × 74mm four-layer square epoxy board. IC is mounted on a four-layer epoxy board, which terminal bias, and the IC's thermal pad is connected to the epoxy board.

WARNING:

1. Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.

Figure 2. Power Dissipation vs. Operation Ambient Temperature



7. Recommended Operating Conditions

Parameter	Symbol	Condition	Value			Unit
			Min	Typ	Max	
1. Reference control block						
Power supply voltage	V_{VCC}	AVCC	2.5	3.3	5.5	V
Output current for reference voltage	I_{REF}	VREF18	-1	-	0	mA
Operating temperature	T_a	-	-30	+25	+85	°C
2. DC/DC channel						
Power supply voltage	V_{VCC}	PVCC1, PVCC2, PVCC3, PVCC4	2.5	3.3	5.5	V
Input voltage	V_{OUT}	IN1,IN2	0	-	AVCC	V
PG input voltage	V_{PG}	PG1, PG2, PG3, PG4	0	-	5.5	V
3. Input block						
Input voltage	V_{CTL} V_{MODE}	CTL1, CTL 2, CTL3, mode CTLMAIN	0	-	AVCC	V
4. I^2C communication block						
Power supply voltage	V_{VCC}	DVCC	1.70	-	3.50	V
Input voltage	V_{LOGIC}	SDA,SCL	0	-	DVCC	V

WARNING:

1. The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated under these conditions.
2. Any use of semiconductor devices will be under their recommended operating condition.
3. Operation under any conditions other than these conditions may adversely affect reliability of device and could result in device failure.
4. No warranty is made with respect to any use, operating conditions or combinations not represented on this data sheet. If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.

9. Operation Mode List

Table 1. Operation Mode List

	Mode	Stand-by	Stand-by2	Normal	Error Detection
CTL signal	CTLMAIN (external)	L	H	H	H
	CTL1 (external/I²C)	L	L	H/L(*1)	X
	CTL2 (external/I²C)	L	L	H/L(*1)	X
	CTL3 (external/I²C)	L	L	H/L(*1)	X
	CTL4 (external/I²C)	L	L	H/L(*1)	X
Operation Block	Reference	OFF	ON	ON	ON
	Digital	OFF	ON	ON	ON
	DD1	OFF	OFF	ON/OFF	OFF
	DD2	OFF	OFF	ON/OFF	OFF
	DD3	OFF	OFF	ON/OFF	OFF
	DD4	OFF	OFF	ON/OFF	OFF
I²Ccommunication	I²Ccommunication	disable	enable	enable	enable
Protection operating	Thermal shut down (TSD)	Not available	Not available	available	(*2)
	Over current protection(OCP)	Not available	Not available	available	(*2)

*1: normal mode means that CTLMAIN pin is "H" level and each DD CTL pin is "H" level

*2: This state is after each err detection. Error state will release, when the power supply voltage or CTLMAIN pin will turn off and on.

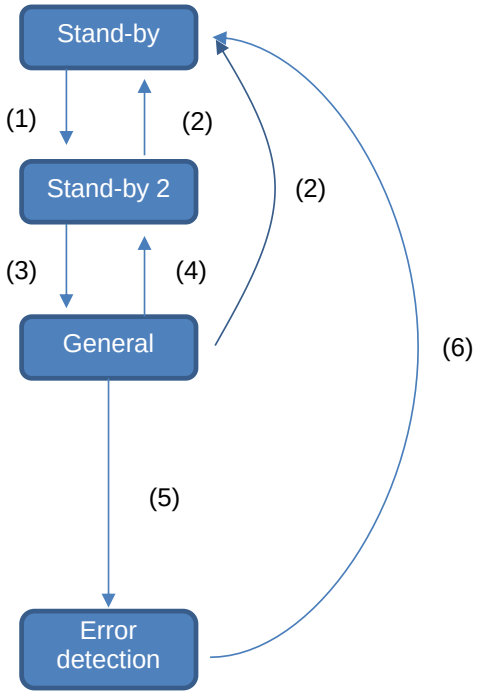
Priority of the External CTL Pin and I²C Communication

CTLMAIN (External)	CTL1, CTL2, CTL3, CTL4 (External)	30h Resistor (I²C)	Relevant Channel
H	H	1	ON
H	H	0	ON
H	L	1	ON
H	L	0	OFF
L	X	disable	OFF

Notes:

- The I²C communication is valid after the reference control block and digital block activation setting the external CTLMAIN pin to "H" level.
- Please attention below note about ON/OFF control of DD1, DD2,DD3, DD4 by I²C communication.
  When each DD control is turned off by I²C communication and external CTL pin remains "H" level, DCDC converter keep operating.

10. State Transition Diagram



(1) External CTLMAIN pin is "H" level.

(2) External CTLMAIN pin is "L" level.

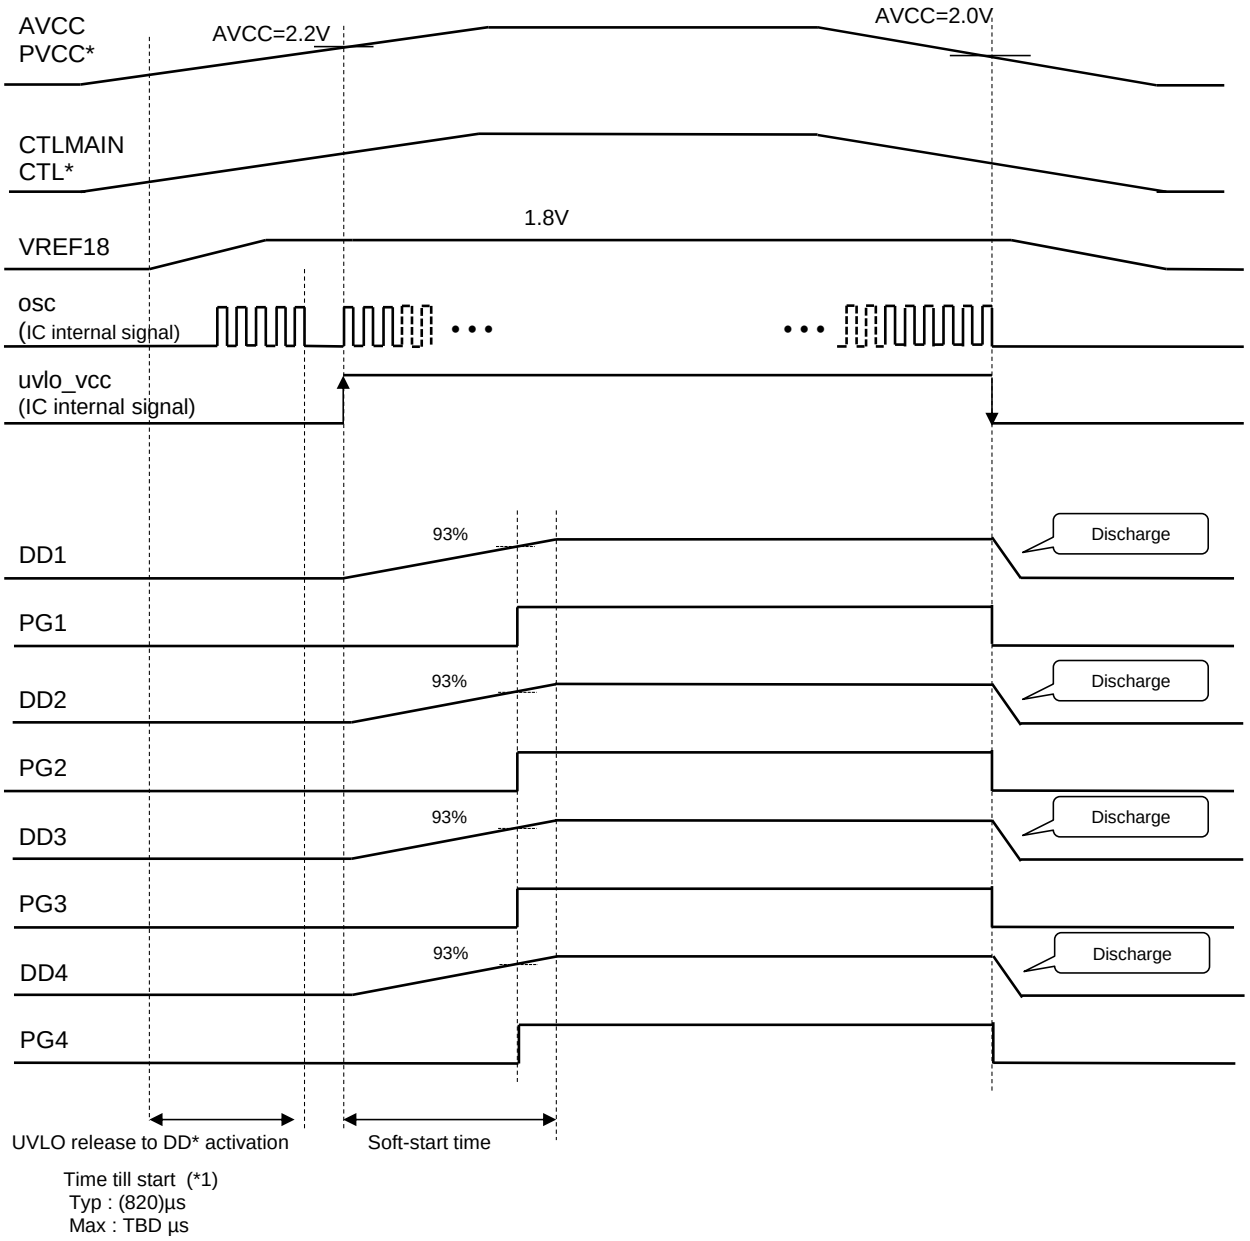
(3) External CTL pin or I^2C communication "relevant CH_ON"

(4) External CTL pin or I^2C communication "relevant CH_OFF"

(5) Error detection (TSD, OCP 1ms continuation)

(6) Turning on the power supply again (equal to or less than uvlo_vcc rest voltage) or setting CTLMAIN to "L" level

11. Turning ON and OFF Sequence (AVCC=CTLMAIN, CTL1, CTL2, CTL3, CTL4)



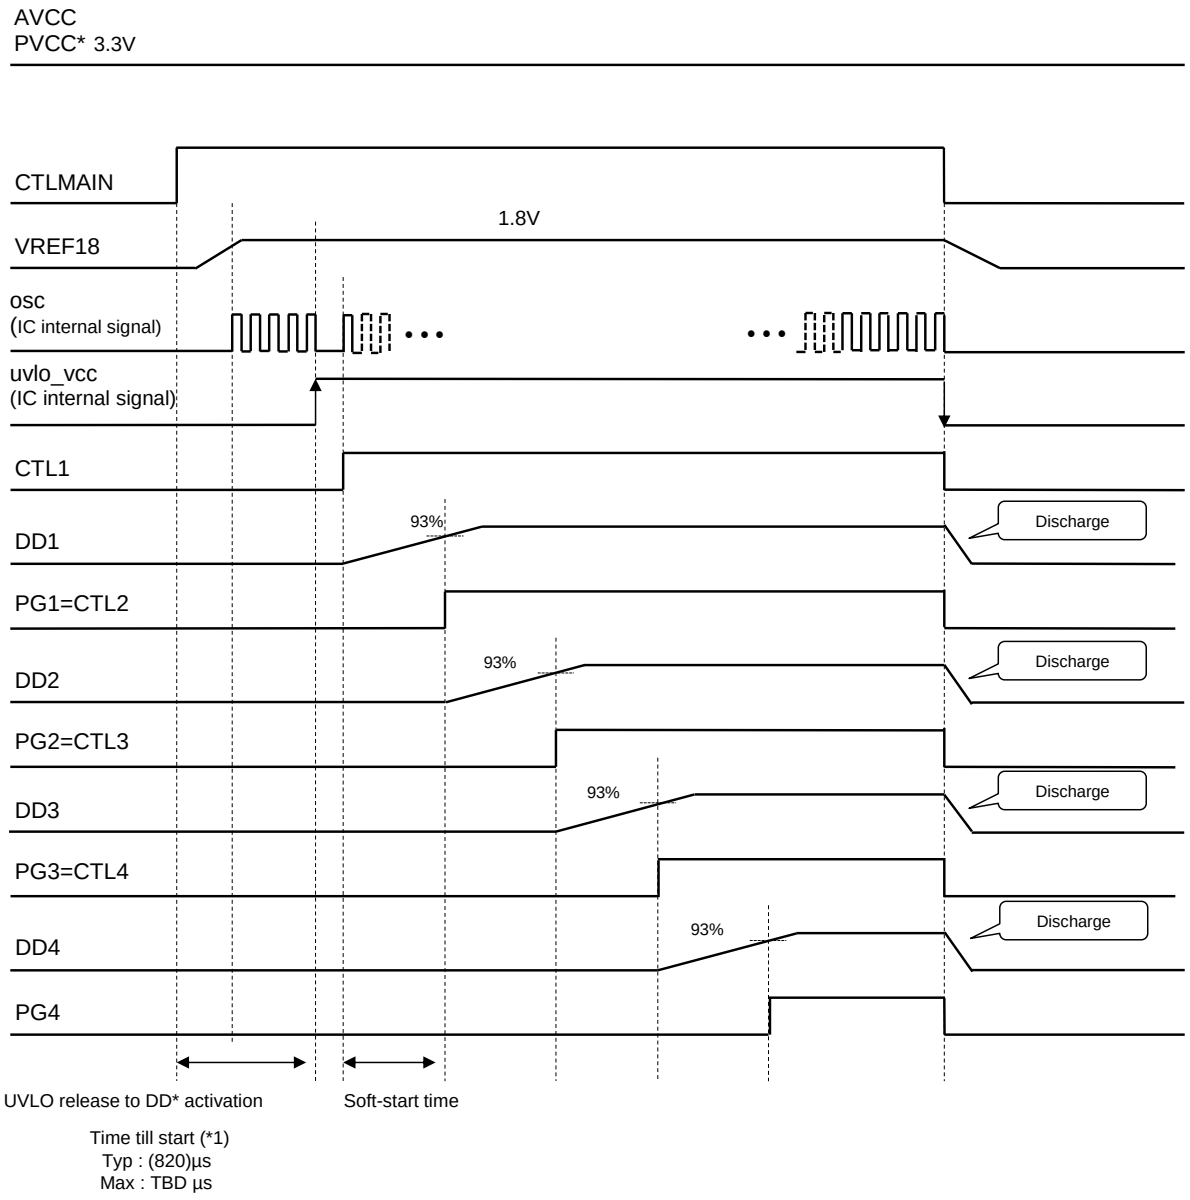
*1: PVCC1, PVCC2, PVCC3, PVCC4

*2: CTL1, CTL2, CTL3, CTL4

*3: DD1, DD2, DD3, DD4

*4: VREF18 activations depend on the VREF18 pin capacitance.
Time in the sequence figure above is applied for the following condition.
VREF18 pin capacitance: 1.0µF

12. Turning ON and OFF Sequence (AVCC →CTLMAIN→CTL1→CTL2→ CTL3→ CTL4)

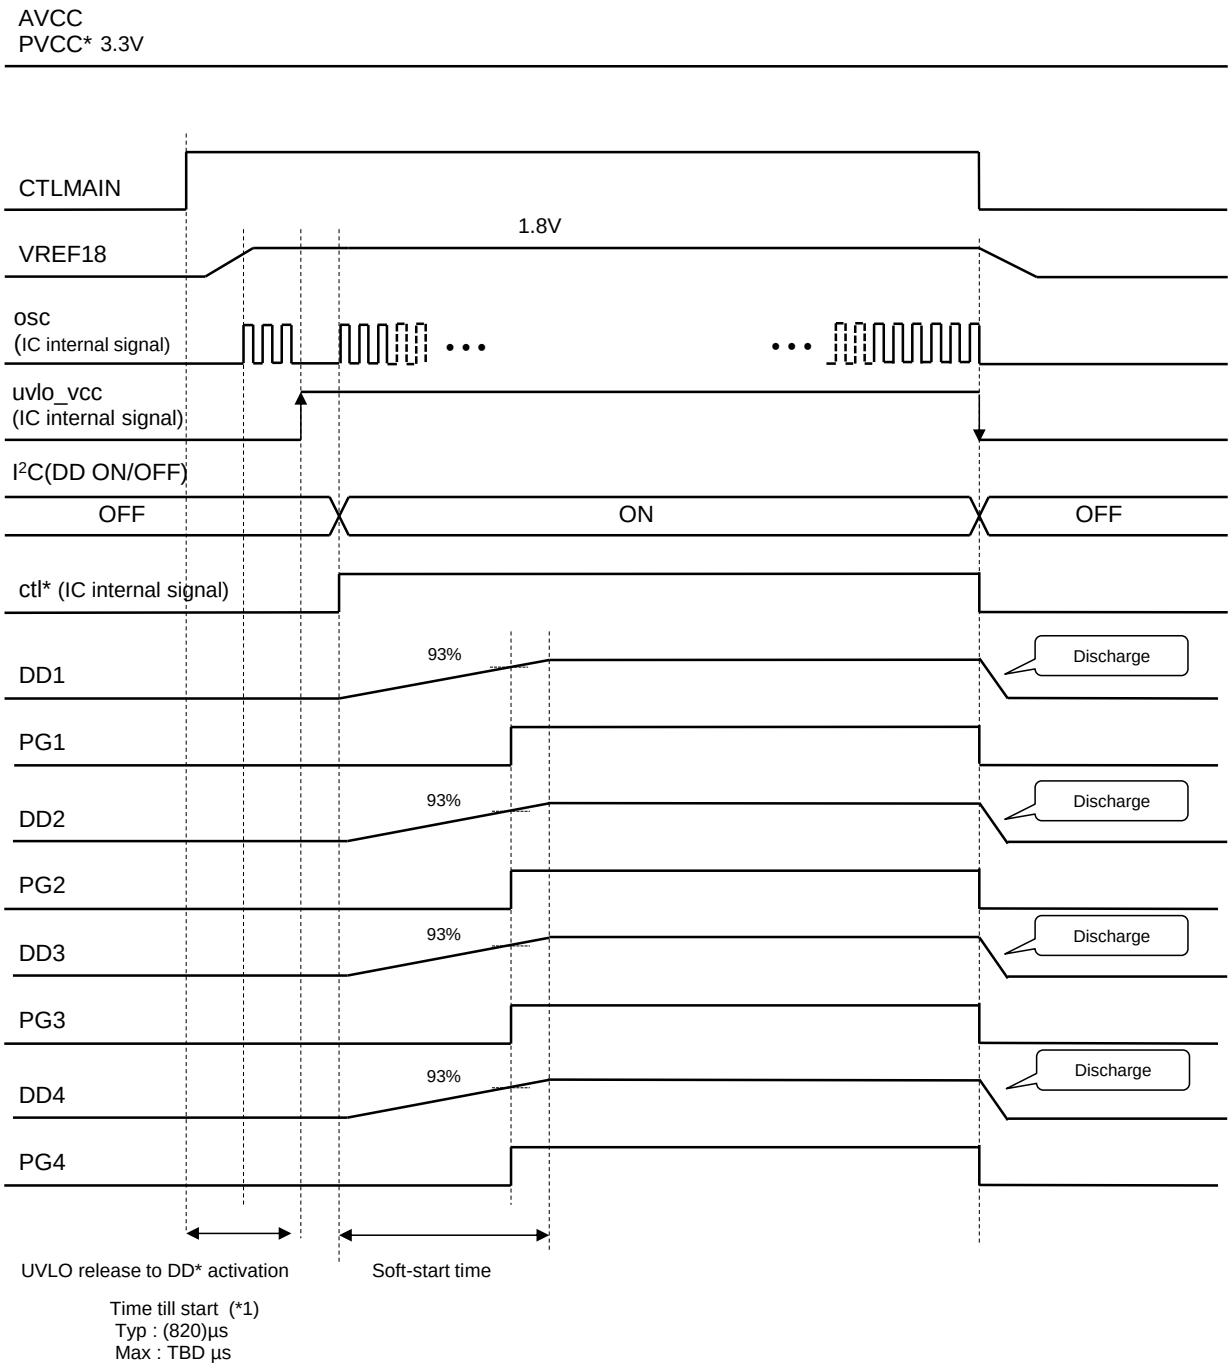


*1: PVCC1, PVCC2, PVCC3, PVCC4

*2: DD1, DD2, DD3, DD4

*3: VREF18 activations depend on the VREF18 pin capacitance.
Time in the sequence figure above is applied for the following condition.
VREF18 pin capacitance: 1.0µF

13. Turning ON and OFF Sequence (AVCC→CTLMAIN→I²C)



*1: PVCC1, PVCC2, PVCC3, PVCC4
*2: CTL1, CTL2, CTL3
*3: DD1, DD2, DD3
*4: VREF18 activations depend on the VREF18 pin capacitance.
Time in the sequence figure above is applied for the following condition.
VREF18 pin capacitance: 1.0µF

14. CTL Pin Threshold Voltage

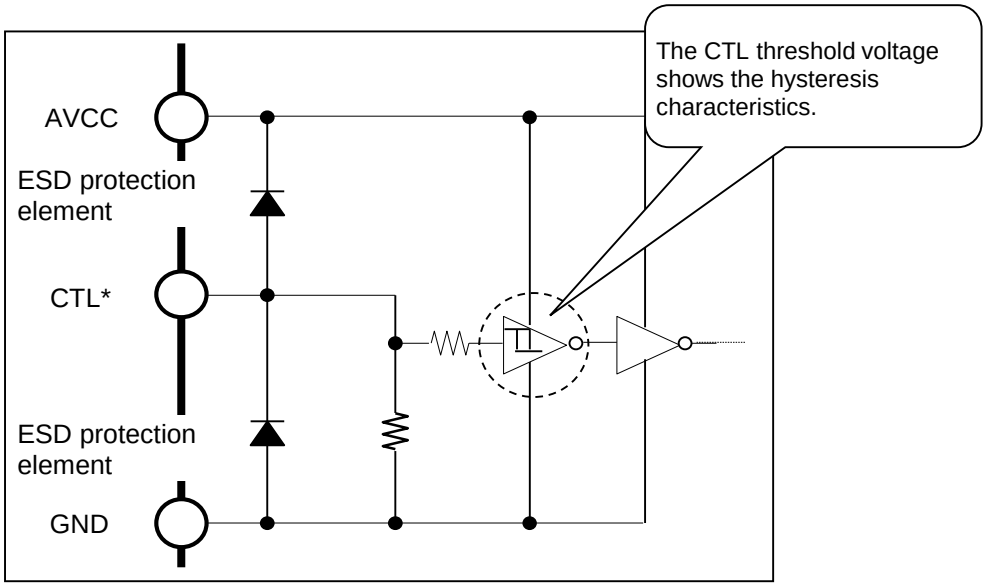
The input circuit structure for the CTL(*1) pin is the Schmitt trigger style, and the threshold voltage shows the hysteresis characteristics when CTL(*1) OFF to ON and ON to OFF.

(See "CTL (*1) Pin Equivalent Circuit Diagram" below.)

Also, the threshold voltage level depends on the VCC pin voltage.

Moreover, make sure to input either the "H" level (>"VCC×0.7"V) or "L" level (<0.4V) to the CTL(*1)pin when in use.

Figure 3. CTL (*1) Pin Equivalent Circuit Diagram



*1: CTLMAIN, CTL1, CTL2, CTL3, CTL4

15. Protection Operation Sequence

Over Current Protection (DD channel)

The DD channel monitors the peak current of FET at any time during the operation. When the DD output becomes the over current state, the output voltage is decreased. Afterward, the timer operation is performed and the output stops after about 1ms progress.

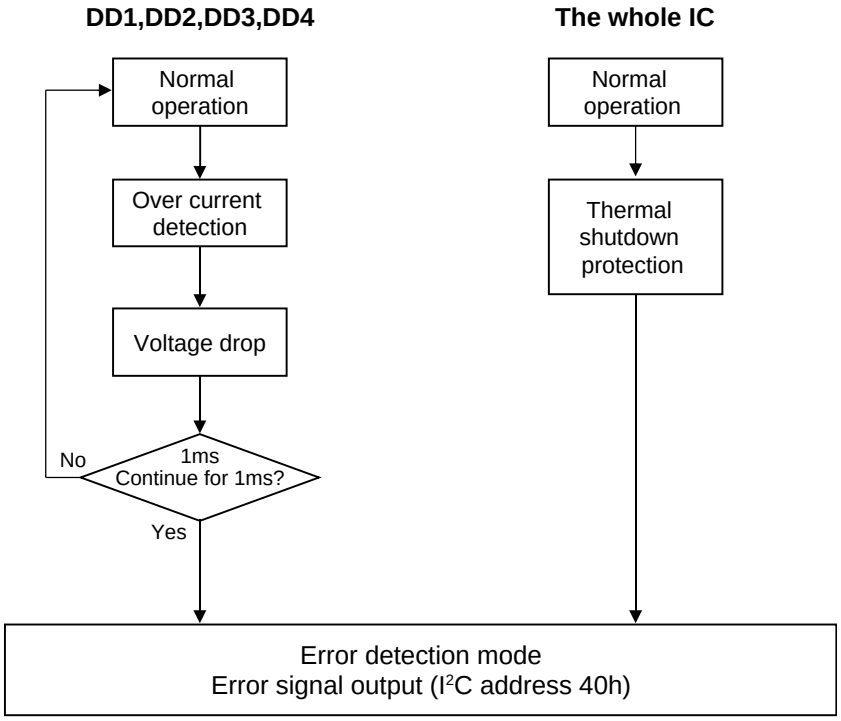
When one of each DD channel stops operation by over current protection, all DD channels stop operation.

Thermal Shut Down

If the temperature at the junction part reaches +150°C, the thermal shutdown protection circuit turns all channels off.

Error Detection Sequence

Figure 4. Error Detection Sequence



Error Detection Mode Release

It is necessary to turn the power supply turning on again, or to turn CTLMAIN turning on again to release the error detection mode.

16. Operation Condition, Stop Circuit and Release Condition for Protection Circuit

Channel	Operation Whilst Under Protection	Over Current Protection (OCP)	Under Voltage Lockout Protection (UVLO)	Thermal Shutdown Protection (TSD)
DD1,DD2,DD3, DD4	Discharge	Operating condition: After about 1ms progress in the over current condition Process during protection operation: DD1, DD2, DD3, DD4 stop Recovery condition: (1) Power supply reasserted (2) CTLMAIN reasserted	Operating condition: Input voltage drop Process during protection operation: DD1, DD2, DD3, DD4 stop Recovery condition: Input voltage rise UVLO operates only when CTLMAIN is "H" (at VREF18 output).	Operating condition: Chip temperature increment Process during protection operation: DD1, DD2, DD3, DD4 stop Recovery condition: (1) Power supply reasserted (2) CTLMAIN reasserted Only when CTLMAIN is in the "H" state and CTL(*1) is in the "H" state, or when DD(*2) in operating condition by I^2C, will operate.
Error output (address 40h)	-	Write "1" when detecting OCP	No change	Write "1" when detecting TSD

Thermal shutdown protection (TSD) operation during over current protection timer operation

When the thermal shutdown protection (TSD) operated during the over current protection (OCP) timer operation, the thermal shutdown protection has priority.

Operation when releasing under voltage lockout protection (UVLO)

- DD1,DD2,DD3,DD4: Activation following the condition for CTL(*1) pin or I^2C

Note:

- When VREF18 decreases at the time of UVLO operation, I^2C register is reset, and all DD does OFF.
  It is necessary to let you do ON by CTL(*1) pin and communication again to let DD have ON."

*1: CTL1, CTL2, CTL3, CTL4

*2: DD1, DD2, DD3, DD4

17. DD Soft Start Operation

The soft-start operation for DD1, DD2, DD3 and DD4 is enabled in order to prevent the rush current during the DD activation. The soft-start time can be controlled by I^2C.

About output voltage changing option, soft start time is showed by follow equation.

Tss=Tslp × Vset/Vdef (ms)

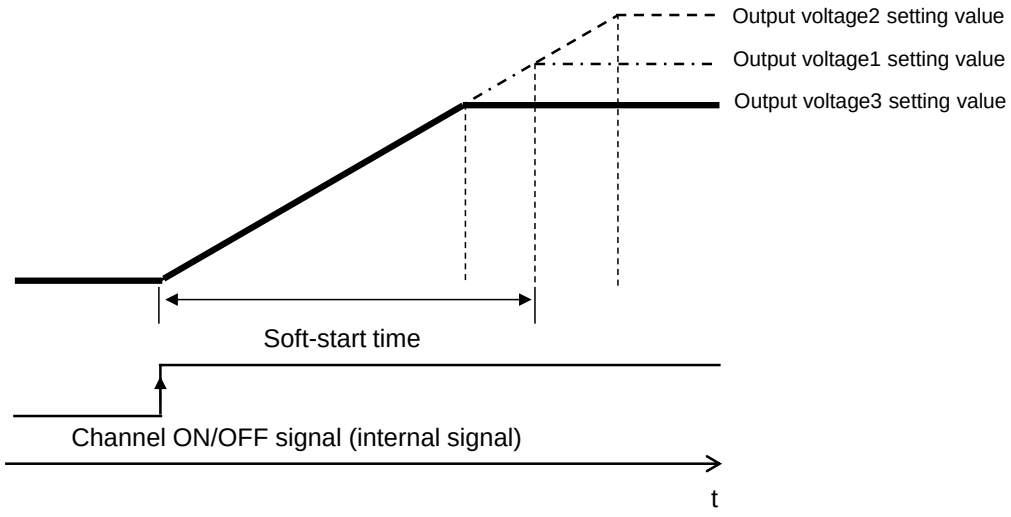
Tss: soft start time

Tslp: slope coefficient of soft start

Vset: output voltage setting

Vdef: DD1=1.0, DD2=1.8, DD3=3.3, DD4=1.0

Figure 5. DD Soft Start



18. Discharge Operation

DD Channel

When executing the DD OFF operation at the channel ON/OFF signal, the DC/DC smooth capacitance charged for each output voltage is discharged using resistor for discharge which is set in the IC and the output voltage is decreased gradually. However, the discharge time changes depending on the DC/DC converter load current.

The discharge time is calculated by the following equation.

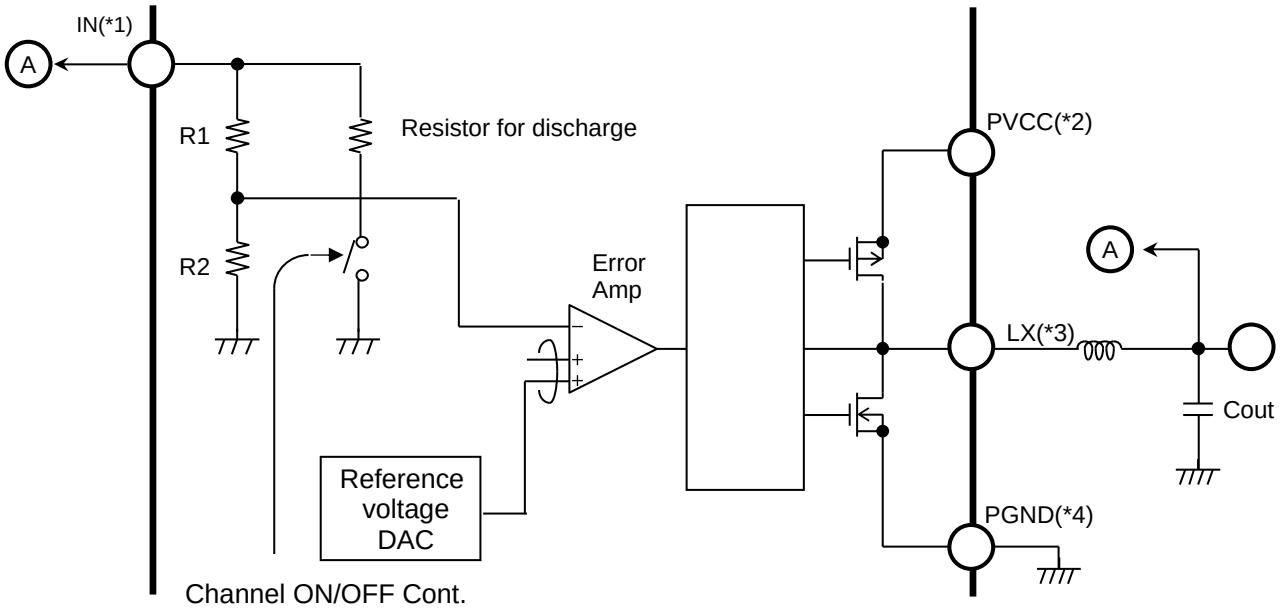
Discharge time (time till the output becomes 10% without load)

$toff(s) \approx 2.3 \times R\_DIS \times C_{OUT}$ (F)

Note:

- See the table in Electrical Characteristics for the discharge resistor value.

Figure 6. Discharge Function



*1: IN1, IN2, IN3, IN4

*2: PVCC1, PVCC2, PVCC3, PVCC4

*3: LX1, LX2, LX3, LX4

*4: PGND1, PGND2, PGND3, PGND4

19. PG Function

The following pins for each channel Power Good output are prepared.

PG1

It is the pin for DD1 Power Good output.

When the output voltage exceeds 93% of the setting value at the DD1 ON mode, "H" is output.

Also, when the output voltage becomes equal or lower than 90% of the setting value after the "H" output, "L" is output. "L" is output at the DD1 OFF mode.

PG2

It is the pin for DD2 Power Good output.

When the output voltage exceeds 93% of the setting value at the DD2 ON mode, "H" is output.

Also, when the output voltage becomes equal or lower than 90% of the setting value after the "H" output, "L" is output. "L" is output at the DD2 OFF mode.

PG3

It is the pin for DD3 Power Good output.

When the output voltage exceeds 93% of the setting value at the DD3 ON mode, "H" is output.

Also, when the output voltage becomes equal or lower than 90% of the setting value after the "H" output, "L" is output. "L" is output at the DD3 OFF mode.

PG4

It is the pin for DD4 Power Good output.

When the output voltage exceeds 93% of the setting value at the DD4 ON mode, "H" is output.

Also, when the output voltage becomes equal or lower than 90% of the setting value after the "H" output, "L" is output. "L" is output at the DD4 OFF mode.

20. I²CInterface

20.1 Structure of I²C Interface

The I²C interface executes the data communication in 1 byte (8-bit) units using two signal lines (bus), a SCL (serial clock line) and a SDA (serial data line).

This bus is connected to multiple devices;

Master: device to generate the clock signal and to control the data transfer (CPU and so on)

Slave: device that an address is specified by a master.

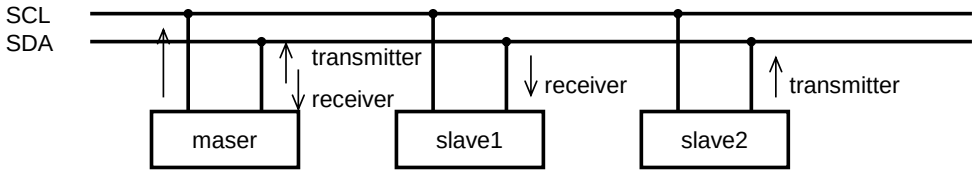
This IC is set as the slave and has no function to be the master.

Each device is defined due to the communication direction as described below.

Transmitter: device to send data to bus

Receiver: device to receive data from bus

The IC has the function both transmitter and receiver.



The IC defines the followings;

Write: data is transmitted from master and the IC receives data

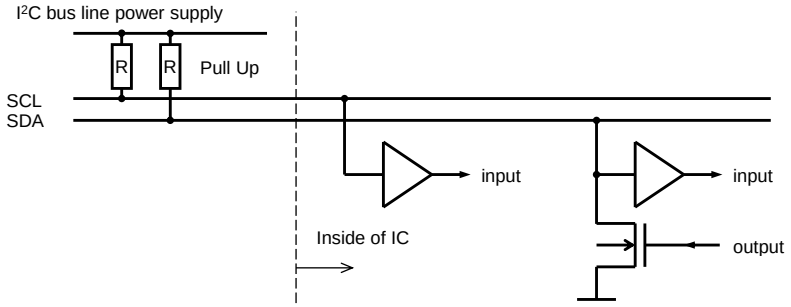
Read: The IC transmits data and master receives data.

20.2 Definition of Signal Lines

SCL and SDA are connected to the power supply by the pull-up resistor.
The output circuit is the open Drain output.
When a bus is not used (waiting state), the open "H" is set changing the open Drain to the OFF state.

Note:

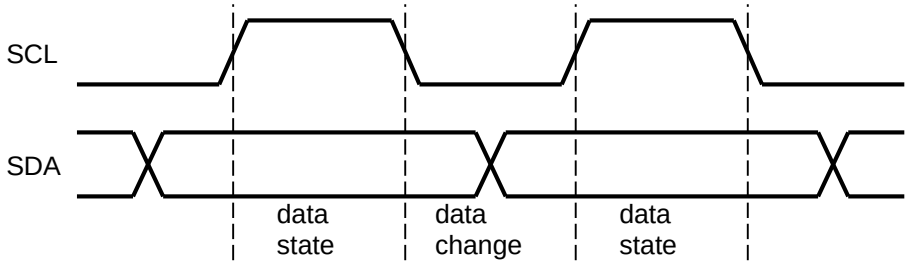
- SCL and SDA pins adopt a different ESD protection system from standard I²C specification because of ESD enhancement (See 22.I/O Pin Equivalent Circuit Diagram). When the power supply is in the bus line, do not shut off the power supply for an IC (DVCC).



20.3 Validity of Data

Data has the following characteristics;

- Change when SCL is the "L" level
- Valid if the state is kept while SCL is the "H" level.

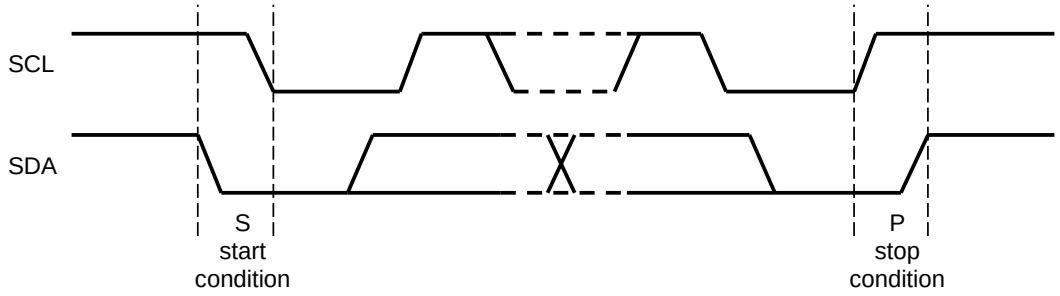


The SDA signal change means the start or stop condition when SCL is the "H" level.

20.4 Definition of Start and Stop Condition

The start and stop conditions are output from the master and shows start and stop of communications to the slave.

- Start: SDA changes from "H" to "L" when SCL is "H".
- Stop: SDA changes from "L" to "H" when SCL is "H".



20.5 ACK Signal

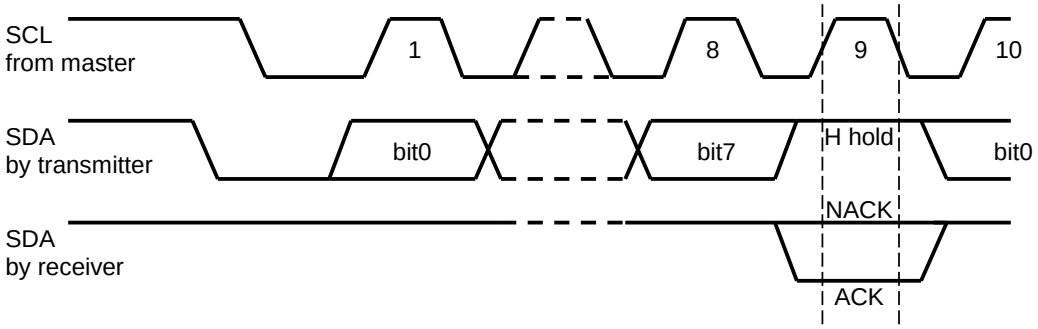
This is a signal to confirm the data reception during communication.
The receiver replies the ACK signal to show the data reception to a transmitter every time
1 byte (8-bit) of data is received. The ACK signal is sent in 9clk after sending data 8-bit matching to the SCL signal that the master generates.

- A transmitter keeps SDA output "open H" in SCL9clk.
- A receiver informs the data reception situation to a transmitter outputting the followings in SCL 9 calk ;

  When data was received: SDA output "L" (ACK)

  When no data was received: SDA output "open H" (NACK)

However, if the master is changed to the receiver, ACK is not replied after the last data reception because the bus keeps open stopping the data transmission to the slave transmitter. In this case, the slave transmitter opens the bus (open H) and is set to the stop condition reception waiting state from the master.



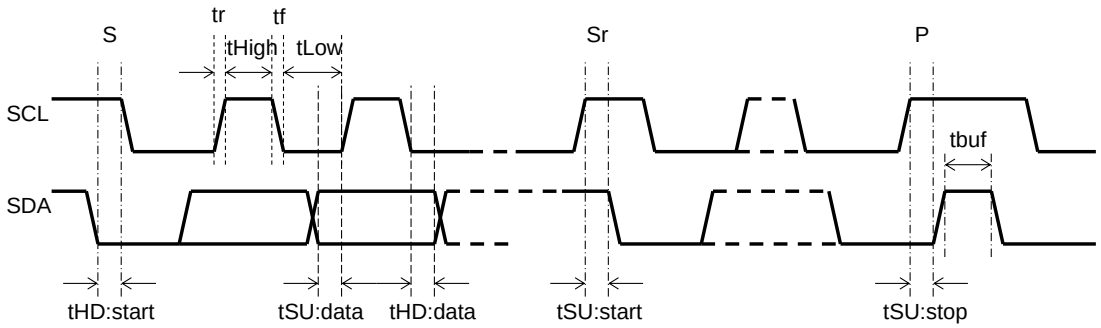
20.6 I²C Interface Input Timing

(Within recommended operating conditions)

Parameter	Symbol	Value				Unit
		SCL=100kHz		SCL=400kHz		
		Min	Max	Min	Max	
SCL clock frequency	f_{SCL}	-	100	-	400	kHz
Start condition hold time	$t_{HD:start}$	4.0	-	0.6	-	µs
Restart condition setup time	$t_{SU:start}$	4.7	-	0.6	-	µs
Stop condition setup time	$t_{SU:stop}$	4.0	-	0.6	-	µs
Stop to Start bus open time	t_{buf}	4.7	-	1.3	-	µs
SCL "L" time	t_{Low}	4.7	-	1.3	-	µs
SCL "H" time	t_{High}	4.0	-	0.6	-	µs
SCL/SDA rising time	t_r	-	1.0	-	0.3	µs
SCL/SDA falling time	t_f	-	0.3	-	0.3	µs
Data hold time	$t_{HD:data}$	0.0	-	0.0	-	µs
Data setup time	$t_{SU:data}$	0.25	-	0.10	-	µs
SCL/SDA capacitor load	C_b	-	400	-	400	pF

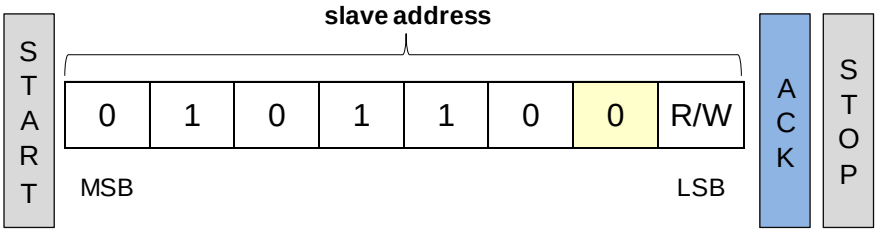
VIH/VIL level reference

Conform to I²C bus specifications



20.7 Slave Address

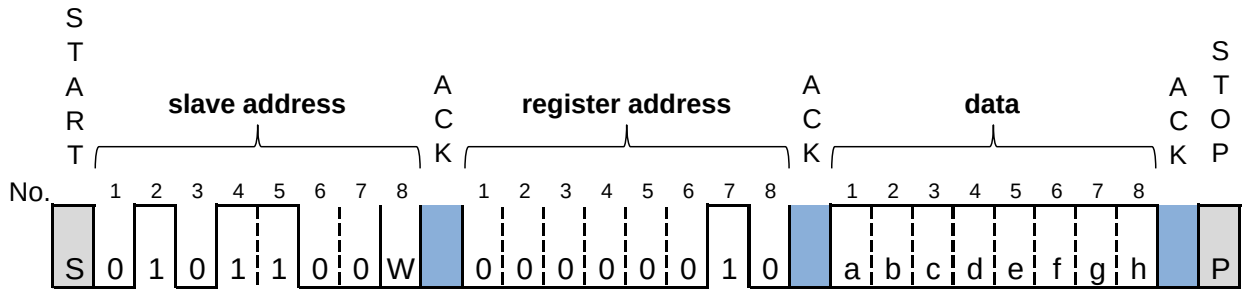
This is a slave address when communicating with the I^2C interface.
The slave address of this IC is set by the first seven bits as shown below.
The eighth bit is called the least significant bit (LSB) and determines the message direction. The bit "0" shows that information will be written from the master to the slave.
The bit "1" shows that the master reads information from the slave.
This does not support the general call address.

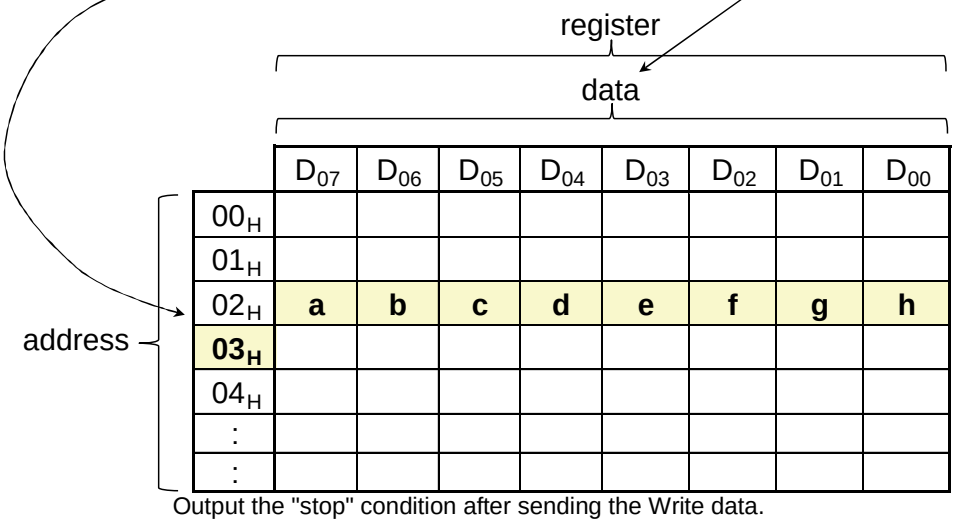


20.8 Bit Structure of Data on I²C Interface

1. Writing Data to Register and Reading Data

The data line is sent/received in the order from the most significant bit (MSB) to the least significant bit (LSB).





Output the "stop" condition after sending the Write data.

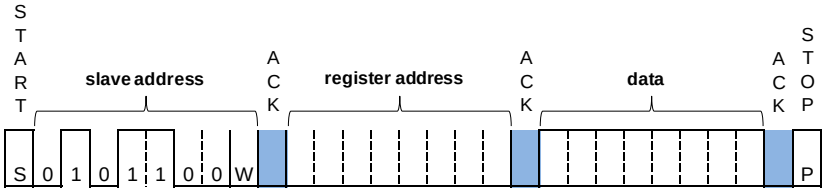
: Signal which a master sends, : Signal which this IC sends

2. I²C Interface Data Format

About I²C Communication

1. When a different slave address comes, non-matching ID is informed by not replying ACK after receiving the slave address.
2. All registers write to internal registers in the ACK signal after receiving the 8-bit data of each setting.
3. If a non-existing register address is specified, data is not written to a register.
4. Output the "stop" condition after sending the write data.

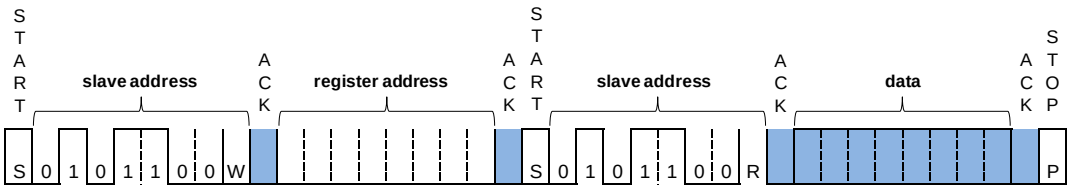
<Write (W)>



Write is allowed per one address. (Sequential writing is not allowed.)
Send register address and data as one unit.

: Signal which a master sends, : Signal which this IC sends

<Read(R)>



Read is allowed per one address. Be sure to perform read by specifying the register addresses.
(Sequential reading is not allowed.)

: Signal which a master sends, : Signal which this IC sends

21. Structure of I²C Interface and Data

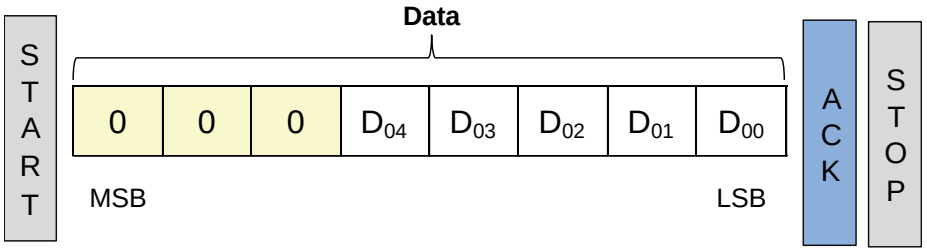
  Do not write/read FX_H and EX_H.

21.1 About DD1, DD4 Output Voltage Setting

■Address 00_H DD1 is allocated as resisters for the DC/DC output voltage setting.
Address 03_H DD4 is allocated as resisters for the DC/DC output voltage setting.

■The DC/DC output voltage setting of DD1 is controlled by writing data to address 00_H.
The DC/DC output voltage setting of DD4 is controlled by writing data to address 03_H.



address00_H: For DD1 output voltage setting
address03_H: For DD4 output voltage setting
D_{04} to D_{00}: Set the output voltage

DD1, DD4 Output Voltage Setting Table

Data	Output Voltage (V)	Data	Output Voltage (V)
00_H	0.700	10_H	1.020
01_H	0.720	11_H	1.040
02_H	0.740	12_H	1.060
03_H	0.760	13_H	1.080

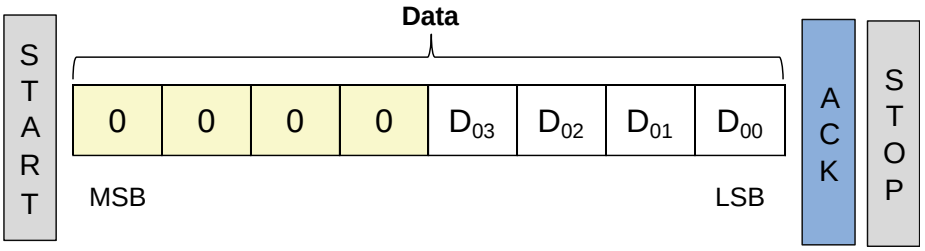
$0F_H$	1.000 (*1)	$1F_H$	1.320

*1: Preset value

21.2 About DD2 Output Voltage Setting

■Address 01_H DD2 is allocated as resisters for the DC/DC output voltage setting.

■The DC/DC output voltage setting of DD2 is controlled by writing data to address 01_H.



address01_H: For DD2 output voltage setting
D_{03} to D_{00}: Set the output voltage

DD2 Output Voltage Setting Table

Data	Output Voltage(V)
00_H	1.200 (*1)
01_H	1.250
02_H	1.300
03_H	1.350 (*1)
04_H	1.400
05_H	1.450
06_H	1.500 (*1)
07_H	1.550
08_H	1.600
09_H	1.650

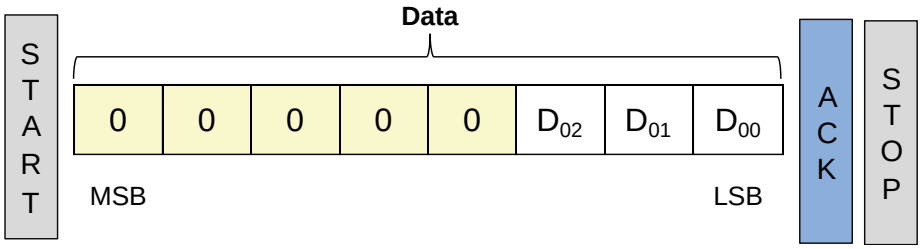
$0D_H$	1.850
$0E_H$	1.900
$0F_H$	1.950

*1: Preset value

21.3 About DD3 Output Voltage Setting

■Address 02_H DD3 is allocated as resisters for the DC/DC output voltage setting.

■The DC/DC output voltage setting of DD3 is controlled by writing data to address 02_H.



address02_H: For DD3 output voltage setting
D02 to D00: Set the output voltage

DD3 Output Voltage Setting Table

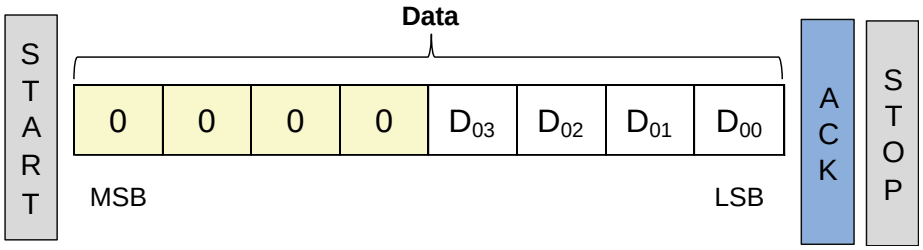
Data	Output Voltage(V)
00_H	2.80 (*1)
01_H	2.90
02_H	3.00 (*1)
03_H	3.10
04_H	3.20
05_H	3.30 (*1)
06_H	3.40
07_H	3.50 (*1)

*1: Preset value

21.4 About Soft Start Time

■Addresses 10_H to 12_H are allocated as registers for the soft start time control.

■The soft start time control is controlled by writing data to addresses 10_H to 12_H.



address10_H: For DD1 soft start time setting
address11_H: For DD2 soft start time setting
address12_H: For DD3 soft start time setting
address13_H: For DD4 soft start time setting

D_{03} to D_{00}: Set the soft start time

Tss=Tslp × Vset/Vdef (ms)

Tss: soft start time

Tslp: slope coefficient of soft start: refer to follow table

Vset: output voltage setting

Vdef: DD1=1.0, DD2=1.8, DD3= 3.3, DD4=1.0

Soft Start Time Setting

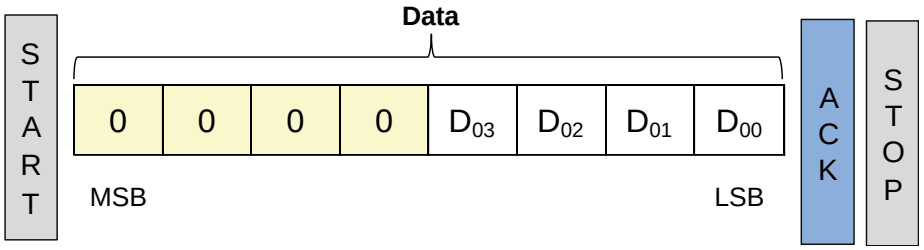
Data	Tslp	Remarks
00_H	1.0	DD1,DD2,DD3,DD4 (*1)
01_H	2.0	
02_H	3.0	
03_H	4.0	
04_H	5.0	
05_H	6.0	
06_H	7.0	
07_H	8.0	
08_H	9.0	
09_H	10.0	
$0A_H$	11.0	
$0B_H$	12.0	
$0C_H$	13.0	
$0D_H$	14.0	
$0E_H$	15.0	
$0F_H$	16.0	

*1: Preset value

21.5 DC/DC Operation Mode

■Address 20_H is allocated as a register for the DC/DC operation mode control.

■The DC/DC operation mode is controlled by writing data to address 20_H.



address20_H: For DC/DC operation mode setting
D_{01} to D_{00}: Set the DC/DC operation mode

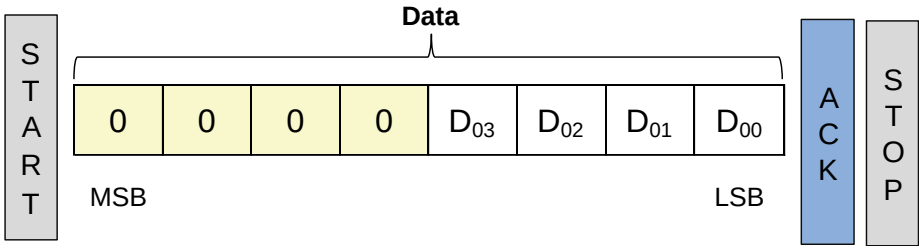
Address	Bit	Description
20_H	D00	0: DD1 Fixed PWM (*1) 1: DD1 PFM/PWM
20_H	D01	0: DD2 Fixed PWM (*1) 1: DD2 PFM/PWM
20_H	D02	0: DD3 Fixed PWM (*1) 1: DD3 PFM/PWM
20_H	D03	0: DD4 Fixed PWM (*1) 1: DD4 PFM/PWM

*1: Preset value

21.6 ON/OFF for DC/DC

■Address 30_H is allocated as a register for the DC/DC ON/OFF.

■The DC/DC ON/OFF is controlled by writing data to address 30_H.



address30_H: For DC/DC ON/OFF
D_{02} to D_{00}: Set ON/OFF for DC/DC

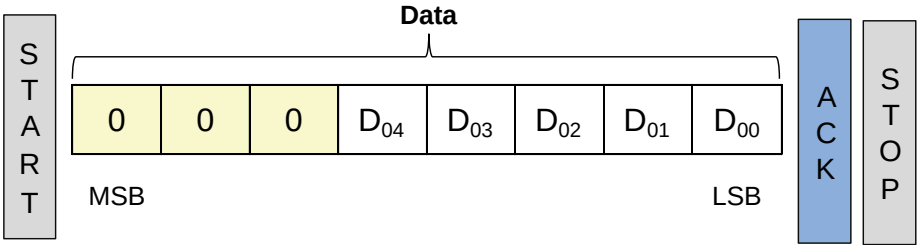
Address	Bit	Description
30_H	D00	0: DD1 output OFF (*1) 1: DD1 output ON
30_H	D01	0: DD2 output OFF (*1) 1: DD2 output ON
30_H	D02	0: DD3 output OFF (*1) 1: DD3 output ON
30_H	D03	0: DD4 output OFF (*1) 1: DD4 output ON

*1: Preset value

21.7 About Error Monitor

■Address 40_H is allocated as error status monitor of each DC/DC output and thermal shut down.

■Address 40_H is read only resistor.



address40_H: For error monitor of each DC/DC output and thermal shut down
D_{04} to D_{00}: read only resistor. (Not allowed write resistor)

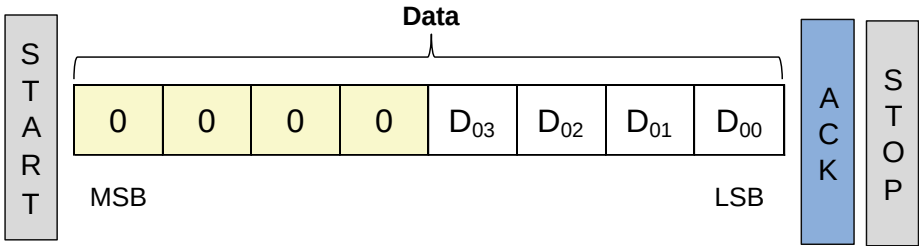
Address	Bit	Description
40_H	D00	0: DD1 OCP non detection (*1) 1: DD1 OCP detection
40_H	D01	0: DD2 OCP non detection (*1) 1: DD2 OCP detection
40_H	D02	0: DD3 OCP non detection (*1) 1: DD3 OCP detection
40_H	D03	0: DD4 OCP non detection (*1) 1: DD4 OCP detection
40_H	D04	0: TSD non detection (*1) 1: TSD detection

*1: Preset value

21.8 About Power Good Monitor

■Address 50_H is allocated as output monitor of each DC/DC output.

■Address 50_H is read only resistor.



address50_H: For output monitor of each DC/DC output.
Detection level is over 93% of DCDC output voltage setting.
D_{04} to D_{00}: read only resistor. (Not allowed write resistor)

Address	Bit	Description
50_H	D00	0: DD1 non output (*1) 1: DD1 output
50_H	D01	0: DD2 non output (*1) 1: DD2 output
50_H	D02	0: DD3 non output (*1) 1: DD3 output
50_H	D03	0: DD4 non output (*1) 1: DD4 output

*1: Preset value

FB	1.20V	1.80V	3.30V	1.20V

27. Layout

Consider the points listed below and do the layout design.

- Provide the ground plane as much as possible on the IC mounted face. GND and PGNDx provide the through hole proximal to GND and PGNDx pins of IC, and connect it with GND of internal layer.
- Provide the power plane as much as possible to lower impedance of VCC.
- Play the most attention to the loop composed of input capacitor (CPVCCx) and SWFET. Input capacitor (CPVCCx) connected with PVCCx should be placed close to the pin as much as possible to make the current loop as small as possible. Also connect the GND pin of the input capacitor with PGNDx.
- Output capacitor (CVO3) connected with VO3 should be placed close to the pin as much as possible. Also connect the GND pin of the output capacitor with PGND3.
- GND pins of the switching system parts provide the through hole at the proximal place, and connect it with GND of internal layer.
- By-pass capacitor (CVREF, CAVCC) connected with VREF and AVCC should be placed close to the pin as much as possible. Also connect the GND pin of the by-pass capacitor with GND of internal layer in the proximal through-hole.
- Pull the feedback line to be connected to the INx pin of the IC separately from near the output capacitor pin, whenever possible. Consider the line connected with INx pins to keep away from a switching system parts as much as possible because it is sensitive to the noise.
- There is leaked magnetic flux around the inductor or backside of place equipped with inductor.

Line and parts sensitive to noise should be considered to be placed away from the inductor (or backside of place equipped with inductor).

Switching system parts: Input capacitor (CPVCCx), Inductor (L), Output capacitor(CVOx)

Note:

- x: Each channel number

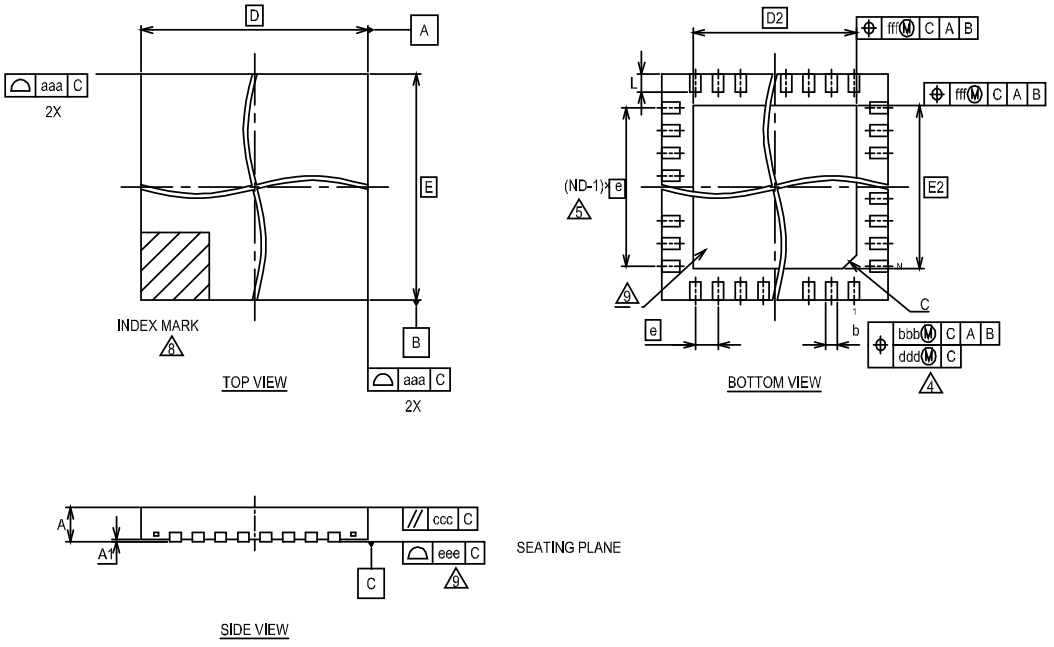
28. Package Dimensions



SYMBOL	MILLIMETER			NOTE
	MIN.	NOM.	MAX.	
A	—	—	0.75	PROFILE
A_1	0.00	—	0.05	TERMINAL HEIGHT
D		5.00 BSC.		BODY SIZE
E		5.00 BSC.		BODY SIZE
b	0.20	0.25	0.30	TERMINAL WIDTH
D_2		3.60 BSC.		EXPOSED PAD SIZE
E_2		3.60 BSC.		EXPOSED PAD SIZE
e		0.50 BSC.		TERMINAL PITCH
n		32		TERMINAL COUNT
L	0.33	0.40	0.47	TERMINAL LENGTH
C		C0.30		EXPOSED PAD CHAMFER
aaa		0.07		
bbb		0.10		
ccc		0.10		
ddd		0.05		
eee		0.05		
fff		0.10		

1. DIMENSIONING AND TOLERANCING CONFORMS TO ASME Y14.5-1994.
2. ALL DIMENSIONS ARE IN MILLIMETERS.
3. N IS THE TOTAL NUMBER OF TERMINALS.
4. DIMENSION "b" APPLIES TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.15 AND 0.30mm FROM TERMINAL TIP.IF THE TERMINAL HAS THE OPTIONAL RADIUS ON THE OTHER END OF THE TERMINAL. THE DIMENSION "b"SHOULD NOT BE MEASURED IN THAT RADIUS AREA.
5. ND REFER TO THE NUMBER OF TERMINALS ON D OR E SIDE.
6. MAX. PACKAGE WARPAGE IS 0.05mm.
7. MAXIMUM ALLOWABLE BURRS IS 0.076mm IN ALL DIRECTIONS.
8. PIN #1 ID ON TOP WILL BE LOCATED WITHIN INDICATED ZONE.
9. BILATERAL COPLANARITY ZONE APPLIES TO THE EXPOSED HEAT SINK SLUG AS WELL AS THE TERMINALS.

OCEAN CHIPS
Океан Электроники
Поставка электронных компонентов

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «**JONHON**», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «**FORSTAR**».

AVIC JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
