

Features

- Low power CapSense[®] block
 - Configurable capacitive sensing elements
 - Supports combination of CapSense buttons, sliders, touchpads, and proximity sensors
- Powerful Harvard-architecture processor
 - M8C processor speeds running up to 12 MHz
 - Low power at high speed
 - Operating voltage: 2.4 V to 5.25 V
 - Industrial temperature range: -40 °C to +85 °C
- Flexible on-chip memory
 - 8 KB flash program storage 50,000 erase/write cycles
 - 512-Bytes SRAM data storage
 - Partial flash updates
 - Flexible protection modes
 - Interrupt controller
 - In-system serial programming (ISSP)
- Complete development tools
 - Free development tool (PSoC Designer™)
 - Full-featured, in-circuit emulator, and programmer
 - Full-speed emulation
 - Complex breakpoint structure
 - 128 KB trace memory
- Precision, programmable clocking
 - Internal ±5.0% 6- / 12-MHz main oscillator
 - Internal low speed oscillator at 32 kHz for watchdog and sleep
- Programmable pin configurations
 - Pull-up, high Z, open-drain, and CMOS drive modes on all GPIOs
 - Up to 28 analog inputs on all GPIOs
 - Configurable inputs on all GPIOs
 - 20-mA sink current on all GPIOs
 - Selectable, regulated digital I/O on port 1
 - 3.0 V, 20 mA total port 1 source current
 - 5 mA strong drive mode on port 1 versatile analog mux
 - Common internal analog bus
 - Simultaneous connection of I/O combinations
 - Comparator noise immunity
 - Low-dropout voltage regulator for the analog array

- Additional system resources
 - Configurable communication speeds
 - I²C: selectable to 50 kHz, 100 kHz, or 400 kHz
 - SPI: configurable between 46.9 kHz and 3 MHz
 - I²C slave
 - SPI master and SPI slave
 - Watchdog and sleep timers
 - Internal voltage reference
 - Integrated supervisory circuit

PSoC Functional Overview

The PSoC family consists of many *Programmable System-on-Chips with On-Chip Controller* devices. These devices are designed to replace multiple traditional MCU based system components with one low cost single chip programmable component. A PSoC device includes configurable analog and digital blocks and programmable interconnect. This architecture enables the user to create customized peripheral configurations to match the requirements of each individual application. Additionally, a fast CPU, flash program memory, SRAM data memory, and configurable I/O are included in a range of convenient pinouts.

The PSoC architecture for this device family, as shown in Figure 1, consists of three main areas: the Core, the System Resources, and the CapSense Analog System. A common versatile bus enables connection between I/O and the analog system. Each CY8C20x34 PSoC device includes a dedicated CapSense block that provides sensing and scanning control circuitry for capacitive sensing applications. Depending on the PSoC package, up to 28 general purpose I/O (GPIO) are also included. The GPIO provide access to the MCU and analog mux.

PSoC Core

The PSoC Core is a powerful engine that supports a rich instruction set. It encompasses SRAM for data storage, an interrupt controller, sleep and watchdog timers, IMO, and ILO. The CPU core, called the M8C, is a powerful processor with speeds up to 12 MHz. The M8C is a two MIPS, 8-bit Harvard-architecture microprocessor.

System Resources provide additional capability such as a configurable I²C slave or SPI master-slave communication interface and various system resets supported by the M8C.

The Analog System consists of the CapSense PSoC block and an internal 1.8 V analog reference. Together they support capacitive sensing of up to 28 inputs.

CapSense Analog System

The Analog System contains the capacitive sensing hardware. Several hardware algorithms are supported. This hardware performs capacitive sensing and scanning without requiring external components. Capacitive sensing is configurable on each GPIO pin. Scanning of enabled CapSense pins is completed quickly and easily across multiple ports.

Figure 1. Analog System Block Diagram

Analog Multiplexer System

The Analog Mux Bus connects to every GPIO pin. Pins are connected to the bus individually or in any combination. The bus also connects to the analog system for analysis with the CapSense block comparator.

Switch control logic enables selected pins to precharge continuously under hardware control. This enables capacitive measurement for applications such as touch sensing. Other multiplexer applications include:

- Complex capacitive sensing interfaces such as sliders and touch pads
- Chip-wide mux that enables analog input from any I/O pin
- Crosspoint connection between any I/O pin combinations

Additional System Resources

System Resources provide additional capability useful to complete systems. Additional resources include low voltage detection and power on reset. Brief statements describing the merits of each system resource follow:

- The I²C slave or SPI master-slave module provides 50/100/400 kHz communication over two wires. SPI communication over three or four wires run at speeds of 46.9 kHz to 3 MHz (lower for a slower system clock).

- Low voltage detection (LVD) interrupts signal the application of falling voltage levels, while the advanced POR (Power On Reset) circuit eliminates the need for a system supervisor.
- An internal 1.8 V reference provides an absolute reference for capacitive sensing.
- The 5 V maximum input, 3 V fixed output, low dropout regulator (LDO) provides regulation for I/Os. A register controlled bypass mode enables the user to disable the LDO.

PSoC Device Characteristics

Depending on your PSoC device characteristics, the digital and analog systems can have 16, 8, or 4 digital blocks, and 12, 6, or 4 analog blocks. Table 1 lists the resources available for specific PSoC device groups. The PSoC device covered by this datasheet is highlighted.

Development Tools

PSoC Designer™ is the revolutionary integrated design environment (IDE) that you can use to customize PSoC to meet your specific application requirements. PSoC Designer software accelerates system design and time to market. Develop your applications using a library of precharacterized analog and digital peripherals (called user modules) in a drag-and-drop design environment. Then, customize your design by leveraging the dynamically generated application programming interface (API) libraries of code. Finally, debug and test your designs with the integrated debug environment, including in-circuit emulation and standard software debug features. PSoC Designer includes:

- Application editor graphical user interface (GUI) for device and user module configuration and dynamic reconfiguration
- Extensive user module catalog
- Integrated source-code editor (C and assembly)
- Free C compiler with no size restrictions or time limits
- Built-in debugger
- In-circuit emulation
- Built-in support for communication interfaces:
 - Hardware and software I²C slaves and masters
 - Full-speed USB 2.0
 - Up to four full-duplex universal asynchronous receiver/transmitters (UARTs), SPI master and slave, and wireless

PSoC Designer supports the entire library of PSoC 1 devices and runs on Windows XP, Windows Vista, and Windows 7.

PSoC Designer Software Subsystems

Design Entry

In the chip-level view, choose a base device to work with. Then select different onboard analog and digital components that use the PSoC blocks, which are called user modules. Examples of user modules are ADCs, DACs, amplifiers, and filters. Configure the user modules for your chosen application and connect them to each other and to the proper pins. Then generate your project. This prepopulates your project with APIs and libraries that you can use to program your application.

The tool also supports easy development of multiple configurations and dynamic reconfiguration. Dynamic reconfiguration makes it possible to change configurations at run time. In essence, this allows you to use more than 100 percent of PSoC's resources for an application.

Code Generation Tools

The code generation tools work seamlessly within the PSoC Designer interface and have been tested with a full range of debugging tools. You can develop your design in C, assembly, or a combination of the two.

Assemblers. The assemblers allow you to merge assembly code seamlessly with C code. Link libraries automatically use absolute addressing or are compiled in relative mode, and are linked with other software modules to get absolute addressing.

C Language Compilers. C language compilers are available that support the PSoC family of devices. The products allow you to create complete C programs for the PSoC family devices. The optimizing C compilers provide all of the features of C, tailored to the PSoC architecture. They come complete with embedded libraries providing port and bus operations, standard keypad and display support, and extended math functionality.

Debugger

PSoC Designer has a debug environment that provides hardware in-circuit emulation, allowing you to test the program in a physical system while providing an internal view of the PSoC device. Debugger commands allow you to read and program and read and write data memory, and read and write I/O registers. You can read and write CPU registers, set and clear breakpoints, and provide program run, halt, and step control. The debugger also allows you to create a trace buffer of registers and memory locations of interest.

Online Help System

The online help system displays online, context-sensitive help. Designed for procedural and quick reference, each functional subsystem has its own context-sensitive help. This system also provides tutorials and links to FAQs and an online support Forum to aid the designer.

In-Circuit Emulator

A low-cost, high-functionality in-circuit emulator (ICE) is available for development support. This hardware can program single devices.

The emulator consists of a base unit that connects to the PC using a USB port. The base unit is universal and operates with all PSoC devices. Emulation pods for each device family are available separately. The emulation pod takes the place of the PSoC device in the target board and performs full-speed (24 MHz) operation.

Designing with PSoC Designer

The development process for the PSoC device differs from that of a traditional fixed function microprocessor. The configurable analog and digital hardware blocks give the PSoC architecture a unique flexibility that pays dividends in managing specification change during development and by lowering inventory costs. These configurable resources, called PSoC Blocks, have the ability to implement a wide variety of user-selectable functions. The PSoC development process is summarized in four steps:

1. Select [User Modules](#).
2. Configure User Modules.
3. Organize and Connect.
4. Generate, Verify, and Debug.

Select User Modules

PSoC Designer provides a library of prebuilt, pretested hardware peripheral components called “user modules.” User modules make selecting and implementing peripheral devices, both analog and digital, simple.

Configure User Modules

Each user module that you select establishes the basic register settings that implement the selected function. They also provide parameters and properties that allow you to tailor their precise configuration to your particular application. For example, a PWM User Module configures one or more digital PSoC blocks, one for each 8 bits of resolution. The user module parameters permit you to establish the pulse width and duty cycle. Configure the parameters and properties to correspond to your chosen application. Enter values directly or by selecting values from drop-down menus. All the user modules are documented in datasheets that may be viewed directly in PSoC Designer or on the Cypress website. These [user module datasheets](#) explain the internal operation of the user module and provide performance specifications. Each datasheet describes the use of each user module parameter, and other information you may need to successfully implement your design.

Organize and Connect

You build signal chains at the chip level by interconnecting user modules to each other and the I/O pins. You perform the selection, configuration, and routing so that you have complete control over all on-chip resources.

Generate, Verify, and Debug

When you are ready to test the hardware configuration or move on to developing code for the project, you perform the “Generate Configuration Files” step. This causes PSoC Designer to generate source code that automatically configures the device to your specification and provides the software for the system. The generated code provides application programming interfaces (APIs) with high-level functions to control and respond to hardware events at run-time and interrupt service routines that you can adapt as needed.

A complete code development environment allows you to develop and customize your applications in either C, assembly language, or both.

The last step in the development process takes place inside PSoC Designer’s debugger (access by clicking the Connect icon). PSoC Designer downloads the HEX image to the ICE where it runs at full speed. PSoC Designer debugging capabilities rival those of systems costing many times more. In addition to traditional single-step, run-to-breakpoint, and watch-variable features, the debug interface provides a large trace buffer and allows you to define complex breakpoint events. These include monitoring address and data bus values, memory locations, and external signals.

Pin Information

This section describes, lists, and illustrates the CY8C20234, CY8C20334, CY8C20434, CY8C20534, and CY8C20634 PSoC device pins and pinout configurations.

The CY8C20x34 PSoC device is available in a variety of packages that are listed and shown in the following tables. Every port pin (labeled with a "P") is capable of Digital I/O and connection to the common analog bus. However, V_{SS} , V_{DD} , and XRES are not capable of Digital I/O.

Electrical Specifications

This section presents the DC and AC electrical specifications of the CY8C20234, CY8C20334, CY8C20434, CY8C20534, and CY8C20634 PSoC devices. For the latest electrical specifications, check the most recent datasheet by visiting the web at <http://www.cypress.com>.

Specifications are valid for $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$ and $T_J \leq 100\text{ }^{\circ}\text{C}$ as specified, except where mentioned.

Refer to [Table 19 on page 24](#) for the electrical specifications on the internal main oscillator (IMO) using SLIMO mode.

| Symbol | Description | Min | Typ | Max | Units | Notes |
|-----------------------|---|-----------------------|-----|-----------------------|-------|--|
| T _{STG} | Storage Temperature | -55 | 25 | +100 | °C | Higher storage temperatures reduces data retention time. Recommended storage temperature is +25 °C ± 25 °C. Extended duration storage temperatures above 65 °C degrades reliability. |
| T _{BAKETEMP} | Bake temperature | - | 125 | See package label | °C | |
| t _{BAKETIME} | Bake time | See package label | - | 72 | Hours | |
| T _A | Ambient temperature with power applied | -40 | - | +85 | °C | |
| V _{DD} | Supply voltage on V _{DD} relative to V _{SS} | -0.5 | - | +6.0 | V | |
| V _{IO} | DC input voltage | V _{SS} - 0.5 | - | V _{DD} + 0.5 | V | |
| V _{IOZ} | DC voltage applied to tri-state | V _{SS} - 0.5 | - | V _{DD} + 0.5 | V | |
| I _{MIO} | Maximum current into any port pin | -25 | - | +50 | mA | |
| ESD | Electro static discharge voltage | 2000 | - | - | V | Human body model ESD. |
| LU | Latch-up current | - | - | 200 | mA | |

Operating Temperature

| Symbol | Description | Min | Typ | Max | Units | Notes |
|--------|----------------------|-----|-----|------|-------|---|
| T_A | Ambient temperature | -40 | - | +85 | °C | |
| T_J | Junction temperature | -40 | - | +100 | °C | The temperature rise from ambient to junction is package specific. See Table 16 on page 22 . The user must limit the power consumption to comply with this requirement. |

DC Electrical Characteristics

DC Chip Level Specifications

[Table 12](#) lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75 V to 5.25 V and $-40\text{ °C} \leq T_A \leq 85\text{ °C}$, 3.0V to 3.6V and $-40\text{ °C} \leq T_A \leq 85\text{ °C}$, or 2.4 V to 3.0 V and $-40\text{ °C} \leq T_A \leq 85\text{ °C}$, respectively. Typical parameters apply to 5 V, 3.3 V, or 2.7 V at 25 °C. These are for design guidance only.

DC Programming Specifications

Table 17 lists the guaranteed minimum and maximum specifications for the voltage and temperature ranges: 4.75 V to 5.25 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, 3.0 V to 3.6 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, or 2.4 V to 3.0 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, respectively. Typical parameters apply to 5 V, 3.3 V, or 2.7 V at 25 °C. These are for design guidance only. Flash endurance and retention specifications with the use of the EEPROM User Module are valid only within the range: 25 °C \pm 20°C during the Flash Write operation. Reference the EEPROM User Module datasheet instructions for EEPROM flash write requirements outside of the 25 °C \pm 20 °C temperature window.

| Flash _{DR} | Flash data retention | 10 | – | – | Years | |

Notes

16. A maximum of 36 x 50,000 block endurance cycles is allowed. This is balanced between operations on 36 x 1 blocks of 50,000 maximum cycles each, 36 x 2 blocks of 25,000 maximum cycles each, or 36 x 4 blocks of 12,500 maximum cycles each (to limit the total number of cycles to 36 x 50,000 and that no single block ever sees more than 50,000 cycles).

17. The 50,000 cycle flash endurance per block is only guaranteed if the flash is operating within one voltage range. Voltage ranges are 2.4 V to 3.0 V, 3.0 V to 3.6 V and 4.75 V to 5.25 V.

DC I²C Specifications

Table 18 lists the guaranteed minimum and maximum specifications for the voltage and temperature ranges: 4.75 V to 5.25 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, 3.0V to 3.6 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, or 2.4 V to 3.0 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, respectively. Typical parameters apply to 5 V, 3.3 V, or 2.7 V at 25 °C. These are for design guidance only. Flash endurance and retention specifications with the use of the EEPROM user module are valid only within the range: 25 °C +/-20C during the Flash Write operation. Reference the EEPROM User Module datasheet instructions for EEPROM flash Write requirements outside of the 25 °C +/-20 °C temperature window.

Note

23. A Fast Mode I²C bus device is used in a Standard Mode I²C bus system but the requirement t_{SU}; DAT ≥ 250 ns is met. This automatically is the case if the device does not stretch the LOW period of the SCL signal. If such device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line t_{max} + t_{SU}; DAT = 1000 + 250 = 1250 ns (according to the Standard Mode I²C bus specification) before the SCL line is released.

Important Note For information on the preferred dimensions for mounting the QFN packages, see the application note “Application Notes for Surface Mount Assembly of Amkor’s MicroLeadFrame (MLF) Packages” available at <http://www.amkor.com>.

It is important to note that pinned vias for thermal conduction are not required for the low power 24, 32, and 48-pin QFN PSoC devices.

Thermal Impedances

Table 33 illustrates the minimum solder reflow peak temperature to achieve good solderability.

Table 33. Thermal Impedances Per Package

| Package | Typical θ_{JA} [24] |
|------------|----------------------------|
| 8 SOIC | 127 °C/W |
| 16 SOIC | 80 °C/W |
| 16 QFN | 46 °C/W |
| 24 QFN[25] | 25 °C/W |
| 28 SSOP | 96 °C/W |
| 30 WLCSP | 54 °C/W |
| 32 QFN[25] | 27 °C/W |
| 48 QFN[25] | 28 °C/W |

Solder Reflow Specifications

Table 34 shows the solder reflow temperature limits that must not be exceeded.

Table 34. Solder Reflow Specifications

| Package | Maximum Peak Temperature (T_C) | Maximum Time above $T_C - 5$ °C |
|--------------|------------------------------------|---------------------------------|
| 8-Pin SOIC | 260 °C | 30 seconds |
| 16-Pin SOIC | 260 °C | 30 seconds |
| 16-Pin QFN | 260 °C | 30 seconds |
| 24-Pin QFN | 260 °C | 30 seconds |
| 28-Pin SSOP | 260 °C | 30 seconds |
| 30-Pin WLCSP | 260 °C | 30 seconds |
| 32-Pin QFN | 260 °C | 30 seconds |
| 48-Pin QFN | 260 °C | 30 seconds |

Notes

24. $T_J = T_A + \text{Power} \times \theta_{JA}$.

25. To achieve the thermal impedance specified for the QFN package, refer to "Application Notes for Surface Mount Assembly of Amkor's MicroLeadFrame (Packages available at <http://www.cypress.com>).

26. Higher temperatures is required based on the solder melting point. Typical temperatures for solder are 220 ± 5 °C with Sn-Pb or 245 ± 5 °C with Sn-Ag-Cu paste. Refer to the solder manufacturer specifications.

Development Tool Selection

Software

PSoC Designer™

At the core of the PSoC development software suite is PSoC Designer, used to generate PSoC firmware applications. PSoC Designer is available free of charge at <http://www.cypress.com> and includes a free C compiler.

PSoC Programmer

PSoC Programmer is flexible enough and is used on the bench in development and also suitable for factory programming. PSoC Programmer works either as a standalone programming application or operates directly from PSoC Designer. PSoC Programmer software is compatible with both PSoC ICE Cube In-Circuit Emulator and PSoC MiniProg. PSoC programmer is available free of charge at <http://www.cypress.com>.

Development Kits

All development kits are sold at the Cypress Online Store.

CY3215-DK Basic Development Kit

The CY3215-DK is for prototyping and development with PSoC Designer. This kit supports in-circuit emulation and the software interface enables users to run, halt, and single step the processor and view the content of specific memory locations. PSoC Designer supports the advance emulation features also. The kit includes:

- PSoC Designer Software CD
- ICE-Cube In-Circuit Emulator
- ICE Flex-Pod for CY8C29x66 Family
- Cat-5 Adapter
- Mini-Eval Programming Board
- 110 ~ 240V Power Supply, Euro-Plug Adapter
- iMAGEcraft C Compiler (Registration Required)
- ISSP Cable
- USB 2.0 Cable and Blue Cat-5 Cable
- 2 CY8C29466-24PXI 28-PDIP Chip Samples

Evaluation Tools

All evaluation tools are sold at the Cypress Online Store.

CY3210-MiniProg1

The CY3210-MiniProg1 kit enables the user to program PSoC devices via the MiniProg1 programming unit. The MiniProg is a small, compact prototyping programmer that connects to the PC via a provided USB 2.0 cable. The kit includes:

- MiniProg Programming Unit
- MiniEval Socket Programming and Evaluation Board
- 28-Pin CY8C29466-24PXI PDIP PSoC Device Sample
- 28-Pin CY8C27443-24PXI PDIP PSoC Device Sample
- PSoC Designer Software CD
- Getting Started Guide
- USB 2.0 Cable

CY3210-PSoCEval1

The CY3210-PSoCEval1 kit features an evaluation board and the MiniProg1 programming unit. The evaluation board includes an LCD module, potentiometer, LEDs, and plenty of bread-boarding space to meet all of your evaluation needs. The kit includes:

- Evaluation Board with LCD Module
- MiniProg Programming Unit
- 28-Pin CY8C29466-24PXI PDIP PSoC Device Sample (2)
- PSoC Designer Software CD
- Getting Started Guide
- USB 2.0 Cable

CY3214-PSoCEvalUSB

The CY3214-PSoCEvalUSB evaluation kit features a development board for the CY8C24794-24LFXI PSoC device. Special features of the board include both USB and capacitive sensing development and debugging support. This evaluation board also includes an LCD module, potentiometer, LEDs, an enunciator and plenty of bread boarding space to meet all of your evaluation needs. The kit includes:

- PSoCEvalUSB Board
- LCD Module
- MiniProg Programming Unit
- Mini USB Cable
- PSoC Designer and Example Projects CD
- Getting Started Guide
- Wire Pack

Device Programmers

All device programmers are purchased from the Cypress Online Store.

CY3216 Modular Programmer

The CY3216 Modular Programmer kit features a modular programmer and the MiniProg1 programming unit. The modular programmer includes three programming module cards and supports multiple Cypress products. The kit includes:

- Modular Programmer Base
- 3 Programming Module Cards
- MiniProg Programming Unit
- PSoC Designer Software CD
- Getting Started Guide
- USB 2.0 Cable

CY3207ISSP In-System Serial Programmer (ISSP)

The CY3207ISSP is a production programmer. It includes protection circuitry and an industrial case that is more robust than the MiniProg in a production programming environment. Note that CY3207ISSP needs special software and is not compatible with PSoC Programmer. The kit includes:

- CY3207 Programmer Unit
- PSoC ISSP Software CD
- 110 ~ 240V Power Supply, Euro-Plug Adapter
- USB 2.0 Cable

Accessories (Emulation and Programming)

Notes

27. Dual function Digital I/O Pins also connect to the common analog mux.

28. This part may be used for in-circuit debugging. It is NOT available for production.

29. Programming adapter converts non-DIP package to DIP footprint. Specific details and ordering information for each of the adapters is available at <http://www.emulation.com>.

Ordering Information

Table 36 lists the CY8C20234, CY8C20334, CY8C20434, CY8C20534, and CY8C20634 PSoC device's key package features and ordering codes.

Numeric Conventions

Hexadecimal numbers are represented with all letters in uppercase with an appended lowercase 'h' (for example, '14h' or '3Ah'). Hexadecimal numbers may also be represented by a '0x' prefix, the C coding convention. Binary numbers have an appended lowercase 'b' (for example, '01010100b' or '01000011b'). Numbers not indicated by an 'h' or 'b' are decimals.

Glossary

| | |
|---|--|
| active high | <ol style="list-style-type: none"> 1. A logic signal having its asserted state as the logic 1 state. 2. A logic signal having the logic 1 state as the higher voltage of the two states. |
| analog blocks | The basic programmable opamp circuits. These are SC (switched capacitor) and CT (continuous time) blocks. These blocks can be interconnected to provide ADCs, DACs, multi-pole filters, gain stages, and much more. |
| analog-to-digital (ADC) | A device that changes an analog signal to a digital signal of corresponding magnitude. Typically, an ADC converts a voltage to a digital number. The digital-to-analog (DAC) converter performs the reverse operation. |
| Application programming interface (API) | A series of software routines that comprise an interface between a computer application and lower level services and functions (for example, user modules and libraries). APIs serve as building blocks for programmers that create software applications. |
| asynchronous | A signal whose data is acknowledged or acted upon immediately, irrespective of any clock signal. |
| Bandgap reference | A stable voltage reference design that matches the positive temperature coefficient of V_T with the negative temperature coefficient of V_{BE} , to produce a zero temperature coefficient (ideally) reference. |
| bandwidth | <ol style="list-style-type: none"> 1. The frequency range of a message or information processing system measured in hertz. 2. The width of the spectral region over which an amplifier (or absorber) has substantial gain (or loss); it is sometimes represented more specifically as, for example, full width at half maximum. |
| bias | <ol style="list-style-type: none"> 1. A systematic deviation of a value from a reference value. 2. The amount by which the average of a set of values departs from a reference value. 3. The electrical, mechanical, magnetic, or other force (field) applied to a device to establish a reference level to operate the device. |

Glossary

| | |
|-------------------------------|--|
| block | <ol style="list-style-type: none">1. A functional unit that performs a single function, such as an oscillator.2. A functional unit that may be configured to perform one of several functions, such as a digital PSoC block or an analog PSoC block. |
| buffer | <ol style="list-style-type: none">1. A storage area for data that is used to compensate for a speed difference, when transferring data from one device to another. Usually refers to an area reserved for IO operations, into which data is read, or from which data is written.2. A portion of memory set aside to store data, often before it is sent to an external device or as it is received from an external device.3. An amplifier used to lower the output impedance of a system. |
| bus | <ol style="list-style-type: none">1. A named connection of nets. Bundling nets together in a bus makes it easier to route nets with similar routing patterns.2. A set of signals performing a common function and carrying similar data. Typically represented using vector notation; for example, address[7:0].3. One or more conductors that serve as a common connection for a group of related devices. |
| clock | The device that generates a periodic signal with a fixed frequency and duty cycle. A clock is sometimes used to synchronize different logic blocks. |
| comparator | An electronic circuit that produces an output voltage or current whenever two input levels simultaneously satisfy predetermined amplitude requirements. |
| compiler | A program that translates a high level language, such as C, into machine language. |
| configuration space | In PSoC devices, the register space accessed when the XIO bit, in the CPU_F register, is set to '1'. |
| crystal oscillator | An oscillator in which the frequency is controlled by a piezoelectric crystal. Typically a piezoelectric crystal is less sensitive to ambient temperature than other circuit components. |
| cyclic redundancy check (CRC) | A calculation used to detect errors in data communications, typically performed using a linear feedback shift register. Similar calculations may be used for a variety of other purposes such as data compression. |
| data bus | A bi-directional set of signals used by a computer to convey information from a memory location to the central processing unit and vice versa. More generally, a set of signals used to convey data between digital functions. |
| debugger | A hardware and software system that allows you to analyze the operation of the system under development. A debugger usually allows the developer to step through the firmware one step at a time, set break points, and analyze memory. |
| dead band | A period of time when neither of two or more signals are in their active state or in transition. |
| digital blocks | The 8-bit logic blocks that can act as a counter, timer, serial receiver, serial transmitter, CRC generator, pseudo-random number generator, or SPI. |
| digital-to-analog (DAC) | A device that changes a digital signal to an analog signal of corresponding magnitude. The analog-to-digital (ADC) converter performs the reverse operation. |
| duty cycle | The relationship of a clock period high time to its low time, expressed as a percent. |

Glossary

| | |
|---------------------------------|--|
| emulator | Duplicates (provides an emulation of) the functions of one system with a different system, so that the second system appears to behave like the first system. |
| External Reset (XRES) | An active high signal that is driven into the PSoC device. It causes all operation of the CPU and blocks to stop and return to a pre-defined state. |
| Flash | An electrically programmable and erasable, non-volatile technology that provides you the programmability and data storage of EPROMs, plus in-system erasability. Non-volatile means that the data is retained when power is OFF. |
| Flash block | The smallest amount of Flash ROM space that may be programmed at one time and the smallest amount of Flash space that may be protected. A Flash block holds 64 bytes. |
| frequency | The number of cycles or events per unit of time, for a periodic function. |
| gain | The ratio of output current, voltage, or power to input current, voltage, or power, respectively. Gain is usually expressed in dB. |
| I ² C | A two-wire serial computer bus by Philips Semiconductors (now NXP Semiconductors). I ² C is an Inter-Integrated Circuit. It is used to connect low-speed peripherals in an embedded system. The original system was created in the early 1980s as a battery control interface, but it was later used as a simple internal bus system for building control electronics. I ² C uses only two bi-directional pins, clock and data, both running at +5V and pulled high with resistors. The bus operates at 100 kbits/second in standard mode and 400 kbits/second in fast mode. |
| ICE | The in-circuit emulator that allows you to test the project in a hardware environment, while viewing the debugging device activity in a software environment (PSoC Designer). |
| input/output (I/O) | A device that introduces data into or extracts data from a system. |
| interrupt | A suspension of a process, such as the execution of a computer program, caused by an event external to that process, and performed in such a way that the process can be resumed. |
| interrupt service routine (ISR) | A block of code that normal code execution is diverted to when the M8C receives a hardware interrupt. Many interrupt sources may each exist with its own priority and individual ISR code block. Each ISR code block ends with the RETI instruction, returning the device to the point in the program where it left normal program execution. |
| jitter | <ol style="list-style-type: none">1. A misplacement of the timing of a transition from its ideal position. A typical form of corruption that occurs on serial data streams.2. The abrupt and unwanted variations of one or more signal characteristics, such as the interval between successive pulses, the amplitude of successive cycles, or the frequency or phase of successive cycles. |
| low-voltage detect (LVD) | A circuit that senses V_{DD} and provides an interrupt to the system when V_{DD} falls lower than a selected threshold. |
| M8C | An 8-bit Harvard-architecture microprocessor. The microprocessor coordinates all activity inside a PSoC by interfacing to the Flash, SRAM, and register space. |
| master device | A device that controls the timing for data exchanges between two devices. Or when devices are cascaded in width, the master device is the one that controls the timing for data exchanges between the cascaded devices and an external interface. The controlled device is called the slave device . |

Glossary

| | |
|-----------------------------|---|
| microcontroller | An integrated circuit chip that is designed primarily for control systems and products. In addition to a CPU, a microcontroller typically includes memory, timing circuits, and IO circuitry. The reason for this is to permit the realization of a controller with a minimal quantity of chips, thus achieving maximal possible miniaturization. This in turn, reduces the volume and the cost of the controller. The microcontroller is normally not used for general-purpose computation as is a microprocessor. |
| mixed-signal | The reference to a circuit containing both analog and digital techniques and components. |
| modulator | A device that imposes a signal on a carrier. |
| noise | <ol style="list-style-type: none">1. A disturbance that affects a signal and that may distort the information carried by the signal.2. The random variations of one or more characteristics of any entity such as voltage, current, or data. |
| oscillator | A circuit that may be crystal controlled and is used to generate a clock frequency. |
| parity | A technique for testing transmitting data. Typically, a binary digit is added to the data to make the sum of all the digits of the binary data either always even (even parity) or always odd (odd parity). |
| Phase-locked loop (PLL) | An electronic circuit that controls an oscillator so that it maintains a constant phase angle relative to a reference signal. |
| pinouts | The pin number assignment: the relation between the logical inputs and outputs of the PSoC device and their physical counterparts in the printed circuit board (PCB) package. Pinouts involve pin numbers as a link between schematic and PCB design (both being computer generated files) and may also involve pin names. |
| port | A group of pins, usually eight. |
| Power on reset (POR) | A circuit that forces the PSoC device to reset when the voltage is lower than a pre-set level. This is a type of hardware reset. |
| PSoC® | Cypress Semiconductor's PSoC® is a registered trademark and Programmable System-on-Chip™ is a trademark of Cypress. |
| PSoC Designer™ | The software for Cypress' Programmable System-on-Chip technology. |
| pulse width modulator (PWM) | An output in the form of duty cycle which varies as a function of the applied measurand |
| RAM | An acronym for random access memory. A data-storage device from which data can be read out and new data can be written in. |
| register | A storage device with a specific capacity, such as a bit or byte. |
| reset | A means of bringing a system back to a know state. See hardware reset and software reset. |
| ROM | An acronym for read only memory. A data-storage device from which data can be read out, but new data cannot be written in. |
| serial | <ol style="list-style-type: none">1. Pertaining to a process in which all events occur one after the other.2. Pertaining to the sequential or consecutive occurrence of two or more related activities in a single device or channel. |

Glossary

| | |
|-----------------|---|
| settling time | The time it takes for an output signal or value to stabilize after the input has changed from one value to another. |
| shift register | A memory storage device that sequentially shifts a word either left or right to output a stream of serial data. |
| slave device | A device that allows another device to control the timing for data exchanges between two devices. Or when devices are cascaded in width, the slave device is the one that allows another device to control the timing of data exchanges between the cascaded devices and an external interface. The controlling device is called the master device. |
| SRAM | An acronym for static random access memory. A memory device where you can store and retrieve data at a high rate of speed. The term static is used because, after a value is loaded into an SRAM cell, it remains unchanged until it is explicitly altered or until power is removed from the device. |
| SROM | An acronym for supervisory read only memory. The SROM holds code that is used to boot the device, calibrate circuitry, and perform Flash operations. The functions of the SROM may be accessed in normal user code, operating from Flash. |
| stop bit | A signal following a character or block that prepares the receiving device to receive the next character or block. |
| synchronous | <ol style="list-style-type: none">1. A signal whose data is not acknowledged or acted upon until the next active edge of a clock signal.2. A system whose operation is synchronized by a clock signal. |
| tri-state | A function whose output can adopt three states: 0, 1, and Z (high-impedance). The function does not drive any value in the Z state and, in many respects, may be considered to be disconnected from the rest of the circuit, allowing another output to drive the same net. |
| UART | A UART or universal asynchronous receiver-transmitter translates between parallel bits of data and serial bits. |
| user modules | Pre-build, pre-tested hardware/firmware peripheral functions that take care of managing and configuring the lower level Analog and Digital PSoC Blocks. User Modules also provide high level API (Application Programming Interface) for the peripheral function. |
| user space | The bank 0 space of the register map. The registers in this bank are more likely to be modified during normal program execution and not just during initialization. Registers in bank 1 are most likely to be modified only during the initialization phase of the program. |
| V _{DD} | A name for a power net meaning "voltage drain." The most positive power supply signal. Usually 5 V or 3.3 V. |
| V _{SS} | A name for a power net meaning "voltage source." The most negative power supply signal. |
| watchdog timer | A timer that must be serviced periodically. If it is not serviced, the CPU resets after a specified period of time. |

Updated 24-pin and 32-pin QFN package diagrams to 0.60 max thickness. Changed from commercial to industrial temperature range. Updated Storage Temperature specification and notes. Updated thermal resistance data. Added development tool kit part numbers. Finetuned features and electrical specifications. |
| *C | 788177 | HMT | See ECN | Added CapSense SNR requirement reference. Added Low Power Comparator (LPC) AC/DC electrical specifications tables. Added 2.7V minimum specifications. Updated figure standards. Updated Technical Training paragraph. Added QFN package clarifications and dimensions. Updated ECN-ed Amkor dimensioned QFN package diagram revisions. |
| *D | 1356805 | HMT/SFVTM P3/HCL/SFV | See ECN | Updated 24-pin QFN Theta JA. Added External Reset Pulse Width, TXRST, specification. Fixed 48-pin QFN.vsd. Updated the table introduction and high output voltage description in section two. The sentence: "Exceeding maximum ratings may shorten the battery life of the device." does not apply to all datasheets. Therefore, the word "battery" is changed to "useful." Took out tabs after table and figure numbers in titles and added two hard spaces. Updated the section, DC GPIO Specifications on page 19 with new text. Updated VOH5 and VOH6 to say, "High Output Voltage, Port 1 Pins with 3.0V LDO Regulator Enabled." Updated VOH7 and VOH8 with the text, "maximum of 20 mA source current in all I/Os." Added 28-pin SSOP part, pinout, package. Updated specs. Modified dev. tool part numbers. |
| *E | 2197347 | UVS/AESA | See ECN | Added 32-pin Sawn QFN Pin diagram Removed package diagram: 32-Pin (5 x 5 mm) SAWN QFN(001-42168 *A) Updated Ordering Information table with CY8C20434-12LQXI and CY8C20434-12LQXIT ordering details. Corrected Table 16. DC Programming Specifications - Included above the table "Flash Endurance and Retention specifications with the use of the EEPROM User Module are valid only within the range: 25 °C +/-20C during the Flash Write operation. Refer the EEPROM User Module datasheet instructions for EEPROM Flash Write requirements outside of the 25 °C +/-20 °C temperature window." |
| *F | 2542938 | RLRM/AESA | 07/30/2008 | Corrected Ordering Information format. Updated package diagrams 001-13937 and 001-30999. Updated datasheet template. Corrected Figure 6 (28-pin diagram). |
| *G | 2610469 | SNV/PYRS | 11/20/08 | Updated V _{OH5} , V _{OH7} , and V _{OH9} specifications |
| *H | 2693024 | DPT/PYRS | 04/16/2009 | Changed title from PSoC® Mixed Signal Array to PSoC® Programmable System-on-Chip™ Replaced package outline drawing for 32-Pin Sawn QFN Updated " Development Tool Selection " on page 37 Updated " Development Tools " on page 6 and " Designing with PSoC Designer " on page 7 Updated " Getting Started " on page 5 |
| *I | 2717566 | DRSW/ AESA | 06/11/2009 | Updated AC Chip-Level, and AC Programming Specifications as follows: Modified F _{IMO6} (page 20), T _{WRITE} specifications (page 23) Added I _{OH} , I _{OL} (page 17), Flash endurance note (page 19), DCILO (page 20), F32K_U (page 20), T _{POWERUP} (page 20), T _{ERASEALL} (page 23), T _{PROGRAM_HOT} (page 24), and T _{PROGRAM_COLD} (page 24) specifications Added AC SPI Master and Slave Specifications Added 30-Ball WLCSP Package |

| Revision | ECN | Orig. of Change | Submission Date | Description of Change |
| *J | 2825336 | ISW | 12/10/2009 | Updated pin description table for 48-pin OCD. Updated Ordering information table to include CY8C20534-12PVXA parts. Updated package diagrams for 48-pin QFN, 16-pin QFN (sawn), 24-pin QFN (sawn), and 30-ball WLCSF specs. |
| *K | 2892629 | NJF | 03/15/2010 | Updated Programmable pin configuration details in Features. Updated Analog Multiplexer System . Updated Cypress website links. Updated PSoC Designer Software Subsystems . Added T _{BAKETEMP} and T _{BAKETIME} parameters in Absolute Maximum Ratings . Removed the following sections: DC Low Power Comparator Specifications, AC Analog Mux Bus Specifications, AC Low Power Comparator Specifications, Third Party Tools, and Build a PSoC Emulator into your Board. Modified Notes in Packaging Dimensions . Updated Ordering Code Definitions . Removed inactive parts from Ordering Information . Updated links in Sales, Solutions, and Legal Information . |
| *L | 2872902 | VMAD | 04/06/2010 | Added part number CY8C20134 to the title. Added 8-pin and 16-pin SOIC pin and package details. Updated content to match current style guide and datasheet template. Moved acronyms and units of measure tables to page 35. |
| *M | 3043170 | NJF | 09/30/2010 | Added PSoC Device Characteristics table . Added DC I ² C Specifications table. Added F _{32K_U} max limit. Added T _{jit_IMO} specification, removed existing jitter specifications. Updated Units of Measure, Acronyms, Glossary, and References sections. Updated solder reflow specifications. No specific changed were made to I ² C Timing Diagram. Updated for clearer understanding. Template and styles update. |
| *N | 3173718 | NJF | 02/16/2011 | CY8C20134-12SX1I and CY8C20234-12SX2I typo error fixed in the ordering information table and changed in to CY8C20134-12SXI and CY8C20234-12SXI. Updated document version and date. Updated package diagram to 001-12919 *C. |
| *O | 3248613 | TOF | 06/10/2011 | Under Table 13 , the text " Table 13 lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75 V to 5.25 V and -40 °C ≤ T _A ≤ 85 °C, 3.0 V to 3.6 V and -40 °C ≤ T _A ≤ 85 °C, or 2.4 V to 3.0 V and -40 °C ≤ T _A ≤ 85 °C, respectively. Typical parameters apply to 5 V, 3.3 V, and 2.7 V at 25 °C. These are for design guidance only." changed to " Table 13 lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75 V to 5.25 V and -40 °C ≤ T _A ≤ 85 °C, 3.0 V to 3.6 V and -40 °C ≤ T _A ≤ 85 °C, or Table 14 for 2.4 V to 3.0 V and -40 °C ≤ T _A ≤ 85 °C, respectively. Компания «Океан Электроники» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Поставка оригинальных импортных электронных компонентов напрямую с производств Америки, Европы и Азии, а так же с крупнейших складов мира;
- Широкая линейка поставок активных и пассивных импортных электронных компонентов (более 30 млн. наименований);
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Помощь Конструкторского Отдела и консультации квалифицированных инженеров;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Поставка электронных компонентов под контролем ВП;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- При необходимости вся продукция военного и аэрокосмического назначения проходит испытания и сертификацию в лаборатории (по согласованию с заказчиком);
- Поставка специализированных компонентов военного и аэрокосмического уровня качества (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Actel, Aeroflex, Peregrine, VPT, Syfer, Eurofarad, Texas Instruments, MS Kennedy, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Компания «Океан Электроники» является официальным дистрибьютором и эксклюзивным представителем в России одного из крупнейших производителей разъемов военного и аэрокосмического назначения «JONHON», а так же официальным дистрибьютором и эксклюзивным представителем в России производителя высокотехнологичных и надежных решений для передачи СВЧ сигналов «FORSTAR».

JONHON

«JONHON» (основан в 1970 г.)

Разъемы специального, военного и аэрокосмического назначения:

(Применяются в военной, авиационной, аэрокосмической, морской, железнодорожной, горно- и нефтедобывающей отраслях промышленности)

«FORSTAR» (основан в 1998 г.)

ВЧ соединители, коаксиальные кабели,
кабельные сборки и микроволновые компоненты:

(Применяются в телекоммуникациях гражданского и специального назначения, в средствах связи, РЛС, а так же военной, авиационной и аэрокосмической отраслях промышленности).
