

# Multiple Channel 1°C Temperature Sensors with Beta Compensation

## PRODUCT FEATURES

Datasheet

### General Description

The EMC1413 / EMC1414 are high accuracy, low cost, System Management Bus (SMBus) temperature sensors. Advanced features such as Resistance Error Correction (REC), Beta Compensation (to support CPU diodes requiring the BJT/transistor model including 45nm, 65nm and 90nm processors) and automatic diode type detection combine to provide a robust solution for complex environmental monitoring applications.

The EMC1413 monitors three temperature channels and the EMC1414 monitors four temperature channels. It provides  $\pm 1^\circ\text{C}$  accuracy for both external and internal diode temperatures.

Resistance Error Correction automatically eliminates the temperature error caused by series resistance allowing greater flexibility in routing thermal diodes. Beta Compensation eliminates temperature errors caused by low, variable beta transistors common in today's fine geometry processors. The automatic beta detection feature monitors each external diode/transistor and determines the optimum sensor settings for accurate temperature measurements regardless of processor technology. This frees the user from providing unique sensor configurations for each temperature monitoring application. These advanced features plus  $\pm 1^\circ\text{C}$  measurement accuracy provide a low-cost, highly flexible and accurate solution for critical temperature monitoring applications.

### Applications

- Notebook Computers
- Desktop Computers
- Industrial
- Embedded applications

### Features

- Programmable SMBus address
- Support for diodes requiring the BJT/transistor model
  - supports 45nm, 65nm, and 90nm CPU thermal diodes
- Automatically determines external diode type and optimal settings
- Resistance Error Correction
- Up to 3 External Temperature Monitors
  - $\pm 1^\circ\text{C}$  max accuracy ( $20^\circ\text{C} < T_{\text{DIODE}} < 110^\circ\text{C}$ )
  - 0.125°C resolution
  - Supports up to 2.2nF diode filter capacitor
  - Anti-parallel diodes for extra diode support (EMC1414 only)
- Internal Temperature Monitor
  - $\pm 1^\circ\text{C}$  accuracy
  - 0.125°C resolution
- 3.3V Supply Voltage
- Programmable temperature limits for ALERT
- Available in these lead-free RoHS compliant packages
  - 10-pin 3mm x 3mm DFN
  - 10-pin MSOP

**Ordering Information:**

| ORDERING NUMBER   | PACKAGE  | FEATURES  | SMBUS ADDRESS                                    |
|-------------------|--|---|--|
| EMC1413-1-AIZL-TR | 10-pin MSOP<br>(lead-free RoHS compliant)          | Up to three temperature sensors, $\overline{\text{ALERT}}$ and $\overline{\text{THERM}}$ pins, fixed SMBus address        | 1001_100(r/w)                                    |
| EMC1413-A-AIZL-TR | 10-pin MSOP<br>(lead-free RoHS compliant)          | Up to three temperature sensors, $\overline{\text{ALERT}}$ and $\overline{\text{THERM}}$ pins, programmable SMBus address | Selectable via $\overline{\text{THERM}}$ pull-up |
| EMC1413-A-AIA-TR  | 10-pin DFN 3mm x 3mm<br>(lead-free RoHS compliant) | Up to three temperature sensors, $\overline{\text{ALERT}}$ and $\overline{\text{THERM}}$ pins, programmable SMBus address | Selectable via $\overline{\text{THERM}}$ pull-up |
| EMC1413-3-AIZL-TR | 10-pin MSOP<br>(lead-free RoHS compliant)          | Up to three temperature sensors, $\overline{\text{ALERT}}$ and $\overline{\text{THERM}}$ pins, programmable SMBus address | 0011_000(r/w)                                    |
| EMC1414-1-AIZL-TR | 10-pin MSOP<br>(lead-free RoHS compliant)          | Up to four temperature sensors, $\overline{\text{ALERT}}$ and $\overline{\text{THERM}}$ pins, fixed SMBus address         | 1001_100(r/w)                                    |
| EMC1414-A-AIZL-TR | 10-pin MSOP<br>(lead-free RoHS compliant)          | Up to four temperature sensors, $\overline{\text{ALERT}}$ and $\overline{\text{THERM}}$ pins, programmable SMBus address  | Selectable via $\overline{\text{THERM}}$ pull-up |
| EMC1414-A-AIA-TR  | 10-pin DFN 3mm x 3mm<br>(lead-free RoHS compliant) | Up to four temperature sensors, $\overline{\text{ALERT}}$ and $\overline{\text{THERM}}$ pins, programmable SMBus address  | Selectable via $\overline{\text{THERM}}$ pull-up |

**REEL SIZE IS 4,000 PIECES**

**This product meets the halogen maximum concentration values per IEC61249-2-21**

## Chapter 3 Pin Description

Figure 3.1 EMC1413 / 1414 Pin Diagram, MSOP-10

Figure 3.2 EMC1413 / EMC1414 Pin Diagram, DFN-10

Table 3.1 EMC1413 / EMC1414 Pin Description

| PIN NUMBER | NAME      | FUNCTION  | TYPE  |
|------------|-----------|---|-------|
| 1          | VDD       | Power supply  | Power |
| 2          | DP1       | External diode 1 positive (anode) connection  | AIO   |
| 3          | DN1       | External diode 1 negative (cathode) connection  | AIO   |
| 4          | DP2 / DN3 | External diode 2 positive (anode) connection / External Diode 3 negative (cathode) connection for anti-parallel diodes (EMC1414 only) | AIO   |
| 5          | DN2 / DP3 | External diode 2 negative (cathode) connection / External Diode 3 positive (anode) connection for anti-parallel diodes (EMC1414 only) | AIO   |
| 6          | GND       | Ground  | Power |

Table 3.1 EMC1413 / EMC1414 Pin Description (continued)

| PIN NUMBER | NAME                             | FUNCTION   | TYPE      |
|------------|----------------------------------|--|-----------|
| 7          | $\overline{\text{THERM}}$ / ADDR | THERM - Critical $\overline{\text{THERM}}$ output signal - requires pull-up resistor | OD (5V)   |
|            |                                  | ADDR - Selects SMBus address based on pull-up resistor                               | OD (5V)   |
| 8          | $\overline{\text{ALERT}}$        | Active low digital $\overline{\text{ALERT}}$ output signal - requires pull-up resist | OD (5V)   |
| 9          | SMDATA                           | SMBus Data input/output - requires pull-up resistor                                  | DIOD (5V) |
| 10         | SMCLK                            | SMBus Clock input - requires pull-up resistor  | DI (5V)   |
| Bottom Pad | Exposed Pad                      | Not internally connected, but recommend grounding.                                   | -         |

**APPLICATION NOTE:** For the 5V tolerant pins that have a pull-up resistor (SMCLK, SMDATA,  $\overline{\text{THERM}}$ , and  $\overline{\text{ALERT}}$ ), the voltage difference between VDD and the pull-up voltage must never exceed 3.6V.

The pin types are described [Table 3.2](#).

Table 3.2 Pin Types

| PIN TYPE | DESCRIPTION   |
|----------|---|
| Power    | This pin is used to supply power or ground to the device.   |
| AIO      | Analog Input / Output -This pin is used as an I/O for analog signals.   |
| DI       | Digital Input - This pin is used as a digital input. This pin is 5V tolerant.   |
| DIOD     | Digital Input / Open Drain Output - This pin is used as a digital I/O. When it is used as an output, it is open drain and requires a pull-up resistor. This pin is 5V tolerant. |
| OD       | Open Drain Digital Output - This pin is used as a digital output. It is open drain and requires a pull-up resistor. This pin is 5V tolerant.                                    |

## Chapter 4 Electrical Specifications

### 4.1 Absolute Maximum Ratings

**Table 4.1 Absolute Maximum Ratings**

| DESCRIPTION   | RATING                         | UNIT |
|---|--------------------------------|------|
| Supply Voltage ( $V_{DD}$ )   | -0.3 to 4.0                    | V    |
| Voltage on 5V tolerant pins ( $V_{5VT\_pin}$ )  | -0.3 to 5.5                    | V    |
| Voltage on 5V tolerant pins ( $ V_{5VT\_pin} - V_{DD} $ ) (see <a href="#">Note 4.1</a> ) | 0 to 3.6                       | V    |
| Voltage on any other pin to Ground  | -0.3 to $V_{DD} + 0.3$         | V    |
| Operating Temperature Range   | -40 to +125                    | °C   |
| Storage Temperature Range   | -55 to +150                    | °C   |
| Lead Temperature Range  | Refer to JEDEC Spec. J-STD-020 |      |
| Package Thermal Characteristics for MSOP-10   |                                |      |
| Thermal Resistance ( $\theta_{j-a}$ )   | 132.2                          | °C/W |
| Package Thermal Characteristics for DFN-10  |                                |      |
| Thermal Resistance ( $\theta_{j-a}$ )   | 77.1                           | °C/W |
| ESD Rating, All pins HBM  | 2000                           | V    |

**Note:** Stresses at or above those listed could cause permanent damage to the device. This is a stress rating only and functional operation of the device at any other condition above those indicated in the operation sections of this specification is not implied.

**Note 4.1** For the 5V tolerant pins that have a pull-up resistor (SMCLK, SMDATA,  $\overline{THERM}$ , and ALERT), the pull-up voltage must not exceed 3.6V when the device is unpowered.

## 4.2 Electrical Specifications

Table 4.2 Electrical Specifications

| V <sub>DD</sub> = 3.0V to 3.6V, T <sub>A</sub> = -40°C to 125°C, all typical values at T <sub>A</sub> = 27°C unless otherwise noted. |                     |     |       |      |       |  |
|--|---------------------|-----|-------|------|-------|--|
| CHARACTERISTIC   | SYMBOL              | MIN | TYP   | MAX  | UNITS | CONDITIONS   |
| DC Power   |                     |     |       |      |       |  |

| Clock High Period  | t <sub>HIGH</sub>   | 0.6  |     |                 | µs    |   |
| Clock/Data Fall time   | t <sub>FALL</sub>   |      |     | 300             | ns    | Min = 20+0.1C <sub>LOAD</sub> ns              |
| Clock/Data Rise time   | t <sub>RISE</sub>   |      |     | 300             | ns    | Min = 20+0.1C <sub>LOAD</sub> ns              |
| Capacitive Load  | C <sub>LOAD</sub>   |      |     | 400             | pF    | per bus line                                  |

## Chapter 5 System Management Bus Interface Protocol

### 5.1 Communications Protocol

The EMC1413 / EMC1414 communicates with a host controller, such as an SMSC SIO, through the SMBus. The SMBus is a two-wire serial communication protocol between a computer host and its peripheral devices. A detailed timing diagram is shown in [Figure 5.1](#).

For the first 15ms after power-up the device may not respond to SMBus communications.

Figure 5.1 SMBus Timing Diagram

#### 5.1.1 SMBus Start Bit

The SMBus Start bit is defined as a transition of the SMBus Data line from a logic '1' state to a logic '0' state while the SMBus Clock line is in a logic '1' state.

#### 5.1.2 SMBus Address and RD / $\overline{\text{WR}}$ Bit

The SMBus Address Byte consists of the 7-bit client address followed by the RD /  $\overline{\text{WR}}$  indicator bit. If this RD /  $\overline{\text{WR}}$  bit is a logic '0', the SMBus Host is writing data to the client device. If this RD /  $\overline{\text{WR}}$  bit is a logic '1', the SMBus Host is reading data from the client device.

The EMC1413-A and EMC1414-A SMBus slave address is determined by the pull-up resistor on the THERM pin as shown in [Table 5.1](#), "SMBus Address Decode".

The Address decode is performed by pulling known currents from VDD through the external resistor causing the pin voltage to drop based on the respective current / resistor relationship. This pin voltage is compared against a threshold that determines the value of the pull-up resistor.

Table 5.1 SMBus Address Decode

| PULL UP RESISTOR ON THERM PIN ( $\pm 5\%$ ) | SMBUS ADDRESS  |
|---|----------------|
| 4.7k  | 1111_100(r/w)b |
| 6.8k  | 1011_100(r/w)b |
| 10k   | 1001_100(r/w)b |

**Table 5.1 SMBus Address Decode (continued)**

| PULL UP RESISTOR ON THERM PIN ( $\pm 5\%$ ) | SMBUS ADDRESS  |
|---|----------------|
| 15k   | 1101_100(r/w)b |
| 22k   | 0011_100(r/w)b |
| 33k   | 0111_100(r/w)b |

The EMC1413-1 SMBus address is hard coded to 1001\_100(r/w).

The EMC1413-3 SMBus address is hard coded to 0011\_000(r/w).

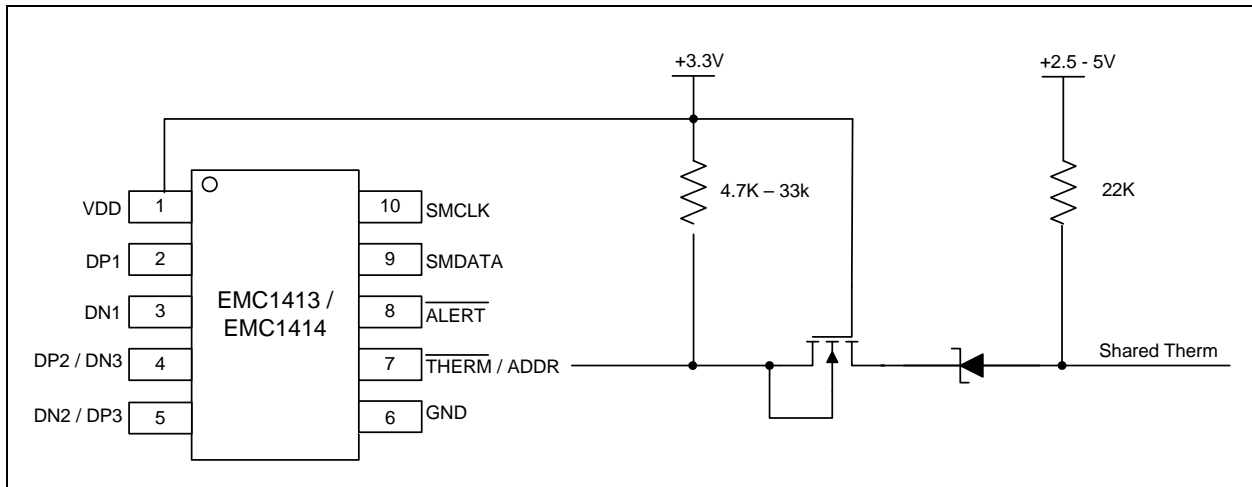

The EMC1414-1 SMBus address is hard coded to 1001\_100(r/w).

### 5.1.3 THERM Pin Considerations

Because of the decode method used to determine the SMBus Address, it is important that the pull-up resistance on the THERM pin be within the tolerances shown in Table 5.1. Additionally, the pull-up resistor on the THERM pin must be connected to the same 3.3V supply that drives the VDD pin.

For 15ms after power up, the THERM pin must not be pulled low or the SMBus address will not be decoded properly. If the system requirements do not permit these conditions, the THERM pin must be isolated from its hard-wired OR'd bus during this time.

One method of isolating this pin is shown in Figure 5.2.

**Figure 5.2 Isolating THERM Pin**

### 5.1.4 SMBus Data Bytes

All SMBus Data bytes are sent most significant bit first and composed of 8-bits of information.

### 5.1.5 SMBus ACK and NACK Bits

The SMBus client will acknowledge all data bytes that it receives. This is done by the client device pulling the SMBus data line low after the 8th bit of each byte that is transmitted. This applies to the Write Byte protocol.

The Host will NACK (not acknowledge) the last data byte to be received from the client by holding the SMBus data line high after the 8th data bit has been sent.

### 5.1.6 SMBus Stop Bit

The SMBus Stop bit is defined as a transition of the SMBus Data line from a logic '0' state to a logic '1' state while the SMBus clock line is in a logic '1' state. When the device detects an SMBus Stop bit and it has been communicating with the SMBus protocol, it will reset its client interface and prepare to receive further communications.

### 5.1.7 SMBus Timeout

The EMC1413 / EMC1414 supports SMBus Timeout. If the clock line is held low for longer than 30ms, the device will reset its SMBus protocol. This function can be enabled by setting the TIMEOUT bit in the Consecutive Alert Register (see [Section 7.12](#)).

### 5.1.8 SMBus and I<sup>2</sup>C Compatibility

The EMC1413 / EMC1414 is compatible with SMBus and I<sup>2</sup>C. The major differences between SMBus and I<sup>2</sup>C devices are highlighted here. For more information, refer to the SMBus 2.0 and I<sup>2</sup>C specifications. For information on using the EMC1413 / EMC1414 in an I<sup>2</sup>C system, refer to SMSC AN 14.0 SMSC Dedicated Slave Devices in I<sup>2</sup>C Systems.

1. EMC1413 / EMC1414 supports I<sup>2</sup>C fast mode at 400kHz. This covers the SMBus max time of 100kHz.
2. Minimum frequency for SMBus communications is 10kHz.
3. The SMBus client protocol will reset if the clock is held at a logic '0' for longer than 30ms. This timeout functionality is disabled by default in the EMC1413 / EMC1414 and can be enabled by writing to the TIMEOUT bit. I<sup>2</sup>C does not have a timeout.
4. I<sup>2</sup>C devices do not support the Alert Response Address functionality (which is optional for SMBus).

Attempting to communicate with the EMC1413 / EMC1414 SMBus interface with an invalid slave address or invalid protocol will result in no response from the device and will not affect its register contents. Stretching of the SMCLK signal is supported, provided other devices on the SMBus control the timing.

## 5.2 SMBus Protocols

The device supports Send Byte, Read Byte, Write Byte, Receive Byte, and the Alert Response Address as valid protocols as shown below.

All of the below protocols use the convention in [Table 5.2](#).

**Table 5.2 Protocol Format**

| DATA SENT TO DEVICE | DATA SENT TO THE HOST |
|---------------------|-----------------------|
| # of bits sent      | # of bits sent        |

### 5.2.1 Write Byte

The Write Byte is used to write one byte of data to the registers, as shown in [Table 5.3](#).

**Table 5.3 Write Byte Protocol**

| START  | SLAVE ADDRESS | WR | ACK | REGISTER ADDRESS | ACK | REGISTER DATA | ACK | STOP   |
|--------|---------------|----|-----|------------------|-----|---------------|-----|--------|
| 1 -> 0 | YYYY_YYY      | 0  | 0   | XXh              | 0   | XXh           | 0   | 0 -> 1 |

### 5.2.2 Read Byte

The Read Byte protocol is used to read one byte of data from the registers as shown in [Table 5.4](#).

**Table 5.4 Read Byte Protocol**

| START  | SLAVE ADDRESS | WR | ACK | REGISTER ADDRESS | ACK | START  | SLAVE ADDRESS | RD | ACK | REGISTER DATA | NACK | STOP   |
|--------|---------------|----|-----|------------------|-----|--------|---------------|----|-----|---------------|------|--------|
| 1 -> 0 | YYYY_YYY      | 0  | 0   | XXh              | 0   | 1 -> 0 | YYYY_YYY      | 1  | 0   | XX            | 1    | 0 -> 1 |

### 5.2.3 Send Byte

The Send Byte protocol is used to set the internal address register pointer to the correct address location. No data is transferred during the Send Byte protocol as shown in [Table 5.5](#).

**Table 5.5 Send Byte Protocol**

| START  | SLAVE ADDRESS | WR | ACK | REGISTER ADDRESS | ACK | STOP   |
|--------|---------------|----|-----|------------------|-----|--------|
| 1 -> 0 | YYYY_YYY      | 0  | 0   | XXh              | 0   | 0 -> 1 |

### 5.2.4 Receive Byte

The Receive Byte protocol is used to read data from a register when the internal register address pointer is known to be at the right location (e.g. set via Send Byte). This is used for consecutive reads of the same register as shown in [Table 5.6](#).

**Table 5.6 Receive Byte Protocol**

| START  | SLAVE ADDRESS | RD | ACK | REGISTER DATA | NACK | STOP   |
|--------|---------------|----|-----|---------------|------|--------|
| 1 -> 0 | YYYY_YYY      | 1  | 0   | XXh           | 1    | 0 -> 1 |

## 5.3 Alert Response Address

The  $\overline{\text{ALERT}}$  output can be used as a processor interrupt or as an SMBus Alert.

When it detects that the  $\overline{\text{ALERT}}$  pin is asserted, the host will send the Alert Response Address (ARA) to the general address of 0001\_100xb. All devices with active interrupts will respond with their client address as shown in [Table 5.7](#).

**Table 5.7 Alert Response Address Protocol**

| START  | ALERT RESPONSE ADDRESS | RD | ACK | DEVICE ADDRESS | NACK | STOP   |
|--------|------------------------|----|-----|----------------|------|--------|
| 1 -> 0 | 0001_100               | 1  | 0   | YYYY_YYY       | 1    | 0 -> 1 |

The EMC1413 / EMC1414 will respond to the ARA in the following way:

1. Send Slave Address and verify that full slave address was sent (i.e. the SMBus communication from the device was not prematurely stopped due to a bus contention event).
2. Set the MASK bit to clear the  $\overline{\text{ALERT}}$  pin.

**APPLICATION NOTE:** The ARA does not clear the Status Register and if the MASK bit is cleared prior to the Status Register being cleared, the  $\overline{\text{ALERT}}$  pin will be reasserted.

## Chapter 6 Product Description

The EMC1413 / EMC1414 is an SMBus temperature sensor. The EMC1413 and EMC1414 monitor one internal diode and up to two (EMC1413) or three (EMC1414) externally connected temperature diodes.

Thermal management is performed in cooperation with a host device. This consists of the host reading the temperature data of both the external and internal temperature diodes of the EMC1413 / EMC1414 and using that data to control the speed of one or more fans.

The EMC1413 and EMC1414 have two levels of monitoring. The first provides a maskable  $\overline{\text{ALERT}}$  signal to the host when the measured temperatures exceeds user programmable limits. This allows the EMC1413 and EMC1414 to be used as an independent thermal watchdog to warn the host of temperature hot spots without direct control by the host. The second level of monitoring provides a non maskable interrupt on the  $\overline{\text{THERM}}$  pin if the measured temperatures meet or exceed a second programmable limit.

For the EMC1414, External Diode channels 2 and 3 are only compatible with general purpose diodes (such as a 2N3904). For the EMC1413, the External Diode 2 channel is compatible with any diode type.

Figure 6.1 shows a system level block diagram of the EMC1414 and Figure 6.2 shows a system level block diagram of the EMC1413.

Figure 6.1 System Diagram for EMC1414

Figure 6.2 System Diagram for EMC1413

## 6.1 Modes of Operation

The EMC1413 and EMC1414 have two modes of operation.

- Active (Run) - In this mode of operation, the ADC is converting on all temperature channels at the programmed conversion rate. The temperature data is updated at the end of every conversion and the limits are checked. In Active mode, writing to the one-shot register will do nothing.
- Standby (Stop) - In this mode of operation, the majority of circuitry is powered down to reduce supply current. The temperature data is not updated and the limits are not checked. In this mode of operation, the SMBus is fully active and the part will return requested data. Writing to the one-shot register will enable the device to update all temperature channels. Once all the channels are updated, the device will return to the Standby mode.

### 6.1.1 Conversion Rates

The EMC1413 / EMC1414 may be configured for different conversion rates based on the system requirements. The conversion rate is configured as described in [Section 7.5](#). The default conversion rate is 4 conversions per second. Other available conversion rates are shown in [Table 7.6, "Conversion Rate"](#).

### 6.1.2 Dynamic Averaging

Dynamic averaging causes the EMC1413 / EMC1414 to measure the external diode channels for an extended time based on the selected conversion rate. This functionality can be disabled for increased power savings at the lower conversion rates (see [Section 7.4, "Configuration Register"](#)). When dynamic averaging is enabled, the device will automatically adjust the sampling and measurement time for the external diode channels. This allows the device to average 2x or 16x longer than the normal 11 bit operation (nominally 21ms per channel) while still maintaining the selected conversion rate. The benefits of dynamic averaging are improved noise rejection due to the longer integration time as well as less random variation of the temperature measurement.

When enabled, the dynamic averaging applies when a one-shot command is issued. The device will perform the desired averaging during the one-shot operation according to the selected conversion rate.

When enabled, the dynamic averaging will affect the average supply current based on the chosen conversion rate as shown in [Table 6.1](#).

**Table 6.1 Supply Current vs. Conversion Rate for EMC1413 / EMC1414**

| CONVERSION RATE   | AVERAGE SUPPLY CURRENT |          | AVERAGING FACTOR (BASED ON 11-BIT OPERATION) |          |
|-------------------|------------------------|----------|--|----------|
|                   | ENABLED (DEFAULT)      | DISABLED | ENABLED (DEFAULT)                            | DISABLED |
| 1 / 16 sec        | 660uA                  | 430uA    | 16x  | 1x       |
| 1 / 8 sec         | 660uA                  | 430uA    | 16x  | 1x       |
| 1 / 4 sec         | 660uA                  | 430uA    | 16x  | 1x       |
| 1 / 2 sec         | 660uA                  | 430uA    | 16x  | 1x       |
| 1 / sec           | 660uA                  | 430uA    | 8x   | 1x       |
| 2 / sec           | 930uA                  | 475uA    | 4x   | 1x       |
| 4 / sec (default) | 950uA                  | 510uA    | 2x   | 1x       |
| 8 / sec           | 1010uA                 | 630uA    | 1x   | 1x       |
| 16 / sec          | 1020uA                 | 775uA    | 0.5x   | 0.5x     |
| 32 / sec          | 1050uA                 | 1050uA   | 0.25x  | 0.25x    |
| 64 / sec          | 1100uA                 | 1100uA   | 0.125x                                       | 0.125x   |

## 6.2 THERM Output

The  $\overline{\text{THERM}}$  output is asserted independently of the  $\overline{\text{ALERT}}$  output and cannot be masked. Whenever any of the measured temperatures exceed the user programmed Therm Limit values for the programmed number of consecutive measurements, the  $\overline{\text{THERM}}$  output is asserted. Once it has been asserted, it will remain asserted until all measured temperatures drop below the Therm Limit minus the Therm Hysteresis (also programmable).

When the  $\overline{\text{THERM}}$  pin is asserted, the THERM status bits will likewise be set. Reading these bits will not clear them until the  $\overline{\text{THERM}}$  pin is deasserted. Once the  $\overline{\text{THERM}}$  pin is deasserted, the THERM status bits will be automatically cleared.

## 6.3 ALERT Output

The  $\overline{\text{ALERT}}$  pin is an open drain output and requires a pull-up resistor to  $V_{DD}$  and has two modes of operation: interrupt mode and comparator mode. The mode of the  $\overline{\text{ALERT}}$  output is selected via the ALERT / COMP bit in the Configuration Register (see [Section 7.4](#)).

### 6.3.1 ALERT Pin Interrupt Mode

When configured to operate in interrupt mode, the  $\overline{\text{ALERT}}$  pin asserts low when an out of limit measurement ( $\geq$  high limit or  $<$  low limit) is detected on any diode or when a diode fault is detected. The  $\overline{\text{ALERT}}$  pin will remain asserted as long as an out-of-limit condition remains. Once the out-of-limit condition has been removed, the  $\overline{\text{ALERT}}$  pin will remain asserted until the appropriate status bits are cleared.

The  $\overline{\text{ALERT}}$  pin can be masked by setting the MASK\_ALL bit. Once the  $\overline{\text{ALERT}}$  pin has been masked, it will be de-asserted and remain de-asserted until the MASK\_ALL bit is cleared by the user. Any interrupt conditions that occur while the  $\overline{\text{ALERT}}$  pin is masked will update the Status Register normally. There are also individual channel masks (see [Section 7.11](#)).

The  $\overline{\text{ALERT}}$  pin is used as an interrupt signal or as an SMBus Alert signal that allows an SMBus slave to communicate an error condition to the master. One or more  $\overline{\text{ALERT}}$  outputs can be hard-wired together.

### 6.3.2 $\overline{\text{ALERT}}$ Pin Comparator Mode

When the  $\overline{\text{ALERT}}$  pin is configured to operate in comparator mode, it will be asserted if any of the measured temperatures exceeds the respective high limit. The  $\overline{\text{ALERT}}$  pin will remain asserted until all temperatures drop below the corresponding high limit minus the Therm Hysteresis value.

When the  $\overline{\text{ALERT}}$  pin is asserted in comparator mode, the corresponding high limit status bits will be set. Reading these bits will not clear them until the  $\overline{\text{ALERT}}$  pin is deasserted. Once the  $\overline{\text{ALERT}}$  pin is deasserted, the status bits will be automatically cleared.

The MASK\_ALL bit will not block the  $\overline{\text{ALERT}}$  pin in this mode; however, the individual channel masks (see Section 7.11) will prevent the respective channel from asserting the  $\overline{\text{ALERT}}$  pin.

## 6.4 Temperature Measurement

The EMC1413 / EMC1414 can monitor the temperature of up to two / three externally connected diodes. Each external diode channel is configured with Resistance Error Correction and Beta Compensation based on user settings and system requirements.

The device contains programmable High, Low, and Therm limits for all measured temperature channels. If the measured temperature goes below the Low limit or above the High limit, the  $\overline{\text{ALERT}}$  pin can be asserted (based on user settings). If the measured temperature meets or exceeds the Therm Limit, the  $\overline{\text{THERM}}$  pin is asserted unconditionally, providing two tiers of temperature detection.

### 6.4.1 Beta Compensation

The EMC1413 / EMC1414 is configured to monitor the temperature of basic diodes (e.g., 2N3904) or CPU thermal diodes. It automatically detects the type of external diode (CPU diode or diode connected transistor) and determines the optimal setting to reduce temperature errors introduced by beta variation. Compensating for this error is also known as implementing the transistor or BJT model for temperature measurement.

For discrete transistors configured with the collector and base shorted together, the beta is generally sufficiently high such that the percent change in beta variation is very small. For example, a 10% variation in beta for two forced emitter currents with a transistor whose ideal beta is 50 would contribute approximately 0.25°C error at 100°C. However for substrate transistors where the base-emitter junction is used for temperature measurement and the collector is tied to the substrate, the proportional beta variation will cause large error. For example, a 10% variation in beta for two forced emitter currents with a transistor whose ideal beta is 0.5 would contribute approximately 8.25°C error at 100°C.

For the EMC1414, the External Diode 2 and External Diode 3 channels do not support Beta Compensation.

### 6.4.2 Resistance Error Correction (REC)

Parasitic resistance in series with the external diodes will limit the accuracy obtainable from temperature measurement devices. The voltage developed across this resistance by the switching diode currents cause the temperature measurement to read higher than the true temperature. Contributors to series resistance are PCB trace resistance, on die (i.e. on the processor) metal resistance, bulk resistance in the base and emitter of the temperature transistor. Typically, the error caused by series resistance is +0.7°C per ohm. The EMC1413 / EMC1414 automatically corrects up to 100 ohms of series resistance.

### 6.4.3 Programmable External Diode Ideality Factor

The EMC1413 / EMC1414 is designed for external diodes with an ideality factor of 1.008. Not all external diodes, processor or discrete, will have this exact value. This variation of the ideality factor introduces error in the temperature measurement which must be corrected for. This correction is

typically done using programmable offset registers. Since an ideality factor mismatch introduces an error that is a function of temperature, this correction is only accurate within a small range of temperatures. To provide maximum flexibility to the user, the EMC1413 / EMC1414 provides a 6-bit register for each external diode where the ideality factor of the diode used is programmed to eliminate errors across all temperatures.

**APPLICATION NOTE:** When monitoring a substrate transistor or CPU diode and beta compensation is enabled, the Ideality Factor should not be adjusted. Beta Compensation automatically corrects for most ideality errors.

## 6.5 Diode Faults

The EMC1413 / EMC1414 detects an open on the DP and DN pins, and a short across the DP and DN pins. For each temperature measurement made, the device checks for a diode fault on the external diode channel(s). When a diode fault is detected, the ALERT pin asserts (unless masked, see [Section 6.6](#)) and the temperature data reads 00h in the MSB and LSB registers (note: the low limit will not be checked). A diode fault is defined as one of the following: an open between DP and DN, a short from  $V_{DD}$  to DP, or a short from  $V_{DD}$  to DN.

If a short occurs across DP and DN or a short occurs from DP to GND, the low limit status bit is set and the ALERT pin asserts (unless masked). This condition is indistinguishable from a temperature measurement of 0.000°C (-64°C in extended range) resulting in temperature data of 00h in the MSB and LSB registers.

If a short from DN to GND occurs (with a diode connected), temperature measurements will continue as normal with no alerts.

## 6.6 Consecutive Alerts

The EMC1413 / EMC1414 contain multiple consecutive alert counters. One set of counters applies to the ALERT pin and the second set of counters applies to the THERM pin. Each temperature measurement channel has a separate consecutive alert counter for each of the ALERT and THERM pins. All counters are user programmable and determine the number of consecutive measurements that a temperature channel(s) must be out-of-limit or reporting a diode fault before the corresponding pin is asserted.

See [Section 7.12, "Consecutive ALERT Register"](#) for more details on the consecutive alert function.

## 6.7 Digital Filter

To reduce the effect of noise and temperature spikes on the reported temperature, the External Diode 1 channel uses a programmable digital filter. This filter can be configured as Level 1, Level 2, or Disabled (default) (see [Section 7.18](#)). The typical filter performance is shown in [Figure 6.3](#) and [Figure 6.4](#).

Figure 6.3 Temperature Filter Step Response

Figure 6.4 Temperature Filter Impulse Response

## 6.8 Temperature Measurement Results and Data

The temperature measurement results are stored in the internal and external temperature registers. These are then compared with the values stored in the high and low limit registers. Both external and internal temperature measurements are stored in 11-bit format with the eight (8) most significant bits stored in a high byte register and the three (3) least significant bits stored in the three (3) MSB positions of the low byte register. All other bits of the low byte register are set to zero.

The EMC1413 / EMC1414 has two selectable temperature ranges. The default range is from 0°C to +127°C and the temperature is represented as binary number able to report a temperature from 0°C to +127.875°C in 0.125°C steps.

The extended range is an extended temperature range from -64°C to +191°C. The data format is a binary number offset by 64°C. The extended range is used to measure temperature diodes with a large known offset (such as AMD processor diodes) where the diode temperature plus the offset would be equivalent to a temperature higher than +127°C.

Table 6.2 shows the default and extended range formats.

**Table 6.2 Temperature Data Format**

| TEMPERATURE (°C) | DEFAULT RANGE 0°C TO 127°C                | EXTENDED RANGE -64°C TO 191°C             |
|------------------|---|---|
| Diode Fault      | 000 0000 0000                             | 000 0000 0000                             |
| -64              | 000 0000 0000                             | 000 0000 0000<br><a href="#">Note 6.2</a> |
| -1               | 000 0000 0000                             | 001 1111 1000                             |
| 0                | 000 0000 0000<br><a href="#">Note 6.1</a> | 010 0000 0000                             |
| 0.125            | 000 0000 0001                             | 010 0000 0001                             |
| 1                | 000 0000 1000                             | 010 0000 1000                             |
| 64               | 010 0000 0000                             | 100 0000 0000                             |
| 65               | 010 0000 1000                             | 100 0000 1000                             |
| 127              | 011 1111 1000                             | 101 1111 1000                             |
| 127.875          | 011 1111 1111                             | 101 1111 1111                             |
| 128              | 011 1111 1111<br><a href="#">Note 6.3</a> | 110 0000 0000                             |
| 190              | 011 1111 1111                             | 111 1111 0000                             |
| 191              | 011 1111 1111                             | 111 1111 1000                             |
| >= 191.875       | 011 1111 1111                             | 111 1111 1111<br><a href="#">Note 6.4</a> |

**Note 6.1** In default mode, all temperatures < 0°C will be reported as 0°C.

**Note 6.2** In the extended range, all temperatures < -64°C will be reported as -64°C.

**Note 6.3** For the default range, all temperatures > +127.875°C will be reported as +127.875°C.

**Note 6.4** For the extended range, all temperatures > +191.875°C will be reported as +191.875°C.

## 6.9 Anti-parallel Diode Connections

The EMC1414 supports reading two external diodes on the same set of pins (DP2, DN2). These diodes are connected as shown in [Figure 6.1](#). Due to the anti-parallel connection of these diodes, both diodes will be reverse biased by a  $V_{BE}$  voltage (approximately 0.7V). Because of this reverse bias, only discrete thermal diodes (such as a 2N3904) are recommended to be placed on these pins.

## 6.10 External Diode Connections

The EMC1413 / EMC1414 can be configured to measure a CPU substrate transistor, a discrete 2N3904 thermal diode, or an AMD processor diode on the External Diode 1 channel only. For the EMC1414 the External Diode 2 and External Diode 3 channels are configured to measure a pair of discrete anti-parallel diodes (shared on pins DP2 and DN2). The supported configurations for the external diode channels are shown in [Figure 6.5](#).

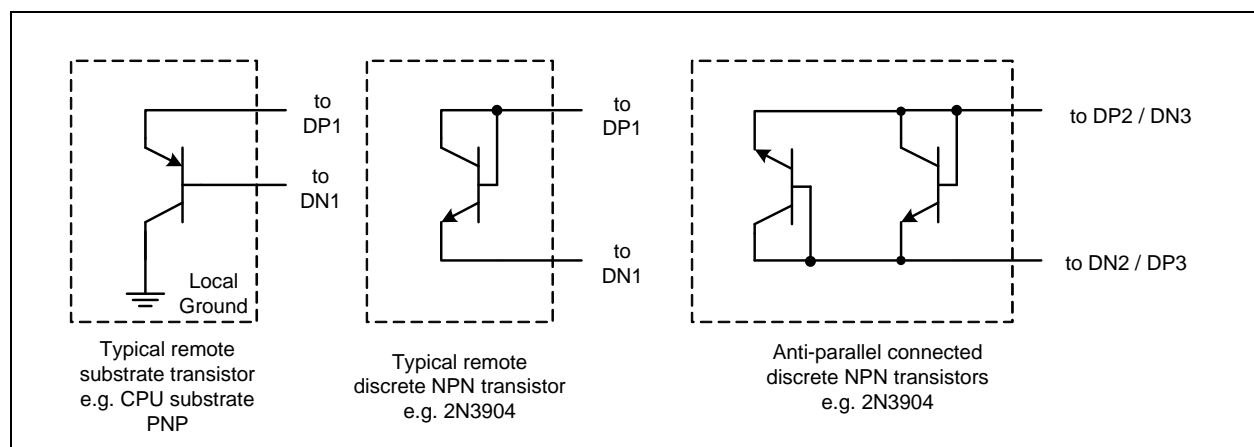

Figure 6.5 Diode Configurations

## Chapter 7 Register Description

The registers shown in [Table 7.1](#) are accessible through the SMBus. An entry of '-' indicates that the bit is not used and will always read '0'.

**Table 7.1 Register Set in Hexadecimal Order**

| REGISTER ADDRESS | R/W | REGISTER NAME                         | FUNCTION   | DEFAULT VALUE | PAGE    |
|------------------|-----|---------------------------------------|--|---------------|---------|

| 35h              | R-C | High Limit Status                     | Status bits for the High Limits  | 00h                                 | Page 40 |
| 36h              | R-C | Low Limit Status                      | Status bits for the Low Limits   | 00h                                 | Page 41 |

Table 7.1 Register Set in Hexadecimal Order (continued)

| REGISTER ADDRESS | R/W | REGISTER NAME        | FUNCTION   | DEFAULT VALUE | PAGE                    |
|------------------|-----|----------------------|--|---------------|-------------------------|
| 37h              | R   | Therm Limit Status   | Status bits for the Therm Limits                                     | 00h           | <a href="#">Page 41</a> |
| 40h              | R/W | Filter Control       | Controls the digital filter setting for the External Diode 1 channel | 00h           | <a href="#">Page 42</a> |
| FDh              | R   | Product ID (EMC1413) | Stores a fixed value that identifies the device                      | 21h           | <a href="#">Page 42</a> |
| FDh              | R   | Product ID (EMC1414) | Stores a fixed value that identifies the device                      | 25h           | <a href="#">Page 42</a> |
| FEh              | R   | Manufacturer ID      | Stores a fixed value that represents SMSC                            | 5Dh           | <a href="#">Page 42</a> |
| FFh              | R   | Revision             | Stores a fixed value that represents the revision number             | 04h           | <a href="#">Page 43</a> |

## 7.1 Data Read Interlock

When any temperature channel high byte register is read, the corresponding low byte is copied into an internal 'shadow' register. The user is free to read the low byte at any time and be guaranteed that it will correspond to the previously read high byte. Regardless if the low byte is read or not, reading from the same high byte register again will automatically refresh this stored low byte data.

## 7.2 Temperature Data Registers

Table 7.2 Temperature Data Registers

| ADDR | R/W | REGISTER                   | B7  | B6   | B5    | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|------|-----|----------------------------|-----|------|-------|----|----|----|----|----|---------|
| 00h  | R   | Internal Diode High Byte   | 128 | 64   | 32    | 16 | 8  | 4  | 2  | 1  | 00h     |
| 29h  | R   | Internal Diode Low Byte    | 0.5 | 0.25 | 0.125 | -  | -  | -  | -  | -  | 00h     |
| 01h  | R   | External Diode 1 High Byte | 128 | 64   | 32    | 16 | 8  | 4  | 2  | 1  | 00h     |
| 10h  | R   | External Diode 1 Low Byte  | 0.5 | 0.25 | 0.125 | -  | -  | -  | -  | -  | 00h     |
| 23h  | R   | External Diode 2 High Byte | 128 | 64   | 32    | 16 | 8  | 4  | 2  | 1  | 00h     |
| 24h  | R   | External Diode 2 Low Byte  | 0.5 | 0.25 | 0.125 | -  | -  | -  | -  | -  | 00h     |

As shown in [Table 7.2](#), all temperatures are stored as an 11-bit value with the high byte representing the integer value and the low byte representing the fractional value left justified to occupy the MSBits.

## 7.3 Status Register

**Table 7.3 Status Register**

| ADDR | R/W | REGISTER | B7   | B6 | B5 | B4   | B3  | B2    | B1    | B0 | DEFAULT |
|------|-----|----------|------|----|----|------|-----|-------|-------|----|---------|
| 02h  | R   | Status   | BUSY | -  | -  | HIGH | LOW | FAULT | THERM | -  | 00h     |

The Status Register reports general error conditions. To identify specific channels, refer to [Section 7.10](#), [Section 7.15](#), [Section 7.16](#), and [Section 7.17](#). The individual Status Register bits are cleared when the appropriate High Limit, Low Limit, or Therm Limit register has been read or cleared.

Bit 7 - **BUSY** - This bit indicates that the ADC is currently converting. This bit does not cause either the ALERT or THERM pins to be asserted.

Bit 4 - **HIGH** - This bit is set when any of the temperature channels exceeds its programmed high limit. See the High Limit Status Register for specific channel information ([Section 7.15](#)). When set, this bit will assert the ALERT pin.

Bit 3 - **LOW** - This bit is set when any of the temperature channels drops below its programmed low limit. See the Low Limit Status Register for specific channel information ([Section 7.16](#)). When set, this bit will assert the ALERT pin.

Bit 2 - **FAULT** - This bit is asserted when a diode fault is detected on any of the external diode channels. See the External Diode Fault Register for specific channel information ([Section 7.10](#)). When set, this bit will assert the ALERT pin.

Bit 1 - **THERM** - This bit is set when the any of the temperature channels exceeds its programmed Therm Limit. See the Therm Limit Status Register for specific channel information ([Section 7.17](#)).

## 7.4 Configuration Register

**Table 7.4 Configuration Register**

| ADDR | R/W | REGISTER      | B7       | B6       | B5         | B4    | B3    | B2    | B1       | B0   | DEFAULT |
|------|-----|---------------|----------|----------|------------|-------|-------|-------|----------|------|---------|
| 03h  | R/W | Configuration | MASK_ALL | RUN/STOP | ALERT/COMP | RECD1 | RECD2 | RANGE | DAVG_DIS | APDD | 00h     |
| 09h  |     |               |          |          |            |       |       |       |          |      |         |

The Configuration Register controls the basic operation of the device. This register is fully accessible at either address.

Bit 7 - **MASK\_ALL** - Masks the ALERT pin from asserting.

- '0' - (default) - The ALERT pin is not masked. If any of the appropriate status bits are set the ALERT pin will be asserted.
- '1' - - The ALERT pin is masked. It will not be asserted for any interrupt condition unless it is configured in comparator mode. The Status Registers will be updated normally.

Bit 6 - **RUN / STOP** - Controls Active/Standby modes.

- '0' (default) - The device is in Active mode and converting on all channels.
- '1' - The device is in Standby mode and not converting.

Bit 5 - **ALERT/COMP** - Controls the operation of the ALERT pin.

- '0' (default) - The ALERT pin acts as described in [Section 6.3](#).
- '1' - The ALERT pin acts in comparator mode as described in [Section 6.3.2](#). In this mode the MASK\_ALL bit is ignored.

## Datasheet

Bit 4 - RECD1 - Disables the Resistance Error Correction (REC) for External Diode 1.

- '0' (default) - REC is enabled for External Diode 1.
- '1' - REC is disabled for External Diode 1.

Bit 3 - RECD2 - Disables the Resistance Error Correction (REC) for External Diode 2 and External Diode 3.

- '0' (default) - REC is enabled for External Diode 2 and External Diode 3.
- '1' - REC is disabled for External Diode 2 and External Diode 3.

Bit 2 - RANGE - Configures the measurement range and data format of the temperature channels.

- '0' (default) - The temperature measurement range is 0°C to +127.875°C and the data format is binary.
- '1' - The temperature measurement range is -64°C to +191.875°C and the data format is offset binary (see [Table 6.2](#)).

Bit 1 - DAVG\_DIS - Disables the dynamic averaging feature on all temperature channels.

- '0' (default) - The dynamic averaging feature is enabled. All temperature channels will be converted with an averaging factor that is based on the conversion rate as shown in [Table 6.1](#).
- '1' - The dynamic averaging feature is disabled. All temperature channels will be converted with a maximum averaging factor of 1x (equivalent to 11-bit conversion). For higher conversion rates, this averaging factor will be reduced as shown in [Table 6.1](#).

Bit 0 - APDD (EMC1414 only) - Disables the anti-parallel diode operation. Beta Compensation is disabled on External Diode 2 and 3 regardless of APDD setting. In addition, External Diode 2 Beta Configuration register will be ignored.

- '0' (default) - Anti-parallel diode mode is enabled. Two external diodes will be measured on the DP2 and DN2 pins.
- '1' - Anti-parallel diode mode is disabled. Only one external diode will be measured on the DP2 and DN2 pins.

## 7.5 Conversion Rate Register

Table 7.5 Conversion Rate Register

| ADDR | R/W | REGISTER        | B7 | B6 | B5 | B4 | B3        | B2 | B1 | B0             | DEFAULT |
|------|-----|-----------------|----|----|----|----|-----------|----|----|----------------|---------|
| 04h  | R/W | Conversion Rate | -  | -  | -  | -  | CONV[3:0] |    |    | 06h<br>(4/sec) |         |
| 0Ah  |     |                 |    |    |    |    |           |    |    |                |         |

The Conversion Rate Register controls how often the temperature measurement channels are updated and compared against the limits. This register is fully accessible at either address.

Bits 3-0 - CONV[3:0] - Determines the conversion rate as shown in [Table 7.6](#).

Table 7.6 Conversion Rate

| CONV[3:0] |   |   |   |   | CONVERSIONS / SECOND |
|-----------|---|---|---|---|----------------------|
| HEX       | 3 | 2 | 1 | 0 |                      |
| 0h        | 0 | 0 | 0 | 0 | 1 / 16               |
| 1h        | 0 | 0 | 0 | 1 | 1 / 8                |

**Table 7.6 Conversion Rate (continued)**

| CONV[3:0] |            |   |   |   | CONVERSIONS / SECOND |
|-----------|------------|---|---|---|----------------------|
| HEX       | 3          | 2 | 1 | 0 |                      |
| 2h        | 0          | 0 | 1 | 0 | 1 / 4                |
| 3h        | 0          | 0 | 1 | 1 | 1 / 2                |
| 4h        | 0          | 1 | 0 | 0 | 1                    |
| 5h        | 0          | 1 | 0 | 1 | 2                    |
| 6h        | 0          | 1 | 1 | 0 | 4 (default)          |
| 7h        | 0          | 1 | 1 | 1 | 8                    |
| 8h        | 1          | 0 | 0 | 0 | 16                   |
| 9h        | 1          | 0 | 0 | 1 | 32                   |
| Ah        | 1          | 0 | 1 | 0 | 64                   |
| Bh - Fh   | All others |   |   |   | 1                    |

## 7.6 Limit Registers

**Table 7.7 Temperature Limit Registers**

| ADDR. | R/W | REGISTER                              | B7  | B6   | B5    | B4 | B3 | B2 | B1 | B0 | DEFAULT    |
|-------|-----|---------------------------------------|-----|------|-------|----|----|----|----|----|------------|

| 17h   | R/W | External Diode 2 High Limit Low Byte  | 0.5 | 0.25 | 0.125 | -  | -  | -  | -  | -  | 00h        |
| 18h   | R/W | External Diode 2 Low Limit Low Byte   | 0.5 | 0.25 | 0.125 | -  | -  | -  | -  | -  | 00h        |
| 2Ch   | R/W | External Diode 3 High Limit High Byte | 128 | 64   | 32    | 16 | 8  | 4  | 2  | 1  | 55h (85°C) |
| 2Dh   | R/W | External Diode 3 Low Limit High Byte  | 128 | 64   | 32    | 16 | 8  | 4  | 2  | 1  | 00h (0°C)  |
| 2Eh   | R/W | External Diode 3 High Limit Low Byte  | 0.5 | 0.25 | 0.125 | -  | -  | -  | -  | -  | 00h        |
| 2Fh   | R/W | External Diode 3 Low Limit Low Byte   | 0.5 | 0.25 | 0.125 | -  | -  | -  | -  | -  | 00h        |

The device contains both high and low limits for all temperature channels. If the measured temperature exceeds the high limit, then the corresponding status bit is set and the  $\overline{\text{ALERT}}$  pin is asserted. Likewise, if the measured temperature is less than or equal to the low limit, the corresponding status bit is set and the  $\overline{\text{ALERT}}$  pin is asserted.

The data format for the limits must match the selected data format for the temperature so that if the extended temperature range is used, the limits must be programmed in the extended data format.

The limit registers with multiple addresses are fully accessible at either address.

When the device is in Standby mode, updating the limit registers will have no effect until the next conversion cycle occurs. This can be initiated via a write to the One Shot Register or by clearing the RUN / STOP bit in the Configuration Register (see [Section 7.4](#)).

## 7.7 Scratchpad Registers

**Table 7.8 Scratchpad Register**

| ADDR | R/W | REGISTER   | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|------|-----|------------|----|----|----|----|----|----|----|----|---------|
| 11h  | R/W | Scratchpad | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  | 00h     |
| 12h  | R/W | Scratchpad | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  | 00h     |

The Scratchpad Registers are Read / Write registers that are used for place holders to be software compatible with legacy programs. Reading from the registers will return what is written to them.

## 7.8 One Shot Register

**Table 7.9 One Shot Register**

| ADDR. | R/W | REGISTER | B7  | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|-------|-----|----------|---|----|----|----|----|----|----|----|---------|
| 0Fh   | W   | One Shot | Writing to this register initiates a single conversion cycle. Data is not stored and always reads 00h |    |    |    |    |    |    |    | 00h     |

The One Shot Register is used to initiate a one shot command. Writing to the one shot register when the device is in standby mode and BUSY bit (in Status Register) is '0', will immediately cause the ADC to update all temperature measurements. Writing to the One Shot Register while the device is in active mode will have no effect.

## 7.9 Therm Limit Registers

**Table 7.10 Therm Limit Registers**

| ADDR. | R/W | REGISTER                     | B7  | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT    |
|-------|-----|------------------------------|-----|----|----|----|----|----|----|----|------------|
| 19h   | R/W | External Diode 1 Therm Limit | 128 | 64 | 32 | 16 | 8  | 4  | 2  | 1  | 55h (85°C) |
| 1Ah   | R/W | External Diode 2 Therm Limit | 128 | 64 | 32 | 16 | 8  | 4  | 2  | 1  | 55h (85°C) |
| 20h   | R/W | Internal Diode Therm Limit   | 128 | 64 | 32 | 16 | 8  | 4  | 2  | 1  | 55h (85°C) |
| 21h   | R/W | Therm Hysteresis             | 128 | 64 | 32 | 16 | 8  | 4  | 2  | 1  | 0Ah (10°C) |
| 30h   | R/W | External Diode 3 Therm Limit | 128 | 64 | 32 | 16 | 8  | 4  | 2  | 1  | 55h (85°C) |

The Therm Limit Registers are used to determine whether a critical thermal event has occurred. If the measured temperature exceeds the Therm Limit, the THERM pin is asserted. The limit setting must match the chosen data format of the temperature reading registers.

Unlike the  $\overline{\text{ALERT}}$  pin, the  $\overline{\text{THERM}}$  pin cannot be masked. Additionally, the  $\overline{\text{THERM}}$  pin will be released once the temperature drops below the corresponding threshold minus the Therm Hysteresis.

## 7.10 External Diode Fault Register

Table 7.11 External Diode Fault Register

| ADDR. | R/W | REGISTER             | B7 | B6 | B5 | B4 | B3    | B2    | B1    | B0 | DEFAULT |
|-------|-----|----------------------|----|----|----|----|-------|-------|-------|----|---------|
| 1Bh   | R-C | External Diode Fault | -  | -  | -  | -  | E3FLT | E2FLT | E1FLT | -  | 00h     |

The External Diode Fault Register indicates which of the external diodes caused the FAULT bit in the Status Register to be set. This register is cleared when it is read.

Bit 3 - E3FLT (EMC1414 only) - This bit is set if the External Diode 3 channel reported a diode fault.

Bit 2 - E2FLT - This bit is set if the External Diode 2 channel reported a diode fault.

Bit 1 - E1FLT - This bit is set if the External Diode 1 channel reported a diode fault.

## 7.11 Channel Mask Register

Table 7.12 Channel Mask Register

| ADDR. | R/W | REGISTER     | B7 | B6 | B5 | B4 | B3      | B2      | B1      | B0       | DEFAULT |
|-------|-----|--------------|----|----|----|----|---------|---------|---------|----------|---------|
| 1Fh   | R/W | Channel Mask | -  | -  | -  | -  | E3 MASK | E2 MASK | E1 MASK | INT MASK | 00h     |

The Channel Mask Register controls individual channel masking. When a channel is masked, the  $\overline{\text{ALERT}}$  pin will not be asserted when the masked channel reads a diode fault or out of limit error. The channel mask does not mask the  $\overline{\text{THERM}}$  pin.

Bit 3 - E3MASK (EMC1414 only) - Masks the  $\overline{\text{ALERT}}$  pin from asserting when the External Diode 3 channel is out of limit or reports a diode fault.

- '0' (default) - The External Diode 3 channel will cause the  $\overline{\text{ALERT}}$  pin to be asserted if it is out of limit or reports a diode fault.

- '1' - The External Diode 3 channel will not cause the  $\overline{\text{ALERT}}$  pin to be asserted if it is out of limit or reports a diode fault.

Bit 2 - E2MASK - Masks the  $\overline{\text{ALERT}}$  pin from asserting when the External Diode 2 channel is out of limit or reports a diode fault.

- '0' (default) - The External Diode 2 channel will cause the  $\overline{\text{ALERT}}$  pin to be asserted if it is out of limit or reports a diode fault.

- '1' - The External Diode 2 channel will not cause the  $\overline{\text{ALERT}}$  pin to be asserted if it is out of limit or reports a diode fault.

Bit 1 - E1MASK - Masks the  $\overline{\text{ALERT}}$  pin from asserting when the External Diode 1 channel is out of limit or reports a diode fault.

- '0' (default) - The External Diode 1 channel will cause the  $\overline{\text{ALERT}}$  pin to be asserted if it is out of limit or reports a diode fault.

- '1' - The External Diode 1 channel will not cause the  $\overline{\text{ALERT}}$  pin to be asserted if it is out of limit or reports a diode fault.

Bit 0 - INTMASK - Masks the  $\overline{\text{ALERT}}$  pin from asserting when the Internal Diode temperature is out of limit.

- '0' (default) - The Internal Diode channel will cause the  $\overline{\text{ALERT}}$  pin to be asserted if it is out of limit.
- '1' - The Internal Diode channel will not cause the  $\overline{\text{ALERT}}$  pin to be asserted if it is out of limit.

## 7.12 Consecutive ALERT Register

**Table 7.13 Consecutive ALERT Register**

| ADDR. | R/W | REGISTER          | B7       | B6         | B5 | B4 | B3         | B2 | B1 | B0 | DEFAULT |
|-------|-----|-------------------|----------|------------|----|----|------------|----|----|----|---------|
| 22h   | R/W | Consecutive ALERT | TIME OUT | CTHRM[2:0] |    |    | CALRT[2:0] |    |    | -  | 70h     |

The Consecutive ALERT Register determines how many times an out-of-limit error or diode fault must be detected in consecutive measurements before the  $\overline{\text{ALERT}}$  or  $\overline{\text{THERM}}$  pin is asserted. Additionally, the Consecutive ALERT Register controls the SMBus Timeout functionality.

An out-of-limit condition (i.e. HIGH, LOW, or FAULT) occurring on the same temperature channel in consecutive measurements will increment the consecutive alert counter. The counters will also be reset if no out-of-limit condition or diode fault condition occurs in a consecutive reading.

When the  $\overline{\text{ALERT}}$  pin is configured as an interrupt, when the consecutive alert counter reaches its programmed value, the following will occur: the STATUS bit(s) for that channel and the last error condition(s) (i.e. E1HIGH, or E2LOW and/or E2FAULT) will be set to '1', the  $\overline{\text{ALERT}}$  pin will be asserted, the consecutive alert counter will be cleared, and measurements will continue.

When the  $\overline{\text{ALERT}}$  pin is configured as a comparator, the consecutive alert counter will ignore diode fault and low limit errors and only increment if the measured temperature exceeds the High Limit. Additionally, once the consecutive alert counter reaches the programmed limit, the  $\overline{\text{ALERT}}$  pin will be asserted, but the counter will not be reset. It will remain set until the temperature drops below the High Limit minus the Therm Hysteresis value.

For example, if the CALRT[2:0] bits are set for 4 consecutive alerts on an EMC1413 / EMC1414 device, the high limits are set at 70°C, and none of the channels are masked, then the  $\overline{\text{ALERT}}$  pin will be asserted after the following four measurements:

1. Internal Diode reads 71°C and both external diodes read 69°C. Consecutive alert counter for INT is incremented to 1.
2. Both the Internal Diode and External Diode 1 read 71°C and External Diode 2 reads 68°C. Consecutive alert counter for INT is incremented to 2 and for EXT1 is set to 1.
3. The External Diode 1 reads 71°C and both the Internal Diode and External Diode 2 read 69°C. Consecutive alert counters for INT and EXT2 are cleared and EXT1 is incremented to 2.
4. The Internal Diode reads 71°C and both external diodes read 71°C. Consecutive alert counter for INT is set to 1, EXT2 is set to 1, and EXT1 is incremented to 3.
5. The Internal Diode reads 71°C and both the external diodes read 71°C. Consecutive alert counter for INT is incremented to 2, EXT2 is set to 2, and EXT1 is incremented to 4. The appropriate status bits are set for EXT1 and the  $\overline{\text{ALERT}}$  pin is asserted. EXT1 counter is reset to 0 and all other counters hold the last value until the next temperature measurement.

Bit 7 - TIMEOUT - Determines whether the SMBus Timeout function is enabled.

- '0' (default) - The SMBus Timeout feature is disabled. The SMCLK line can be held low indefinitely without the device resetting its SMBus protocol.
- '1' - The SMBus Timeout feature is enabled. If the SMCLK line is held low for more than 30ms, the device will reset the SMBus protocol.

## Datasheet

Bits 6-4 - CTHRM[2:0] - Determines the number of consecutive measurements that must exceed the corresponding Therm Limit before the  $\overline{\text{THERM}}$  pin is asserted. All temperature channels use this value to set the respective counters. The consecutive Therm counter is incremented whenever any measurement exceed the corresponding Therm Limit.

If the temperature drops below the Therm Limit, the counter is reset. If a number of consecutive measurements above the Therm Limit occurs, the  $\overline{\text{THERM}}$  pin is asserted low.

Once the  $\overline{\text{THERM}}$  pin has been asserted, the consecutive therm counter will not reset until the corresponding temperature drops below the Therm Limit minus the Therm Hysteresis value.

The bits are decoded as shown in Table 7.14. The default setting is 4 consecutive out of limit conversions.

Bits 3-1 - CALRT[2:0] - Determine the number of consecutive measurements that must have an out of limit condition or diode fault before the  $\overline{\text{ALERT}}$  pin is asserted. All temperature channels use this value to set the respective counters. The bits are decoded as shown in Table 7.14. The default setting is 1 consecutive out of limit conversion.

Table 7.14 Consecutive Alert / Therm Settings

| 2 | 1 | 0 | NUMBER OF CONSECUTIVE OUT OF LIMIT MEASUREMENTS |
|---|---|---|---|
| 0 | 0 | 0 | 1<br>(default for CALRT[2:0])                   |
| 0 | 0 | 1 | 2   |
| 0 | 1 | 1 | 3   |
| 1 | 1 | 1 | 4<br>(default for CTHRM[2:0])                   |

## 7.13 Beta Configuration Registers

Table 7.15 Beta Configuration Registers

| ADDR. | R/W | REGISTER                            | B7 | B6 | B5 | B4 | B3      | B2         | B1 | B0 | DEFAULT                             |
|-------|-----|-------------------------------------|----|----|----|----|---------|------------|----|----|-------------------------------------|
| 25h   | R/W | External Diode 1 Beta Configuration | -  | -  | -  | -  | ENABLE1 | BETA1[2:0] |    |    | 08h                                 |
| 26h   | R/W | External Diode 2 Beta Configuration | -  | -  | -  | -  | ENABLE2 | BETA2[2:0] |    |    | 08h for EMC1413 and 07h for EMC1414 |

These registers are used to set the Beta Compensation factor that is used for the external diode channels.

Bit 3 - ENABLEX - Enables the Beta Compensation factor auto-detection function. The ENABLE2 control is disabled for the EMC1414; beta compensation cannot be enabled for External Diode 2 or 3.

- '0' - The Beta Compensation Factor auto-detection circuitry is disabled.
- '1' - The Beta Compensation factor auto-detection circuitry is enabled. At the beginning of every conversion, the optimal Beta Compensation factor setting will be determined and applied. The BETAX[2:0] bits will be automatically updated to indicate the current setting. This is the default for

EMC1413. This is the default for EMC1414 for External Diode 1 only; it is disabled and cannot be enabled for External Diode 2 or 3.

Bit 2-0 - BETAX[2:0] - These bits always reflect the current beta configuration settings. If auto-detection circuitry is enabled, these bits will be updated automatically and writing to these bits will have no effect. If the auto-detection circuitry is disabled, these bits will determine the beta configuration setting that is used for their respective channels.

Care should be taken when setting the BETAX[2:0] bits when the auto-detection circuitry is disabled. If the Beta Compensation factor is set at a beta value that is higher than the transistor beta, the circuit may introduce measurement errors. When measuring a discrete thermal diode (such as 2N3904) or a CPU diode that functions like a discrete thermal diode (such as an AMD processor diode), the BETAX[2:0] bits should be set to '111b'.

**Table 7.16 CPU Beta Values**

| HEX     | ENABLEX | BETAX[2:0] |   |   | MINIMUM BETA   |
|---------|---------|------------|---|---|----------------|
|         |         | 2          | 1 | 0 |                |
| 0h      | 0       | 0          | 0 | 0 | 0.11           |
| 1h      | 0       | 0          | 0 | 1 | 0.18           |
| 2h      | 0       | 0          | 1 | 0 | 0.25           |
| 3h      | 0       | 0          | 1 | 1 | 0.33           |
| 4h      | 0       | 1          | 0 | 0 | 0.43           |
| 5h      | 0       | 1          | 0 | 1 | 1.00           |
| 6h      | 0       | 1          | 1 | 0 | 2.33           |
| 7h      | 0       | 1          | 1 | 1 | Disabled       |
| 8h - Fh | 1       | X          | X | X | Auto-detection |

## 7.14 External Diode Ideality Factor Registers

**Table 7.17 Ideality Configuration Registers**

| ADDR. | R/W | REGISTER                         | B7 | B6 | B5             | B4 | B3 | B2 | B1 | B0  | DEFAULT |
|-------|-----|----------------------------------|----|----|----------------|----|----|----|----|-----|---------|
| 27h   | R/W | External Diode 1 Ideality Factor | -  | -  | IDEALITY1[5:0] |    |    |    |    | 12h |         |
| 28h   | R/W | External Diode 2 Ideality Factor | -  | -  | IDEALITY2[5:0] |    |    |    |    | 12h |         |
| 31h   | R/W | External Diode 3 Ideality Factor | -  | -  | IDEALITY3[5:0] |    |    |    |    | 12h |         |

## Datasheet

These registers store the ideality factors that are applied to the external diodes. [Table 7.18](#) defines each setting and the corresponding ideality factor. Beta Compensation and Resistance Error Correction automatically correct for most diode ideality errors; therefore, it is not recommended that these settings be updated without consulting SMSC.

**Table 7.18 Ideality Factor Look-Up Table (Diode Model)**

| SETTING | FACTOR | SETTING | FACTOR | SETTING | FACTOR |
|---------|--------|---------|--------|---------|--------|
| 08h     | 0.9949 | 18h     | 1.0159 | 28h     | 1.0371 |
| 09h     | 0.9962 | 19h     | 1.0172 | 29h     | 1.0384 |
| 0Ah     | 0.9975 | 1Ah     | 1.0185 | 2Ah     | 1.0397 |
| 0Bh     | 0.9988 | 1Bh     | 1.0200 | 2Bh     | 1.0410 |
| 0Ch     | 1.0001 | 1Ch     | 1.0212 | 2Ch     | 1.0423 |
| 0Dh     | 1.0014 | 1Dh     | 1.0226 | 2Dh     | 1.0436 |
| 0Eh     | 1.0027 | 1Eh     | 1.0239 | 2Eh     | 1.0449 |
| 0Fh     | 1.0040 | 1Fh     | 1.0253 | 2Fh     | 1.0462 |
| 10h     | 1.0053 | 20h     | 1.0267 | 30h     | 1.0475 |
| 11h     | 1.0066 | 21h     | 1.0280 | 31h     | 1.0488 |
| 12h     | 1.0080 | 22h     | 1.0293 | 32h     | 1.0501 |
| 13h     | 1.0093 | 23h     | 1.0306 | 33h     | 1.0514 |
| 14h     | 1.0106 | 24h     | 1.0319 | 34h     | 1.0527 |
| 15h     | 1.0119 | 25h     | 1.0332 | 35h     | 1.0540 |
| 16h     | 1.0133 | 26h     | 1.0345 | 36h     | 1.0553 |
| 17h     | 1.0146 | 27h     | 1.0358 | 37h     | 1.0566 |

For CPU substrate transistors that require the BJT transistor model, the ideality factor behaves slightly differently than for discrete diode-connected transistors. Refer to [Table 7.19](#) when using a CPU substrate transistor.

**Table 7.19 Substrate Diode Ideality Factor Look-Up Table (BJT Model)**

| SETTING | FACTOR | SETTING | FACTOR | SETTING | FACTOR |
|---------|--------|---------|--------|---------|--------|
| 08h     | 0.9869 | 18h     | 1.0079 | 28h     | 1.0291 |
| 09h     | 0.9882 | 19h     | 1.0092 | 29h     | 1.0304 |
| 0Ah     | 0.9895 | 1Ah     | 1.0105 | 2Ah     | 1.0317 |
| 0Bh     | 0.9908 | 1Bh     | 1.0120 | 2Bh     | 1.0330 |

| 17h     | 1.0066 | 27h     | 1.0278 | 37h     | 1.0486 |

**APPLICATION NOTE:** When measuring a 65nm Intel CPU, the Ideality Setting should be the default 12h. When measuring a 45nm Intel CPU, the Ideality Setting should be 15h.

## 7.15 High Limit Status Register

**Table 7.20 High Limit Status Register**

| ADDR. | R/W | REGISTER          | B7 | B6 | B5 | B4 | B3     | B2     | B1     | B0    | DEFAULT |
|-------|-----|-------------------|----|----|----|----|--------|--------|--------|-------|---------|
| 35h   | R-C | High Limit Status | -  | -  | -  | -  | E3HIGH | E2HIGH | E1HIGH | IHIGH | 00h     |

The High Limit Status Register contains the status bits that are set when a temperature channel high limit is exceeded. If any of these bits are set, then the HIGH status bit in the Status Register is set. Reading from the High Limit Status Register will clear all bits if. Reading from the register will also clear the HIGH status bit in the Status Register.

The  $\overline{\text{ALERT}}$  pin will be set if the programmed number of consecutive alert counts have been met and any of these status bits are set.

The status bits will remain set until read unless the  $\overline{\text{ALERT}}$  pin is configured as a comparator output (see [Section 6.3.2](#)).

Bit 3 - E3HIGH (EMC1414 only) - This bit is set when the External Diode 3 channel exceeds its programmed high limit.

Bit 2 - E2HIGH - This bit is set when the External Diode 2 channel exceeds its programmed high limit.

Bit 1 - E1HIGH - This bit is set when the External Diode 1 channel exceeds its programmed high limit.

Bit 0 - IHIGH - This bit is set when the Internal Diode channel exceeds its programmed high limit.

## 7.16 Low Limit Status Register

Table 7.21 Low Limit Status Register

| ADDR. | R/W | REGISTER         | B7 | B6 | B5 | B4 | B3    | B2    | B1    | B0   | DEFAULT |
|-------|-----|------------------|----|----|----|----|-------|-------|-------|------|---------|
| 36h   | R-C | Low Limit Status | -  | -  | -  | -  | E3LOW | E2LOW | E1LOW | ILOW | 00h     |

The Low Limit Status Register contains the status bits that are set when a temperature channel drops below the low limit. If any of these bits are set, then the LOW status bit in the Status Register is set. Reading from the Low Limit Status Register will clear all bits. Reading from the register will also clear the LOW status bit in the Status Register.

The  $\overline{\text{ALERT}}$  pin will be set if the programmed number of consecutive alert counts have been met and any of these status bits are set.

The status bits will remain set until read unless the  $\overline{\text{ALERT}}$  pin is configured as a comparator output (see [Section 6.3.2](#)).

Bit 3 - E3LOW (EMC1414 only) - This bit is set when the External Diode 3 channel drops below its programmed low limit.

Bit 2 - E2LOW - This bit is set when the External Diode 2 channel drops below its programmed low limit.

Bit 1 - E1LOW - This bit is set when the External Diode 1 channel drops below its programmed low limit.

Bit 0 - ILOW - This bit is set when the Internal Diode channel drops below its programmed low limit.

## 7.17 Therm Limit Status Register

Table 7.22 Therm Limit Status Register

| ADDR. | R/W | REGISTER           | B7 | B6 | B5 | B4 | B3       | B2       | B1       | B0     | DEFAULT |
|-------|-----|--------------------|----|----|----|----|----------|----------|----------|--------|---------|
| 37h   | R-C | Therm Limit Status | -  | -  | -  | -  | E3 THERM | E2 THERM | E1 THERM | ITHERM | 00h     |

The Therm Limit Status Register contains the status bits that are set when a temperature channel Therm Limit is exceeded. If any of these bits are set, the THERM status bit in the Status Register is set. Reading from the Therm Limit Status Register will not clear the status bits. Once the temperature drops below the Therm Limit minus the Therm Hysteresis, the corresponding status bits will be automatically cleared. The THERM bit in the Status Register will be cleared when all individual channel THERM bits are cleared.

Bit 3 - E3THERM (EMC1414 only) - This bit is set when the External Diode 3 channel exceeds its programmed Therm Limit. When set, this bit will assert the THERM pin.

Bit 2 - E2THERM - This bit is set when the External Diode 2 channel exceeds its programmed Therm Limit. When set, this bit will assert the THERM pin.

Bit 1 - E1THERM - This bit is set when the External Diode 1 channel exceeds its programmed Therm Limit.

Bit 0 - ITHERM - This bit is set when the Internal Diode channel exceeds its programmed Therm Limit. When set, this bit will assert the THERM pin.

## 7.18 Filter Control Register

**Table 7.23 Filter Configuration Register**

| ADDR. | R/W | REGISTER       | B7 | B6 | B5 | B4 | B3 | B2 | B1          | B0 | DEFAULT |
|-------|-----|----------------|----|----|----|----|----|----|-------------|----|---------|
| 40h   | R/W | Filter Control | -  | -  | -  | -  | -  | -  | FILTER[1:0] |    | 00h     |

The Filter Configuration Register controls the digital filter on the External Diode 1 channel.

Bits 1-0 - FILTER[1:0] - Control the level of digital filtering that is applied to the External Diode 1 temperature measurement as shown in [Table 7.24](#). See [Figure 6.3](#) and [Figure 6.4](#) for examples on the filter behavior.

**Table 7.24 FILTER Decode**

| FILTER[1:0] |   | AVERAGING          |
|-------------|---|--------------------|
| 1           | 0 |                    |
| 0           | 0 | Disabled (default) |
| 0           | 1 | Level 1            |
| 1           | 0 | Level 1            |
| 1           | 1 | Level 2            |

## 7.19 Product ID Register

**Table 7.25 Product ID Register**

| ADDR | R/W | REGISTER             | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|------|-----|----------------------|----|----|----|----|----|----|----|----|---------|
| FDh  | R   | Product ID (EMC1413) | 0  | 0  | 1  | 0  | 0  | 0  | 0  | 1  | 21h     |
| FDh  | R   | Product ID (EMC1414) | 0  | 0  | 1  | 0  | 0  | 1  | 0  | 1  | 25h     |

The Product ID Register holds a unique value that identifies the device.

## 7.20 SMSC ID Register

**Table 7.26 Manufacturer ID Register**

| ADDR. | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|-------|-----|----------|----|----|----|----|----|----|----|----|---------|
| FEh   | R   | SMSC ID  | 0  | 1  | 0  | 1  | 1  | 1  | 0  | 1  | 5Dh     |

The Manufacturer ID register contains an 8-bit word that identifies the SMSC as the manufacturer of the EMC1413 / EMC1414.

## 7.21 Revision Register

**Table 7.27 Revision Register**

| ADDR. | R/W | REGISTER | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 | DEFAULT |
|-------|-----|----------|----|----|----|----|----|----|----|----|---------|
| FFh   | R   | Revision | 0  | 0  | 0  | 0  | 0  | 1  | 0  | 0  | 04h     |

The Revision register contains an 8-bit word that identifies the die revision.

## Chapter 10 Document Revision History

**Table 10.1 Customer Revision History**

| REVISION LEVEL & DATE | SECTION/FIGURE/ENTRY                                | CORRECTION  |
|-----------------------|---|---|
| Rev. 1.41 (02-23-12)  | Chapter 3, Pin Description                          | Labeled exposed pad in pinout figure and added row in pin description table. Recommendation is to ground the exposed pad.   |
| Rev. 1.40 (01-05-12)  | Table 4.3, "SMBus Electrical Specifications"        | Added conditions for $t_{HD:DAT}$ . Data hold time minimum of 0.3 $\mu$ s is required when receiving from the master.   |
|                       | Section 5.1.8, "SMBus and I2C Compatibility"        | Renamed from "SMBus and I2C Compliance." First paragraph, added first sentence: "The EMC1413 / EMC1414 is compatible with SMBus and I <sup>2</sup> C." And added last sentence: "For information on using the EMC1413 / EMC1414 in an I <sup>2</sup> C system, refer to SMSC AN 14.0 SMSC Dedicated Slave Devices in I <sup>2</sup> C Systems." |
| Rev. 1.39 (06-07-11)  | Figure 3.2, "EMC1413 / EMC1414 Pin Diagram, DFN-10" | Updated to include EMC1414.   |
|                       | Figure 9.5, "EMC1414-A 10-Pin DFN Package Markings" | Added.  |
|                       | Ordering Information                                | Added EMC1414-A-AIA to ordering information table.  |
| Rev. 1.38 (09-30-10)  | Table 4.2, "Electrical Specifications"              | Filter MAX changed from "2.5nF" to "2.7nF".   |
|                       | Section 7.21, "Revision Register"                   | Set revision ID to 04h.   |
|                       | Chapter 5, System Management Bus Interface Protocol | Updated error on ACK bit settings and reorganized chapter information and moved ALERT pin considerations.   |
|                       | Chapter 6, Product Description                      | Reorganized information for temperature monitoring and ALERT pin considerations.  |
| Rev. 1.37 (12-23-09)  | Section 7.21, "Revision Register"                   | Changed default from 01h to 03h to match the actual value.  |
|                       | Ordering Information                                | Added EMC1414-A-AIA-TR in a 10-pin DFN  |
|                       | Section 4.1, "Absolute Maximum Ratings"             | Updated voltage on 5V tolerant pins with pull up from -0.3 to 3.6 to 0 to 3.6.  |
|                       | Chapter 9, Package Information                      | Added package information for the TDFN.   |
|                       | Section 9.1, "Package Markings"                     | Added package marking information for the TDFN.   |

**Table 10.1 Customer Revision History (continued)**

| REVISION LEVEL & DATE | SECTION/FIGURE/ENTRY   | CORRECTION  |
|-----------------------|--|---|
| Rev. 1.35 (05-06-09)  | Pin Table  | Identified 5V tolerant pins. Added the following application note below table: "For the 5V tolerant pins that <u>have a pull-up resistor</u> (SMCLK, SMDATA, THERM, ALERT), the voltage difference between VDD and the pull-up voltage must never exceed 3.6V."                       |
|                       | <a href="#">Table 4.1, "Absolute Maximum Ratings"</a>                | Updated voltage limits for 5V tolerant pins with pull-up resistors.<br><br>Added the following note below table: "For the 5V tolerant pins <u>that have a pull-up resistor</u> (SMCLK, SMDATA, THERM, ALERT), the pull-up voltage must not exceed 3.6V when the device is unpowered." |
|                       | <a href="#">Table 4.2, "Electrical Specifications"</a>               | Added leakage current   |
|                       | Ordering Information and <a href="#">Table 2.1, "Part Selection"</a> | Added EMC1414-3 and EMC1413-3   |
|                       | <a href="#">Table 9.2, "10-Pin DFN Package Drawing"</a>              | Updated figures for package   |
| Rev. 1.34 (12-02-08)  | Initial document creation  |   |

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

## JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели, кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
