

MAX14853/MAX14855

2.75kV_{RMS} Isolated 500kbps/25Mbps Full-Duplex RS-485/RS-422 Transceivers with ±35kV ESD Protection and Integrated Transformer Driver

Absolute Maximum Ratings

V _{DDA} to GNDA	-0.3V to +6V
V _{DDB} to GNDB	-0.3V to +6V
V _{LDO} to GNDB	-0.3V to +16V
TD1, TD2 to GNDA	-0.3V to +12V
TXD, DE, $\overline{\text{RE}}$, RXD to GNDA	-0.3V to +6V
A, B, Y, Z to GNDB	-8V to +13V
TD1, TD2 Continuous Current	1.4A
Short-Circuit Duration (RXD to GNDA, A, B, Y, Z, V _{DDB} to GNDB)	Continuous

Continuous Power Dissipation (T _A = +70°C) 16-pin Wide SOIC (derate 14.1mW/°C above +70°C)	1126.8mW
Operating Temperature Range	-40°C to +105°C
Junction Temperature	+150°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (soldering, 10s)	+300°C
Soldering Temperature (reflow)	+260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Thermal Characteristics (Note 1)

Junction-to-Ambient Thermal Resistance (θ _{JA})	71°C/W	Junction-to-Case Thermal Resistance (θ _{JC})	23°C/W
---	--------	--	--------

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

DC Electrical Characteristics

(V_{DDA} - V_{GNDA} = 3.0V to 5.5V, V_{DDB} - V_{GNDB} = 3.0V to 5.5V, T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at V_{DDA} - V_{GNDA} = 3.3V, V_{DDB} - V_{GNDB} = 3.3V, V_{GNDA} = V_{GNDB}, and T_A = +25°C.) (Notes 2, 3)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
POWER						
Supply Voltage	V _{DDA}		3.0		5.5	V
	V _{DDB}		3.0		5.5	
Supply Current	I _{DDA}	V _{DDA} = 5V, DE = high, $\overline{\text{RE}}$ = TXD = low, RXD unconnected, no load, TD1/TD2 unconnected		4.7	7.7	mA
	I _{DDB}	DE = high, $\overline{\text{RE}}$ = TXD = low, RXD unconnected, no load, V _{DDB} = 3.3V		7.4	12.5

Note 2: All devices are 100% production tested at T_A = +25°C. Specifications over temperature are guaranteed by design.

Note 3: All currents into the device are positive. All currents out of the device are negative. All voltages are referenced to their respective ground (GNDA or GNDB), unless otherwise noted.

Note 4: V_{LDO} max indicates voltage capability of the circuit. Power dissipation requirements may limit V_{LDO} max to a lower value.

Note 5: Not production tested. Guaranteed by design.

Note 6: ΔV_{OD} and ΔV_{OC} are the changes in V_{OD} and V_{OC}, respectively, when the TXD input changes state.

Note 7: The short-circuit output current applies to the peak current just prior to hiccup-mode current limiting and to the peak current during the hiccup-mode retry period (around 6μs). In hiccup mode, driver outputs are high impedance for 900μs and then are re-enabled. If the short circuit persists, drivers are turned off after the retry period and the cycle restarts.

Note 8: CMTI is the maximum sustainable common-mode voltage slew rate while maintaining the correct output states. CMTI applies to both rising and falling common-mode voltage edges. Tested with the transient generator connected between GNDA and GNDB.

Note 9: Capacitive load includes test probe and fixture capacitance.

Insulation Characteristics

PARAMETER	SYMBOL	CONDITIONS	VALUE	UNITS

Pin Configuration

Pin Description

PIN	NAME	REFERENCE	FUNCTION
1	TD1	GNDA	Transformer Driver Output 1
2	TD2	GNDA	Transformer Driver Output 2
3	GNDA	—	UART/Logic-Side Ground. GNDA is the ground reference for digital signals and the transformer driver.
4	VDDA	GNDA	UART/Logic-Side Power Input. Bypass VDDA to GNDA with both 0.1μF and 1μF capacitors as close as possible to the device.
5	RXD	GNDA	Receiver Data Output. Drive $\overline{RE}$ low to enable RXD. With $\overline{RE}$ low, RXD is high when $(V_A - V_B) > -10\text{mV}$ and is low when $(V_A - V_B) < -200\text{mV}$. RXD is high when VDDB is less than VUVLOB. RXD is high impedance when $\overline{RE}$ is high.
6	$\overline{RE}$	GNDA	Receiver Output Enable. Drive $\overline{RE}$ low or connect to GNDA to enable RXD. Drive $\overline{RE}$ high to disable RXD. RXD is high impedance when $\overline{RE}$ is high. $\overline{RE}$ has an internal 4.5μA pull-down to GNDA.

Pin Description (continued)

PIN	NAME	REFERENCE	FUNCTION
7	DE	GNDA	Driver Output Enable. Drive DE high to enable bus driver outputs Y and Z. Drive DE low or connect to GNDA to disable Y and Z. Y and Z are high impedance when DE is low. DE has an internal 4.5 μ A pulldown to GNDA.
8	TXD	GNDA	Driver Input. With DE high, a low on TXD forces the noninverting output (Y) low and the inverting output (Z) high. Similarly, a high on TXD forces the noninverting output high and the inverting output low. TXD has an internal 4.5 μ A pullup to V _{DDA} .
9, 15	GNDB	—	Cable-Side Ground. GNDB is the ground reference for the internal LDO and the RS-485/RS-422 bus signals.
10	V _{LDO}	GNDB	LDO Power Input. Connect a minimum voltage of 3.18V to V _{LDO} to power the cable-side of the transceiver. Bypass V _{LDO} to GNDB with both 0.1 μ F and 1 μ F capacitors as close as possible to the device. To disable the internal LDO, leave V _{LDO} unconnected or connect to GNDB.
11	Y	GNDB	Noninverting Driver Output
12	Z	GNDB	Inverting Driver Output
13	B	GNDB	Inverting Receiver Input
14	A	GNDB	Noninverting Receiver Input
16	V _{DDB}	GNDB	Cable-Side Power Input/Isolated LDO Power Output. Bypass V _{DDB} to GNDB with both 0.1 μ F and 1 μ F capacitors as close as possible to the device. V _{DDB} is the output of the internal LDO when power is applied to V _{LDO} . When the internal LDO is not used (V _{LDO} is unconnected or connected to GNDB), V _{DDB} is the positive supply input for the cable-side of the IC.

Function Tables

TRANSMITTING					
INPUTS				OUTPUTS	
V _{DDA}	V _{DDB}	DE	TXD	Y	Z
$\geq V_{UVLOA}$	$\geq V_{UVLOB}$	1	1	1	0
$\geq V_{UVLOA}$	$\geq V_{UVLOB}$	1	0	0	1
$\geq V_{UVLOA}$	$\geq V_{UVLOB}$	0	X	High-Z	High-Z
$< V_{UVLOA}$	$\geq V_{UVLOB}$	X	X	High-Z	High-Z
$\geq V_{UVLOA}$	$< V_{UVLOB}$	X	X	High-Z	High-Z
$< V_{UVLOA}$	$< V_{UVLOB}$	X	X	High-Z	High-Z

Note: Drive DE low to disable the transmitter outputs. Drive DE high to enable the transmitter outputs. DE has an internal pulldown to GNDA.

X = Don't care.

RECEIVING				
INPUTS				OUTPUTS
V _{DDA}	V _{DDB}	$\overline{RE}$	(V _A - V _B)	RXD
$\geq V_{UVLOA}$	$\geq V_{UVLOB}$	0	$> -10\text{mV}$	1
$\geq V_{UVLOA}$	$\geq V_{UVLOB}$	0	$< -200\text{mV}$	0
$\geq V_{UVLOA}$	$\geq V_{UVLOB}$	0	Open/Short	1
$\geq V_{UVLOA}$	$\geq V_{UVLOB}$	1	X	High-Z
$< V_{UVLOA}$	$\geq V_{UVLOB}$	X	X	High-Z
$\geq V_{UVLOA}$	$< V_{UVLOB}$	0	X	1
$< V_{UVLOA}$	$< V_{UVLOB}$	X	X	High-Z

Note: Drive RE high to disable the receiver output. Drive RE low to enable to receiver output. RE has an internal pulldown to GNDA.

X = Don't care.

Detailed Description

The MAX14853/MAX14855 isolated RS-485/RS-422 transceivers provide 2750V_{RMS} (60s) of galvanic isolation between the RS-485/RS-422 cable-side of the transceiver and the UART-side. These devices allow up to 500kbps (MAX14853) or 25Mbps (MAX14855) communication across an isolation barrier when a large potential exists between grounds on each side of the barrier.

Isolation

Both data and power can be transmitted across the isolation barrier. Data isolation is achieved using integrated capacitive isolation that allows data transmission between the UART-side and the cable-side of the transceiver.

To achieve power isolation, the MAX14853/MAX14855 feature an integrated transformer driver to drive an external center-tapped transformer, allowing the transfer of operating power from the UART-side across the isolation barrier to the cable-side. Connect the primary side of the external transformer to the MAX14853/MAX14855's transformer driver outputs (TD1 and TD2).

Integrated LDO

The MAX14853/MAX14855 include an internal low-dropout regulator with a set 3.3V (typ) output that is used to power the cable-side of the IC. The output of the LDO is V_{DDB}. The LDO has a 300mA (typ) current limit. If the LDO is unused, connect V_{LDO} to GNDB and apply +3.3V directly to V_{DDB}.

True Fail-Safe

The MAX14853/MAX14855 guarantee a logic-high on the receiver output when the receiver inputs are shorted or open, or when connected to a terminated transmission line with all drivers disabled. The receiver threshold is fixed between -10mV and -200mV. If the differential receiver input voltage (V_A - V_B) is greater than or equal to -10mV, RXD is logic high. In the case of a terminated bus with all transmitters disabled, the receiver's differential input voltage is pulled to zero by the termination resistors. Due to the receiver thresholds of the MAX14853/MAX14855, this results in a logic-high at RXD.

Driver Output Protection

Two mechanisms prevent excessive output current and power dissipation caused by faults or by bus contention. The first, a hiccup-mode current limit on the output stage,

provides immediate protection against short circuits over the entire common-mode voltage range. The second, a thermal-shutdown circuit, forces the driver outputs into a high-impedance state if the die temperature exceeds +160°C (typ).

Thermal Shutdown

The MAX14853/MAX14855 are protected from overtemperature damage by integrated thermal-shutdown circuitry. When the junction temperature (T_J) exceeds +160°C (typ), the driver outputs go high impedance. The device resumes normal operation when T_J falls below +145°C (typ).

Transformer Driver

Overcurrent Limiting

The MAX14853/MAX14855 feature overcurrent limiting to protect the integrated transformer driver from excessive currents when charging large capacitive loads or driving into short-circuits. Current limiting is achieved in two stages: internal circuitry monitors the output current and detects when the peak current rises above 1.2A. When the 1.2A threshold is exceeded, internal circuitry reduces the output current to the 730mA current-limit. The MAX14853/MAX14855 monitor the driver current on a cycle-by-cycle basis and limit the current until the short is removed.

The transformer driver on the MAX14853/MAX14855 can dissipate large amounts of power during overcurrent limiting, causing the IC to enter thermal shutdown.

Transformer Selection

The integrated push-pull transformer driver allows the transmission of operating power from the logic side, across the isolation barrier, to the isolated field side of the device. The 450kHz transformer driver operates with center-tapped primary and secondary transformers. Select a transformer with an ET product greater than or equal to the ET of the driver to ensure that the transformer does not enter saturation. E is the voltage applied to the transformer and T is the maximum time it is applied during any one cycle. Calculate the minimum ET product for the transformer primary as:

$$ET = V_{MAX} / (2 \times f_{MIN})$$

Where V_{MAX} is the worst-case maximum supply voltage on V_{DDA} and f_{MIN} is the minimum frequency at that supply voltage. For example, using 5.5V and 350kHz, the required minimum ET product is 7.9V μ s.

Applications Information

128 Transceivers on the Bus

The standard RS-485 receiver input impedance is one unit load, and a standard driver can drive up to 32 unit loads. The MAX14853/MAX14855 transceivers have a $\frac{1}{4}$ -unit load receiver, allowing up to 128 transceivers connected in parallel on one communication line. Connect any combination of these devices, and/or other RS-485 devices, for a maximum of 32 unit loads to the line.

Typical Application

The MAX14853/MAX14855 full-duplex transceivers are designed for bidirectional data communications on multi-point bus transmission lines. Figure 9 and Figure 10 show typical network applications circuits. To minimize reflections, the bus should be terminated at the receiver input in its

characteristics impedance, and stub lengths off the main line should be kept as short as possible.

Layout Considerations

It is recommended to design an isolation or keep-out channel underneath the isolator that is free from ground and signal planes. Any galvanic or metallic connection between the cable-side and UART-side defeats the isolation.

Ensure that the decoupling capacitors between V_{DDA} and $GNDA$ and between V_{LDO} , V_{DDB} , and $GNDB$ are located as close as possible to the IC to minimize inductance.

Route important signal lines close to the ground plane to minimize possible external influences. On the cable-side of the MAX14853/MAX14855, it is good practice to have the bus connectors and termination resistor as close as possible to the A and B pins.

Figure 10. Typical Isolated RS-485/RS-422 Application with Integrated Transformer Driver

Extended ESD Protection

ESD protection structures are incorporated on all pins to protect against electrostatic discharge encountered during handling and assembly. The driver outputs and receiver inputs of the MAX14853/MAX14855 have extra protection against static electricity. The ESD structures withstand high ESD in normal operation and when powered down. After an ESD event, the devices keep working without latch-up or damage.

Bypass V_{DDA} to GNDA and bypass V_{DDB} and V_{LDO} to GNDB with both 0.1µF and 1µF capacitors to ensure maximum ESD protection.

ESD protection can be tested in various ways. The transmitter outputs and receiver inputs of the MAX14853/MAX14855 are characterized for protection to the cable-side ground (GNDB) to the following limits:

- ± 35 kV HBM
- ± 18 kV using the Air-Gap Discharge method specified in IEC 61000-4-2
- ± 8 kV using the Contact Discharge method specified in the IEC 61000-4-2

The transmitter outputs and receiver inputs also include extended ESD protection with reference to the UART-side ground (GNDA) to the following limits:

- ± 8 kV HBM

ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

Human Body Model (HBM)

Figure 11 shows the HBM test model and Figure 12 shows the current waveform it generates when discharged in a low-impedance state. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged in to the test device through a 1.5k Ω resistor.

IEC 61000-4-2

The IEC 61000-4-2 standard covers ESD testing and performance of finished equipment. However, it does not specifically refer to integrated circuits. The MAX14853/MAX14855 help in designing equipment to meet IEC 61000-4-2 without the need for additional ESD protection components.

The major difference between tests done using the HBM and IEC 61000-4-2 is higher peak current in IEC 61000-4-2 because series resistance is lower in the IEC 61000-4-2 model. Hence, the ESD withstand voltage measured to IEC 61000-4-2 is generally lower than that measured using the HBM. Figure 13 shows the IEC 61000-4-2 model and Figure 14 shows the current waveform for IEC 61000-4-2 ESD Contact Discharge Test.

2.75kV_{RMS} Isolated 500kbps/25Mbps Full-Duplex
RS-485/RS-422 Transceivers with ± 35 kV ESD
Protection and Integrated Transformer Driver

The schematic diagram illustrates a differential RS-485 transceiver system, divided into two sections by a vertical dashed line labeled "ISOLATION BARRIER".

Left Section (Microcontroller Interface):

- A microcontroller (μC) is connected to the system.
- Power supply V_{DDA} is connected to the microcontroller and the RXFMR DRIVER.
- Ground $GNDA$ is connected to the microcontroller and the RXFMR DRIVER.
- The RXFMR DRIVER has two outputs, TD1 and TD2, which are connected to the RXD and RE pins of the MAX14853/MAX14855 transceiver.
- The TXD and DE pins of the transceiver are connected to the microcontroller.

Right Section (Transceiver and RS-485 Interface):

- The MAX14853/MAX14855 transceiver is connected to the RXFMR DRIVER and the RS-485 transceiver.
- Power supply V_{LDO} is connected to the transceiver and the RS-485 transceiver.
- Ground $GNDB$ is connected to the transceiver and the RS-485 transceiver.
- The RS-485 transceiver has four outputs, A, B, Z, and Y, which are connected to the RS-485 bus.
- The RS-485 bus is shown as a differential pair of lines with termination resistors.

Isolation Barrier:

The ISOLATION BARRIER separates the microcontroller and the RXFMR DRIVER from the transceiver and the RS-485 transceiver, ensuring galvanic isolation between the two sections.

Maxim Integrated cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim Integrated product. No circuit patent licenses are implied. Maxim Integrated reserves the right to change the circuitry and specifications without notice at any time. The parametric values (min and max limits) shown in the Electrical Characteristics table are guaranteed. Other parametric values quoted in this data sheet are provided for guidance.

Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
